On 9 March 1735, there was a gale at Kilverston in Norfolk, *England*. The gale was very violent, but brief, and only extended one mile. [This is most likely a tornado.]<sup>212</sup>

On 9 March 1735, at Kilverston in Norfolk, *England*, “rose a hurricane, which blew the lead off the church [roof] and the [roof] tiles off a house and carried them some way in the air; and levelled a piece of high-furrow’d land just as if it had been harrow’d down; it blew water out of the river, and carried it a furlong and a half [990 feet, 302 meters], and a hurdle from a sheepfold over the tops of houses. It continu’d but a short time, extended not above a mile and ended in a sulphurous smell.”<sup>277</sup>

At Ashby-de-la-Zouch in Leicestershire, *England* on 2 June 1735, there was a thunderstorm. On 23 August, there was a great rainstorm and the next day a flood. On 27 October, there was a great flood. On 7 December, there was a fearful thunderstorm and flood.<sup>212</sup>

On 19 July 1735 at Kingston, *England*, there was a flood. The excessive wet has laid the corn [grain] flat, and much hay has been spoilt by flood in the valley of the [River] Thames.<sup>212</sup>

On 19 July 1735 at Kingston, *England*, wheat sold for 11 *l.* 10 *s.* a load; the price being raised by the excessive wet weather, which in many places has laid the corn [grain] flat. The [River] Thames has been so swell'd, that in many places the farmers were forc'd to carry off their hay to the hills to make it.”<sup>277</sup>

On 30 July 1735, the wet weather caused a landslide at Wedderlaw [Wedder Law] in Midlothian, *Scotland*. “A great thunderstorm, with rain and hail, after a very hot and dry season. The side of a hill moved into the valley close to Gala, and a great quantity as far as Galashiels.”<sup>212</sup>

In 1735, it was very wet in Rutland, in central *England*.<sup>212</sup>

In summer 1735 [in *England*], it was remarkably cold and wet, like winter. During June and July, there were but few fair days.<sup>212</sup>

In 1735, the price of wheat [in *England*] averaged 43 shillings per quarter [quarter ton].<sup>212</sup>

On 27 August 1735, there was a violent gale at Sandwich Bay on the east coast of Kent, *England*. It did much damage in many parts, and destroyed a third of the hops.<sup>212</sup>

On 7 September 1735, there was a gale at Worcester, *England*, with tremendous rain, especially at Droitwich [Droitwich Spa], where inhabitants were forced into their chambers; men, horses, sheep, and bridges were carried away by the flood.<sup>212</sup>

On 7 September 1735, there was a flood at Coventry, *England*, greater than any during the past 40 years.<sup>212</sup>

On 7 September 1735 at Worcester and in the neighbouring counties in *England*, “was a tempestuous wind, attended with so fierce rains as if the clouds had bursted; the water ran like rivers thro’ several neighbouring towns, particularly at Droitwich, where the inhabitants were forc’d into their chambers; and their salt and other goods spoil’d to several hundred pounds damage; men and their horses, gates, bridges, sheep, &c. were borne away by the violence of the torrents.”<sup>277</sup>

On 13 September 1735, a fierce storm of hail destroyed most of the corn [grain] unreaped, in the shire of Air, *Scotland*. It lay two foot thick in some places.<sup>277</sup>

On 15 September 1735, a hailstorm struck Ayr, *Scotland*. The hailstones destroyed most of the unreaped corn [grain] in Ayrshire. The hailstones laid 2 feet [61 centimeters] thick in some places.<sup>212</sup>

Measured temperatures in northern *France* varied widely in 1735. In Paris, temperature variations exceeded 27° F (15° C) in the winter; 50.4° F (28° C) in the spring; 39.6° F (22° C) in the summer; and 28.8° F (16° C) in the autumn. The year was also dry and harvest was late.<sup>79</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

January – though cold at times, there has been much pleasant and moderate weather this month. February 28<sup>th</sup> – this has been a summer month; only two or three cold days. March – not so pleasant as the last month. April 9<sup>th</sup> – cold and windy. April 17<sup>th</sup> – quite hot. April 21<sup>st</sup> – same. July 10<sup>th</sup> – people began to mow. August 11<sup>th</sup> – there has been so much rain, it is feared there will be but little good English hay. December – there have been several pleasant days, this month. None remarkably cold.<sup>78</sup>

In 1735, a drought engulfed several regions of *China* including: <sup>153</sup>

— During the period between 21 June and 19 July, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Hsia-ching; Anhwei (now Anhui province) in eastern *China* at Kuei-ch'ih; and Szechwan (now Sichuan province) in southwest *China* at P'i-shan. Rivers dried up.

— During the period between 18 August and 15 September, a drought engulfed Hupeh (now Hubei province) in central *China* at P'u-ch'i, Chung-hsiang, Tang-yang, Wuchang, Ch'ung-yang, Ch'i-shui and I-tu.

In 1735 during the 7<sup>th</sup> moon in the vicinity of Shanghai, *China*, there was a storm of great wind; sea overflowed.<sup>166</sup>

In 1735 in the vicinity of Shanghai, *China*, a dragon destroyed dwellings, tore up trees and damaged [rice] paddies. [In early *China*, tornadoes and waterspouts were commonly described as dragons.]<sup>166</sup>

**Winter of 1735 / 1736 A.D.** In January 1736, the winter was mild [in *England*]. There was scarcely any frost. There were continuous rains and many lives lost by floods.<sup>212</sup>

[During the winter of 1735/36 in *England*] “We had scarce any frost this winter; on the contrary such continued rain, that sheep, hares and venison, in some parts, dy'd [died] rotten; and many lives were lost by the floods. Perhaps it may be attributed to the dampness of the season, that the mushrooms gathered in the woods near Boulogne in *France* were so poisonous, that three persons who supp'd [suppered] thereon, dy'd [died] the same night, and a 4<sup>th</sup>, who only tasted them, was seized in a violent manner. In *Poland* they had so much frost, that the Vistula [River] was frozen over above [more than] a month; and the cold so severe, that the dogs were driven mad by it.”<sup>278</sup>

On 2 February 1736 a gale struck Ashby-de-la-Zouch in Leicestershire, *England*. The barometer fell to 28.39 inches. On 8 February, there was a great snowfall with a gale. On 21 February, there was another great snowfall. On 24 November, there was a gale.<sup>212</sup>

In 1736 in *England*, the snows were remarkably deep.<sup>41, 43, 56</sup>

**1736 A.D.** On 16 February 1736, there was a high tide [at London, *England*]. The River Thames rose 6  $\frac{3}{4}$  inches [17 centimeters] above the height of the great tide of 8 March 1726, being higher than anytime during the past 50 years.<sup>212</sup>

On 16 February, the tide of the River Thames in London, *England* rose so high that the counsel were carried out of Westminster Hall in boats.<sup>39</sup>

On 16 February 1736 in London, *England*, a question was carried in the House of Commons for building a bridge over the River Thames from Palace Yard to the Surry Side. “During the debate, that river overflow'd [overflowed] its banks by reason of a strong spring tide, the water was higher than ever known before, and rose above 2 foot in Westminster Hall; where the Courts being sitting, the judges &c. were obligated to be carry'd [carried] out. The water came into all the cellars and ground rooms, near the river on both sides, and flow'd [flowed] thro' [through] the streets of Wapping and Southwark, as it proper channel; a general inundation cover'd [covered] all the marshes and lowlands in Kent, Essex, Suffolk, Norfolk and Lincolnshire, and some thousands of cattle were destroy'd [destroyed] with several of their owners in endeavouring to save them. The tide being brought in by a strong wind at N.W. [northwest] was the highest in Lincolnshire of any for 135 years past; 17 breaches were made, about sun-rise, in the banks of the river between Spalding and Wisbech, with several between Wisbech and Lynn, and irreparable damage done; some graziers having lost all their cattle. At Clay in Norfolk, waters came over the Great Beach, almost demolish'd [demolished] the town, and left nine foot water in the marshes. At Gold-Ongar, Essex, Mr. Cooper, and four of his servants, were drowned in endeavouring to save some

sheep, the sea-wall giving way of a sudden. The little Isle of Candy and Foulness, on the Coast of Essex, were quite under water; not a hoof [animal with hooves?] was saved thereon, and the inhabitants were taken from the upper part of their houses into boats. The particular damages may be better conceived than related.”<sup>278</sup>

The River Thames in London, *England*, rose so high at Westminster, that the lawyers were brought out of the hall in boats.<sup>40</sup>

On 28 February 1736, *England* reported, “About the middle of this month we had hard frosts, and frequent snow, for about a fortnight: They had a great deal more in *Scotland*, where several persons were lost in the snow: And in *North Wales* very old men cou’d [could] not remember it so deep before.”<sup>278</sup>

In May 1736, there was an epidemic of smallpox at Nottingham, *England*. It raged with such violence that in the month of May, 104 people were buried in St. Mary’s churchyard. During 1736, the burials exceeded the births by 380.<sup>212</sup>

In May 1736, there was a great flood in Nottinghamshire, *England*. In July, the houses near the [River] Leen were two feet [61 centimeters] deep in water.<sup>212</sup>

In 1736, there were floods in *England*. “From the beginning of March [to 5 July] such continued rains, the like not known in ye memory of man. All the low meadows in ye kingdom floated [flooded], and the hay and corn [grain] carried away or spoilt. The damage done almost incredible. In Oxfordshire the meadows were floated for many miles. In three days 5 inches [13 centimeters] of rain fell”<sup>212</sup>

On 5 July 1736, *England* reported, from the beginning of the month, we had such continued rain, the like not known in the memory of man; insomuch that all the low meadows in the Kingdom were about this time floated [flooded], and the hay, corn, and grass thereon carried away, or spoiled. Some bridges and mills gave way, and the damage done almost incredible. In the parish of Tingwick, in Oxfordshire, a large tract of earth computed at about 6,000 loads, with a hedge and several large trees thereon, was carried by the violence of the torrent across the channel of the river, by which means the current was entirely stopped, and the meadow floated for many miles.<sup>278</sup>

In 1736, the price of wheat [in *England*] averaged 40 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

February – a close [overcast] cold winter. February 28<sup>th</sup> – it looked promising for a forward spring. March 15<sup>th</sup> – severely cold. April 10<sup>th</sup> – a hot day. April 11<sup>th</sup> – the spring looks promising. April 17<sup>th</sup> – we dug the lower garden, and sowed carrots, parsnips, etc. May 29<sup>th</sup> – it was through the whole month, except one week, cold and raw. July 9<sup>th</sup> – sowed turnip seed. The fowls and chickens have destroyed the grasshoppers. July 25<sup>th</sup> – it was a wonderful year for grass. August – cold weather the last of this month. September – it has been very dry all this month. November 3<sup>rd</sup> – we pulled up all our turnips. Fine weather. December 30<sup>th</sup> – hardly any winter yet.<sup>78</sup>

The summer of 1736 in Paris, *France* was characterized by:

Hot days	62 days
Very hot days	4 days
Extremely hot days	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The hot days were broken down to: 7 in May, 11 in June, 21 in July, 18 in August and 10 in September.<sup>62</sup>

In Algiers, *Algeria* from May to October, the following weather was observed:<sup>62</sup>

Hot days	124 days
----------	----------

Very hot days                      41 days

The peak temperatures observed this year:

Paris, <i>France</i>	( 98.6° F, 37.0° C) on 30 July
Utrecht, <i>the Netherlands</i>	( 93.9° F, 34.4° C) on 24 July
Algiers, <i>Algeria</i>	( 92.8° F, 33.8° C) on 15 July and 5 August

In Dijon, *France*, in Burgundy, the grape harvest began on 17 September. The harvest was low but the wine quality was pretty good.<sup>62</sup>

On 14 September 1736, Constantinople [now Istanbul, *Turkey*] reported. “About two [o’clock] in the afternoon, the horizon over the city was cover’d [covered] with a thick cloud and as dark as at midnight, in the midst of the cloud a bright star appeared, of the colour of blood, and took the form of a comet with a long train. The star remain’d [remained] 35 minutes in the same situation, and about 4 [o’clock] the darkness dispers’d [dispersed], and left a stinking fog which remained till midnight.”<sup>278</sup>

Around September 1736, Petersburg [Saint Petersburg, *Russia*] reported, “A great fire has happen’d [happened] there, by which 2000 warehouses and dwelling-houses, with the post-office and shambles, and several noblemen’s palaces were reduc’d [reduced] to ashes; orders were given for rebuilding the houses at a greater distance, *viz.* instead of 3 into 2 streets, and those 30 foot wide. The roads of Livonia [now *Latvia* and *Estonia*] and *Finland*, having taken fire thro’ [through] the excessive heat of the weather, the smoke of them cover’d [covered] the country, and reached even to Muscow [Moscow].”<sup>278</sup>

On 7 October 1736, *England* reported “a great storm did considerable mischief [damage] to our shipping, but was in *France* much more violent.”<sup>278</sup>

On 9 October 1736, a gale struck *England*. The great storm did considerable damage to the shipping, but in *France* it was much more severe.<sup>212</sup>

On 12 November 1736 at Edinburgh, *Scotland*, there was a great northwest gale. From 12 to 18 November, there was an intense frost. It was so severe that in 24 hours after it began, persons were walking on the [frozen] lake.<sup>212</sup>

On 20 December 1736, there was a gale [in *England*].<sup>212</sup>

On 24 December 1736 at London, *England*, there was a very high tide. The River Thames flowed into Westminster Hall.<sup>212</sup>

On 24 December 1736 in London, *England*, “this morning at 5 [o’clock] by a very high tide the [River] Thames flowed into Westminster-Hall, broke down the bank above the horse-ferry, and did great damage in the gardens, meadows, and cellars thereabouts. In the afternoon it was high water again at two o’clock, being at London Bridge 2 hours sooner than usual. A breach was made a little below the old one near Dagenham, in Essex, and great tracts of land laid under water.” At this time, his Majesty was at sea in a great storm. Concern for his safety was relieved when it was reported on the 26<sup>th</sup> that he had safely landed onshore.<sup>278</sup>

In 1736, a drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Ch’ao-yang. Also in the same year, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang, Han-ch’uan, Chiang-ling, Mien-yang and T’ien-mên. During the period between 7 August and 4 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ningpo and Ch’ing-yüan.<sup>153</sup>

**Winter of 1736 / 1737 A.D.** The winter of 1736-37 was very severe near the foot of Horrilakero [a mountain consisting of a reddish stone, interspersed with white crystals of an oblong form] in Lapland [*Finland*]. “The cold was fo [so] extreme in December 1736, that whenever we would taftē [taste] a little brandy, the only thing that could be kept liquid, our tongues and lips froze to the cup, and came away bloody. The froft [frost] even congealed the fingers of fome [some] of us, and threatened us with yet more difmal [dismal] accidents. While the extremities of our bodies were thus freezing, the reft [rest], thro’ [through] exceffive [excessive] toil, was bathed in fweat [sweat]. Brandy did not quench our thirt [thirst]; we muft [must] have recourfe [recourse] to deep wells dug thro’ [through] the ice, which were fhut [shut] almoft [almost] as foon [soon] as open, and from which the water could fcarce [scarce] be conveyed unfrozen to our lips; and muft [must] thus run the hazard of the dangerous contraft [contrast] which icy water might produce in our heated bodies. Judge what it muft [must] be to walk in fnow [snow] two foot deep, with heavy poles in our hands, which we were continually laying upon the fnow [snow], and lifting up again.” In the town of Tornea in the month of January, the cold was increased to the extremity, that Mr. Reaumur’s mercurial thermometer, which at Paris, in the great frost of 1709, it was thought strange to see fall to 14 degrees below the freezing point [0.5° F, -17.5° C], were now got down to 37 [-51° F, -46° C]. The spirit of wine in the others was frozen. If we opened the door of a warm room, the external air instantly converted all the vapor in it to snow, whirling it round in white vortexes. If we went abroad, we felt as if the air was tearing our breasts in pieces. And the cracking of wood, whereof the houses are built, as the violence of the cold split it, continually alarmed us with an approaching increase of cold. During our whole stay in the frigid zone, the cold was so excessive, that the 7<sup>th</sup> of April 1737 at five in the morning, the thermometer was fallen to twenty divisions below the point of freezing [-13° F, -25° C].<sup>227</sup>

In Philadelphia, Pennsylvania in the *United States* the winter of 1736 was intensely cold and many people perished.<sup>1</sup>

In Philadelphia, Pennsylvania in the *United States* the winter of 1737 was intensely cold and many people perished.<sup>1</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1737 on January 2<sup>nd</sup> - 'Tis thought the ground was frozen four-feet (1.2 meters) deep. January 3<sup>rd</sup> – there is no wood, little corn; sad complaints everywhere. January 4<sup>th</sup> – Corn has been secured but the grain mills are inoperative [because the water is frozen]; people know not what to do. January 11<sup>th</sup> – it snowed all day. January 16<sup>th</sup> – a level snow of about eight-inches (20 centimeters) but turned to rain. January 17<sup>th</sup> – glare of ice. January 18<sup>th</sup> to 22<sup>nd</sup> – snow. January 27<sup>th</sup> – more snow.<sup>78</sup>

---

**1737 A.D.** On 9 January 1737, there was a great gale at Bristol in southwest *England*. In the evening, and for some hours in the night, such a violent storm of wind, rain and hail that the like has not been felt since the great November storm of 1703, the water rising within 4 or 5 inches [10-13 centimeters] of this mark [high water mark]. The lowlands in Gloucestershire and Somersetshire, and in Barton Regis overflowed [flooded], and abundance of sheep etc. were drowned. The freshes of water (rain and hail) joined to the tide, flooded and did incredible damage in Bristol. A public house, and the sea wall for 200 yards [183 meters] were carried away. At Redwick and Chitnen, 800 sheep were drowned. At Upton-on-Severn [Upton-upon-Severn], many trees were blown down. There was a great deal of thunder and lightning. In Bridgewater, the floods went into the houses. At Highbridge, many hundred acres of land overflowed and a great number of sheep drowned. At Thornbury, there were destructive floods. At Chepstow, the water rose 70 feet [21 meters]; one man lost 130 cattle. The damage in Bristol was estimated at £100,000 [£13.6 million in today’s currency using the retail price index inflation rate].<sup>212</sup>

On 13 March 1737, there was a violent gale off *Ireland*. A sailing ship traveling from Cork to Nevis was two days out of port when it encountered this storm.<sup>212</sup>

In March 1737, Proske, near Rosenberg in *Poland* reported, “That a famine raged in those parts, and that a woman had her head cut off for killing and eating her own infant. That a peasant and his family were taken up for having consumed the flesh of 2 small children, and another 12 years old.”<sup>279</sup>

In April 1737, an expedition into the northernmost part of *Lapland* in search of an ancient monument [with prehistoric writing] commented, “During the winter, while the snow continues in separate particles like dust, the deer [reindeer] will spurn it away to get at the moss [which they eat], which they scent at the depth of 5 or 6 feet [1.5-1.8 meters], but the surface of the snow having now been thawed and again frozen, was become a solid cake of ice, which, when the deer stopped, the Laplanders were obligated to break for them, and indeed this is the only way in which they reward an animal that affords them almost all the necessaries and conveniences of life. The milk of this creature [rain deer or reindeer], which is a little acrid, but as rich as the cream of cows milk, they keep in cakes, for when it is frozen it will continue good a long time. They also make it into cheeses, which would be excellent if the skill was equal to the material. The skins afford them great variety of garments. Those of the young, of which the hair is very soft, yellowish, and a little curled, are used for linings; the colour afterwards becomes brown, and the hair stronger; the skin then serves for a warm and light covering, with the hair on the outside, called lappmudes [gowns made of reindeer skin]. When the deer is yet older, the skins are used for gloves and belts. The guts are spun out into thread, with which the several parts of these garments are sowed together. The flesh, which is excellent, they eat, either fresh or dried, and the horns they sacrifice to their deities.”<sup>300</sup> [An interesting symbiotic relationship]

In May 1737, Copenhagen reported, “That the sickness in *Poland*, occasioned by the misery of that country, and the extreme dryness of the season increasing daily, and having reached to Dantzick [now Gdańsk] and other places upon that coast, the Danish Court apprehending it may prove infectious, have forbid communication with the places infected.” This drought may have also played a part in several fires, which occurred at that time. “The town of New Brandelburgh [Neubrandenburg, *Germany*], in the Dutchy of Stargard, has been burnt to ashes. And that a fire had happened at Jenekoping [Jönköping], a city in *Sweden*, which reduced the castle, church, and many fine buildings to ruins: the magazine took fire, and was burnt in half a hour: the ammunition sufficient for 40,000 men blew up, and gave a most terrible shock.”<sup>279</sup>

On 21 May 1737, a hurricane struck the Road at the Cape of Good Hope [*South Africa*] and as a result 8 out of 9 homeward bound East-India ships were lost.<sup>279</sup>

During the summer of 1737, several dreadful fires occurred. [These in part may be related to the dryness of the season.] *Panama* in the Spanish West Indies was entirely destroyed. Twelve thousand houses and palaces at Moscow, *Russia* were destroyed by fire. Two thousand five hundred houses at Jaroslaw in Muscovy [Jaroslaw, *Poland*] were destroyed by fire. The fires at Moscow and Jaroslaw were believed to be set by the Turks who also apparently tried to also set fire to Saint Petersburg without success.<sup>279</sup>

As recorded on 7 June 1737, there was a thunderstorm at Birr, *Ireland* during the previous week. “Last week the greatest lightning that has happened for many years.”<sup>212</sup>

On 21 June 1737, there was a great drought in the west of *England*.<sup>212</sup>

On 28 June 1737, there was a plague of gnats (small stinging flies) at Gravesend, *England*. They were so troublesome, that smoky fires had to be lighted to drive them away. Then on 9 July, there was such a cloud of these small flies that the inhabitants of Barnet in Middlesex, could not see across some of the streets. They stained the wearing apparel of passers-by. At Gravesend, the little black flies lay so thick on the surface of the River Thames that for a great way it looked black. The leaves of the trees and plants

were also black. On 1 August 1737, there was a plague of ladybirds [Coccinellidae or ladybugs] at Erith in Kent. They formed incredible swarms and were never before seen in such abundance. The ground and plants were completely covered with them.<sup>212</sup>

In 1737, the price of wheat [in *England*] averaged 38 shillings per quarter [quarter ton].<sup>212</sup>

The summer of 1737 in *Italy* was excessively hot. The summer of 1736 in Paris, *France* was characterized by:

Hot days	45 days
Very hot days	10 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The peak temperature occurred on July 21; namely 91.6° F (33.1° C). The year was dry. In Paris, the annual rainfall was only 427 mm (16.8 inches). In Dijon, *France*, in Burgundy, the grape harvest took place from 16 to 23 September. The grape production was very low because the vines were twice hit by a hailstorm; on 6 June and 30 August.<sup>62</sup>

On 2 July 1737, there was a thunderstorm at Bristol, *England*. It was very violent in the evening. The rain fell for 45 minutes heavier than ever remembered before.<sup>212</sup>

On 2 August 1737, there was a violent gale with great rainfall at London, *England*. Innumerable trees torn up by the roots, chimneys blown down, and ships sunk in the River Thames. At Tunbridge Wells [Royal Tunbridge Wells] on 3 August, there was a great flood. On 4 August, there was a thunderstorm at Walton-on Thames.<sup>212</sup>

On 3 August 1737, a terrible hurricane with winds at north blew down an abundance of trees [in *England*] and several ships from anchor.<sup>279</sup>

On 9 September 1737 between 4 and 5 o'clock in the evening, a most dreadful hurricane that was ever remembered in these parts struck the Isle of Cows on the coast of St. Domingo [now *Haiti* and the *Dominican Republic*] in the West Indies. "The town of St. Louis was entirely levelled with the ground, except the church and two houses, those of the Fort St. Louis were blown down; the ships at anchor under that fort were thrown upon the coast, or foundered on their anchors, and several persons were drown'd; all the sugar canes and cotton-trees are destroyed. The master of a ship from St. Eustasia [*Sint Eustatius*] reports, that when he left that coast, he saw above 20 boats perish, that the town is almost all blown down, and the country ruined. The thunder and lightning fell in several places, and burnt divers [diverse] ships and magazines."<sup>280</sup>

On 9 September 1737, a hurricane struck the *Dominican Republic*. The hurricane carried away Negroes into the sea. Several persons were drowned near Fort St. Louis.<sup>141</sup>

During the evening of 9 September 1737, the town of St. Louis in Saint Domingo, was entirely destroyed by a hurricane. All the sugar canes and cotton trees were destroyed, and all the ships at anchor there were thrown upon the coast.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

Heavy rains from 28 September to 3 October 1737 caused floods that did great damage at St. Ives, Huntingdon, and Ely, *England*.<sup>212</sup>

In September 1737, there was a cattle plague in Nottinghamshire and Lincolnshire, *England*. Upwards of 40,000 cattle died in these two counties.<sup>212</sup>

On 30 September 1737, a furious hurricane struck the Bay of Bengal in *India* and *Bangladesh*. The hurricane “attended with heavy rain, which raised 15 inches [38 centimeters] of water in 5 hours, and a violent earthquake, which threw down abundance of houses; and as the storm reached 60 leagues [180 miles, 290 kilometers] up the River Ganges, it is computed that 20,000 ships, barks, sloops, boats, canoes, &c. have been cast away. A prodigious quantity of cattle of all sorts, a great many tygers [tigers], and several rhinoceroses were drowned; even a great many caymans [a reptile similar to alligators and crocodiles] were stifled by the furious agitation of the water, and an innumerable quantity of birds was beat down into the river by the storm. Two English ships of 500 tons were thrown into a village above 200 fathom [1200 feet, 366 meters] from the bed of the River Ganges, broke to pieces, and all the people drowned pell-mell among the inhabitants and cattle. Barks of 60 tons were blown two leagues [6 miles, 10 kilometers] up into the land over the tops of high trees. The water rose in all 40 foot [12 meters] higher than usual. The English ships drove ashore, and broke to pieces, were the *Decker*, *Devonshire*, and *Newcastle*; and the *Pelham* is missing. A French ship was drove on shore, and bulged; after the wind and waters abated they opened their hatches, and took out several bales of merchandize, &c. but the man who was in the hold to fling the bales suddenly ceased working; nor by calling to him, could they get any reply; on which they sent down another, but heard nothing of him, which very much added to their fear; so that for some time no one would venture down. At length one more hardy than the rest, went down, and became silent and unactive [inactive] as the two former, to the astonishment of all. They then agreed by lights to look down into the hold, which had a great quantity of water in it, and to their great surprise, they saw a huge alligator sta[?] in thro’ [through] a hole in the ship’s side, and ‘twas with difficulty they killed it; when they found the three men in the creature’s belly.”<sup>280</sup>

On 11 October 1741 [Misprint, should be 1737], there was the most awful and destructive storm in *India*, which was ever experienced. It was computed that three hundred thousand persons perished on the land and water. The water rose 40 feet (12 meters) higher than ever before known. It was also computed that more than a thousand vessels were lost, and among them eight English East India ships, with all their crew.<sup>1</sup>

At the mouth of the Ganges River in *Bangladesh/India*, there was a great storm causing 20,000 vessels of different kinds to be cast away, eight English East-India ships, and 300,000 people were lost, and the water rose forty feet higher than usual on October 11, 1737.<sup>40, 41, 43, 56</sup>

A great storm struck *India* on 11 October 1737. Many hundreds of vessels cast away; a fleet of Indiamen greatly damaged. Some 30,000 persons are believed to have perished.<sup>47, 57, 90</sup>

In 1737, the Hooghly River Cyclone struck *India* and *Bangladesh* causing 300,000 deaths.<sup>98</sup>

In October 1737, a hurricane struck St. Kitts in the *West Indies* and Montserrat in the *Leeward Islands*. An English merchantman was sunk at Basseterre, St. Kitts and only one of the crew survived. At Montserrat, the storm carried away Negroes into the sea.<sup>141</sup>

In 1737, a hurricane did great damage at St. Kitts and Montserrat. At Montserrat, it blew down all the windmills and houses and carried away mules, Negroes, and cattle into the sea. The sugar canes were all destroyed.<sup>143</sup>

In October 1737, it was reported in England “there was lately a terrible hurricane at *Montserrat* and *St. Kitts*, in which Capt. Sutton’s ship was lost, with the crew except one man, and 50 hogshead of sugar. At *Montserrat* the storm was so violent, that it blew down and washed away all the windmills, houses and sugar-houses, and carried [carried] away mules, negroes and cattle into the sea, the sugar-canecanes were all

destroy'd [destroyed], and had the hurricane continued 6 hours longer, the whole island must have been wash'd [washed] away." <sup>279</sup>

On 18 October 1737 at Canterbury, *England*, the River Stour had a higher flood than for the past 30 years. <sup>212</sup>

In 1737 in Sheffield in Yorkshire, *England*, the weather was very changeable. The summer was dry. August was as cold as winter. September was very changeable. In October, there was much catarrh [inflammation of mucous membranes]. In November, there was fatal diarrhea. <sup>212</sup>

On 1 December 1737, there was a violent gale at London, *England* that did much damage. <sup>212</sup>

On 16 December 1737, there was a violent gale at Margate, *England*. <sup>212</sup>

In 1737, a drought engulfed several regions of *China* including: <sup>153</sup>

— During the period between 5 February and 8 August, a severe drought engulfed Hopei (now Hebei province) in northern *China* at Yü-t'ien.

— During the period between 31 March and 29 April, a drought engulfed Hopei province at An-tz'ü [uncertain name, "Tung-an"] and Kansu (now Gansu province) in northwest *China* at Hui-ning. Crops were damaged by the drought.

— During the period between 28 June and 26 July, a drought engulfed Hupeh (now Hubei province) in central *China* at Hanyang, Huang-p'o, Hsiao-kan, Huang-kang and Ma-ch'êng.

— During the period between 24 September and 23 October, a drought engulfed Hopei province at Huo-lu, Luan-ch'êng and P'ing-shan.

In 1737, floods struck many regions of *China* including: <sup>153</sup>

— During the period 1-30 March, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Yüeh-ch'ing, Wên-chou and Shui-an.

— During the period between 29 May and 27 June, floods struck Anhwei (now Anhui province) in eastern *China* at Shou and Hupeh (now Hubei province) in central *China* at Huang-kang.

— During the period between 27 July and 25 August, floods struck Hopei (now Hebei province) in northern *China* at Wu-ch'iang, Jao-yang, Huo-lu, Luan-ch'êng, P'ing-shan, Ching, Jung-ch'êng, Hsien, Hsin-yüeh, Kao-i and Peiping; and Shantung (now Shandong province) on the east coast of *China* at Hsin and Liao-ch'êng.

The year 1737 was a year of abundance in the vicinity of Shanghai, *China*. Some stalks had double, others four or five heads. <sup>166</sup>

In *Italy* and *Spain*, the frost was very severe; none in Holland [now *the Netherlands*] or *Germany*. <sup>47, 93</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

January 31<sup>st</sup> – pleasant. February – rains and pleasant weather alternately. March 5<sup>th</sup> – it is a melancholy time in regard to the scarcity of corn; some have had none for several weeks. March 26<sup>th</sup> – it was a very backward spring indeed. March 30<sup>th</sup> – spring like day; the trees hardly beginning to bud. All the talk in Boston is about the mob that pulled down the market. [There was a great scarcity of provisions at that time in Massachusetts as well as in the whole eastern country. Much distress prevailed in Boston in the spring of the year, and this outbreak was probably occasioned by high prices and the exactions of the market people.] April 2<sup>nd</sup> – the gooseberry bushes look quite green. April 11<sup>th</sup> – snowed all day. April 18<sup>th</sup> – cloudy and cold. April 20<sup>th</sup> – it looks no more like spring than it did a month ago. No plowing or gardening yet. April 21<sup>st</sup> – all the talk is – no corn, no hay, and there is not a peck of potatoes in all the eastern country. April 25<sup>th</sup> – there is no grass at all. May 2<sup>nd</sup> – we sowed our peas, and lower garden. May 4<sup>th</sup> – a multitude of creatures were not able to get up; many have died [because of starvation]. May 9<sup>th</sup> – warm today. May 10<sup>th</sup> – the whole neighborhood without milk. May 17<sup>th</sup> – the grass hasn't grown because of a

lack of rain. May 20<sup>th</sup> – a joyful, seasonable rain. May 24<sup>th</sup> – very pleasant. June 4<sup>th</sup> – corn is 10s. a bushel in Boston; hardly any to be got. July 18<sup>th</sup> – there never was, in the memory of man, more seasonable weather. July 20<sup>th</sup> – grass is very thin. July 22<sup>nd</sup> – no feed on the Neck [peninsula]. July 27<sup>th</sup> – grasshoppers plentiful. August 8<sup>th</sup> – the grass began to shoot. September – various weather this month, but on the whole a fine season for the corn to dry. October 10<sup>th</sup> – cold. October 19<sup>th</sup> – fine weather. October 23<sup>rd</sup> – it was never known to be so dry. No sawing nor grinding. [The rivers were so dry that the water mills could not grind the grain nor saw lumber] November 5<sup>th</sup> – there has been some rains. November 24<sup>th</sup> – no grinding; we had a bag of corn go from mill to mill, for about two months, and not ground yet. December 18<sup>th</sup> – it was remarkable that there had been no northwesterly winds this fall or winter.<sup>78</sup>

In 1736, Charles Marie de La Condamine traveled to *Peru* [and *Ecuador*] to measure the degree of the Meridian in order to determine the shape of the Earth [the study of geodesy that showed the earth's shape to be that of an oblated spheroid, rather than perfectly round sphere]. He observed that on the top of their high mountains a unique atmospheric phenomenon is every day to be seen. The first time that M. Bouguer, and his company [Bouguer and Condamine teamed together between 1737 and 1741] remarked it, they were together on a mountain, called Pambamareca [Pambamarca – elevation 13,500 feet, 4,100 meters], somewhat lower than Pichinca [Guagua Pichincha – elevation 15,696 feet, 4,785 kilometers]. Upon the dissipation of a cloud, in which they had been involved, they perceived the sun rising, which shone very bright. The cloud passed to the side of them, which was furthest from the sun, and each one saw his own shadow projected upon it, and his own only, because the surface of the cloud was irregular. The cloud was so near them that they could distinguish all the parts of the shadow, the arms, the legs, and the head. But their astonishment was greatly increased, when they perceived the head to be adorned with a glory, or aureolus [golden, splendid, magnificent], formed of 3 or 4 little concentric crowns, of very vivid colors each, with the same variety as the primary rainbow, red being the outermost. The intervals between these circles were equal, the last was the faintest. And at a great distance they perceived a large white circle, which surrounded the whole figure. This was a kind of apotheosis [glorification] of each spectator, and every one enjoyed a sensible pleasure in seeing himself adorned with all these crowns, without perceiving those of his neighbors. The diameter of this iris increased every moment, and the circle appeared interrupted and broken on those parts of the clouds, the particles of which were frozen.<sup>295</sup> [This phenomena is referred to as a *Brocken Spectre* with halo-like rings of a *Glory*]

---

**1738 A.D.** On 2 January 1738, there was a gale at Bristol, *England*. Such a violent storm of hail, wind, and rain, that the like has not been known, nor the water so high since November 1703. A great number of people and sheep drowned.<sup>212</sup>

On 9 January 1738 in *England*, it was reported, “This evening happened such a violent storm of hail, wind, and rain at Bristol, that the like has not been known, nor the water so high since Nov. 1703. Several ships were drove ashore on the marshes, the low lands on Gloucestershire and Somersetshire sides were overflowed by the rapidity of the tide joined with the freshes [freshets], and great numbers of sheep lost, and several garden walls broken down; also incredible damage done in the city by overflowing streets, cellars, and houses. The 3 Horse-Shoes, a publick-house [tavern], was carried away by the torrent, with all the goods, and barrels of liquor, but the people saved their lives. Several persons were drowned, but particularly at Thornbury, on P. Beasy lost his wife, 5 children, and 2 servants, but saved his own life by sitting upon the ridge of his house till morning, when a boat took him off.”<sup>280</sup>

On 4 January 1738, there was a severe thunderstorm with a sudden violent wind at Bath, *England*. It destroyed the Walcott church.<sup>212</sup>

On 14 January 1738, there was a violent gale at *Scotland*. At Edinburgh, from midnight until 4 a.m., much damage was done. Many [ship] wrecks in *Scotland*, and several churches were blown down. At Aberbrothwick, a church was destroyed. At Inverary, the gale was very violent. At Cambelton, 20 houses were blown down. At Perthshire and Dundee, there was great damage. Along the North Road,

nothing was seen but the ruins of houses. In the Isle of Mull, several towns did not have a house standing. At Newcastle, from 1 a.m. until 5 a.m., there was great damage. The roofs of houses were blown away. There was no storm of such fury for many years.<sup>212</sup>

On 25 January 1738, there was a gale at Deal in Kent, *England*. On 2 February, there was a gale at London.<sup>212</sup>

On 27 February 1738 in Dublin, *Ireland*, there was a great hailstorm accompanied by thunder and lightning.<sup>93</sup>

In June 1738, two men fell dead from only the influence of heat [heatstroke] on the streets of Charles Town, [in the *United States*]. On that day the thermometer rose to 29.3° Reaumur in the shade (36.7° C, 98° F). Many slaves died on the same day in the countryside where they worked. [Benjamin] Franklin said it is not rare in Pennsylvania to see on hot summer days the harvesters drop dead in masses while they are cutting [the fields].<sup>58,80</sup>

In June 1738 in South Carolina in what would become the *United States*, the temperature rose to 98° F [37° C] in the shaded air. In the sun, the temperature was closer to 126° F [52° C]. Two men in the streets dropped suddenly dead; as did several slaves who were at work in the rice fields, whose face, necks, breasts and hands immediately became livid.<sup>295</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

January – the month came in warm, like the beginning of April. January 23<sup>rd</sup> – two things are remarkable, relative to the wind, for several months past; one is, that the wind always comes about with the sun. The other, that after foul weather, the wind comes as far as the southwest and except once or twice, no further. February – the former part of the month cold. The last half, fair, pleasant and moderate weather. March – plenty of hay, corn, etc.; a vast difference on this account between last spring and this spring. March 27<sup>th</sup> – the frost is generally out of the ground. It looks likely for a forward spring. April 11<sup>th</sup> – Jack dug the lower garden. April 14<sup>th</sup> – unusually hot weather. The spring is thought to be two or three days forwarder than the last. May – pleasant. We finished planting potatoes today. May 15<sup>th</sup> – hot weather. May 23<sup>rd</sup> – fine, pleasant day. May 29<sup>th</sup> – abundance of rain. July 7<sup>th</sup> – grasshopper. The drought came on very severely, and prevailed in such a manner, as the like was never known. September 3<sup>rd</sup> – more raccoons, jays, and red squirrels than ever was known. The weather this month generally pleasant. November 5<sup>th</sup> – there was, I think, more grass now than in the summer. November 23<sup>rd</sup> – cold weather. November 27<sup>th</sup> – snow last night, but fair and moderate today. December – frequent snows this month, but turned to rain, and the latter part of the month remarkably slippery.<sup>78</sup>

The summer of 1738 in Paris, *France* was characterized by:

Hot days	49 days
Very hot days	1 day
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The peak temperature in Paris of 98.4° F (36.9° C) took place on 5 August. The year was dry, which can be seen by the annual rainfall in Paris of only 399 millimeters (15.7 inches). In Dijon, *France*, in Burgundy, the grape harvest began on 29 September. It was very poor harvest, but the season produced pretty good wines.<sup>62</sup>

On 25 July 1738 in *England*, there was a great hailstorm in Bedfordshire, Middlesex and Suffolk.<sup>93</sup>

On 25 July 1738, there was a dreadful thunderstorm at Dunstable [Dunstable Downs], *England*. Many windows were shattered by hailstones as big as walnuts. At Uxbridge, the hailstones were bigger, and several persons were wounded. The tiles of houses and the branches of trees were broken. This storm

was also felt at Watford, Bushby, and St. Albans, at about noon. A similar storm 3 or 4 hours later occurred at Bungay in Suffolk, where turkeys and poultry were killed in great abundance. It was violent at Islip in Oxfordshire. It also struck Marlborough and Newbury. At Reading, there was much damage to houses and windows.<sup>212</sup>

On 25 July 1738, “about noon a dreadful storm of thunder, lightening [lightning], and hail, happened at Dunstable [in Bedfordshire, *England*], which put the whole town in the utmost consternation. A house opposite to the sign of the Sugar Loaf was fir’d [fired] and shatter’d to pieces by the lightening; the people were apprehensive of the fire spreading throughout the town and brought forth the [fire] engine; but no farther damage was done: except the shattering a great many windows by the hail-stones, which were as big as walnuts. At Uxbridge the hail-stones being bigger, wounded several people, and broke not only the windows, but the [roof] tiles of the houses, and tore off the branches of trees. This storm was felt also at Watford, Busby, St. Albans, and places adjacent in Hertfordshire. Between three [three] and four a-clock [o’clock] in the afternoon, they had a like storm of hail, about Bungay, in Suffolk, preceded by an uncommon clap of thunder. The windows of the churches were shatter’d, the corn [grain] laid flat, turkeys and other poultry kill’d in great numbers.”<sup>280</sup>

In 1738, the price of wheat [in *England*] averaged 35 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

On 5 August 1738, there was a thunderstorm at Harlow in Essex, *England*.<sup>212</sup>

In 1738, there was a great drought from August through 7 September at Sheffield in Yorkshire, *England*.<sup>212</sup>

In September 1738, Cranborne in Dorsetshire, *England* reported, “The 29<sup>th</sup> of last month at five in the afternoon, was seen near this place a surprising meteor, or phænomenon in the sky to the north east, the sun shining bright. It first appear’d as fire bursting from behind a cloud, out of which fire issued a light glowing ball, with a train of flame behind it, which quickly disappeared. The same was seen at Wells in Somersetshire; also at Tupton in Derbyshire about the same time; it did not come from behind a cloud, for the sky was quite free from clouds, and the sun shin’d very clear; it appear’d like a cone of fire, which terminated in a sharp point, with a bright nucleus or a ball at its thicker end, which seem’d to burst and go away in a great flame. It was a most south east. At Reading, and 15 miles [24 kilometers] round, (the same time) an astonishing noise was heard in the air, when it was quite serene. The crack which was very sudden and violent was succeeded by a rumbling noise for the space of a minute. This phænomenon by its description from different parts, perfectly agrees with what happen’d in the month of March 1719, and was very dreadful and surprising to the western parts of *England*; and is that sort of meteor which naturalist call *Draco Volans*, or, a flying dragon.”<sup>280</sup>

In 1738 during the period between 20 March and 14 August, a severe drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Yen-ch’êng. During the period between 6 May and 8 August, a drought engulfed Kiangsu province at Wu-chiang and Huai-yin. During the period between 13 October and 11 November, a drought engulfed Kiangsu province at Wu-chin and Yen-ch’êng.<sup>153</sup>

In 1738 during the period between 15 August and 13 September, floods struck many regions of *China* including:<sup>153</sup>

- The Sang-kan River in Hopei (now Hebei province) in northern *China* and Shansi (now Shanxi province) in northern *China*. The crops in 190 villages were damaged by the floodwaters.
- Hupeh (now Hubei province) in central *China* at Huang-kang and Ma-ch’êng.
- Hopei province at Pai-hsiang, Su-ning, Ts’ang, Wu-ch’iang, An-tz’ü, Hsien, Hsing-t’ai, Shen-tsê and Wu-chi.
- Honan (now Henan province) in central *China* at Hsin-an [uncertain name].

— Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Jao-p'ing.

— Szechwan (now Sichuan province) in southwest *China* at Sui-ning and Ho-chiang.

In 1738 during the 10<sup>th</sup> moon on the 5<sup>th</sup> day in the vicinity of Shanghai, *China*, there was a storm with violent wind from northwest. Flocks of sea birds filled the sky; the storm devastated the grains for over a month and then dispersed.<sup>166</sup>

---

**1739 A.D.** On 4 January 1739, there was a violent gale with thunder, lightning, hail and rain at Bristol and Bath, *England*. A great number of trees were torn up by the roots and many others twisted off at their trunks. At Bath, the flood was so great that boats came up the streets. In most parts of the kingdom, the waters overflowed the roads so as to make them impassable. This storm was also felt in Paris, *France*.<sup>212</sup>

On 4 January 1739, “in the morning was a most violent storm of thunder, lightning, wind and rain, whereby great numbers of trees were tore up by the roots, many twisted off at their trunks, and numbers of boats staved [broken] in the river. At Bristol [*England*] the same time, the thunder-claps were astonishing, and the vehement showers of rain and hail attended with boisterous gales of wind, swell'd the river to that height, as to make its way against the tide of flood with a full torrent. At Bath, was so great a flood, the boats came up the street and the cellars were filled with water. The lead on a church [roof] by a gust of wind was [was] rolled up from the eaves to the top, and the building so shaken, as to make it unsafe to assemble therein; the floods also set a new-built house on fire, by falling in among some sacks of stone lime. In most parts of the Kingdom the water overflow'd the roads, so as to make them unpassable. The same storm was felt at Paris [*France*], where the lightning beat down the steeple of a church, in be burnt a cottage.”<sup>281</sup>

In South Carolina in what would become the *United States* on January 1739, the temperature fell to 19° F [-7.2° C].<sup>300</sup>

On 14 January 1739, “happen'd at Edinburgh [*Scotland*] a dreadful hurricane of wind, which continued with great fury from one to four [o'clock] in the morning, whereby the high-built houses of that city receiv'd considerable damage. The leads which cover'd the stately buildings in the Parliament close were carry'd off the roofs, some upwards of 40 feet [12 meters] in dimension; the Canon-Gate Church suffer'd extremely, and its portico almost demolished; the buildings in the Castle were very much damaged, their fine lead coverings carry'd off, and thrown upon the rocks, and the magazine ruin'd. At Glasgow several ships drove ashore, and are very much damag'd, and two were cast away; the North Coast betwixt Roseneth [Rosneath] and Glasgow, is full of gabarts and small boats drove up among the corn land. In the Merse few houses are less undestroy'd, several churches are blown down, numbers smother'd in the ruins, and an universal havock [havoc] made amongst their sheep and cattle; at Dumfries, the fine church was unroofed, and the high steeple much damag'd; at Dysart a woman in labor, attended by the midwife and neighbours were all killed by the falling in of the house. At Londonderry [*Ireland*] the storm was observ'd to begin and end with the eclipse of the moon, raging with the same violence and doing a vast deal of damage to houses; at Dublin, it threw down 3 chimnies [chimneys] belonging to the Ld [Lord] Chief Justice Reynolds, blew down a corner of the Deanery House belonging to Christ-Church, the front of a house in Francis-street, and almost innumerable chimnies [chimneys].”<sup>281</sup>

On 14 January 1739, there was a dreadful gale at Edinburgh, *Scotland*, that continued from 1 to 4 a.m. The storm did much damage to the roofs of houses. At Glasgow, several ships were driven ashore. The north coast of *Scotland* between Glasgow and Roseueth [Rosneath] was full of gabarts and small boats, drove up amongst the cornland. In Merse, few houses are left undestroyed, several churches are blown down, numbers of people were smothered in the ruins, and caused universal havoc among the sheep and cattle. The storm was also violent at Dumfries, *Scotland* and Dysart, Londonderry, and Dublin,

*Ireland.*<sup>212</sup>

In January 1739, “a ship being off the Capes of Virginia [in what would become the *United States*], with Palatines from Germany [Palatinate region of Germany] in great distress for want of provisions, and not knowing the Bay, drop’d anchor, and fired several guns for a pilot to come off; but the weather being bad, and much ice floating, none came: whereupon a German gentleman was on board took his son and daughter, and several other passengers, (to the number of about thirty) in the longboat, and went on shore to see if they could get some provisions for their relief; but not finding a house, they made a fire in the woods, and sat by it all night; the weather being extreme cold, there were but four of them alive next morning: several of them were gentlemen of good estates, and had gold watches in their pockets, and pieces of gold. The wind blowing very hard that night, the ship drag’d her anchor, and struck so much that she sunk till the water came to her upper deck: a great number of the passengers in their cabins [cabins], were so sick and weak that they were not able to get upon deck to save themselves, but were drown’d, and were found floating in the ship. The master and mate died at sea, and the boatswain had the command of the ship, which came out from Rotterdam with 300 passengers, of which there is but 4 left alive, besides 4 or 5 sailors. She was bound to James River in Virginia, the German Lord who came there last year, having obtain’d a grant for a large tract of land, and was to bring over about 3000 people to settle it, and this ship’s company was the first of them.”<sup>281</sup>

On 11 May 1739, there was a thunderstorm at Colchester in Essex, *England.*<sup>212</sup>

On 20 May 1739, there was a thunderstorm at Cobham in Surrey, *England.* “Greatest storm of thunder, hail and rain ever known. Hail larger than the biggest marbles. Incredible damage done. Windsor, hail and large pieces of ice 3½ inches [9 centimeters] long and 1 inch [2.5 centimeters] thick. At Abergavenny [in Monmouthshire, *Wales*], hail like pieces of ice, were 3 to 5 inches [8-13 centimeters].”<sup>212, 281</sup>

On 17 June 1739, Scaffhausen [Schaffhausen] in *Switzerland* reported, “Many people who went from this country to inhabit the British Colonies of Carolina and Georgia [in what would become the *United States*] are returning from thence, the climate not agreeing with them.”<sup>281</sup>

In 1739, the price of wheat [in *England*] averaged 38 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

In August 1739, the Turkish fleet in the *Black Sea* was almost destroyed by a storm.<sup>281</sup>

On 10 September 1739, about 7 o’clock in the evening, began a most violent storm of thunder and lightning, accompanied with an excessive rain, which lasted until midnight. A farmer at Raveningham, Norfolk [in *England*], had his barn fired [catch fire] by the lightning, and all his corn [grain] consumed. At Mr. Collier’s, Lambeth, the lightning pierced through the roof, and thence through the floor, splitting in several pieces a large old-fashioned oaken bedpost; and then through a 2<sup>nd</sup> floor, on a very thick piece of deal, to which the jack was fastened, which it shivered into a thousand pieces, but did no other damage. Mr. Collier and his wife being in bed, saw the lightning break through the ceiling, and it did not appear much larger than the blaze of a common candle; the holes through the roof, and both the floors, are not 2 inches [5 centimeters] diameter, and look as if bored by a large auger. At Bremen in *Germany*, the lightning set fire to a magazine of 40,000 pounds [20 U.S. short tons] of gunpowder, whereby a fort, with the adjacent houses, were blown up, 40 persons killed, near 1000 houses damaged, and the city set on fire in 25 places; but a heavy rain falling, the flames were happily extinguished.<sup>281</sup>

On 10 September 1739, there was a most violent thunderstorm at London and at Raveningham in Norfolk, *England.* It began at 7 p.m., with excessive rain until midnight. This terrible storm struck Aldborough in Sussex, where some ships were wrecked. The storm was also violent at Bremen,

*Germany*, where a gunpowder magazine was blown up.<sup>212</sup>

On 11 September 1739, a gale struck London, *England* causing much damage. At Bristol and the lowlands of Yorkshire, there was great damage from excessive rains, which swept away great quantities of corn [grain] and raised the price of grain. The gale, which came from the southwest, was violent between Bristol and Portsmouth.<sup>212</sup>

On 11 September 1739 in *England*, “all the day was a very high wind whereby several boats were overset on the [River] Thames, and several persons drowned; [roof] tiles blown from the houses, and a bricklayer was kill’d [killed], by the fall of a brick on his head; at nine [o’clock] at night the wind rose higher, ‘till between 11 and 12 it blew a prodigious storm, which continued ‘till morning, in which the *Endeavour*, from Bristol to Portsmouth, and the *Nancy*, from Shields to London, were lost, with all their men and cargoes. Great damage was done about Bristol, and the low grounds of Yorkshire, by the excessive rains, which swept away great quantities of outstanding corn [grain], and raised the price of grain, especially barley.”<sup>281</sup>

On 28 September 1739, there was a flood in *England* and *Wales*. Great damage was done to crops by excessive rain in Yorkshire, Devonshire [Devon], and *Wales*.<sup>212</sup>

On 30 October 1739, there was a gale at Newcastle-on-Tyne [Newcastle-upon-Tyne], *England*. On 21 November, another gale struck Beachyhead [Beachy Head], Tinmouth [Teignmouth], and Lime [Lyme Regis].<sup>212</sup>

In *France* in 1739, there was a severe famine.<sup>57, 91</sup>

In 1680, 1720, 1739 and 1740 [in *Europe*], storms of hail of one foot thickness fell.<sup>190</sup>

On 3 December 1739, Oporto [Porto, *Portugal*] “after long and heavy rains, our river began to rise, and continu’d to do so for the next 3 days, till it became so high, rapid and terrible, as to exceed description. It overflow’d great part of the city wall next [to] the water. All the houses, workhouses, lodges, &c. near the river were overflow’d, and many of them carry’d away, four Portuguese ships loaden [loaded] for Brazil and one Swede, were lost; a Portuguese ship, almost built, was carry’d off the stocks and lost; two English ships are lost, and another thrown upon the keys; and one drove over the bar to Sea. The damage is supposed to amount to 200,000 *l*.”<sup>281</sup> [In present currency, this would equate to 27.1 million pounds using the retail price index inflation rate.]

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: April 11<sup>th</sup> – no appearance of any feed [i.e. grass] yet. April 20<sup>th</sup> – we have remarkable seasonable weather. April 30<sup>th</sup> – there has been no rain for about a month past, except a small shower. August 31<sup>st</sup> – we have had more hot weather these four days past, than all the summer together. September 17<sup>th</sup> – last night there was a very white frost that killed the tops of our potatoes. October 8<sup>th</sup> – the cold weather prevails as far as Boston, so that there is no business going forward.<sup>78</sup>

In northern *India* in 1739, there was a famine in Delhi and its neighborhood.<sup>57</sup>

In 1739, there was a famine in *India*.<sup>156</sup>

In 1739 A.D., there was a famine in Delhi and its neighborhood in *India* and a famine in Sindh [now a province in *Pakistan*].<sup>179</sup> Following the raid of Nadir Shah army on Delhi in 1739 and on the Sikh inroads in the western districts which occurred soon after, there was scarcity.<sup>181</sup>

In 1739, a drought engulfed several regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, a drought engulfed Hupeh (now Hubei province) in central *China* at Ch'i-shui and Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-yu.

— During the period between 6 May and 8 August, a drought engulfed Kiangsu province at Nan-t'ung [uncertain name, "T'ung"] and Ch'ing-p'u; T'i-shan [uncertain name and province]; and Anhwei (now Anhui province) in eastern *China* at T'ung-ling, Ho-fei, Lu-chiang, Wu-wei and Tung-liu.

— During the period between 8 August and 8 November, a drought engulfed Hupeh province at Hanyang, Huang-p'o, Hsiao-kan, Chung-hsiang, Ching-shan, T'ien-mên and Ao-ch'êng.

In 1739 during the period between 8 May and 5 June, floods struck Anhwei (now Anhui province) in eastern *China* at Po, Ying-shang, Fou-yang and Wu-ho. During the period between 8 August and 8 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Yang-ku and Shou-chang. In Shantung province, crops were damaged by the floodwaters.<sup>153</sup>

In 1739 during the 9<sup>th</sup> moon on the 3<sup>rd</sup> day in the vicinity of Shanghai, *China*, dragons fought at Mau Lake, and went off southeast to the sea, destroying the [rice] paddies as they went. [In early *China*, tornadoes and waterspouts were commonly described as dragons.]<sup>166</sup>

**Winter of 1739 / 1740 A.D.** In 1739, the winter was recorded as being intensely cold throughout *Europe*.<sup>1</sup>

*Denmark* experienced a cold winter between 29 September 1739 and May 1740. Wolves crossed the ice.<sup>28</sup>

During the winter of 1739-40, the *Baltic Sea* froze.<sup>37</sup>

During the winter of 1739-40, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

In 1740, *Denmark* and *Prussia* experienced very intense frost.<sup>47, 93</sup>

In 1740, the cold during the winter was intense in *Germany*.<sup>237</sup>

In 1740, the River Thames in *England* was frozen for eleven weeks. Forest birds almost all perished, and trees were split by the frost. The harbor of Barcelona in southern *Spain* froze over, and navigation was suspended in the *Greek Archipelago* on account of the danger from floating ice.<sup>63</sup>

The winter of 1739-40 was unusual because of the long duration of cold weather. From October to March there were 75 frost days in Paris, *France* including 22 days in a row. The thermometer reached its lowest level on 10 January 1740 with a reading of 7.3° F (-13.7° C). The cold was very strict in January. And in February the cold was constantly making itself felt. Every day the thermometer fell below freezing point, and then it rose again slightly. The mildest afternoon brought us only 37.6° F (+3.1° C). A very strong northerly wind brought from the 23<sup>rd</sup> to the 24<sup>th</sup> of February, a severe drop in temperature. Then on 25 February, the intense cold dropped the temperature back down to 9.3° F (-12.6° C), almost matching the extreme cold of 10 January. Finally, up to the ninth of March, the temperature fell below zero every day.<sup>62</sup>

During the winter of 1739-40, the chill was both very intense and very stubborn. It affected mainly the northern regions. Its persistence had earned it a remarkable name called the "Alarming Long Winter". In Paris, *France* each day the thermometer fell below zero (0° C) during the months of January, February and the first nine days of March. The temperature rose very little during the rest of March and April. It only returned to normal range on May 23. The temperature again fell far below the penny ordinary

degree after the month of June. There was even a white frost in the countryside during the morning of August 3. October had two frosts and ice. The weather went cold early in the month of November. Extraordinary rains finally crowned this deplorable year by producing disastrous floods.<sup>79</sup>

The chill of 1740 was composed of alternating periods of freezing and thawing. The frosts in Paris, *France* lasted two and a half months. A strong north wind blew hard on 23 and 24 February, bringing sudden bitterness. The record cold arrived on February 25 producing a temperature of 3.9° F (-15.6° C). The Seine River froze across its entire width. Montpellier did not feel the harshness of this winter. The air in Montpellier was sweeter than a normal springtime in Paris. But Provence did not share this privilege, all olive trees were destroyed by a cold, which was measured at 0.5° F (-17.5° C). In central *France*, the winter of 1740 stood midway between the excessive cold in the north and the general softness in the south of *France*. In Bordeaux, the cold during the month of January dropped only once to 27.5° F (-2.5° C). February was much harder but still did not drop below 17.6° F (-8° C). But the severity of the winter was its persistency; the thermometer remained almost constantly below zero. The cold temperatures dropped deeper in Lyon, near the east of *France*. There a low temperature of 18.5° F (-7.5° C) was observed in January, and 12.0° F (-11.1° C) on 19 February.<sup>79</sup>

In *England* the cold was more intense than in *France*. The River Thames was frozen over completely. In the *Northern Europe*, the *Zuider-Zee* was completely frozen. In Uppsala in eastern *Sweden*, the temperature was recorded on 11 January as -5.3° F (-20.7° C). In February at the same location, the ice measured 0.67 meters thick and the observed temperature was -10.8° F (-23.8° C). The effects of the cold on the plants were, despite this long winter, less severe than in the winter of 1709. The grain harvest was very mediocre. But the olive trees that were not on trellises and were not covered had been destroyed. The long duration of the cold affected the general health; and increased mortality rates were a result of this extraordinarily destructive weather. Réaumur said, "I know towns in Poitou, *France*, which lost half its residents". The swallows that arrived at the beginning of April died from lack of food because of the long duration of winter and the delay in the arrival of small insects, which they feed upon. The swallows fell down dead at all times of the day in the streets, yards and gardens. In *England*, during the first half of January, many cattle perished. As in 1709, this thaw was accompanied by devastating floods; the bridge at Rouen, *France* was torn away by the ice.<sup>62</sup>

On 24 December 1739, a great frost began in London, *England* that lasted nine weeks. (Some accounts indicated it lasted 104 days, and others said it began on 25 December and ended on 17 February 1840.) The ice was so thick that carriages were driven on the River Thames. On 29 December, the cold was very great. Outside it was 5° F [-15° C], and in the room only 11° F [-12° C]. The frost was more severe than any since the memorable winter of 1715-16. In Hertfordshire, a number of oaks were riven [split] by the frost, and the solid timber split as far as a case knife could be thrust. Flocks of ducks, widgeons, and coots, in Kent and Essex were frozen to death. The rivers Severn, Tyne, Avon by Bristol, Forth, Tay, and Liffy were all frozen up. The streets of London were clogged with snow and ice, so that the coal carts had eight horses. The cold was also extreme in *Holland [the Netherlands]*, *France*, *Germany*, *Poland*, *Lithuania*, and *Podolia* [present day *Ukraine* and northeastern *Moldova*]. Mr. Derham says, "This was the most severe frost on record, and on January 3<sup>rd</sup> the temperature was -11° F [-24° C]." During the night of 5 and 6 January at Stoke Newington [a district of London], ink froze in a room in a few minutes. There was a printing press on the ice upon the River Thames as far down the river as Queenhithe.<sup>212</sup>

On 29-30 December 1739, a violent east gale with snow struck London, *England*. The tides bore heavy floating ice upon them, many ships were driven ashore and dashed to pieces.<sup>212</sup>

On 29 & 30 December 1739 [in *England*], "a great number of lighters, barges and boats were driven from their fastenings in the river by a violent storm from the east, accompanied with snow, and the tides bearing heavy, floated ice upon them. Many ships at sea were drove on shore and sandbanks, and dashed

to pieces, the sailors being unable to work them by reason of the extreme cold, some losing their lives, and many the use of their limbs.”<sup>282</sup>

In December 1739, the frost was also felt at Lyndon in Rutland in central *England*. The ice froze three inches [8 centimeters] thick in 24 hours, the most severe ever known.<sup>212</sup>

According to Lord Charles Cavendish from 1 January to 5 February 1740, the temperature was seldom as high as 32° F [0° C] in *England*. It fell as low as 2° F [-17° C].<sup>212</sup>

During the winter of 1740, the frost lasted nine weeks in *England*. There were great fairs and coaches on the [frozen River] Thames. It was known as a hard winter. In London, the ice was 10½ inches [27 centimeters] thick. In *Scotland* at St. Andrews, the minimum temperature was 9° F [-13° C], at Ayrshire 6° F [-14° C], and at Glasgow 9° F [-13° C].<sup>212</sup>

In 1740, the River Thames at London, *England* was frozen over.<sup>38, 60</sup>

In *England*, the frost of 1740 will stand famous in history.<sup>72</sup>

In *England*, there were fairs on the frozen River Thames during the winter of 1739-40.<sup>90</sup>

In *England* in 1740, the frost lasted 9 weeks, when coaches plied upon the River Thames, and festivities and diversions of all kinds were enjoyed upon the ice. The winter was known as “The Hard Winter”.<sup>90</sup>

In 1740, the *Zuiderzee* froze completely. The River Thames in *England* was also frozen over completely.<sup>62</sup>

In *England*, an intense frost as perhaps was ever known in those parts, began about Christmas and continued eight weeks.<sup>39</sup>

In *England*, a frost began on 24 December 1739 and continued nine weeks, or 103 days.<sup>2, 40, 41, 43</sup>

In *England*, there was nine weeks of frost; coaches plied on the Thames. This year “will stand famous in history”. “I well remember after that dreadful winter, 1739-40, that cold northeast winds continued to blow on through April and May.”<sup>47, 93</sup>

In London, *England* “the frost of 1739-40 commenced on Christmas-day, and lasted till the 17th of the following February, when it began to break up; but the river was not clear of ice till the end of the month. The usual sports of a fair were made upon the ice; booths and drinking-tents erected; and also printing-presses, which in all these fairs upon the Thames seem to have been considered the greatest wonder of all.” “Above bridge the Thames was completely frozen over, and tents, and numerous booths were erected on it for selling liquors, &c. to the multitudes that daily flocked thither for curiosity or diversion. The scene here displayed was very irregular, and had more the appearance of a fair on land than a frail exhibition, the only basis of which was water. Various shops were opened for the sale of toys, cutlery, and other light articles.”<sup>29</sup>

On 31 January 1740, *England* reported, “this month the frost, which began the 26<sup>th</sup> of last [26 December 1739], grew more severe than has been known since the memorable winter of 1715-16; so that many who had lived years at Hudson’s Bay [in *Canada*], declar’d they never felt it colder in those parts. The [River] Thames floated with rocks and shoals of ice; and when they fixed [froze together], represented a snowy field, rising every where in hillocks and huge rocks of ice and snow; of which scene several painters took sketches. Booths, stalls, and printing-presses were erected, and a Frost-Fair held on it: multitudes walk’d

over it, and some were loss by their rashness. Several perished with cold in the streets and fields in and about the city. All navigation being obstructed, coals rose to 3 *l.* 10 *s.* per chaldron [cauldron, about 3136 pounds or 1422 kilograms]; and the damage among the shipping between the Medway and London Bridge was computed at 100,000 *l.* [In present currency, this would equate to 12.3 million pounds using the retail price index inflation rate.] Flocks of ducks, widgeons and cepts were found on the ice on the Kent and Essex shores, perish'd with cold, or starv'd to death. Vast quantities of fish, especially eels, were found frozen to death on the banks of the Severn, near Thornbury in Gloucestershire, and flocks of crows resorted thither to feed on them. In Suffolk wild-geese and other birds devour'd the winter-corn close to the earth for the space of many acres. In Hertfordshire numbers of oaks were riven [split violently] by the frost, and split into the solid timber as far as a case-knife could be thrust; and at Buntingford, in that county, a new spring forced its way out of the ground, and filled the road with ice so as to make it unpassable. The rivers Severn, Tyne, the Avon by Bristol, the rivers of Forth, Tay, &c. in *Scotland*, and the Liffy by Dublin [*Ireland*], were all frozen up like the Thames. And by all advices from Holland [now *the Netherlands*], *France*, *Germany*, &c. the cold was extreme. In *Poland* and *Lithuania*, the inhabitants, besides what they suffer'd by the frost, were very much incommoded by the bears and wolves, which ranged about devouring men and cattle. In Podolia [now *Ukraine* and northeast *Moldova*], whence the Russians, in their march, had carry'd off all the forage and most of the provisions, tho' they left money for it, the inhabitants were perishing both with hunger and cold." "The streets of London [*England*] were so clog'd [clogged] with snow and ice, that hackney-coaches went with 3 or 4 horses, and coal carts up the streets from the wharfs with 8 horses; and Fleet-Street was so long neglected, and so dangerous, that some scores of men were at work on Sunday the 27<sup>th</sup> to clear the way. The want of meal being great in *Scotland*, and some mills frozen up, they were obliged to work on Sundays. An unusual thing there!" The streets were so slippery during the frost, that many people fell and broke, others sprain'd their limbs."<sup>282</sup>

In *England*, "This winter was one of the most severe ever remembered, and from the long continuance of frost from Christmas Day, 1739, to February 17th, 1740, when it began to thaw, but very gradually, it has been known ever since as the Great Frost. It was impossible for the colliers from the north to get up the river, and the distress among the poorer classes was terrible, not only from want of fuel, food and water, but also of work. The watermen and fishermen with a peter-boat in mourning, and the carpenters, bricklayers, and labourers, walked in procession through the streets soliciting the alms of the charitable, and to the honour of the city and all, great sums were collected and disbursed. Another terrible calamity happened a few days after the frost had commenced: this was a terrible gale which did incalculable damage in the river, dragging vessels from their moorings and dashing them against one another, while the large sheets of ice floating in the stream overwhelmed the wherries and lighters and barges, and sunk many, especially those laden with coal and corn. Above the bridge the Thames was frozen completely over and a Frost Fair was held on it. Various shops were opened for the sale of toys, cutlery, and other light articles. Printing presses were set up and the usual drinking booths and puppet shows abounded. All sorts of sports and diversions were carried on, and the place became a perfect carnival, as if the populace were utterly oblivious of the distress and misery which existed on shore."<sup>29</sup>

In *England*, Thomas Gent, the famous printer of York, in his life, tells how he setup a printing press on the river in that city during this frost, as follows: In January "the frost having been extremely intense, the rivers became so frozen that I printed names upon the ice. It was a dangerous sport on the south side of the bridge, where I first set up, as it were, a new kind of press – only a roller wrapped about with blankets. Whilst reading the verses I had made to follow the names – wherein King George was most loyally inserted, some soldiers round about that made great acclamation, with other good people; but the ice suddenly cracking, they almost as quickly ran away, whilst I, who did not hear well, neither guessed the meaning, fell to work, and wondered at them as much for retiring so precipitately as they at me for staying; but taking courage, they shortly returned back, brought company, and I took some pence amongst

them. After this I moved my shop to and fro, to the great satisfaction of young gentlemen, ladies, and others, who were very liberal on the occasion.”<sup>47</sup>

In *England*, “This month (January) the frost, which began the 26<sup>th</sup> of last, grew more severe than has been known since the remarkable winter of 1715-16; so that many who had lived years at Hudson’s Bay declared they never felt it colder in those parts. The Thames floated with rocks and shoals of ice. . . . Bookstalls and printing presses were erected, and a frost fair held on it; multitudes walked over it, and some were lost by their rashness. Several perished with cold in the streets and fields in and about the city. All navigation being obstructed, coals rose to 3*l.* 10*s.* per chaldron. Many forest trees were split up by the frost, as had been the case in 1684.”<sup>47, 93</sup>

In February 1740, Newcastle, *England* reported the weather was observed to be notably cold through all of last year, particularly the autumn or latter part of it, occasioned by frequent north and northeasterly winds, which brought along with them large quantities of chill vapours and clouds; so that we had continual changes and varieties of fair and rain even at the time of year which is generally the best in our climate. By these means neither the earth nor atmosphere have been so much heated or warmed by the rays of the sun, as generally happens in moderate summers.<sup>282</sup>

On 23 February 1740, Carlisle, *England* reported, “Our frost broke on Sunday the 17<sup>th</sup> instant, and notwithstanding the rapidity of some of our rivers, which withstood its assaults long before they froze, I measur’d some of the icy fragments tost [tossed] ashore by the flood 22½ inches [57 centimeters] thick next day after the thaw, the like certainly never known in these climates. The ice on the River Eden by Carlisle, which is many miles lengthways in several places, is not risen to the flood, and we expect very bad consequences whenever it shall, unless dissolv’d by a gentle thaw, which the present circumstances seem to promise, it having bore [the frozen river supported the weight of] all manner of carriages for six weeks past, and must be very thick. Our snow is quite gone, save in the mountains.”<sup>282</sup>

In February 1740, Uffington [now in Oxfordshire, *England*] reported, “most of the large oak trees growing in the common meadow are split by the violence of the frost.”<sup>282</sup>

It was noted that in the winter of 1740 even the most temperate climates [of *Europe*] felt the effects of winter. Boiling water froze in a minute and a half. The ice was 30 inches [76 centimeters] thick in the ditches about Upsal [Uppsala, *Sweden*], and several lakes were frozen to the bottom.<sup>294</sup>

In *Ireland*, during 1739-40, potatoes destroyed by the frost. Wheat sold for 42*s.* per kilderkin [about 18 gallons or 82 liters].<sup>57, 91</sup>

At Leeds in Yorkshire, *England*, during the winter of 1739-40, there were 103 days of frost.<sup>272</sup>

In Philadelphia, Pennsylvania in the *United States* the winter of 1740 was very cold and stormy. The Delaware River was closed until the 14<sup>th</sup> of March.<sup>1</sup>

---

**1740 A.D.** In *England*, there were great floods from the breaking up of the frost and snow of the preceding severe winter.<sup>47</sup>

In April 1740 in *Ireland*, there was excessive cold with hail.<sup>93</sup>

The summer of 1740 in New England in what was to become the *United States* was cool and wet. An early frost injured the corn crop and the long season of rain, which followed, hindered it’s ripening. One-third was cut when it was green and most of the rest molded because of the rain. Therefore, there was little seed corn in New England for the next spring’s planting. The rain of the summer and fall flooded

the lowlands everywhere.<sup>199</sup>

On the 9<sup>th</sup> past [9 June 1740], began a great riot at Newcastle upon Tyne, *England*, on account of the dearness [scarcity] of corn [grain].<sup>282</sup>

On 29 June 1740 at Wisbich [Wisbech] in the Isle of Ely, *England*, a mob arose, and entering the town broke the corn merchants windows, seized about 25 laths of wheat, and forced wagons to carry it off, sold some for 1 *d.* a bushel, and some for 4 *d.*<sup>282</sup>

After the long winter of 1739-40, came one of the coldest summers of this century. The highest temperature of summer in Paris, *France* was 83.1° F (28.4° C) on 23 July. In Denainvilliers in north-central *France* the winter cold ceased on 25 May. The weather was noticeably milder, although there were only a few warm days during June but the nights were always fresh. The grain and the fruit were very late. In July, the nights were cold, and by early August the grain had not yet formed the ears. Harvesting started towards the end of August and was completed on the 20<sup>th</sup> of September due to the cold and rain. In Boulonnais in northern *France*, the harvest began in the beginning of November. It was after the first snow fell, and the grains were still in the fields. Some cereals could not ripe and as a result rotted in the fields. The early melons, called Carmelite melons [Noir des Carmes], were harvested in September. In Burgundy, *France*, the grape harvest only began on 10 October. The yield of grapes was very low in quantity and the wine produced was of a poor quality. The year was rainy in Burgundy. Even in June there were frost and snow. The plant runners broke the ice.<sup>62</sup>

In 1680, 1720, 1739 and 1740 [in *Europe*], storms of hail of one foot thickness fell.<sup>190</sup>

At Antigua in the *West Indies*, there was a violent storm in August 1740.<sup>40, 41</sup>

In 1740, Antigua in the *West Indies* and the *Caribbean* island of Martinico [Martinique] suffered considerably from a hurricane.<sup>143</sup>

In 1740, the price of wheat [in *England*] averaged 50 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

On 4 September 1740, a gale struck London, *England*. On 7 September, another gale struck London and Newcastle. This second gale caused great damage to the shipping.<sup>212</sup>

On 7 September 1740, “blew a storm at southwest, which did a great deal of damage to the ships and boats on the [River] Thames [near London, *England*]. A tidewater was blown overboard and drowned, and some trees were blown down in St. James’s Park. The same raged with great violence at Newcastle, sinking keels, and driving ships from their moorings.”<sup>282</sup>

Around September 1740, a hurricane struck *Antigua* and Martinico [now *Martinique*] and caused prodigious damage. Many ships were drove in there [cast ashore]. The French and Spanish Fleets suffered much, and two of the former were lost.<sup>282</sup>

On 11-12 September 1740, a hurricane struck *Puerto Rico*. Two warships were lost.<sup>141</sup>

In September 1740, the Spanish fleet arrived at *Puerto Rico* greatly damaged by a storm, in which they lost two ships of war.<sup>143</sup>

On 12 September 1740, a destructive hurricane, lasting 12 hours, struck from the mouth of the Mississippi River to Pensacola, Florida in the *United States*.<sup>117</sup>

There was a violent storm off the coast of *England* on November 1.<sup>40, 41, 43, 56</sup>

On 1 November 1740, a gale struck London, *England* where it caused much damage. The gale also struck the eastern and northeastern parts of the kingdom. One of the spires of Westminster Abbey, and a great part of Hyde Park wall were blown down. Between Lynn and Yarmouth, 60 ships went ashore. At Whitby, the damage amounted to £40,000 [£5 million in today's currency using the retail price inflation index]. The storm was not violent in western *England*.<sup>212</sup>

On 1 November 1740, "a most violent hurricane did much damage in and about London [*England*], and the eastern and north-eastern parts of the Kingdom. At Kensington, the Reverend Mr. Dormer, who kept a boarding-school, and his wife were killed by the fall of a stack of chimnies [chimneys]; one of the spires of Westminster Abbey, and a great part of Hide-Park wall were blown down; several persons were cast away on the River of Thames, abundance of boats broke to pieces, the Pr. [*Prince*] of Orange, the Ship [70 guns] of Capt. Peddie, who a few days before had bravely defended her against a Spanish privateer off the Lizard, was drove ashore near Margate and dash'd to pieces, and five of the crew lost. The passage-boat from the Nore to Chatham, was lost with 15 persons. Between Lyn [Lynn] and Yarmouth above 60 ships were drove ashore, and many of their men drowned; the coast of Suffolk were covered with wrecks and dead bodies, and the damage on land is very considerable. At Whitby in Yorkshire, besides the loss of many lives, the damage is computed at 40,000 *l*. The western parts felt but little of this storm." The ship *Buckingham* returned to Spithead having lost her mast in the storm of 1 November. The *Superbe* had lost all her mast but the bowsprit.<sup>282</sup>

In 1740, there was a flood at Foulness in Essex, *England*.<sup>212</sup>

In France there was a flood. On 25 December 1740, the Seine River in Paris, *France*, at the bridge "Pont de la Tournelle" reached a height of 7.9 meters (25.9 feet) above the zero mark [the low water mark of the year 1719]. The water level reached the window of a second story house on the wharf of the porte Saint Bernard.<sup>71</sup>

In *France*, the rains and cold almost filled the entire year 1740. The precipitation gauges at the Paris Observatory measured in 23 inches (584 millimeters) of rainfall this year. There were 6 inches (153 millimeters) in the first six months, and 17 inches (431 millimeters) in the last six. December furnishes 5.4 inches (137 millimeters) of rainfall, almost as much as the first six months. Bordeaux had greater rainfall than Paris, because she surpassed 6.4 inches (162 millimeters) the annual average figure. Because of the cold, the evaporation was almost zero. The accumulation of these rains while the ground was already very wet and saturated resulted in considerable floodwater. The Seine River in Paris was particularly monstrous. It reached at the end of the year, 24.3 feet (7.39 meters) above the zero water mark on the bridge "Pont de la Tournelle". This was the highest known river height after the flood of 1658, which was 27 feet (8.23 meters). The rainfalls this year was really extraordinary. They produced disastrous floods on all sides. Few provinces escaped. In Paris, the month of December produced the heaviest rainfalls. The overflow of the Seine River surpassed that of February 1711, however, without reaching the level of 1658.<sup>79</sup>

In Dublin, *Ireland*, there were heavy rains and great floods; shipping at Dublin injured.<sup>47, 92</sup>

In *England* during 1740-41, there was a famine from frost, cold, exporting and hoarding up of corn.<sup>57, 72, 91</sup>

In 1740 during the period between 24 June and 23 July, a drought engulfed Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Ch'üan.<sup>153</sup>

In 1740 during the 4<sup>th</sup> moon, heavy rain and hail damaged the wheat crop in the vicinity of Shanghai,

*China*.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

January – this month was generally fair and pleasant. February 18<sup>th</sup> – a summer like winter. We had only two snows, and sledding but about three weeks; two or three snaps of cold weather, else constantly warm and open, and always fair. February 27<sup>th</sup> – warm southerly weather. March 3<sup>rd</sup> – a summer day. March 10<sup>th</sup> – same. March 18<sup>th</sup> – warm. March 29<sup>th</sup> – charming weather. April 14<sup>th</sup> – the spring does not look very promising. April 23<sup>rd</sup> – exceeding hot. April 30<sup>th</sup> – a pleasant day. May 11<sup>th</sup> – a very backward, cold spring. June 25<sup>th</sup> – we have had the finest, most seasonable weather that can be; everything is promising. July 22<sup>nd</sup> – it begins to be a dry time. July 28<sup>th</sup> – the last month was ideal as any for growing, as ever was in the memory of man. August 10<sup>th</sup> – there has been an uncommon season of hot weather this summer.<sup>78</sup>

---

**Winter of 1740 / 1741 A.D.** The winter of 1741 near Philadelphia, Pennsylvania in the *United States* was intensely cold. The Delaware River was closed from the 19<sup>th</sup> of December to the 13<sup>th</sup> of March. Many creatures died from hunger and cold. As late in the season as the 19<sup>th</sup> of April, snow fell to the depth of three feet (0.9 meters).<sup>1</sup>

During the winter of 1740-41, the Hudson River between New York and Powles' Hook [now called Paulus Hook, Jersey City, New Jersey] in the *United States* was frozen and was crossed on the ice. [Manhattan, New York is located 1 mile across the Hudson River from Powles' Hook. "Crossed on the ice" generally means the ice was sufficiently thick to allow foot and wagon traffic.] [This is only one of four winters when the Hudson River was completely frozen over during the century from 1740-1840. The other winters were 1764-65, 1779-80, and 1820-21.]<sup>202</sup>

The winter of 1740-41 began early with October "as cold as ordinarily November is" in Bolton, Connecticut in the *United States*. By January 1741, drifting snow soon brought an end to regular travel by highway in New England and the Middle Colonies, and the penetrating cold closed all the rivers and waterways with solid ice. One man made a 200-mile trip by sleigh over the frozen sound from Cape Cod to New York City. The extreme cold was not confined to the Northeast; that year the York River in Virginia froze solid enough to cross. "Notwithstanding the settling of the snow, the snow on the sixth day of March was three foot deep," wrote Bissell. "The weather continued cold and the snow wasted but slowly, so that there was considerable quantity of snow the middle of April." The Connecticut River was still frozen solid enough to be crossed on the first of April.<sup>26</sup>

In the *United States* not only was the winter 1740/1741 characterized by very low temperatures, but also by huge amounts of snow. People in the region saw this winter as the most severe since the European settlement began. There were 23 snowstorms in all, most of them being strong. On 3 February about a foot of snow fell, and about one week later there were two more storms, filling the roads in Newbury, Massachusetts, up to the top of fences. Snow depths of about 10 feet (3 meters) were reported from some places.<sup>32</sup>

The winter of 1740-41 in New England in what was to become the *United States* was very cold and snowy. The region was hit with 27 snowstorms, most of them of good size. On 3 February 1741, nearly a foot [30 centimeters] of snow fell in Newbury, Massachusetts. The next week there were two more storms. In some places the snow was 8-10 feet [2.4-3.0 meters] deep and filled the roads to the tops of fences. The fences were still covered with snow on 4 April. Three days later another storm hit dumping another foot of snow. In the woods the snow was four feet [1.2 meters] deep on the level. The drifts on the island of Dorchester, Massachusetts were still not melted on 3 May.<sup>199</sup>

— In Salem, Massachusetts, the rivers were frozen over as early as October and on 4 November 1740 the weather became very cold. It snowed from 13-15 November in Essex County, Massachusetts. Snow depth measured one foot [30 centimeters] at that time. The cold weather broke on 22 November and for

nearly three weeks it rained. This caused freshets in the Merrimack River and several rivers and streams. Rawson's meadow in the lowlands at Turkey hill in Newbury was 12 feet [3.7 meters] underwater. As a result of the freshet, floating ice created an ice dam at Falmouth, Massachusetts, which caused great damage.

— Plum Island River was frozen over on 12 December 1740 and remained frozen until the end of March. The Merrimack River also froze from the extreme cold. Ice soon became thick enough to support teams. Before the end of December, the river became a great thoroughfare. Loaded sleds drawn by two, three or four yoke of oxen came from the towns up the river, and landed below the upper long wharf near where the ferry was then located in Newbury. Twenty to forty teams traveled daily from Amesbury and Haverhill, and people traveled down the harbor as far as half-tide rock. On 28 February, a hole was cut in the Merrimack River near Deer Island, where the current ran the swiftest. The ice measured 30 inches [0.8 meters] thick.

— As far south as New York, the harbors were so frozen that vessels could not come into them. The sea was also frozen and people traveled out long distances. In Boston harbor, a beaten road through the snow was kept open on the ice as far out as Castle William [now Fort Independence]. Tents were set up on the ice to provide refreshments to the travelers. Horses, sleighs and people on foot continually traveled up and down the frozen rivers.

In the *United States* the snow remained on the ground into April and May 1741, delaying the time when the ground was ready for planting. The farmers were almost discouraged, thinking of the failure of the corn crop the year before.<sup>32</sup>

In the *United States* shortages arose, "by reason of which scarcity a great number of cattle and horses died, and near half the sheep, and about two thirds of the goats," Bissell wrote. "Exceeding scarcity followed, partly by reason of abundance of Indian corn being ruined by the long rains in December, and partly by people giving their corn to their creatures to save their lives. We suppose the ensuing summer was the greatest scarcity as ever the English (settlers) felt since the first settlement of this government. Indian corn rose in the price from ten to twenty shillings, and what was commonly sold for twenty shillings, till at last all buying and selling utterly ceased. Money was no temptation, and men of good estates who had money was found to put themselves into the quality of beggars, and beg sometimes two quarts at a place, to relieve the distresses of their poor families."<sup>26</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1740 on October 28<sup>th</sup> – it began to snow. October 29<sup>th</sup> – significant snow melt, yet it is still three-inches (8 centimeters) deep. November 5<sup>th</sup> – I believe no man ever knew so wintery spell so early in the year. December 3<sup>rd</sup> – there was a great freshet [flood caused by a thaw], which did a great deal of damage. December 4 – the frost is still wholly out of the ground. December 21<sup>st</sup> – Rev. Smith rode to Saco and lodged with his father, who was forced out of his own lodging by vast quantities of ice, which jammed and raised the water eighteen-inches (46 centimeters) higher than his bedstead. December 29<sup>th</sup> – the Fore River has been shut up [blocked by ice] a day or two. December 30<sup>th</sup> – several persons walked over to Purpoodock [now Cape Elizabeth on the frozen ice]. In 1741 on January 1<sup>st</sup> – a little cooler, but a pleasant day. January 7<sup>th</sup> – I rode with Mater [Nicholas] Hodge to North Yarmouth; we rode round the cove and turned down to Mr. Norris' across Presumpscot River, and rode from thence all the way on the ice, which was exceedingly hard and secure. January 11<sup>th</sup> – I rode over the [frozen] river. January 19<sup>th</sup> – the whole week produced a spell of charming weather. January 27<sup>th</sup> – a charming pleasant day. January 29<sup>th</sup> – much cooler. April 10<sup>th</sup> – melancholy time, the snow lying, and little hay. April 25<sup>th</sup> – the snow melted wonderfully. April 30<sup>th</sup> – roads now settled [became hard] surprisingly; the reason for this was the frost failed to penetrate the ground the winter past. May 1<sup>st</sup> – fair, hot, sunshine but easterly wind. I saw one patch of snow on the Neck [peninsula].<sup>78</sup>

In December 1740 in *England*, there were great snows, rains, storms and severe frosts, and in some places dreadful thunder and lightning. Cattle, corn, and hay were swept away by the rising of the rivers Severn, Trent, and Wye. The weather was similar in *France*. But it was worse in Holland [now *the Netherlands*] and *Germany*, where whole territories were underwater.<sup>212</sup>

During December 1740, *England* had great snows, rains, storms, severe frost, and in some places dreadful thunder and lightning. Cattle, corn [grain], and hay were swept away by the rising of the Severn, Trent, Wye, and other rivers. The like happened in *France*, but Holland [now *the Netherlands*] and *Germany* suffered more severely. The dikes were broken in several places. Whole territories laid underwater, particularly 30 villages in Altena [in *Germany*], where the inhabitants got to the tops of houses and trees to save their lives. The roof of St. Bartholomew's Church at Frankfort [*Germany*], where the Emperors are elected, was beat in the storm.<sup>282</sup>

In December 1740, the temperature at Stoke, Newington [a district in the London Borough of Hackney, *England*] fell to 2° F [-16.7° C].<sup>300</sup>

---

**1741 A.D.** On 28 July 1741, a violent thunderstorm struck the southeast parts of the West Riding of York and parts of Nottinghamshire and Lincolnshire in *England*. "Most of the hailstones as large as musketballs, some big as pigeons' eggs, some three inches [8 centimeters] long and one inch [2.5 centimeters] in diameter, of various shapes like broken icicles, which tore up the standing corn [grain], broke large branches of trees, tore up trees by the roots, knocked down and broke the heads of several people, and killed birds and hares. Thus it raged ten miles [16 kilometers] in length and one mile [1.6 kilometers] broad; and did much damage 40 miles [64 kilometer] long and 2 miles [3.2 kilometer] broad. The farmers' loss is £4000. Hail lay in heaps half a yard [46 centimeters] deep, like ice, two days after."<sup>212</sup>

On 28 July 1741 in *England*, "happened a violent storm of thunder and hail in the south east parts of West Riding of Yorkshire, part of Nottinghamshire, and Lincolnshire. The hailstones were generally as large as musketballs, many as big as pigeons eggs, and some two or three inches long, and an inch in diameter, of various shapes, like broken icicles, which tore and cut up the standing corn [grain], and beat, as with a flail, the corn that was reaped; broke off large branches of trees, and tore up some by the roots; knocked down and broke the heads of several people, and killed birds and hares. Thus it raged 10 miles [16 kilometers] in length, and 1 [mile, 1.6 kilometers] in breadth. The hail lay in heaps half a yard [46 centimeters] deep 2 days after like ice. The loss of the poor farmers is computed at 4000 *l.* and a collection is proposed for their relief."<sup>284</sup>

On 29 July 1741, it was reported, "a terrible tempest has ruined all the country about Geneva [*Switzerland*], so that it will take up three years to restore the vines to their former condition, and nine [for] the chestnut-trees. The Cantons of Berne and Fribourg have likewise suffered, and the country was covered with hail two foot in depth."<sup>284</sup>

In 1741, the price of wheat [in *England*] averaged 46 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

On 8 August 1741 about 11:45, a very violent hurricane of wind from the west struck St. Ives in Huntingdonshire, *England*. The storm only lasted about 30 minutes but in that time it blew down the spire, which broke through the church, and the damage was computed at 1500 *l.* Scarce a windmill is left standing within seven or eight miles [11-13 kilometers] of the place. The spires of Hemingford and Bluntisham churches were likewise blown down, and the damage done the rector's house, and gardens of the latter place amounts to above 500 *l.* The same storm reached Lynn about one and spread a general desolation round that place; mills, trees, barns, stacks of hay, were blown down, some [houses] stripped of the thatch. Two spires fell, one of them through the body of the church. Several ships lost their masts and riggings and the damage in the town is reckoned above 20,000 *l.* Maidenhead, Slough, Rochester, Chatham, Stroud, and several parts of Surrey and Kent likewise felt the fury of this hurricane, which there came for the south. At night, the shipping of Sunderland in Yorkshire suffered greatly by the storm where the wind was at east.<sup>284</sup>

On 8 September 1741, a southwest gale struck Buntisham in Huntingdonshire, *England*. The gale began at noon and lasted 13 minutes, in which period sixteen barns, twelve houses, and all the mills within seven or eight miles [11-13 kilometers] were blown down. Hay and cornstalks were quite blown away. The spires of St. Ives steeple, Bluntisham and of Hemmingford were blown down. The course of the storm was from Huntingdon to St. Ives, Erith, between Wisbeach and Downham, to Lynn and Sultshaw, where very few trees escaped. The gale was not so violent at Cambridge, where there was thunder and lightning. Another account said the storm reached Lynn about one o'clock, and there spread a general desolation; mills, houses, stacks of hay, and two church spires blown down. The damage at Lynn being £20,000. [In today's currency, this would be equivalent to £2.4 million using the retail price inflation rate.] The following towns also felt the fury of this gale: Maidenhead, Slough, Rochester, Chatham, Strood, and parts of Surrey and Kent. During the night the gale struck the shipping off Sunderland and Yorkshire, which suffered greatly. [Because of the short duration of the gale and the localized damage, this storm sounds more like the damage from a tornado.]<sup>212</sup>

In Canterbury, *England*, there was a storm on September 8<sup>th</sup>.<sup>40, 41, 56</sup>

In *Scotland* in 1741, there was a famine from terrible shake-winds when corn [grain] was ready for reaping.<sup>57, 72, 91</sup>

In December 1741, it was noted that the last two severe winters [the winter of 1739-40 and the winter of 1740-41] and dry summers [in *England*] have raised the price of tallow [the fat from cattle and sheep that is used chiefly to make candles and soap].<sup>212</sup>

About noon on 18 December 1741, a large ball of fire was seen to pass over Canterbury, *England*, which was followed by a storm that broke almost all the windows in town, and the next morning three suns appeared in the sky attended with a rainbow inverted, which lasted from nine to twelve, to the great astonishment of the inhabitants.<sup>284</sup> [Possible meteor air burst.]

In 1741 during the period between 5 February and 8 August, a drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Mei and Yai.<sup>153</sup>

In 1741, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 15 May and 12 June, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang, T'ien-mên and Mien-yang.

— During the period between 13 June and 12 July, floods struck Kiangsi (now Jiangxi province) in southern *China* at Ning-tu and Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Lung-ch'uan and Ch'ao-yang.

— During the period between 11 August and 9 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Wên-chou and Hu-chou; Kiangsi province at Kao-an; Kiangsu (now Jiangsu province) on the east coast of *China* at Pao-shan; and Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Ts'ang-wu.

— During the period between 10 September and 9 October, floods struck Hupeh province at Chung-hsiang.

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 2<sup>nd</sup> – raw, rainy. May 3<sup>rd</sup> – rain showers. We hear there is a famine in Ireland and a universal scarcity. May 4<sup>th</sup> – cloudy, but warm and looks like clearing up. Up to this time there was no plowing or any prospect of it unless God suddenly gives us steady fair weather; the ground being so wet and full of water. The grass seems to be appearing finely. May 9<sup>th</sup> there is now a bank of snow on the front of the Neck, though none anywhere else for some time. In Rhode Island and other places, they have lost half their sheep and many cattle. May 18<sup>th</sup> – I don't think ever more rain (since the Great Flood) fell in one day; the ground is everywhere one universal pond, and many

bridges are carried away. May 23<sup>rd</sup> – a hot summer day. May 24<sup>th</sup> – it was extraordinarily hot; I sweated much during the afternoon preaching. May 25<sup>th</sup> – very hot last night and again today. Corn is rotten in the ground everywhere, and a pretty deal that was planted was not fit for seed. The cherry trees do but now bloom; the apple trees do just begin; as fine a grass spring as can be. August 10<sup>th</sup> – we had more hot weather the summer past than ever known here. It is now a dry time, no water in the roads, and rain much wanted. August 30<sup>th</sup> – exceedingly hot Sabbath, people dying almost from the heat. From the 25<sup>th</sup> of the month, there has been such a spell of hot weather as that there has been not only nothing like it the summer past, but I think the whole sixteen years I have been in Falmouth. Hot weather constantly.<sup>78</sup>

---

**Winter of 1741 / 1742 A.D.** In 1741 in *England*, there was all frost or rain from 15<sup>th</sup> September to 1<sup>st</sup> February. “All frost or rain.”<sup>47, 72, 93</sup>

On 31 December 1741, letters from Madrid reported that a French squadron from Toulon [*France*] was by a violent storm driven into Cartagena [*Spain*] in a shattered condition, and the Spanish squadron from Cadiz [*Spain*], which had entered the straights had been driven back into the ocean.<sup>284</sup>

On 31 December 1741, Rev. William Gostling reported an Airquake [blast wave from an atmospheric explosion of an asteroid/comet] in Canterbury, *England*. “About one in the afternoon I found my house violently shaken for some seconds of time, as if several loaded carriages had been driving against my walls; and heard a noise, which at first my family took for thunder, but of an uncommon sound. For my own part (as I thought thunder which could shake us at that rate, would have been much louder). I concluded it an earthquake: and, going immediately to the top of my house, found the sky cloudy, but nothing like a thunder cloud in view; only there was a shower of rain from the eastward presently after, and the coldest that I have felt. I thought it the shock of an earthquake, as I told you before; but since find it was attended (and I suppose caused) by a ball of fire, which passed with great rapidity over our country, from westward to eastward, for how long a journey I cannot tell. It began with two great blows, like the reports of cannon (which the jumbling of my sashes prevented my distinguishing); and then rolled away till it was heard no more. The appearance, I hear, was as that of a very large shooting-star; and it left a train of light, which soon disappeared, it being noon-day. I met a pilot today coming from Deal, whom I asked about it, and he told me he saw no fire-ball, but heard the noise, and that it made the ship shake he was in, going from Gravesend to the Nore [in Thames Estuary].”<sup>296</sup> [Additional accounts of this phenomenon, from Sussex, Newport in the Isle of Wight, and London, may be seen in the Philosophical Transaction for that year.]

On 20 January 1742, the temperature at Tooting in Surrey, *England* was very hot, unusually so.<sup>212</sup>

In 1742, "The cold of this year, says Maraldi, is the largest that has been seen in Paris, *France* since the year 1709. It started to snow on 2 January and up to the 10th increased continually." At 6:30 in the morning, the observer in the northeastern side of the tower at the observatory recorded the temperature using a thermometer as follows: on the second of January (32° F, 0° C); on the third (25.2° F, -3.8° C); fourth at (19.6° F, -6.9° C); on the fifth (12.9° F, -10.6° C); on the sixth (10.9° F, -11.7° C); on the seventh (6.1° F, -14.4° C); on the eighth (4.5° F, -15.3° C); on the ninth (3.9° F, -15.6° C); on the tenth (1.6° F, -16.9° C). The Seine River was frozen over from 27 December 1741 until towards the end of January 1742. The winter was long, for on the 11<sup>th</sup> and 12<sup>th</sup> of March, the thermometer was still reading 21.9° F (-5.6° C). As a result of the late frost many plants were damaged. In *England*, there were only a few weeks of severe cold.<sup>62</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: In 1742 on March 11<sup>th</sup> – the snow is four-feet (1.2 meters) deep in the woods.<sup>78</sup>

The following is an account by Captain Middleton of the effects of cold at Prince Wales's Fort in Churchill River in the Hudson Bay [located across from Churchill, Manitoba, *Canada* during the winter of 1741-42].<sup>286</sup>

— The trees, joists and rafters of the buildings, burst with a noise like the firing off a great many guns together, on the approach of a severe frost. The rocks also split and were raised up in great heaps, leaving large cavities beneath.

— The hares, rabbits, foxes and partridges, in September and the beginning of October, changed their natural color to a snowy white, except some foxes of a different sort, which were grizzled, and some half red and half white.

— Lakes, and standing waters of 10 or 12 foot deep were frozen to the ground, and the fish all perished. But in the lakes of greater depth, and in rivers near the sea, fish are caught all the winter, by cutting holes through the ice to the water, and letting down lines and hooks. To catch them with nets, several holes are cut in a straight line the length of the net, which by a stick fastened to the head line is passed from hole to hole, until it reaches the utmost extent, and what fishes come to these holes for air are thereby entangled, and when taken out are instantaneously frozen stiff. The seamen freshen their salt provision, by cutting large holes through the ice in the stream or tide of the river, at the beginning of winter, and keep it open all that season, and the minute the salt meat is immersed underwater, it becomes pliable and soft, though before it was hard and frozen. In large lakes and rivers the ice is sometimes broken by trapped vapors.

— Beef, pork, mutton and venison, killed at the beginning of winter are preserved by the frost, for 6 or 7 months, free from putrefaction. Geese, partridges &c. killed at the same time, and kept with their feathers on, and guts in, require no other preservative but the frost as long as winter continues. Fish are preserved in the same manner.

— If beer or water is left, even in copper pots, and though they were put by the bedside, in a severe night the pots are split into pieces before morning, not being able to withstand the expansive force of the enclosed ice.

— The air is filled with innumerable particles of ice, very sharp and angular and plainly perceptible to the naked eye. Captain Middleton several times tried to make observations on some celestial bodies, with reflecting and refracting telescopes, but the metals and glasses by the time he could fix them to the objects, were covered a quarter of an inch thick with ice, and thereby the object rendered indistinct. He also tried to get the sun's refraction to every degree above the horizon, with Elton's Quadrant, but to no purpose, for the spirits froze almost as soon as brought into the open air.

— Bottles of strong beer, brandy, strong brine, spirits of wine, set in the open air 3 or 4 hours, froze to solid ice.

— The earth, in the two summer months, at 10 or 12 feet [3.0-3.7 meters] depth is hard frozen, and what moisture is found 5 or 6 feet [1.5-1.8 meters] down, is white like ice.

— Rivers near the Sea, where the current of the tide is strong, do not freeze above 9 or 10 feet [2.7-3.0 meters] deep, but waters in land are frozen fast by the beginning of October, and continue so till the middle of May. All the water used for cooking, brewing, &c. is melted snow and ice, no spring being yet found free from freezing, though ever so deep.

— The walls of the houses are of stone, two feet [0.6 meters] thick. The windows very small with thick wooden shutters, which are closed shut 18 hours every day in the winter. They made four large fires every day in great stoves, and as soon as the wood was burnt to a coal, the tops of the chimneys were closed stopped with an iron cover, to keep the heat within the house. Notwithstanding which, in 4 or 5 hours after, the fire is out, the inside walls and bed-places [bedrooms] were 2 or 3 inches [5-8 centimeters] thick with ice, which is every morning cut away with a hatchet. Three or four times a day, iron of 24 pounds [11 kilograms] weight, are heated red hot and hung up in the windows, yet all this will not keep beer, wine, ink, &c. from freezing by the bedside.

— The snow that falls here is as fine as dust, but never any hail, except at the beginning and end of winter. At almost every full and change of the moon, there are very hard gales from the North.

— The fogs and mists, says Captain Middleton, that are brought here from the Polar parts, in winter, appear visible to the naked eye in icicles innumerable, as small and fine hairs or threads, and sharp as

needles [rare long prism diamond dust ice crystals]. These icicles lodge in our cloaths [clothing usually made of leather and skin], and if our faces or hands were uncovered, they produced white blisters, as hard as horn. Yet if we immediately turn our backs to the weather, and can endure our hand out of the mittens to rub the blistered part a little, we sometimes bring the skin to its former state. If not, we make all possible haste to a fire, get warm water to bathe it, and thereby dissipate the humours [in ancient physiological theory, the 4 humours were considered blood, phlegm, yellow bile and black bile]; otherwise the skin would be off in a short time, with much hot ferous [containing], watry [watery] matter. This happened to some individuals almost every time they went abroad for 5 or 6 months in the winter. — The doctors have in vain used their utmost skill, to prevent the terrible effects of the scurvy, which is occasioned by keeping within doors for the cure of the frozen parts. Nothing will hinder this distemper from proving mortal, but exercise and stirring abroad.

Captain Middleton journal recorded his stay at Prince Wales's Fort in Churchill River in the Hudson Bay [located across from Churchill, Manitoba, *Canada*] during the winter of 1741-42. On 18<sup>th</sup>-27<sup>th</sup> of October 1741, the snow was 10-12 feet deep [3.0-3.7 meters] and there was no stirring about without snowshoes. On the 15<sup>th</sup> of November, the ice on the river was 4 or 5 feet [1.2-1.5 meters] thick. On the 14<sup>th</sup> of December, it was so cold that a 70-year old Indian was starved to death under the walls of the fort in his tent. On the 7<sup>th</sup> of April, the water rose 9 or 10 feet [2.7-3.0 meters], the ice at the ship was 10 feet [3 meters] thick, and the snow above it another 13 feet [4 meters]. On the 9<sup>th</sup> and 10<sup>th</sup> of April 1742, there was moderate warm weather, some hail and large flakes of snow. This was a sign that the winter was spent. All the snow for 6 months being as fine as dust [diamond dust ice crystals]. On the 23<sup>rd</sup> of April, the tide rose 10 feet 3 inches [3.1 meters]. On 1 June, the ice gave way in the channel and drove to the Sea.<sup>292</sup>

---

**1742 A.D.** In Limerick, *Ireland*, there was a great flood; much damage.<sup>47, 92</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: April 18<sup>th</sup> – comfortable Sabbath. April 25<sup>th</sup> – unusually hot. May 6<sup>th</sup> – the grass grows wonderfully. May 29<sup>th</sup> – same. Very hot weather for a week past. October 18<sup>th</sup> – some unusually hot days about this time. December 23<sup>rd</sup> – charming weather everyday. December 29<sup>th</sup> – wonderful weather for about ten days past; there has been no cold weather yet.<sup>78</sup>

On 22 June 1742, there was a thunderstorm at Thorndon [in Suffolk, *England*] between 3 and 4 a.m.<sup>212</sup>

In 1742, the price of wheat [in *England*] averaged 34 shillings per quarter [quarter ton].<sup>212</sup>

On 18 August 1742, a thunderstorm struck Tettenhall in Wolverhampton, *England*. The storm produced great heat [hail] and thunder, which did terrific damage to the corn [grain], trees, etc. The hail lay on the ground in a sheltered place for a week [afterwards].<sup>212</sup>

On 31 August 1742, it was reported that great damage was done to the pastures, particularly around Bristol, *England*, by swarms of grasshoppers. The same has happened in Pennsylvania in the *United States*.<sup>285</sup>

A great storm struck on the 2<sup>nd</sup> and 3<sup>rd</sup> [of October or November 1742] near Cardiff, *Wales*. The sea broke in and destroyed 700 sheep and many vessels were cast away.<sup>285</sup>

On 27-28 October 1742, an Atlantic hurricane struck the *Virgin Islands* and *Puerto Rico*. Two ships were lost to the storm.<sup>141</sup>

On 9 November 1742, the sea rose at St. Malo in *France*, three foot higher than it does in the greatest spring tide.<sup>285</sup>

*Gibraltar* [at the southern end of the Iberian Peninsula at the entrance to the Mediterranean Sea] reported that on the 21<sup>st</sup> of November 1742 between nine and ten at night it began to blow a violent storm at southwest in which was lost, the *Drake* sloop and two other ships, and two fine xebeques [xebec sailing ship] belonging to the King, three ships with stores for the garrison and a large settee [lateen-rigged masts] storeship, besides several Portuguese vessels.<sup>285</sup>

In 1742 during the period between 5 February and 6 May, a drought engulfed Yunnan province in southwest *China* at Hao-ch'ing and Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Kuang-ning, Lung-ch'uan, Ch'ao-yang, Jao-p'ing and Chieh-yang. During the period between 5 February and 8 August, a drought engulfed Kwangtung province at Yang-chiang.<sup>153</sup>

In 1742 during the period 2-31 July, floods struck Hupeh (now Hubei province) in central *China* at Kuang-hua, I-ch'êng, Chiang-ling and Chih-chiang; and Kiangsi (now Jiangxi province) in southern *China* at Ta-yü and Ning-kang [uncertain name, "Yung-ning"]. At Ning-kang, houses and fields were damaged by the floodwaters. During the period 1-29 August, floods struck many regions of China including:<sup>153</sup>

— Kiangsu (now Jiangsu province) on the east coast of *China* at Yen-ch'êng and Suchow. At Suchow, houses were damaged by the floodwaters. At Yen-ch'êng, several tens of thousands of houses were damaged.

— Kiangsi province at I-ch'un.

— Shantung (now Shandong province) on the east coast of *China* at An-ch'iu and T'an-ch'êng [possible misprint, "Yen-ch'êng"]. At An-ch'iu, 6 or 7 li [over 2 miles] flooded and some people drowned.

— Anhwei (now Anhui province) in eastern *China* at Tung-liu, Ying-shang, Wu-ho and Po.

— Hupeh province at Wuchang, Chia-yü, Han-ch'uan, Huang-p'o, Hsiao-kan, Chung-hsiang and Hanyang.

**Winter of 1742 / 1743 A.D.** The Seine River in *France* was entirely frozen over.<sup>38</sup>

The Seine River in *France* was on 27 December 1742 at 13.5° F (-10.3° C) , frozen in its breadth and stayed for a portion of January in this state.<sup>62</sup>

During December 1742 and January 1743, several ships suffered by storms. On the 1 January 1743, a large Dutch ship bound from Curasoe [Curaçao] for Amsterdam with the Master and a crew of 31 came into Ballyvaughan Harbor in *Ireland* with a cargo of 400,000 *l.* value. They had been eight weeks at Sea, without other sustenance than rainwater and cocoa nuts. The ship was stove to pieces on the Coast of Galway, and a great part of her cargo was plundered. All the crew had large sums of money about them, and one of them who died in the boat, was rifled as soon as brought ashore; another was robbed of 170 pieces of eight, and a ring he had on his finger, which being tight, was gnawed by one of the villains to get it off. The rest of the crew shared the same inhuman treatment. If they had not been protected by the timely assistance of Mr. Wecomb, a neighboring gentlemen, who likewise went to save what he could of the wreck. The *Neptune*, Captain Lawson, from Antigua with rum, sugar, &c. bound for Dublin, was forced on shore in Cardigan Bay, *Ireland*, where the people not only plundered the cargo, but destroyed the ship, and made an attempt on the captain's life, who endeavored to defend his vessel and goods. A vessel from Cork, for Amsterdam, having foundered off Jersey Island, the crew, amounting to seven, got ashore in the boat, and while five of them went to look for lodging in the country, the people came down and murdered the two in the boat.<sup>286</sup>

Frost in *England*.<sup>40, 41, 43</sup>

In *England*, by the 18<sup>th</sup> of December 1742, the frost was very severe for many weeks. “The frost having continued near three weeks, the streets in some parts of the city, though there had been no snow, were rendered very incommodious, and several accidents happened.”<sup>47, 93</sup>

On 18 December 1742, there was a frost in London, *England* that lasted for three weeks but without any snow. There was significant ice on the River Thames.<sup>212</sup>

On 18 December 1742, [London, *England*] reported, “The frost having continued near three weeks, the streets, in some parts of the city, tho’ there had been no snow, were rendered very incommodious, and several accidents happened. Most of the merchant ships in the river, unloaded, were hawl’d [hailed] on shore, to prevent any damage they might receive from the vast floats of ice, and crossing in wherries was become almost impracticable. On the 16<sup>th</sup> at night two boats, one with four women and a waterman [a river worker who transferred passengers across and along the city rivers], and the other with a waterman only, were jamm’d in by the ice at Westminster, and the passengers got not to land till 9 next morning at Fulham; having lost the use of their limbs.”<sup>285</sup>

During the winter of 1742-43, Marshall Belle-Isle left Prague [*Czech Republic*] according to French accounts with 11,000 foot and 3,000 horse soldiers. The Austrian according to their accounts killed and took prisoners between four and five thousand [in the Bohemina Forest], including those destroyed by the cold, seized the greatest part of the French baggage, and the wagons loaded with the plunder of Prague. Nothing they say, can describe the dismal spectacles in the road, which the French took. They were strewed with the dead, or dying bodies of men and cattle, and full of blood, and the villages burnt and plundered. The frost was so excessive that many of the French were unable to march, and some of those taken prisoners lost the use of their limbs on approaching the fire.<sup>286</sup>

The winter of 1742-43 was severe in *France* and Quebec, *Canada*. In Paris, *France*, the Seine River froze on the night of the 26<sup>th</sup>/27<sup>th</sup> of December 1742. The thermometer read 13.5° F (-10.3° C) on 27 December and on 10 January 1743 the readings took place in ice conditions. It is believed that in Quebec, *Canada* the thermometer fell almost to the freezing point of mercury. [The mercury in mercury thermometers solidifies (freezes) at -37.89 °F (-38.83 °C).]<sup>62</sup>

At Fort Churchill [located on the west shore of the Hudson Bay in Manitoba, *Canada*] the winters around 1742 were severe. The fort was situated upon an elevated situation upon a rock without shelter, close by the shore, surrounded with snow and ice for eight months in the year, exposed to all the winds and storms. The town of Missilimakinac [Michilimackinac, Michigan in the *United States*] is situated a league [3 miles, 4.8 kilometers] of the Entrance of the Illinese Lake [Lake Michigan]. This lake has excellent climate. On the north side of the lake, the spring begins in April N.S. [new style – Gregorian calendar]. In the land, the ice breaks up in March, but there is floating ice until the beginning of April. The frost and the winter set in during the latter end of November. On the southern side of the lake, the winter breaks up the beginning of March, all the ice being gone before April, and the winter does not begin until the beginning of December. On the south side of the lake is the River Chicacou [Chicago in Illinois], which was frozen over the beginning of December, and upon the 3<sup>rd</sup> of January it began to thaw and was navigable on the 24<sup>th</sup>. Lake Errie or Conti [Lake Erie] has excellent climate. It is never disturbed by storms and only has 3 months of winter.<sup>292</sup>

In the *United States*, the winter of 1742 was one of the coldest winters since the settlement of the country; a gentleman drove himself with a horse and sleigh through Long Island Sound (on the ice) to Cape Cod.<sup>1</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1743 on March 1<sup>st</sup> – very cold. This has been a closed [overcast] winter, the snow was constantly so deep in the woods that the teams could not stir, though there was not so much near us, and in Boston there was hardly any.<sup>78</sup>

---

**1743 A.D.** On 1 February 1743 at night there being a great storm of wind, many ships were drove from their moorings in the [River] Thames [in London, *England*]. Barges and boats were overset, and some people drowned.<sup>286</sup>

On 3 February 1743, there was a great gale at London, *England* that caused many [ship]wrecks.<sup>212</sup>

On 1 April 1743, there was a violent northeast gale at Newcastle, Hartley, Blyth, Sunderland, Scarborough, Whitby, and on the Norfolk coast in *England*. The storm produced many [ship]wrecks.<sup>212</sup>

On 1 April 1743, a violent storm or rather hurricane at northeast struck *England*. It began at 6 o'clock in the morning. Seven cobsles [fishing vessels] belonging to Newcastle, attempted to make the harbor. Two of which with great difficulty got safely into the harbor. But the other five being at a greater distance from land, and the men much fatigued when they came near shore, were incapable of managing their boats, so that they were all, to the number of 19 [individuals], lost in sight of the towns people, who could give them no assistance. Two vessels belonging to Hartly [Hartley], and one to Blyth, were lost at the same time, and all the people perished. Several ships lying at Sunderland were drove to sea in great confusion, running foul of each other, with the loss of their masts, bowsprits, &c. Two ships foundered near the bay, one of which appeared to be a new one of 300-tons, and the other about 200-ton, whose crews all perished. The riggings and the masts of the ship came ashore near Scarborough. Another ship likewise ran ashore at the same place and was beat to pieces. A great many wrecks appeared all along the Yorkshire coast. Three colliers were drove by the violence of the wind on Whitby Rocks in Yorkshire, and all lost with their crews. A Boston vessel was also lost at Blackney [Blackeney] in Norfolk.<sup>286</sup>

On 27 April 1743, there was a gale at Gravesend in Kent, *England*. “His Majesty driven back and detained at Sheerness by the gale.”<sup>212</sup>

On 15 July 1743, a hailstorm struck [the London Borough of] Enfield in *England*. The hailstones were as big as nutmegs and they broke the windows and laid [down] the corn [grain] for several miles round.<sup>212</sup>

On 15 July 1743 in Enfield (Middlesex) England, there were hailstones as big as nutmegs. The hailstones broke windows, and laid the grain for several miles round. A boy and 2 horses were killed by the lightning.<sup>93</sup>

On 15 July 1743 in *England*, there was a hailstorm at Middlesex and Leicestershire.<sup>93</sup>

On 15 July 1743, hailstones fell about Enfield [a suburb of London], *England* as big as nutmegs, broke the windows, and laid the corn [grain] for several miles round. A boy and two horses were struck dead by lightning.<sup>286</sup>

A major heat wave struck Peking (now Beijing) in northern *China* on 25 July 1743. Eleven thousand people suffered heatstroke. The temperature was 120° F (49° C).<sup>28</sup>

More than 5,400 people died suddenly in Beijing, *China* in 1743 from the effects of extreme heat. The thermometer recorded 34° Reaumur (108.5° F, 42.5° C).<sup>80</sup>

In 1743, the price of wheat [in *England*] averaged 25 shillings per quarter [quarter ton].<sup>212</sup>

On 18 August 1743, a thunderstorm struck Tewkesbury in Gloucestershire, *England*. The storm produced

unusual hail with thunder and lightning. The hailstones were as big as hen's eggs. They broke windows to the value of £1000. [In today's currency, this would be equivalent to £141,000 using retail price inflation index.] They struck off the ears of corn [grain] and killed pigeons. At Chester, the storm was equally violent, so that in some places only very little wheat could be reaped.<sup>212</sup>

A storm struck Tewkesbury, in Gloucestershire, *England* on August 18 causing 1,000*l.* damage.<sup>40, 41</sup>

On 18 August 1743, a very unusual storm of hail, with thunder and lightning did much damage in the northwest part of the Kingdom [*England*]. The hailstones were as big as hen eggs, and broke the church and other windows in Tewkesbury, to the value of 1000 *l.* It struck off the ears of the corn [grain], and killed several pigeons. The storm was felt almost with the same violence as far as Chester, so that in some places little of the wheat could be reaped, and they were obligated to turn out their hogs to eat up the rest. At Leicester fell pieces of ice near 5 inches [13 centimeters] in length and hailstones 2 inches [5 centimeters] in circumference, which killed some hundreds of small birds. The streets were so flooded, that almost all the houses had water in them several feet deep. Many wagonloads of ice were gathered in heaps. This storm was compared there to the breaking of waterspouts.<sup>286</sup>

On 19 August 1743 in the western and northwestern area of *England*, there were hailstones as big as hens' eggs. Church and other windows broken in Tewkesbury to a value of £1000. Pigeons were killed and grain crops destroyed. The same storm felt in Cheshire where there was great damage to grain crops, which were afterwards fed off by pigs. The storm extended into Gloucestershire, Leicestershire and Warwickshire. In this same storm, there fell at Leicester pieces of ice 5 inches long, and many large hailstones. These hailstones killed hundreds of small birds. The hail blocked the drains, and the town was flooded. Tons of ice were gathered into wagons. The storm was compared there to the "breaking of waterspouts."<sup>93</sup>

In September 1743, several ships of the Jamaica fleet suffered in a hurricane at sea [in the *Atlantic Ocean*].<sup>286</sup>

On 20 October 1743, a hurricane struck *Jamaica*.<sup>124</sup>

On 20 October 1743, a hurricane struck *Jamaica*. A great number of marines were drowned.<sup>141</sup>

[The source cites this year as 1740, but it appears to be out of chronological order, which leads me to believe the actual year is 1743] Droughts engulfed many regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, a drought engulfed Anhwei (now Anhui province) in eastern *China* at Shou.

— During the period between 5 February and 8 August, a drought engulfed Hopei (now Hebei province) in northern *China* at An-hsin [uncertain name, "Hsin-an"].

— During the period between 24 April and 23 May, a drought engulfed Anhwei province at T'ung-ling.

— During the period between 24 May and 21 June, a drought engulfed Hopei province at Kao-ch'êng.

— During the period between 21 July and 18 August, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tê and Hopei province at Wu-ch'iang, Chêng-ting, Ho-chien, Ning-ching and Hêng-shui.

— During the period between 8 November 1743 and 5 February 1744, a drought engulfed Hopei province at Wu-i.

In 1743 during the period between 6 May and 8 August, floods struck Hupeh (now Hubei province) in central *China* at Huang-kang and I-tu; Kiangsi (now Jiangxi province) in southern *China* at Hsing-kuo; and Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-ch'un.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 28<sup>th</sup> – there has been no easterly weather this month, and though cold, yet raw and chilly as usual. The roads are everywhere as dry as summer. May 1<sup>st</sup> – an uncommonly dry time. May 7<sup>th</sup> – refreshing rains. June 1<sup>st</sup> – Indian corn wants heat. June 20<sup>th</sup> – a very dry time; people fear a drought. June 22<sup>nd</sup> – it rained plentifully. June 27<sup>th</sup> – there are millions of worms, in armies, appearing and threatening to cut off every green thing; people are exceedingly alarmed. July 1<sup>st</sup> – days of fasting are kept in one place and another, on account of the worms. July 28<sup>th</sup> – an exceeding scarce time for hay: it is £7 to £8 a load. August 1<sup>st</sup> – fine growing season. October 31<sup>st</sup> – wonderful weather, moderate and dry. November 7<sup>th</sup> – there has been no rain for many weeks, so that not a mill goes in this part of the country. [The rivers are dry and the water mills could not function.]<sup>78</sup>

---

**Winter of 1743 / 1744 A.D.** In 1744, the Seine River in *France* was entirely frozen over.<sup>38</sup>

The Seine River in *France* froze on the morning of 11 January 1744, in low northeast winds and clear weather, while the thermometer showed 16.3° F (-8.7° C).<sup>62</sup>

The winter in 1744 in *France* was severe, but the cold was not as great nor did it last as long as the winter of 1742. The Seine River froze on the morning of 11 January between the Pont-Neuf and Pont-Royal entirely. The coldest day occurred on 14 January measuring 14° F (-10° C).<sup>62</sup>

In January 1744, there was so great a fog at The Hague in *the Netherlands*, that at midday the people were forced to carry torches before the coaches, and the coachmen had to lead their horses to prevent accidents. The people in churches, were obligated to remain there until the weather cleared up before they could return home.<sup>287</sup>

On 29 January 1744, the temperature at Lydon in Rutland, *England* fell to 20° F [-6.7° C].<sup>300</sup>

---

**1744 A.D.** On 19 February 1744, a gale struck Deal in Kent, *England*. On 25 February, a great gale struck Deal. And then on 28 February, another gale struck Deal.<sup>212</sup>

On 20 February 1744, a gale struck Guernsey [in the *English Channel* off the coast of Normandy].<sup>212</sup>

A storm on 20 February 1744 caused two French Men-of-War ships to split on the Rocks of *Guernsey*, an island in the English Channel. Two others were able to make harbor, one without its head and the other had lost its masts. A storm on 24 February caused nine or ten merchant ships to be driven ashore from the Downs in *England* and several of the crews perished. On 5 March, it was reported that General Bowle's Regiment of Horse landed at Parkgate, from Dublin, *Ireland*. They had so bad a passage in the late storm that upwards of 50 of the horses died. It was reported on 10 March that 7 or 8 French transports with troops were cast away in a storm.<sup>287</sup>

On 24 February 1744, a northeast gale struck Brighton on the southern coast of *England*. A dozen ships were driven on shore from the Downs.<sup>212</sup>

On 2 April 1744, it snowed in London, *England*. Then on 6 April, it was the greatest cold in the month at 34° F [1° C]. Then on 20 April, London experienced its first warm day of the year when the temperature rose to 65° F [18° C]. The next day, temperatures peaked at 75° F [24° C]. On 24 April, a lightning storm struck London.<sup>212</sup>

The maximum temperature during the summer on a plantation on the Comewyne River, [*Suriname*], was 89.4° F (31.9° C).<sup>62</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 29<sup>th</sup> – a forward spring; a great mercy, on account of the scarcity of hay. No person ever saw such an April in this eastern country, so dry and warm and pleasant. May 1<sup>st</sup> – a fine season as ever was known. May 31<sup>st</sup> – no person in the land ever saw such a spring, so hot, and intermixed with seasonable showers. We have ripe strawberries, and everything were two weeks more advanced than normal. July 15<sup>th</sup> – a wonderful year for grass and hay, both English and salt. August 20<sup>th</sup> – I don't remember that pigeons were ever so plentiful as now. October – I reckon this month was more like the month of September, and September was more like October.<sup>78</sup>

On 4 June 1744 in *England*, there was a great hailstorm in Gloucestershire.<sup>93</sup>

On 4 June 1744, a thunderstorm struck Gloucester, *England*. The storm began at noon and lasted all afternoon. It produced thunder, lightning, hail and rain and did much damage. In the North Highlands of *Scotland* another storm caused a great inundation, which carried away several houses and two fine bridges.<sup>212</sup>

On 4 June 1744, Gloucester in southwest *England* advised that at noon began there a most violent storm of lightning, thunder, hail and rain, which lasted the whole afternoon and did much damage. In the North Highlands in *Scotland* was a storm of thunder, lightning and rain, which caused a great inundation, and carried away some houses and two fine bridges build by General Wade.<sup>287</sup>

In 1744, the price of wheat [in *England*] averaged 25 shillings per quarter [quarter ton].<sup>212</sup>

On 13 August 1744, a very violent thunderstorm struck Edinburgh, *Scotland*. “The rain so great that ye streets and cellars were filled with water. The hailstones measured five inches [13 centimeters] round, and entirely threshed the standing corn.” The next day a violent thunderstorm struck London, *England*.<sup>212</sup>

On 13 August 1744, at Edinburgh, *Scotland* and several miles to the southwest was felt a very violent thunder and lightning storm. Several people in the castle were stunned [by the lightning], and some houses in the city were damaged. The storm of rain was so great at the same time that streets and cellars were filled with water. The steeple of Liberton Church was ruined and the east end of the church a smooth round hole made, as if done with the greatest art. A man and a horse were killed near Strathmiglo. The hailstones measured 5 inches [13 centimeters] round. The hailstones entirely shreaded [shredded] the standing corn [grain].<sup>287</sup>

On 14 August 1744 in *England*, a storm of thunder and lightning struck a lad dead, and a woman blind in St. George's Fields. Another person was struck blind in Black Pryers, and a journeyman painter at work in a house near Streatham Church in Surrey.<sup>287</sup>

In October 1744 [in *England*], the constant heavy rain caused floods in divers [diverse] places. As a consequence, sheep and cattle drowned.<sup>212</sup>

Great many pieces of a shipwreck were observed. A large ship believed to be English struck the rocks called the Caskets near the Isle of Awvigny [Acquigny] in *Normandy* during a terrible storm. The shipwreck occurred a few days before 20 October 1744.<sup>287</sup>

A letter dated from 30 October 1744 from Derby in the East Midlands region of *England* reported; “The continual rains have overflowed these parts, and the bridges in many places are covered with water, so that the farmers cannot come to market, many thousand acres of land are like a sea, vast numbers of sheep and other cattle drown'd, and great quantities of barley destroyed, which has occasioned a considerable rise in that commodity. Mr. Warner, a farmer near Mansfield, was drown'd last week in crossing the river Ouse.” Similar accounts were received from Kent, the Isle of Sheppey and other places.<sup>287</sup>

On 31 October 1744, [England] reported that the constant and heavy rain this month occasioned floods in diverse places, and some sheep and other cattle were drowned.<sup>287</sup>

In October 1744, Flanders [now Belgium] reported that the wind and rain was so violent for 3 days that great numbers of their soldiers became sick and as a result the Army went into winter quarters. The other armies in the region also retired. The English horse guard and the regiment of horse proceeded to Brussels; and the foot and dragoons to Ghent and Bruges, the Dutch, Austrian and Hanoverians went likewise to their respective quarters. A dreadful murrain broke out among the black cattle, calves, sheep and hogs in Burgundy, Forest, Beaujolais, Lyonnais, and Dauphiny. The animals died of this distemper. Their spleen and lungs were quite dried up. But the peasants discovered a very odd cure. If the beast were buried alive in a hole full of mud, with nothing but the head of the beast sticking out for 9 hours, when the animal was removed, they were well.<sup>287</sup>

On 20 October 1744, a dreadful hurricane struck *Jamaica*. The hurricane began at six in the afternoon and lasted until six in the morning. The wind during this time was due south. Mosquito Fort was demolished— eight of his Majesty's ships and vessels, and ninety-six merchant vessels, were stranded, wrecked, and foundered. Out of 105 vessels, only his Majesty's ship *Rippon* rode out the gale, and she without masts. His Majesty's ships *Prince of Orange*, *Bonetta*, and *Thunder* bomb were wrecked, but the people saved. [A bomb ship was a wooden sailing ship that fired mortars.] The *Montague* went aground and bilged. The *St. Alban's* and *Experiment* on shore. The *Greenwich* sunk, and Captain Allen and seventy-one men drowned. The *Lark* hulk sunk, and 110 persons drowned.<sup>143</sup>

A violent hurricane struck *Jamaica* in October 1744. The hurricane, which was accompanied by an earthquake, almost destroyed Port Royal. The fortifications at Mosquito Point (later known as Fort Augusta) were badly damaged and the Old Harbour was swept away. Only one out of 105 ships then in Kingston Harbor managed to ride out the storm.<sup>152</sup>

A hurricane struck *Jamaica* in October, 1744.<sup>40, 41, 42, 43</sup>

Port-Royal in *Jamaica* destroyed by a storm on October 20, 1744.<sup>43, 56</sup>

On 20 October 1744 at *Jamaica*, happened as dreadful a storm as ever was known in this part of the world. It began about six o'clock in the evening, and lasted till 6 o'clock in the morning. The winds at all times were due south. By this hurricane, the new fort at Mesquita point was demolished, many houses were blown down, roofs and piazza's blown off, and the wharfs of this town, Port Royal and Passage Fort destroyed, and a great part of the goods thereon washed away. Eight of his Majesty's ships and vessels, and 96 merchant vessels were stranded, wrecked and foundered, so that out of one hundred and five vessels, only his Majesty's ship the *Rippon* rode it out but without masts. The people in Port Royal were terribly afraid of a deluge, the town being two or three feet [0.6-0.9 meters] overflowed from the harbor, and the sea threatening destruction, which the wall most happily prevented. They have met with great damages in their houses, &c. In the country, several plantations, houses, works, &c. were destroyed. Many people, both white and black, drowned. Cattle, sheep, poultry, and provisions in great quantities of all kinds destroyed by the fury of the tempest, and the rapidity of the overflowing rivers. Of his Majesty's ships, the *Prince of Orange*, *Bonetta*, and *Thunder* bomb were wrecked, but the people saved. The *Montague* aground, bulged, and lost her mast but the people were saved. The *St. Albans* and *Experiment* ashore, the people saved and both will be got off. The *Greenwich* sunk, and Captain Allen, and lieutenant Battersworth, and 70 men drowned. The *Lark* hulk sunk, and about 20 white men and 90 Negroes drowned. The greater part of the merchant ships will get off, and most of their cargoes saved.<sup>288</sup>

On 31 October to 1 November 1744, a hurricane struck *Jamaica* causing 182 deaths.<sup>141</sup>

In 1744, a storm did prodigious damage at Port Royal, in *Jamaica*. It stranded, wrecked and foundered eight British ships, and ninety-six merchant ships in the harbor.<sup>174</sup>

In 1744, there was a famine in *India*.<sup>156</sup>

In 1744, floods struck many regions of *China* including:<sup>153</sup>

— Hopei (now Hebei province) in northern *China* at Tientsin, Ho-chien, Pa and Fu-ning.

— During the period between 11 June and 9 July, floods struck Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Ch'ên-hai and Ta-pu. At Ch'ên-hai, the dikes and several hundred house-sections were damaged by the floodwaters. At Ta-pu, over 190 house-sections damaged.

— During the period between 10 July and 7 August, floods struck Hupeh (now Hubei province) in central *China* at Han-ch'uan; Szechwan (now Sichuan province) in southwest *China* at Sui-ning, Chien-yang, Ch'ung-ch'ing, Mien-yang, Ch'iung-lai, Chengtu, Hua-yang, Chin-t'ang, Hsin-tu, P'i, Ch'ung-ning, Wên-chiang, Hsin-fan, P'êng-shui, Shih-fang, Lo-chiang, P'êng-shan, Ch'ing-shen, Yüeh-shan and Jen-shou; and Shantung (now Shandong province) on the east coast of *China* at Tzū-yang and Shih-hung. Over 600 persons drowned in these three provinces.

— During the period between 8 August and 5 September, floods struck Hupeh province at Tang-yang and Chekiang province at Shao-hsing, Ch'ang-shan, Ch'un-an, T'ung-lu, Ch'ang-hua, Chia-shan, and Chien-tê. At Tang-yang and Shao-hsing, the crops were damaged by the floodwaters. At Ch'ang-shan, innumerable people drowned.

In 1744 during the period between 12 May and 10 June, a drought engulfed Hsi-ch'ing [uncertain name and province]; Ch'ing-p'ing [uncertain name and province]; and Hopei (now Hebei province) in northern *China* at Kao-i and Ning-ho. During the period between 8 August and 5 September, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Hui-min.<sup>153</sup>

The year 1744 was a year of abundance in the vicinity of Shanghai, *China*.<sup>166</sup>

**Winter of 1744 / 1745 A.D.** In 1745 in *Russia*, the frost was unusually severe.<sup>47, 93</sup>

In 1745 the cold of winter reached 14° F (-10° C) in January in the region of olive groves in southern *France*. Many of these trees died.<sup>79</sup>

The winter in 1745 was very long in *Italy* and strong. In Paris, *France* the thermometer on 14 January 1745 read 9° F (-12.8° C); but this cold did not last long and the winter was without snow.<sup>62</sup>

On 10 January 1745 in South Carolina in what would become the *United States*, the temperature at 2 p.m. was 70° F [21° C]. The next morning it had fallen to 26° F [-3° C]. And on the 12<sup>th</sup> in the morning it reached 15° F [-9° C].<sup>295</sup>

**1745 A.D.** In Dublin, *Ireland*, there was a great flood; serious damage to bridges.<sup>47, 92</sup>

In April 1745 in London, *England*, a great cattle plague began, having been brought from *Holland* [*the Netherlands*]. It also struck other parts of *England* and lasted for many years. In summer it was very violent in Essex. In the autumn it was very violent in London. In Buckinghamshire, it was stamped out by killing the cattle that were sick. It appeared two years before in *Germany*. The cattle plague appeared in Argyllshire [*Argyllshire, Scotland*] in May, where it caused a great mortality among the black cattle. Six thousand died.<sup>212</sup>

On 11 May 1745, a hailstorm struck Yorkshire, *England*. The great storm caused great damage to the

gardens and fields. The hailstones were 5 inches [13 centimeters] in circumference.<sup>212</sup>

In Yorkshire, *England* in May, there was a hailstorm with stones measuring 5 inches round.<sup>40, 41, 43, 56, 57</sup>

On 11 May 1745, in *England*, hailstone masses of ice 5 inches in length fell in Yorkshire and did great damage to fruit and grain crops.<sup>93</sup>

On 11 May 1745, there was a great storm of hail. The hailstones, which were 5 inches [13 centimeters] about fell in Yorkshire, *England*, and did much damage to the fields and gardens.<sup>288</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Rome, <i>Italy</i>	( 95.0° F, 35.0° C)
Moscow, <i>Russia</i>	( 94.1° F, 34.5° C) on 15 June

The rains of 1745 caused extensive flooding in southern *France*. There were 72.4 inches (1,840 millimeters) of rainfall in Nîmes; 33.2 inches (844 millimeters) in Toulon; and 32.7 inches (830 millimeters) in Bordeaux.<sup>79</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

February – a very moderate, pleasant month; but little snow or foul weather. March 30<sup>th</sup> – this month has been like February; wonderfully pleasant, and like a normal April. June – so cool a June has not been known. August 18<sup>th</sup> – a good hay season. September 30<sup>th</sup> – no frosts till a night or two ago. October 26<sup>th</sup> - warm and pleasant.<sup>78</sup>

On 25 June 1745, there was a thunderstorm at Norwich, *England*. The storm was very violent at Horseford. There was a sudden sinking of the earth, leaving a hole 12 feet [3.7 meters] deep, and 12½ feet [3.8 meters] in diameter, circular in form, having perpendicular sides, and without cracks.<sup>212</sup>

In 1745, the price of wheat [in *England*] averaged 27 shillings 6 pence per quarter [quarter ton]. Other accounts give the price at 19 shillings.<sup>212</sup>

On 24 October 1745, a letter from Plymouth, England reported that his Majesty's ship, the *York*, chased ten French merchant ships, and two frigates, their convoy on the coast near Audierne Bay [in northwest *France*], and being in a hard gale at southeast was lost with them, and the crews of the whole perished.<sup>288</sup>

During 18-20 November 1745, tempestuous weather struck *Great Britain*. Several vessels were lost at sea particularly his Majesty's ship the *Fox in the Frith* and all men lost. Also two sloops of war were lost. The same storm was also felt by our enemies, and their embarkations retarded.<sup>288</sup> [At this time England was pursuing war with rebel armies in Scotland.]

During 18-20 November 1745, a gale struck throughout *England*. It caused many shipwrecks.<sup>212</sup>

In 1745 in London, *England*, the spring and summer were very wet. Autumn was cold and dry. The winter was damp and cold.<sup>212</sup>

In *India* during the years 1745-52, there was a famine in Nara districts of Sind [now *Pakistan*], and Thar and Parkar.<sup>57</sup>

In 1745 A.D., there was a famine in Sindh [now a province in *Pakistan*].<sup>179</sup>

In 1745, floods struck many regions of *China* including:<sup>153</sup>

— During the period 2-30 May, floods struck Hsi-kuei [uncertain name]; Kweichow (now Guizhou province) in southwestern *China* at P'an; and Hupeh (now Hubei province) in central *China* at Mien-yang and Ch'ien-chiang.

— During the period between 31 May and 29 June, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at T'ai; Anhwei (now Anhui province) in eastern *China* at Po; Po-hsien [uncertain name, uncertain province]; and Kansu (now Gansu province) in northwest *China* at T'ien-shui. At Po-hsien and T'ien-shui, innumerable people and cattle drowned.

— During the period between 29 July and 26 August, floods struck Kansu province at Ch'ing-shui [uncertain name, "Pai-sha"] and Lung-hsi [possible misprint, "Lung-shih"]; and Hupeh province at Tsao-yang and Chiang-ling. At Ch'ing-shui, the dikes and many houses were damaged by the floodwaters.

— During the period between 23 November and 22 December, floods struck Shantung (now Shandong province) on the east coast of *China* at Tsinan; Hupeh province at Tsao-yang, Ch'ien-chiang and Mien-yang; Kiangsi (now Jiangxi province) in southern *China* at I-ch'un; and Shantung (now Shandong province) on the east coast of *China* at Kao-wan.

In 1745 during the period between 31 May and 29 June, a drought engulfed Hopei (now Hebei province) in northern *China* at San-ho. During the period between 8 August and 8 November, a drought engulfed Hopei province at Yüan-shih, Hsing-t'ai, Tsao-ch'iang, Chêng-ting, Wu-chi and Kao-ch'êng; Chahar province (now eastern *Inner Mongolia*) at Huai-lai; and Shansi (now Shanxi province) in northern *China* at Hsi-yang and Tai. Crops were damaged by the drought.<sup>153</sup>

In 1745 during the 2<sup>nd</sup> moon on the 9<sup>th</sup> day, there was a hailstorm in the vicinity of Shanghai, *China*. Hailstones fell, which were the size of millstones; killing birds, beasts and men. At the time of the hailstorm, it grew suddenly as dark as night; lamps were lighted; again after it was over, the sun suddenly shone brightly. This darkness lasted about four hours.<sup>166</sup>

---

**Winter of 1745 / 1746 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1745 on November 16<sup>th</sup> – uncomfortable weather; deep snow in Boston, Massachusetts that lied on the ground all week; a considerable snow in Portland, Maine. December 27<sup>th</sup> – thus far moderate, and hardly like a normal December. December 31<sup>st</sup> – a blustering, severe night. This is the first day that looks like winter. No sledding yet. In 1746 on January 31<sup>st</sup> – a fine, moderate winter thus far. Only two short cold snaps. February 24<sup>th</sup> – the snow is three or four feet (0.9 or 1.2 meters) deep in the woods. February 28<sup>th</sup> – the snow is still as deep as at any time this winter. March 20<sup>th</sup> – a severe month, quite unlike the last. The snow still covers all the Neck [peninsula].<sup>78</sup>

On 20 February 1746, a storm struck Louisbourg [on Cape Breton Island, Nova Scotia, *Canada*]. “A violent gust of wind and snow storm arose, which shipwreck'd almost all the vessels in the harbour, and among other damages done in the city, the general's house did not escape, but a great part of its roof was blown down. On the evening before, it was clear, still weather, and no symptoms of a stormy night; yet before morning the whole harbour was blocked up with ice and snow, so that it was all as firm land. The greater sort of seals [seals] and sea-cows were trapan'd [trapped] thereby, and left their watry [watery] element, for fear of being drowned. The whalemén, who were posted on the island battery, drove near a dozen of these sea-cows ashore alive on that fortress. Many of them were almost thrice the bigness of a large horse; their skins are almost an inch thick, and some of these sea animals will make more than a barrel of oil. Their teeth, or rather horns, were about two feet [61 centimeters] in length, and are some of the finest ivory in the world. The French say there was never such a sight seen here before; and, what was very affecting and awful, the force of the wind and sea drove the ice so hard against the walls of the island battery, that it burst open the gates (tho' barr'd with iron) and tore up the dead corps [corpses] in their coffins which were buried on that battery; and these were seen jamm'd in the ice, in one place and another, and people now walk over the harbour in safety as on terra firma [dry land].”<sup>294</sup>

This winter in *Russia* was of great severity. In Astrakhan in the *southern European Russia*, the thermometer fell to  $-23^{\circ}\text{F}$  ( $-30.6^{\circ}\text{C}$ ). In Paris, *France* the coldest day was 15 February with a reading of  $15.6^{\circ}\text{F}$  ( $-9.1^{\circ}\text{C}$ ). The Seine River produced ice floes twice, once on 14, 15 and 16 February, and again on 13 and 14 March.<sup>62</sup>

---

**1746 A.D.** The summer of 1746 produced very hot days in the *Languedoc*. In the middle of *France* there were large storms in June. The grape harvest in Burgundy only began on 26 September. The harvest of wine was not very abundant, but of excellent quality. The grain production was only two-thirds of an average year. There was an abundance of vegetables; but little fruit. The year was dry throughout its duration. Only 390 millimeters (15.4 inches) of rain fell during the year.<sup>62</sup>

On 19 May 1746, the ship *Elizabeth and Mary*, commanded by Captain Adamson met with a violent storm of wind and ice [in the *Atlantic Ocean*], which lasted 48 hours in which 30 Dutch vessels and 3 English vessels (the *Volunteer*, Captain Alcock; the *Hurst* galley, Captain Guy; and an unidentified ship commanded by Captain Nicholson) were lost. The *Elizabeth and Mary* was almost torn to pieces. The *Elizabeth and Mary* took 130 men from the *Volunteer* and *Hurst* onboard but the rest was feared lost. The above English vessels had on board 2 and 3 whales each; which the Dutch found means to save, though they refused to take any men onboard except 83, who had saved themselves in some Greenland yawls, and forced their way into one of them, and were afterwards taken onboard the *Elizabeth and Mary*. The Dutch ships caught 406 whales, including 23 that were lost in the ships cast away.<sup>289</sup>

On 24 June 1746, there was a violent storm of wind, with thunder and rain, which did much damage. The *Berkeley* galley, commanded by Captain Steward, bound for Cape Breton, with several families going to settle there, was overset between Fiarlee and Beech, on the coast of Kent, *England*, and all but three perished. Letters from Tunbridge relates that the tempest blew down several elms, and the lightning rived [tore apart violently] into splinters 4 oaks, and that for 15 minutes there was a continuous thunder without intermission and a continual storm of hail, rain and flame [lightning]. Several sheep were killed, and one man and two horses were struck dead near Boughton-Green fair [*England*]. The man had his fingers and his toenails, and the skin of his legs stripped off, whence issued a sulphurous scent.<sup>289</sup>

On 24 June 1746 in *England*, there was a hailstorm in Kent.<sup>93</sup>

On 24 June 1746, a violent gale with thunderstorm struck Kent, *England*. The gale caused much damage.<sup>212</sup>

On 18 July 1746, it was the hottest day [of the year] in London, *England*. The temperature reached  $85^{\circ}\text{F}$  [ $29^{\circ}\text{C}$ ] in the shade. The next day the temperature was  $77.5^{\circ}\text{F}$  [ $25^{\circ}\text{C}$ ].<sup>212, 296</sup>

In 1746, the price of wheat [in *England*] averaged 20 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

In 1746, the cattle plague struck Cottenham in Cambridgeshire, *England*. In 1746 and 1747, 1,200 cattle perished. The disease spread in *England*. It August, it broke out again in London.<sup>212</sup>

In 1746, a hurricane struck the Gulf coast of the *United States*.<sup>117</sup>

In 1746, a hurricane struck the *Caribbean Sea*. Thirteen out of twenty-one ships on their way from Brazil to Lisbon, Portugal "disappeared without a trace" in a hurricane.<sup>141</sup>

On 2 October 1746, a typhoon struck along the coast of *India*. The French squadron, commanded by Le Bourdonnai, being at anchor in Madras Roads [now near Chennai], a hurricane came on, which in a few hours destroyed nearly the whole of the fleet, together with twenty other ships belonging to different

nations. One of the French ships foundered in an instant, and only six of the crew were saved.<sup>191</sup>

In October 1746, a violent earthquake struck Lima, *Peru*. It lasted for about 3 minutes. Fifteen hundred souls were lost, 4 churches, 14 monasteries, and 15 hospitals, besides some thousands of houses were buried in the ruins. The jewels and vessels of gold and silver lost amount, it is said to 300 million piasters [coin - piece of eight]. The town of Callao, a seaport within two leagues [6 miles, 10 kilometers] of that city was swallowed up by the sea [a tsunami], and the hurricane was so violent, that several vessels, which rode at anchor, were afterwards found on dry land several leagues up the country. The sea has filled up the place where the town stood, which was the best port in *Peru*, and all the inhabitants between 6,000 and 7,000 perished, except about 200 sailors and fishermen, who were thrown upon land with their vessels. The loss of the king of Spain is irreparable, both in regard to the settlement, and the vast treasure laid up there during the war, which was not to be brought to Europe till after a peace. (Lima has been twice before almost destroyed by earthquakes, first in 1586, and last in October 1687. The latter of these shocks was so dreadful, the *Wafer*, who felt it 150 leagues [450 miles, 724 kilometers] at sea, affirms, that it frightened the whole ship's company, who thought they had struck upon a rock, and was convinced of the contrary only by sounding. The water was mixed with sand, though no bottom could be found; and the ships on the coast were driven some leagues over the land, as in this last earthquake. The city was built by Pizarro, the conqueror of Peru, in 1534. It stood 12° 30' S.L. [south latitude] was surrounded with a wall, fortified with bastions, and very populous. The plain around it is fruitful in corn, wine, oil, sugar, flax, and fruits. It was about four miles in length, and near two in breadth; had a square, with piazzas in the center, where all the principal streets were terminated, and the palaces of the viceroy and the archbishop, with all the public offices, were situated.)<sup>293</sup>

In 1746 during the period between 19 June and 14 September, a drought engulfed Kiangsi (now Jiangxi province) in southern *China* at Yü-tu.<sup>153</sup>

[Although this is cited as 1745, it is out of chronological order and these entries appear to belong within the year 1746.] In 1745, floods struck several regions of *China* including:<sup>153</sup>

— During the period between 18 July and 16 August, floods struck Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Lien and Hunan province in south-central *China* at Lin-wu.

— During the period between 17 August and 14 September, floods struck Anhwei (now Anhui province) in eastern *China* at Fêng-yang, Ying-shang and Po.

— During the period between 13 November and 11 December, floods struck Hupeh (now Hubei province) in central *China* at Chiang-ling and Ch'ien-chiang. At Chiang-ling, the dikes were damaged.

— During the period between 12 December and 10 January, floods struck Shantung (now Shandong province) on the east coast of *China* at Chi-mo.

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

March 27<sup>th</sup> – a sweet pleasant day. April 11<sup>th</sup> – Jack dug the upper garden. April 12<sup>th</sup> – the spring is uncommonly forward. April 18<sup>th</sup> – I sowed peas, carrots, etc. April 29<sup>th</sup> – the most part of the week has been as dry as midsummer. May 4<sup>th</sup> – the creatures were let on the Neck. June 9<sup>th</sup> – a fine growing season. June 26<sup>th</sup> – the weather turned very dry. July 9<sup>th</sup> – a melancholy drought advances. July 31<sup>st</sup> – there was a little rain this morning, but the ground is exceeding dry. August 15<sup>th</sup> – it is thought the present is the greatest drought that ever was in New England. August 24<sup>th</sup> – plentiful showers. August 29<sup>th</sup> – it rained like a flood. September 29<sup>th</sup> – an unusual, moderate growing season. October 5<sup>th</sup> – it was like springtime; the grass grew surprisingly. Pleasant weather the latter part of the month. November 25<sup>th</sup> – Indian corn 25s. a bushel. November 30<sup>th</sup> – hay at Boston £20. December 1<sup>st</sup> – very pleasant day.<sup>78</sup>

The maximum temperature during the summer at Mahon, *Island of Minorca*, was 86.9° F (30.5° C).<sup>62</sup>  
[The Island of Minorca is one of the Balearic Islands off the southeastern coast of Spain in the Mediterranean Sea]

---

**Winter of 1746 / 1747 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: In 1746 on December 15<sup>th</sup> – severely cold. In 1747 on January 12<sup>th</sup> – our whole bay froze over entirely.<sup>78</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

Governor Glen of South Carolina in the *United States*, in a pamphlet published in London in 1761, says "that on the 7<sup>th</sup> of February 1747, the temperature at Charleston was as low as 10° [F] at 8 o'clock in the morning, and had been lower during the night; that all bearing orange trees were killed to the ground, and even an olive tree eighteen inches in diameter."<sup>115</sup>

A frost in South Carolina in the *United States* on 7 February 1747 killed almost all the orange trees in the country.<sup>174</sup>

---

**1747 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: January 19<sup>th</sup> – moderate weather. February 28<sup>th</sup> – since the 7<sup>th</sup>, the weather was pleasant and moderate. March 31<sup>st</sup> – there were no high winds this month or lion-like days; the month was more like April. We had our upper garden dug. April 3<sup>rd</sup> – it is thought the spring is full month forwarder than usual. April 9<sup>th</sup> – the grass grows wonderfully. April 16<sup>th</sup> – English beans and peas came up in our garden. April 30<sup>th</sup> – the latter part of this month had been pretty raw, cold and wet, and the grass no forwarder than in the beginning of April. May 24<sup>th</sup> – the earth had a fine green face. June 30<sup>th</sup> – everything is wonderfully flourishing. July 10<sup>th</sup> – mowed some of my hay. July 20<sup>th</sup> – mowers exceeding scarce. September 29<sup>th</sup> – there has been no fall like this, so moderate and dry; my potato tops look more green and flourishing than at any time this year. October 28<sup>th</sup> – the fall was dry; no water at the mills, or grinding.<sup>78</sup>

On 3 June 1747, a very violent thunderstorm struck Midhurst in Sussex, *England*. A bridge was washed away.<sup>212</sup>

In 1747, there was a flood in London, *England*. The River Thames was very high.<sup>212</sup>

On 3 June 1747, a violent storm of thunder and rain struck Arun at Midhurst in Suffex, *England*. A bridge was carried away and the church and churchyard was overflowed with water some feet deep. Several sheep were drowned and a man attending them killed by lightning, as was a grocer in Arundel.<sup>293</sup>

On 8 July 1747, a violent storm of thunder and lightning and a fall of hail struck Bristol, *England*. Many of the hailstones were several inches round. One in particular measured about 5 inches [13 centimeters] round. When it was put in a basin and dissolved, it yielded nearly a quarter pint of water. Several shocks of an earthquake, attended with a considerable noise, and succeeded by claps of thunder, were felt in different parts of Devonshire.<sup>293</sup> [The thunder was so strong that it made the ground shake.]

On 8 July 1747, thunderstorm with violent rain and hail struck Bristol, *England*. The hailstones were 2-3 inches [5-8 centimeters] in circumference.<sup>212</sup>

On 8 July 1747 in *England*, there was a great hailstorm in Gloucestershire and Somersetshire.<sup>93</sup>

On 11 July 1747, a violent thunderstorm struck Bridgewater in Sussex, *England*. The storm split trees and damaged corn [grain].<sup>212</sup>

On 12 July 1747, a violent storm of thunder and lightning, with rain struck Bridgewater in Sussex, *England*. It split trees, damaged corn [grain] and killed Mr. Best, a farmer.<sup>293</sup>

In 1747, the price of wheat [in *England*] averaged 28 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

In 1747, there was a drought in *Scotland*. The autumn was hot and dry. The rivers were lower than ever known.<sup>212</sup>

In 1747, the cattle plague struck Nottinghamshire and Leicestershire, *England*. In those two counties 40,000 cattle died. In Cheshire 30,000 died in six months. In this visitation of the plague throughout *Europe*, 3 million cows died. In May, the cattle plague was very violent throughout *England*. Eighty thousand cattle were slaughtered and 150,000 died of this plague in *England*.<sup>212</sup>

In 1747, several regions of *China* experienced flooding.<sup>153</sup>

During the period of 8 June – 7 July, the following areas were affected:

— Shansi (now Shanxi province) in northern *China* at Yang-ch'êng, Ying, Hun-yüan and Tatung experienced flooding.

During the period of 6 August – 4 September, the following areas were affected:

— Chekiang (now Zhejiang province) on the east coast of *China* at Hai-ning and Chên-hai experienced flooding. At Chên-hai, the city walls were damaged.

— Kiangsu (now Jiangsu province) on the east coast of *China* at Soochow, Ch'ang-shou, K'un-shan and T'ai experienced flooding. At Soochow, there was a typhoon. At Ch'ang-shou, over 74,600 acres of land and 22,490 house-sections were damaged. Over 50 persons were drowned. At K'un-shan, innumerable people were drowned. At T'ai, there was a typhoon and many people drowned.

— Hupeh (now Hubei province) in central *China* at Tsao-yang experienced flooding.

— Shantung (now Shandong province) on the east coast of *China* at Chi-yang, Tê-p'ing, P'ing-yüan, Chan-hua, Tzū-yang, Chi-ning, Chia-hsing, T'an-ch'êng, Chü, Mêng-yin, Jih-chao, and Lin-i experienced flooding. [Lin-i is located at 118.24 E. longitude, 35.07 N. latitude.]

— Hopei (now Hebei province) in northern *China* at Ch'ih-ch'êng experience flooding. [There is some uncertainty on the city location because the original text described it as Tung-ch'ih-ch'êng.]

In 1747 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Chi-mo and P'ing-tu. During the period between 6 May and 8 August, a drought engulfed Shantung province at Wên-têng. During the period between 8 August and 8 November, a drought engulfed Shantung province at Kao-mi and Shansi (now Shanxi province) in northern *China* at An-i and Yüan-ch'ü.<sup>153</sup>

In 1747 during the 6<sup>th</sup> moon, snow fell [during summer] in the vicinity of Shanghai, *China*.<sup>166</sup>

On 15 September 1747, the Barbados and Leeward Island fleet, consisting of 86 sails [sailing ships] met a violent storm in the *Atlantic Ocean* at North latitude 38°, about 150 leagues [450 miles, 724 kilometers] from Bermuda. Her Majesty's ship *Lyme* of 20 guns was overset and all her crew except four perished. The *William and Anne*, Capt. Wraton; the *Catherine*, Capt. Debuke; the *Unicorn*, Capt. Armstrong; the *John and Martha*, Capt. Bosewell; the *Scroop*, Capt. Rasbury, for London; and the *Polly*, Capt. Gregg, for Liverpool, all from St. Kitts, foundered but the crews were saved. The *Hornet*, Capt. Gardiner, from Barbados for Liverpool, and a ship from Falmouth foundered, and only one man, which belonged to the latter, was saved.<sup>293</sup>

Two violent hurricanes on 21 September and 24 October 1747 did great damage among the *Leeward Islands*. Fourteen sails [sailing ships] were lost at St. Kitts and thirty-six at the other islands.<sup>143</sup>

On 26 September 1747, a hurricane struck the central *Atlantic Ocean*. The Fleet from Barbados on the 15<sup>th</sup> met a violent storm in Latitude 39° North, in which the *Lyme* 20-Gun Man-of-War overset

[overturned] and all the crew except four perished. The *Homer* from Barbados for Liverpool, and a ship for Falmouth, foundered at the same time, and only one man was saved.<sup>141</sup>

On 31 December 1747, it was reported that two violent hurricanes on 21 September and 24 October last, have done vast damage among the leeward islands of *Montserrat*, *Nevis*, *St. Kitts*, and *Antigua*. Fourteen ships were lost at *St. Kitts* in the last storm. Those ships were bound for London and most of them fully loaded with sugar. The loss of all sorts of ships are reckoned above 50.<sup>293</sup>

On 1 December 1747, a violent storm struck *England*. In London, the storm blew down trees in St. James's Park and upset boats in the River Thames by which several persons drowned. The storm did a great deal of damage to the shipping on the coasts of *England* and Holland [now *the Netherlands*]. Nine English ships were lost, and many forced on shore, among them the *Nympha*, a very rich prize, taken by the Royal Family privateers, at Beachy Head; but the gold on board her, with other valuable effects were saved. Multitudes flocked to the wreck for plunder and several perished with the cold on the shore. And on their way homeward, many more were taken up as if dead but recovered by warm beds. A woman was found dead with two children crying by her. But the plundering was soon stopped. Mr. Belchier, member for Southwark and part owner, on the first news of this shipwreck, going down with a warrant from the secretary of war, for all soldiers on the coast to assist him, he met about 12 smugglers, with their loading, which they abandoned at sight of the soldiers. But on the next day, they returned in great numbers to retake it, on which, the soldiers firing, killed 2 and dispersed the rest. The *Portsmouth* storeship, laden with naval stores for the fleet in the Mediterranean, to a very great value, was sunk in 18-foot water. She had on board also Rear Admiral Forbe's baggage. Many ships were also cast away on the coasts of *Zealand*, *Denmark* and in the *Texel* in *the Netherlands* among them were lost two Dutch privateers, just fitted, with all their men. Vast damage was also done at land and the sea ran so high at Rotterdam in *the Netherlands*, as to top two stories of many houses. The hurricane extended to Brussels, *Belgium*, where it blew down the palisades and tumbled the [guard] sentries with their boxes into the ditch. The Rhine [River] carried away the bridge at Cologne, *Germany* with carts, wagons and 100 people upon it.<sup>293</sup>

In 1747, the people of *France* have suffered great distress on account of the scarcity of bread.<sup>294</sup>

---

**Winter of 1747 / 1748 A.D.** In 1747, the winter was recorded as being intensely cold throughout *Europe*.<sup>1</sup>

In December 1747, the barometer went down 36 millimeters in less than two days. Strong winds from the south and southwest dominated Paris, *France* around the same month.<sup>79</sup>

The winter of 1747 was very severe in *Russia*.<sup>2, 40, 41, 43</sup>

On the morning of 13 January 1748, the Seine River in *France* began to ice up. On the 15<sup>th</sup>, the river was completely frozen. On 7 March, the ice drove home.<sup>62</sup>

The winter of 1748 was long and pretty hard. The Seine River in *France* was on 15 January was completely frozen over. On 7 March drove on strong ice. The late cold in March delayed the fieldwork.<sup>62</sup>

In 1748 the cold of winter reached 14° F (-10° C) in January in the region of olive groves in southern *France*. Many of these trees died.<sup>79</sup>

At Tholouse [Toulouse, *France*], the temperature fell to 14.9° F [-9.5° C] on 14 & 15 January 1748.<sup>295</sup>

On 1 December 1747, the temperature at Tooting in south London, *England* fell to 0° F [-18° C]. The

snow was 5 inches [13 centimeters] deep. From 29 December to 10 January 1748, there was a hard frost in London. On 3 January, it snowed at Nottingham. On 29 January, multitudes of sheep were lost under the snow in Derbyshire and Southdowns of Sussex. January was an excessively cold month. From 15-26 February, the weather was cold in London, especially on the 15<sup>th</sup> and 16<sup>th</sup>.<sup>212</sup>

During the winter of 1747-48 in New England in what was to become the *United States*, snow whirled above deep drifts around half buried houses. There were around 30 snowstorms and they came storm after storm until the snow lay four to five feet [1.2-1.5 meters] deep on the level. On 22 February 1748, snow measured 4½ feet [1.4 meters] deep in the woods and on the 29<sup>th</sup>; no one would travel unless they were wearing snowshoes.<sup>199</sup>

In February 1748, several people have been found dead this month [in *England*] due to the excessive cold. Multitudes of sheep in Derbyshire, the south downs of Sussex, and other parts have been lost under deep snow.<sup>294</sup>

In Central and Southeastern Illinois in the *United States*, the winter of 1830-31 produced great snowstorms. According to the oral history kept by the Indians, approximately 75 years earlier, there was another great winter. There was a snowfall, which swept away [exterminated] the immense herds of buffalo and elk that then roamed over these prairies. This history was verified by the vast quantity of buffalo and elk bones found on the prairies in different locations when first visited by white men. [This might have been the severest winter to strike the American Midwest in the past 500 years. The exact date of this winter is unknown. It might line up with several great winters in the New England states about this approximate timeframe. They were the winters of 1740-41, 1747-1748, 1757-1758, and 1761-62.]<sup>245</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1747 on December 24<sup>th</sup> – the snow, though settled considerably, was a full three-feet (0.9 meters) deep. December 30<sup>th</sup> – this was a very unpleasant month. January, 1748 – a cold, snowy month. February – a cold, snowy, uncomfortable month. February 11<sup>th</sup> – there is a surprising body of snow upon the ground. [There was a great depth of snow in February and it was difficult to travel. Sometimes travel was limited to snowshoes.] March 1<sup>st</sup> – comes in smiling; the rest of the month, generally cold and snowy. April 1<sup>st</sup> – comes in joyfully. April 8<sup>th</sup> – the snow is all gone, except in a few drifts. April 23 – the earth looks beautifully green. May 15<sup>th</sup> – unusually hot, dry weather. May 20<sup>th</sup> – it was about seven weeks since there were 5½ feet (1.7 meters) of snow on the ground.<sup>78</sup>

---

**1748 A.D.** On 25 January, the River Teviot [or Teviot Water in *Scotland*] (2 miles before it joins the Tweed) became dry for 9 hours. It left the fish on dry ground. On 20 February, the rivers Sark [or Sark Water] and Liddall [Liddel Water] stopped their current, and the shallows became dry. This happened on the River Sark near Philipston and at the River Liddell [Liddel Water] near Penton [in *Scotland*]. The River Eske and the River Line [Lyne] were both dry on the 25<sup>th</sup>. This occurred at Longtown [on the English/Scottish border] and Longholm [Langholm, *Scotland*] on the River Eske and near Westlinton [West Linton, *Scotland*] on the River Line [Lyne]. The river Kirtle [Kirtle Water] was dry on the 17<sup>th</sup>, near Springhall, *Scotland*.<sup>212</sup>

In *Scotland* and *Ireland*, in 1748, several rivers temporarily dried up. On 25 January, the River Teviot, for two miles before it joins the Tweed, stopped its current, and its channel became dry, leaving fishes, &c. on dry ground, many of which were taken up by the country people, and sold at Langtown [Longtown] and other places. It continued in this condition for the space of nine hours, and when it began to resume its course, it began gradually, till it ran as usual again; but in no greater quantity from its stopping, as might be expected. How to account for this phenomenon we know not; for there are no mines of any sort, or any other cavities in the whole country; and if the waters had been stopped by any rising of that part of the ground by an earthquake, they would have been heaping up in such quantities, in a minute's time, that upon the ground's descending, the whole country must have been overflowed. On

19 February, the River Kirtle [Kirtle Water] was dry for six hours, leaving fishes, &c. at the bottom. This alarmed the whole country, insomuch that Sir William Maxwell, who lives within 500 yards [457 meters] of it, and many rode with him along the banks of the river, and saw it dry for 7 miles [11 kilometers], but could not find out the cause of the water's stopping. And on 23 February, the River Eske itself stopped its course, and the channel was quite dry (except some deep holes, where the water could not get out) for the space of six hours, to the admiration of the whole country; the more so, because this large river is as rapid as most in England.<sup>294</sup>

In February 1748, it was noted that the severity of the weather has kept the troops inactive in *the Netherlands*. Marshal Lowendahl forces were at Sas van Ghent to descend upon Zealand.<sup>294</sup>

In Bergen, *the Netherlands* in March 1748, provisions were very scarce. Bread was 8 *d.* per pound and fresh meat was 12 or 14. An egg was 6 *d.*, and that very often that was the price before it was laid. The inhabitants lived on roots, and whatever vegetables they could pick up in the fields.<sup>294</sup>

In April 1748, the French laid siege to the Hague, *the Netherlands*. It is said that they lost nearly 10,000 troops through the inclemency of the weather, inundations in the camp, and want of necessaries [food], besides those killed by [gun] fire from the besieged. "The weather's bad; the ground is damp; which makes a sickness in the camp: Their men want bread; their horses hay."<sup>294</sup>

In May 1748, the joy was much increased in Bourdeaux [Bordeaux], *France* when 30 English ships laden with wheat arrived. Bread at the time cost 12 sols per pound and at the arrival of the ships it dropped down to 3 sols.<sup>294</sup> [A sol is an ancient coin valued at 12 deniers. It roughly has the buying power of a Euro today.]

On 18 May 1748, a most violent storm struck Joigny in Champagne, *France*. Houses, gardens, vineyards, &c. were destroyed to the value of 2 million livres.<sup>294</sup>

In 1748, there was a famine in *Britain*.<sup>212</sup>

In *England* in 1748, there was an extended famine.<sup>57, 90, 91</sup>

In 1748, the cattle plague continued in *England*. Seven thousand cattle were killed per month. In June, the plague was very violent in Yorkshire. On 22 September, it again broke out at Burton-on-Trent, Camberwell, and in Buckinghamshire.<sup>212</sup>

On 11 June 1748, a severe thunderstorm struck Sussex, *England*. The next day [12 June] another thunderstorm struck Streatham in Surrey. Two houses were struck [by the lightning]. The preceding day had been very hot. At Springfield, near Chelmsford, the storm was very violent and produced hail. At Addington Place in Surrey, the hailstones were 7 inches [18 centimeters] in circumference. These hailstones rebounded 2 feet [61 centimeters] from the ground when they struck. Great damage was done to windows and gardens. At Warwick and between Scarborough and Malton, the storm was very destructive. Ailsbury church steeple was nearly destroyed. In Reading, the hail was broken ice in flat pieces 2 inches [5 centimeters] across. At Paris, *France*, there was very great heat followed by a terrific hailstorm.<sup>212</sup>

On 11 June 1748, in *England*, an individual reported that the day was very hot and sultry. In the morning the temperature was 78° F [25.6° C], and at noon 80° F [26.7° C], and during the evening it was 78° F [25.6° C]. "This was as great a heat as any where between the tropics. The marble chimney-pieces below stairs were all so wet, that they ran with water, and the stone pavement in the hall was as if wash'd: my key rusted in my pocket." The wind in the morning was east, about noon south and southwest, then

threatened rain, but none fell. The next day, Sunday, it rained hard, with much thunder and lightning; and great damage was done. At Springfield in Essex, a person was killed, and some others much hurt.<sup>294</sup>

On Sunday, 12 June 1748, a violent thunder and lightning storm with hail in some places struck *England*. At Springfield near Chelmsford, a lad was killed by the lightning in a church during divine service. A waterman on the river [a river worker who transferred passengers across and along the city rivers] lost the sight of an eye by the flash. At Streatham in Surrey, the lightning singed the hair off a boy's head, without hurt, and the painting off a landscape over a chimney-piece, and the gold off the frame, but did no further mischief. At Addington Place in Surrey, there fell hail 7 inches [18 centimeters] in circumference, rebounding 2 feet [0.6 meters] from the ground. This hailstorm did much damage to the gardens and windows. The day before a grazier riding to Boroughbridge-fair was struck dead with his horse by the lightning. A person also at Ferrybridge, and another with his horse in the East Riding of Yorkshire, had the same fate on Sunday. At Fullbrook Park, near Warwick, a flash set on fire and burnt the house, barn, stables and ricks, and singed the master's hair as he sat in the house. By the same tempest the steeple at Ailsbury was so damaged that it must be taken down and rebuilt. Near Reading was a storm of broken ice, in flat pieces, about 2 inches [5 centimeters] broad. In the morning of the 12<sup>th</sup>, the greatest storm of thunder and lightning also struck between Scarborough and Malton. One traveler was killed instantly from a lightning strike and his companion who was 3 yards [2.7 meters] away was also struck. The companion suffered the loss of sight in his left eye and the loss of speech for 8 hours. The heat at Paris, *France* was so great that same day as to confine the people within doors, and was followed by a terrible storm of hail. It was also very hot in *England* at the same time.<sup>294</sup>

On 12 June 1748 in *England*, there was a great hailstorm in Berkshire and Surrey.<sup>93</sup>

At Tholouse [Toulouse, *France*], the temperature rose to 95.9° F [35.5° C] on 25 June 1748.<sup>295</sup>

On 27 June 1748 about sunset, a terrible storm of rain, thunder and lightning struck Crawford, *Scotland*. Thomas Brown in Comphead, had his eldest son, about 20, and 320 ewes [female sheep] all killed at one time. The ground 50 yards [46 meters] in length and 20 [18 meters] in breadth was covered over with dead sheep, and some were lying above one another in the strangest confusion imaginable. The young man who lost his life was standing about 40 yards [37 meters] from the flock of sheep, and, his brother close by his side, who was so stunned that for a long time he did not recover. When he did, he found his brother breathing his last [breath] at a distance, a dismal smook [smoke] arising from among the sheep, and a most strong smell of sulfur. The young man's body was entire, only some blue spots on his skin. The sheep also were without wounds or broken bones. Only their bellies could be seen covered in blisters, out of which issued bluish water. Yet there was no breach on the ground, not a grass pile broken, nor were the fleeces of the cattle [sheep] in the least singed.<sup>294</sup>

On 27 June 1748, there was a terrible thunderstorm at Crawford [Crawford, *Scotland*]. A flash of lightning killed 320 ewes [female sheep], killed lying 59 yards [54 meters] in length and 20 [yards] [18 meters] in breadth, and also a man 40 yards [36 meters] off.<sup>212</sup>

In June 1748, there was a plague of insects at Norwich, Shropshire, and Staffordshire, *England*. They destroyed the leaves and fruit. The orchards and oak trees were as bare of leaves as at Christmas. On 4 & 5 August, great swarms of locust invaded the streets of London. They consumed the vegetables. They were 3 times the size of grasshoppers.<sup>212</sup>

There was a heat wave during the summer of 1748 in London, *England*. On 21 July, the temperature reached 77.2° F [25° C]. On 22 July, it peaked at 78° F [26° C]. Then on 23 July, the temperature peaked at 85° F [29° C].<sup>212</sup>

The summer of 1748 in Denainvilliers, *France* was characterized by:

Hot days           48 days

Very hot days    4 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:

Quebec, *Canada*                   ( 99.5° F, 37.5° C) in July

Paris, *France*                       ( 98.4° F, 36.9° C) on 23 June

Toulouse, *France*                 ( 95.7° F, 35.4° C)

Denainvilliers, *France*           ( 92.8° F, 33.8° C) on 23 June

The cereal harvest in the area of Orleans in north-central *France* did not exceed half a normal crop, and the quality of the grain was mediocre, and the oats was missing in part. The year produced little fruit. In Burgundy, the harvest began on 25 September, its yield was weak, but of good quality.<sup>62</sup>

In July 1748 it was reported that a swarm of locust lately fell near Bristol, *England*, much resembling those that fell sometime ago [22 August 1747] in Transylvania [now central *Romania*] and now ravage that country. A sort of locust also had done great damage in Shropshire and Staffordshire, by eating the blossoms of the apple and crab-trees, but especially the leaves of oaks, which look as bare as at Christmas. The rooks [a type of crow] devour these locusts in prodigious numbers.<sup>294</sup>

There were several large fires reported in June and July 1748 [which may have been related to the weather]. The city of Moscow, *Russia* burned on 1-4 June destroying 32 churches, 1924 house, 13 hospitals, 14 breweries, 5 baths, 12 taverns, and 482 people lost their lives. Fires happened at the same time in Jaroslaw [Yaroslavl, *Russia*] and Veronitz [about 100 miles north of the River Don in *Russia*]. The city of Vilna in *Lithuania* was burned destroying 12 churches, 4 convents and 2364 houses, and 313 persons perished. On 26 June, a fire broke out in the palace of Aranjuez, in *Spain* and consumed a great part of it. It was so sudden that the king, queen and infant don Lewis, and the infantas [sons of a Spanish king other than the heir of the throne] with great difficulty escaped the flames.<sup>294</sup>

On 23 July 1748 at Curdisso in Glamorganshire, *Wales* there was a terrible shower of hail and rain, accompanied with thunder and lightning, as can be remembered by any man, there being scarce a house or cellar that was not filled with rain, and very few windows that escaped being broke or cracked by the hailstones. Some hailstones were two inches and a quarter [6 centimeters] round. It was remarkable that there was no wind.<sup>294</sup>

Around 23 July 1748 on the edge of Cheshire and Derbyshire, *England*, there was the greatest flood ever known. The River Goit [Goyt] overflowed, and carried all the bridges, mills, and several houses away, besides washing out of their graves, at Hawfield churchyard, 14 bodies, which were found hanging upon hedges some miles from the church. Two maiden sisters were carried away from their door and drowned, and immense damage was done to the hay, corn, &c.<sup>294</sup>

Another account reports “At Meller in the north west part of Derbyshire [*England*] on Saturday the 23<sup>rd</sup> of July last [1748] there was a very great storm of rain, attended with constant lightning and thunder, and some hail, several stones of which were measured to two inches [5 centimeters] in circumference, and were of a flat irregular form. The hail lasted but a short time, but the rain, thunder and lightning, four hours, with very little intermission. The brooks in that neighbourhood, and the river Goit [Goyt] were swell’d much higher than ever was known in the memory of man, by which several thousand pounds damage was done to the mills, bridges, houses, fences and corn; several acres of land were entirely swept away, and nothing left but the bare rock, and others were covered with large heaps of gravel. At Heyfield the church yard wall was broken down, a house adjoining to the steeple carried away, and several corpse washed out of their graves and carried to a great distance down the brook, four of which are already found. An overshot mill belonging to the D. [Duke] of Norfolk, fix’d on a small brook, which in the

summer time was frequently very near dry, was entirely destroyed (except the gable end) and all the materials carried away; the great wheel dash'd to pieces, and the shaft of a very large size carried half a mile [0.8 kilometers] down the stream; one of the mill stones was found upwards of a quarter of a mile [400 meters] from the mill, the other is not yet discovered; but what is most remarkable, the mill stood on a rock consisting of very large stones, some of them several tuns [tons] weight, with open joints two or three inches [5-8 centimeters] wide. This was tore up more than half the compass of the mill by the fall and force of the current, the rock carried away, and a pond of water upwards of three yards [2.7 meters] deep left in its room. Two poor women in Meller whose house stood very nigh to a small brook, in attempting to save an earthen vessel were drowned, being carried away by the stream; and one of them was found in the river Mersey upwards of seven miles [11 kilometers] from the place of her habitation, having all her cloaths [clothes] entirely torn off, and stript [stripped] naked of ever thing but a necklace. The river Goit [Goyt], which separates the counties of Derby and Chester swelled to the degree at the confluence of three brooks, that it covered the highest battlements of Marple bridge, upwards of 22 feet [6.7 meters] from the surface of the water when at a common height; it washed away every thing on the Derbyshire side of the bridge, except the bare arch stones, which tho' founded on a rock at each end, 'twas surprising they were left, as much bigger were torn away. The highway leading to the bridge was guarded by a good wall upwards of three hundred feet [91 meters] in length and founded on a rock nineteen feet [5.8 meters] higher than the river, the rock and wall for some roods [roads] were carried away and the road rendered impassable for any carriage. There was one stone torn away from the rock and carried several roods [rods] down the river that contained 169 cubic feet [4.8 cubic meters]. While divers [diverse] small bridges were broke down and carried away, one strangely escaped, being entirely covered with sand gravel and stone, in such a manner that there was no appearance of it, but upon removing the gravel, &c. it was found to be not at all damaged. [This storm of rain, &c. which was felt at Cardiff, in *South Wales*, extended to Yorkshire, *England* and *Scotland*.]"<sup>294</sup>

On 23 July 1748, two melancholy accidents happened in the neighborhood of Saline in Fifeshire, *Scotland*. William Reid was killed by thunder and lightning. The lady Wardlaw of Craighouse, and her man-servant, in their return from hearing sermon at Toryburn [Torryburn], was unfortunately drowned in the Cowsland Burn, overflown [overflowed] by the great fall of rain in the time of the thunder, and were carried two miles [3 kilometers] before they were found. On the same day at Easingwold in Yorkshire, *England*, they had a like storm. Once crack of thunder particularly was exceedingly terrifying. It broke just over the town, and forced its way into the house of Thomas Jackson, a tanner, tore off several splinters of shares [shards], and drove them into the thatch, and struck his wife dead below stairs, while making the cradle for her infant, who was not hurt. It tore her shoes off, and her stays [corset], and made her breast in a manner black.<sup>294</sup>

On 23 July 1748, there was a great flood at Cheshire and Derbyshire, *England*. "The greatest ever known. The River Goit overflowed and destroyed all the bridges and mills. At Hawfield, fourteen bodies were washed out of their graves."<sup>212</sup>

On 28 July 1748, there was a thunderstorm at Cardiff in Glamorganshire, *Wales*. "As terrible a shower of rain, hail, thunder, and lightning, as can be remembered by any man. Very few windows escaped the hailstones (some 2½ inches round [6 centimeters]). The houses were full of water. No wind." At Mellor in Derbyshire, *England*, there was a very great storm of thunder, lightning, rain and hail. Some of the hailstones were 2 inches [5 centimeters] in circumference. The rain lasted four hours, and the River Goit, at Marplebridge was 22 feet [6.7 meters] above the common height and a wall, 19 feet [5.8 meters] above the ordinary water level, was washed away. At Saline in Fifeshire, *Scotland*, the storm was very violent with much thunder and lightning. The Cowsland Burn overflowed. At Easingwold in Yorkshire, *England*, the storm was also very violent.<sup>212</sup>

On 28 July 1748, a tornado struck Pepperell, Massachusetts in what was to become the *United States*.<sup>199</sup>

On 23 August 1748 in *Wales*, there was a great hailstorm in Glamorganshire.<sup>93</sup>

In 1748, the price of wheat [in *England*] averaged 27 shillings per quarter [quarter ton].<sup>212</sup>

On 1 September 1748, there was a violent but short-lived thunderstorm that struck Ipswich in Suffolk, *England*.<sup>212</sup>

On 1 September 1748 between 8 and 9 o'clock, there was a short but most violent storm of thunder and lightning at Ipswich in Suffolk, *England*. It did considerable damage to St. Clement's church, and to 3 or 4 houses in different parts of the town.<sup>294</sup>

On 10 October 1748, there was a gale that struck at night with thunder, lightning, and much snow at Norfolk, *England*. Many trees were blown down.<sup>212</sup>

In 1748 during the period between 29 March and 26 April, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hangchow. During the period between 27 May and 25 June, a drought engulfed Chekiang province at Chia-hsing and Ch'ung-tê. During the period between 26 June and 24 July, a drought engulfed Shansi (now Shanxi province) in northern *China* at Jui-ch'êng and Chahar province (now eastern *Inner Mongolia*) at Huai-lai.<sup>153</sup>

In 1748 during the period between 27 May and 25 June, floods struck several regions of *China* including:<sup>153</sup>

— Shantung (now Shandong province) on the east coast of *China* at Jih-chao, Chin-hsiang, Yü-t'ai, Fan, Chi-ning, Ning-yang, Shou-kuang, Chiao and Fei-ch'êng.

— Jun-tê [possible misprint, unknown province].

— Shensi (now Shaanxi province) in central *China* at Ch'i-shan.

— Hupeh (now Hubei province) in central *China* at Ch'ien-chiang, Han-ch'uan, T'ien-mên, Mien-yang, Chiang-ling and Chien-li.

— Shansi (now Shanxi province) in northern *China* at Taiyuan.

Then during the period between 22 October and 20 November, floods struck Hupeh province at Yün-hsi and Fang.

In 1748 during the 7<sup>th</sup> moon in the vicinity of Shanghai, *China*, there was a storm [typhoon] of great wind. The sea overflowed, and drowned over 20,000 people.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 31<sup>st</sup> – melancholy time; all the talk is about the heat and drought—never the like [seen before]. June 2<sup>nd</sup> – exceeding raw and cold. June 14<sup>th</sup> – an epidemic cold prevails. June 20<sup>th</sup> – dry time comes on again: there were [light] showers frequently, but no rain in the country this year. July 4<sup>th</sup> – fine showers. July 10<sup>th</sup> – dying hot. It was a most melancholy dry time; the grass in the pastures was all burnt up. July 19<sup>th</sup> – a steady rain. July 31<sup>st</sup> = the lightning killed Mrs. Hicks of Westbrook and her child. Her father, Mr. Giddings was much burnt and near dead. None escaped unhurt but a little child [Joseph], which by crying brought in the people, who found Mrs. Hicks and three of her children prostrate on the hearth, and Mrs. Giddings appeared dead. August 31<sup>st</sup> – dry, dry, very dry, and very hot. September 6<sup>th</sup> – reviving rains. September 24<sup>th</sup> – a white frost. September 29<sup>th</sup> – wonderful, hot summer day; the grass grows as fast as ever I saw it. October 2<sup>nd</sup> – we dug our potatoes; no appearance of moisture in the ground.<sup>78</sup>

---

**Winter of 1748 / 1749 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1748 on October 10<sup>th</sup> – the ground froze hard this morning. November 22<sup>nd</sup> – a moderate fall day. December – generally pleasant. December 30<sup>th</sup> – severe snowstorm. December 31<sup>st</sup> – cold, and the year ends stingingly. In

1749 on January 3<sup>rd</sup> – a very cold month. The river froze over on the 3<sup>rd</sup> day, and was still frozen on the 19<sup>th</sup>. February – a cold month. March 11<sup>th</sup> – an uncommon springlike day, but most of March was very cold. March 30<sup>th</sup> – snow gone.<sup>78</sup>

On 10 October 1748 at night, much snow fell at Norfolk, *England* accompanied with high winds, thunder and lightning, by which the steeple at Westwick was beaten down. Several trees were split and many blown down by the wind. The horses of the Wells carrier took fright at the lightning, and overturned the cart, by which a man in it was killed.<sup>294</sup>

From 11-14 November 1748, there was a severe frost in London, *England*.<sup>212</sup>

The winter of 1749 was severe in *Switzerland* and in Friesland (*the Netherlands*). In *France*, the weather remained nearly constant fairly mild.<sup>62</sup>

On 16 December 1748, a storm of wind did considerable damage to the small craft and boats on the River Thames [in London, *England*] and some watermen were drowned. On land, some houses and stacks of chimneys were blown down by which several persons were dangerously wounded. At Ramsgate, a fisherman, his two sons, and his [?] were lost in their smack [traditional fishing boat]. The storm did great damage in and near the Downs. The *John and James*, Captain Grant; the *Hawk*, Captain Edwards from London to Bristol; and the *St. George*, Captain Johnson, were lost. The *Bennet*, Captain Lesly, for Marseilles, the *Pretty Betsy*, for the Straits (which since got off); the *Delight*, Captain Bailey, and the *Stubbs*, Captain Eliot, for Marseilles, drove ashore at Ramsgate and Sandwich Flats. A Dutch East-Indiaman, with two Lisbon traders, drove ashore at Dungeness (the first got off). The *Stephen and Sarah*, Captain Clinch; the *Margaret and Anne*, Captain Butler, from London to Marseilles; the vessels of Anthony Bayle, and Roger Bayle, damaged. The brigantine, *Stephen and Sarah*, on shore at Margate, and three others (which were since got off) the people saved. The transports with the forces from Williamstadt, which had been embarked above a month, and suffered very much, met with the storm soon after they set forth, and were in great danger; particularly one with some troops of horse, in which by keeping the hatches close all the horses were suffocated, except 4, which they killed and threw overboard with the rest. Many horses were lost in the others, but the ships all got safe into different harbors. At the time of the storm there were nearly 100 sailing ships in the Downs.<sup>294</sup>

Great damage was done in *Great Britain* in January 1749 by high winds and floods and many lives were lost. The *Wolf* sloop of war was shipwrecked on the coast of *Ireland*. Captain Veachel, with 90 of his men, his wife and his sister-in-law, were drowned and not an officer saved but the gunner. The *Neptune*, Captain Whittle, from Chester to Dublin, with near 100 passengers, was cast away, and all perished. The *Hope*, from Curasao [Curaçao] to Amsterdam, 30 guns, and 100 men, worth above 100,000 *l.* was lost on the 16<sup>th</sup> of January off Weymouth in Dorset, *England*. At Shepperton in Surrey, *England*, by the high winds and floods, the ferryboat for passing the River Thames, was sunk, with a wagon and 5 passengers in it. The people were saved but the 5 horses drowned. The temporary bridge at Walton was also very much damaged. At Barnstaple in Devon, the tide overflowed many houses. At Appledore, not far thence, the floods washed away a whole street and drowned many inhabitants. At Folkstone, in Kent, on the 11<sup>th</sup>, the wind strong at southwest and a spring tide attended with an extraordinary swell (the tide running with the wind), the surge of the sea carried away almost all the beach from before the town and did but little more damage. On the 12<sup>th</sup>, the tide washed away part of a house, at the south head of the town, and smashed the boats. His Majesty's watch-house was in so much danger that the officers quitted it. When the tide abated, the beach was carried clean away, almost knee-deep all along the town. Goods were washed out of the houses, as coppers, barrels, tubs, wearing cloaths [clothes], &c.<sup>295</sup>

From 10 to 13 January 1749, the cold was so severe in and about Petersburg [Saint Petersburg, *Russia*], that de Lisle's thermometer sunk to 206 degrees [206°D, -35° F, -37° C]. Over 100 people were found

dead in the streets. The last division of the guards and the retinue of the ambassador from Vienna, *Austria* were forced to stop on their march for Moscow, *Russia*. Several perished on the road, some having their noses and ears, others their hands and feet frozen, and others deprived of speech. In several villages of the northern provinces, all the inhabitants and beast were frozen, and even bakers in the bake houses. Other accounts from Petersburg say, that after a thaw accompanied by southern and western winds, the wind of 23 December, turned to the north-northeast, and two clouds like rainbows, a sure sign of extreme cold in these climates, appeared. [The prismatic color effects of a cloud of diamond dust?] On 25 December, the thermometer exposed to the air sunk to 18.5 degrees below the zero mark [-18.5° C, -1.3° F]. On the 26<sup>th</sup> and 27<sup>th</sup> it was -20° C [-4° F]. On the 29<sup>th</sup> at 7 p.m. it fell to -30° C [-22° F]. On the 30<sup>th</sup> of December it was -28° C [-18.4° F]. On the 31<sup>st</sup>, it was -27° C [-16.6° F]. In Lapland, and other northern provinces of *Sweden*, numbers [of people] perished. The works in *Finland* were suspended. Bears and wolves were forced [by the cold] from their retreats, and did much mischief [destruction] in the country villages. Perhaps it is by guarding against the severe cold, that so many destructive fires happened in these countries. On the 7<sup>th</sup> [of January] the Russian Marine Hospital at Cronstadt [Kronstadt], a wooden structure, together with many stores, and several of the patients were consumed by fire.<sup>295</sup>

On 7 February 1749, about 4 o'clock in the morning, a violent storm blew such a vast amount of snow from the top of Mount Romond in Swisserland [Mount Romont in *Switzerland*] onto a village nearby completely covering it. Fifty-four houses and 28 people were buried in the snow. Eight were dug out alive, and 17 dead. The others are not found. About 50 cows and 200 calves, sheep and goats also perished.<sup>295</sup>

In May 1749, some frost did prodigious damages to the gardeners about London, *England*. The walnut trees in Hyde-Park were almost killed. On 3 June, snow lay on the ground till 7 o'clock in the morning, particularly near Carlisle in northwest *England*. On 15 June, there was a great snowfall on Mount Skiddow [Skiddaw] and the snow laid until 3 o'clock in the afternoon. On 16 June, ice was taken up in large pieces. Peas, &c. in the gardens were blasted, and even ferns on the heaths shriveled up. The likes of which was not remembered by the oldest man. Ice on the River at Stockport in Cheshire was strong enough to support the weight of a dog. Near that place, snow was two inches [5 centimeters] deep.<sup>295</sup>

On 24 and 25 May 1749, a most violent snowstorm struck Cromar, Badenoch, and Strathspey, *Scotland*. Eight hundred to nine hundred cattle perished. On 3 June, the snow lay till 7 a.m. at Carlisle [at the border between *England* and *Scotland*]. On 10 June, there was a sharp frost in London, *England*. "A saucer of water frozen over." On 15 June, there was a snowstorm at Skiddaw [the fourth highest mountain in *England*]. The snow lay on the ground until 3 p.m. On 16 June, there was ice in large pieces; the gardens were blasted. The like of which was not remembered by the oldest man. At Stockport, the ice on the river was strong enough to bear the weight of a dog, and snow 2 inches [5 centimeters] deep.<sup>212</sup>

On 6 June 1749, Edinburgh, *Scotland* reported, "They write from the North that the week before last was a most violent storm of snow, in the counties of Cromar, Badenoch, and Strathspey, in which between 800 and 900 black cattle perished."<sup>295</sup>

---

**1749 A.D.** On 11 January 1749, there was a lightning storm in London, *England* with "uncommon flashes". A violent gale struck Folkestone [a port located on the English Channel, in Kent in southwest *England*].<sup>212</sup>

On 16 January 1749, a violent gale struck Weymouth in Dorset, *England*. It produced severe floods.<sup>212</sup>

On 13 April 1749, a violent storm struck Bombay, *India*. It caused the loss of 3 of his Britannic Majesty's ships – the *Namur*, *Pembroke*, and *Apollo* hospital ship. It struck at St. David's road [sea road]. The following is a list of the ships and vessels lost and damaged in the storm on the Coromandel coast, the 14<sup>th</sup> of April, 1749: <sup>296</sup>

— At Colderoon near the [sea] road of Fort St. David, his Majesty's ship *Namur*, of 74 guns, foundered in nine fathom [54 feet, 16.5 meters] of water. She went out of Fort St. David road, after having taken in [?] water the 13<sup>th</sup>, at 7 p.m. Captain Marshal, her third lieutenant Mr. Gilchrist, Captain of Marines, surgeon, purser, chaplain, boatswain, and about 40 other people were saved; and also the 70 sick ashore in the hospital. The first, second, and fourth lieutenants, master, gunner, and two lieutenants of marines, in all 520 were drowned.

— His Majesty's ship *Pembroke*, of 60 guns, struck on Colderoon point, and overset, having parted her cable the 13<sup>th</sup>, at 6 p.m. She made sail out of Fort St. David road, but could not clear the point. Twelve men only were saved. Captain Fincher, and about 330 men were drowned, and all the officers except a Captain of Marines.

— Fifty swam to land from the wrecks of the *Pembroke* and the *Namur*.

— A large ship drove on shore near the point, supposed to be the *Apollo* hospital ship of 40 guns. She had onboard 350 men, and was seen near the point without mast between Cudalore [Cuddalore] and Fort St. David.

— At Cudalore [Cuddalore] and Fort St. David, the *Winchelsea*, Captain Barow, the *Lincoln*, Captain Nansan, both company ships run ashore and most of the crew saved. *Princess Augusta*, a country ship, belonging to the company, run ashore. *Fanny*, a country ship, Captain Rennie, was run ashore. A Portuguese ship from Macao run ashore, only one third unladen [unloaded]. Twenty-four brigantines, sloops and grain vessels run ashore.

— At Pondicherry Road [sea road], one French ship of 64 guns, run ashore, three men lost. Two other ships and one brigantine run ashore. The *Edgebaston*, a company ship, now at anchor near Pondicherry, without any mast, but cannot tell what further damage she has sustained; from the governor of which place, Mr. Dupleiz, she received great assistance in her distress.

— At Sadras [Sadras] Negapatnam [Nagapattinam], Portonuovo [now Parangipettai] and Puliacatt [Pulicat], two Moors and one Armenian ship lost. Four Dutch ships lost. A Dutch ship, of 50 guns, dismasted at sea, and put in after the storm was over.

— At Madras [Madras], two French ships and several grain vessels lost.

— Ships that were disabled and put into Fort St. David since the storm were: *Tartar* man-of-war, her topmasts and heads of her lower mast gone. *Deal Castle* man-of-war, main and mizzenmast gone. *Swallow* man-of-war, all her mast gone. Rhoda, company ship, all her topmasts gone. The factories on land also suffered much.

On 27 April 1749, a storm of thunder and lightning caused much damage to the Cheltenham church, and at Ewe Elm [Ewell?] in Oxfordshire, *England*. In a violent shower of rain, the earth on the plowed lands was carried away by the current, quite to the gravel, and the corn [grain] thereon entirely destroyed. In many houses, the furniture was swept away. <sup>295</sup>

On 27 April 1749, there was a violent thunderstorm with rain at Cheltenham and Oxfordshire, *England*. <sup>212</sup>

On 3 May 1749 O.S. [Old Style – Julian Calendar], Oporto [Porto, *Portugal*] reported, “Sunday last, after dinner, it began to thunder and lighten [lightning] very much, and a black cloud from the south threatened a heavy shower; a squall of wind soon came on, and it began to hail very large stones, and in less than a minute they came down as big as hens eggs, and with such impetuosity that the house-top seem'd to be beating in. The noise they made, confounded with the thunder, was as if the heavens were fighting against the earth; after the shower, which happily lasted but a few minutes, we measured hailstones of 4 and 5 inches, and some 6 inches [10-15 centimeters] in circumference; some spheroidal, others oval, and all tending to round; but a league or two to the southward, the hailstones were as big as large oranges,

and one weigh'd 3 pounds [1.4 kilograms]; they tore up the ground, cut the corn [grain] in pieces, destroyed the fruit-trees, and killed several persons.”<sup>295</sup>

On 14 May 1749 at Frewin in Lincolnshire, *England*, close to 20 sheep were struck dead by lightning, and a barn caught fire [from lightning] but the fire was extinguished by the rain. On 15 May, a storm of thunder and lightning, attended with hail and rain struck Brendon in Worcestershire, *England*. It damaged the corn [grain] in that parish valued at 200 or 300 *l*. A poor woman in the storm, either through fright or the violence of the hail, died as soon as she got home. At Brabram, a village six miles [10 kilometers] from Cambridge, on the 16<sup>th</sup> of May, the rain did great damage to the farmers, and the road. In less than an hour after the storm began, the water was up to the belly of a horse.<sup>295</sup>

On 15 May 1749, a violent storm of hail struck Derbyshire in the east Midlands of *England*. The hailstones measured 4 inches [10 centimeter] round, and did vast damage to fruit trees, pease [vegetable peas], &c. At Dunnington Park, a seat of the Earl of Huntington, it broke many windows and killed a great number of rooks. At Chesham and Amersham, and Bucks, there was a dreadful storm of thunder and lightning, with such violent rains, that both towns appeared like a sea. The water ran into houses, and half filled the cellars. At Amersham, there was a fair; the sheep pens and large pieces of beech were carried through the town by the currents. The like shower was in Cambridgeshire and Gloucestershire. And in Northumberland, the violence of the rain tore the ground two feet [0.6 meters] deep.<sup>295</sup>

On 15 May 1749 in *England*, there was a great hailstorm in Derbyshire and Worcestershire.<sup>93</sup>

In May 1749, there was a remarkable thunderstorm at Nottingham, *England* with hailstones 4 inches [10 centimeters] in circumference. On 14 May, there was a thunderstorm at Frewin in Lincolnshire. On 15 May, a hailstorm struck Nottinghamshire, Derbyshire, and Leicestershire. It caused much damage. The hailstones, or rather pieces of ice were 4 inches [10 centimeters] in circumference. At Breedon in Worcestershire, the storm of thunder and hail caused great damage to the corn [grain] crop. Also on 15 May, a hailstorm struck in Derbyshire. The stones were 4 inches [10 centimeters] round. At Dunnington Park, it broke many windows and killed many rooks. Also on 15 May, a thunderstorm struck Chesham and Amersham in Buckinghamshire. There was dreadful thunder and lightning, and such violent rains that they half filled the cellars. The storm was also violent in Cabridgeshire, Gloucestershire, Northumberland, and Richmond (Yorkshire). On 16 May, a thunderstorm struck Brabram in Cambridge. It caused great damage by floods. On 18 May, there was a flood at Riponden [Ripponden] near Halifax. The River Beck was raised 20 feet [6.1 meters], and fifteen persons were drowned, and many bridges and mills were carried away.<sup>212</sup>

On 26 May 1749 about two in the afternoon, a dreadful storm of thunder, lightning, rain and hail struck Aix la Chapelle [Aachen, *Germany*]. In only a few minutes it raised the rivers Gulp and Guele [Geul or Gueule] [These are rivers of *Belgium* and *the Netherlands*] to such a surprising height, that the village of Gulpen, situated at their confluence, and half way between this city and Maestricht [Maastricht, *the Netherlands*], was entirely destroyed, and much more damage done by it.<sup>295</sup>

On 29 May 1749 in the afternoon, Cologne, *Germany* was struck by a most dreadful storm of thunder, lightning, rain and hail that has happened in the memory of man. Within the space of half an hour, the water rose so high in all the streets, that it was impossible to go from one house to another. The violence of this storm lasted for about two hours. During that time there was a great deal of damage done. It appears that adjacent areas of the countryside were also affected because several dead bodies and a great number of cattle were brought down by the rapidity of the flood.<sup>295</sup>

On 14 June 1749, Rome, *Italy* reported, “Last Wednesday, about two hours after midnight, we had a tempest here, which threatened the return of all the elements into their first chaos. Besides lightning

[lightning] and thunder-claps, which continued without ceasing from the different points of the heavens, besides a deluge of rain, which overflowed the whole city, filling the cellars, and even many houses, and besides a terrible hail, which broke the windows and the [roof] tiles which cover'd the houses, a hurricane or tourbillion of fire and wind, beginning near the Calesio [Calascio] whe [where] it made the first ravages, extended itself along the great street which leads to Santa Maria Majora, and afterwards broke on the gardens of the house of Negroni, and on the other gardens, vineyards and buildings on each side of Porto Pia, carrying off the roofs of houses, throwing down entire walls, breaking the doors, the [door] frames and glass of windows, rooting up the largest trees, and carrying them to a great distance; in one word, leaving in every part of this city marks of its fury, which we shall long feel, and ever remember.”<sup>295</sup>

On 21 June 1749 at 3 o'clock in the morning, lightning struck Breslaw [now Wrocław, *Poland*]. The lightning struck a magazine, which stored 580 quintals [58 tons] of gunpowder. One half of the town was destroyed by the explosion. Its houses, convents, and churches are demolished and over 400 lives are lost. And where the shock was felt with less violence; windows, and roofs were shattered to pieces.<sup>295</sup>

The summer of 1749 in Denainvilliers, *France* was characterized by:

Hot days           41 days

Very hot days    1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The peak temperature occurred in Paris on 23 July at 98.4° F (36.9° C); in Toulouse at 98.4° F (36.9° C); and Denainvilliers at 92.8° F (33.8° C) on 13 July. In Burgundy, the grape harvest began on 29 September. The wine was by no means abundant, and was of medium quality. Little wheat was available in the area of Orleans, *France*, but of sufficient quality. In Burgundy, the harvest began on 25 September, its yield was weak, but of good quality. The year produced very few vegetables and almost no fruit.<sup>62</sup>

The summer of 1749 brought temperatures in the range of 98.6° to 100.4° F (37° to 38° C) to Languedoc, *France*.<sup>79</sup>

In 1749, the price of wheat [in *England*] averaged 29 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

A heat wave struck *England* on 2 July 1749. At London, the temperature reached 88° F [31° C] in the shade. At Lydon in Rutland, the temperature reached 84° F [29° C].<sup>212</sup>

On 2 July 1749 at Milford Haven in Pembrokeshire, *Wales*, there was an unusual tide. At 11 a.m., near low water, the sea being smooth and no wind, “there was a sudden hideous noise, and in one minute the tide ran up to the high water mark, and returned again as rapidly; and this was repeated seven times in three-quarters of an hour.”<sup>212</sup>

On 5 July 1749, Charlestown, South Carolina in what was to later become the *United States* reported dismal rice crops. “It was generally expected, early in the spring, that 100,000 barrels of rice would be made this year, in this province; but some rains that fell the latter end of May, and beginning of June, have sadly disappointed the planters, by overflowing their dams and low lands, and either drowning, or bringing the craw-fish among the young plants. At a moderate computation, the crop will be reduced to less than one third. Most people have planted the seed, even to a third time, (when the season was almost too far advanced) and have lost all.”<sup>295</sup>

On 1 August 1749, there was a thunderstorm at Highgate [a suburb of London, *England*]. On 21 August, it was extremely hot at Keswick in Cumbria, *England*. On 22 August, a thunderstorm struck Wolverhampton in West Midlands, *England*. The storm lasted 3 hours and caused an inundation the like

never known before. The violent storm also struck Worcestershire, Oxfordshire, Shrewsbury, Bridgenorth [Brignorth], and Drayton [Market Drayton] in *England* and Magrofeld [Magherafelt] in *Ireland*. On 22 August, there was a flood at Keswick in Cumberland, *England*. “With most terrible thunderstorm and tremendous rain at 9 p.m., causing a great flood in the valley. Most violent at Legburthat Fells [Legburthwaite Fells] (lasting two hours). A small stream, called Catcheety Gill, swept away a mill. Rocks, larger than a team of ten horses could move, were carried a considerable way into the fields; one measured nineteen yards almost. Damage from £1000 to £1500. This storm was the most remarkable in man’s recollection.” The next day, thunderstorms struck in the same towns and at Oldham in Greater Manchester, *England*. It was more violent than on August 22<sup>nd</sup>.<sup>212</sup>

On 22 August 1749, there was extreme rainfall in the Valley of St. John’s near Keswick in Cumberland in northwest *England*. Before the rainfall, the weather was extremely hot and sultry. Two hours before the storm struck, there was a strange buzzing noise like that of a malt mill, or the sound of wind in the tops of trees. The valley is next to a high, steep, rocky mountain. The rainwater came roaring down 4 small brooks in the space of 1½ hours that at the bottom of Catcheety Gill, a mill and kiln were entirely swept away. The torrents of rain opened up a great chasm, 4 yards wide and 8 to 9 yards deep. Some of the large rocks carried into the fields, a team of 10 horses could not move. At Lobwath, one of these stones was measured and was 19 yards in circumference. There was great damage done to the grounds, houses, walls, fences, highways and crops.<sup>236</sup>

On 22 August 1749, a terrible inundation occurred in the valley of St. John’s near Keswick in Cumberland [now Cumbria] in northwest *England*. “There was the most terrible thunder, and incessant lightning, ever known in that part in the memory of man, the preceding afternoon having been extreme hot and sultry. The inhabitants of the vale heard a strange buzzing noise, like the working of a maltmill, or wind in the tops of trees, for two hours together, before the breaking of the clouds, which was accompanied by the water-fall. From the havock [havoc] it made in so short a time (for it was all over in less than two hours) it must have far exceeded any thunder shower ever seen; most probably it was a spout, or large body of water, which by the lightning incessantly rarefying the air, broke at once on the tops of the mountains, and so descended upon the valley below, of about three miles long, half a mile broad, and lying nearly E. and W. closed in on the S. and N. side, with prodigious high, steep, rocky mountains. Legburthet Fells on the N. side had almost the whole cataract, and the spout did not extend above a mile in length, and swelling chiefly four small brooks; but to that amazing degree, that the greatest of them, called Catcheety Gill, swept away a mill and a kiln in five minutes, leaving the place where they stood covered with huge rocks and rubbish, 3 or 4 yards [2.7-3.7 meters] deep; so that one of the mill stones cannot be found. In the violence of the storm, the mountain tumbled so fast down, as to choak [choke] up the cold course of this brook, the water forcing its way through a shivery rock, and now runs there in a chasm 4 yards [3.7 meters] wide, and betwixt eight and nine deep. These brooks have lodged such quantities of gravel and sand on their bordering meadows, that they can never be recovered. Many vast pieces of rock have been carried a considerable way into the fields, larger than a team of ten horses can move; one of these measured nineteen yards [17.4 meters] about. The damages alone to the grounds, houses, highways, &c. are by some computed at 1000, by others at 1500 pounds. [In present currency, that would be equivalent to £134,000 to £202,000 in damages based on the retail inflation price index.] One of the said brooks, called Mose, or Mosedale Beck, which rises near the source of the others, but runs North from the other side of Legburthet Fells, continues still foul and muddy, probably from having worked its channel into some mineral substances, which gives it the colour of water gushed from lead mines, and is so strong as to tinge the river Derwent, even at the sea, near twenty miles [32 kilometers] from their meeting.”<sup>297</sup>

On 22 August 1749, a vast storm of thunder, lightning, and rain for 3 hours struck Wolverhampton in West Midlands, *England*. This caused an inundation in the lower part of town greater than was ever known there. Part of it reached Worcestershire, Oxfordshire, Manchester, Shrewsbury and Bridgenorth

[Bridgnorth]. The storm at Bridgenorth on the 23<sup>rd</sup> was more violent and the lightning penetrated the roof and broke the windows of a church. At Manchester on the 22<sup>nd</sup>, the lightning was dreadful and continued all night with little thunder. The whole heavens seemed in flames. During the night of the 23<sup>rd</sup>, it was much the same, but an abundance of wet, which swelled the small rivers and carried away great quantities of reaped corn [grain]. At Oldham, six miles [10 kilometers] off, a man was killed and 7 children injured, and a barn full of hay consumed [from lightning].<sup>295</sup>

On 22 August 1749, a terrible storm of thunder and lightning struck Magherafelt [Magherafelt], *Ireland*. A ball of fire came down a chimney into a room, where was a woman and her two sons, and another person. It burnt off the skirt of the coat of one sitting by the fire and lighting on the floor. The ball of fire rolled about several times; then dividing into two parts, one burst, and scorched another of the company. The other ascended, forced its way through the floor of the chamber, where were two young women, and bursting with a great explosion, struck one of them instantly dead. And though no wounds appeared on the body, but part of her skin scorched similar to gunpowder, yet the bones were all broken as if pounded.<sup>295</sup>

In September 1749, Germany reported, “The locusts, after ravaging part of *Poland* and Vienna [*Austria*] took their flight, darkening the air, towards Bohemia [now western *Czech Republic*] and Bavaria, and did vast damage about Pilsen in Bohemia [now Plzeň, *Czech Republic*]; being driven away from Budweis [now České Budějovice in the *Czech Republic*] by the noise of bells, and discharge of cannon, they settled a league [3 miles, 4.8 kilometers] off on trees, the branches of which broke down with their own weight, and tho’ 160 sacks of them were destroyed in the night by burning straw under the trees, they came next morning near the town, and soon devour’d two cart loads of hay. They have advanced in Bavaria to Ratisbon [now Regensburg, *Germany*] and Aichstet [now Eichstätt, *Germany*], and cover’d 300 acres [121 hectares] of land in Franconia [eastern part of the historic Duchy of Franconia in *Germany*].”<sup>295</sup>

On 15 September 1749, a waterspout was observed at Hatfield in Yorkshire, *England*.<sup>212</sup>

A drought struck New England in the *United States* in 1749. The spring was uncommonly dry, and by the end of May pastures were all scorched and burned in eastern Massachusetts. The drought probably continued longer and was felt more severely than any one that the people had before experienced. June 9 was appointed as a day of public fasting and prayer. Between 1 and 6 July, plenty of showers fell in New England, and the period of drought was brought to an end. A small crop of hay, barley, and oats and a good crop of Indian corn were harvested; flax and herbs of all kinds were a failure; cattle were killed in the autumn to save the great expense of keeping them through the winter.<sup>138</sup>

A drought struck New England in what was to become the *United States* in 1749. Spring was uncommonly dry. By the end of May, pastures yielded little feed for the cattle. The grass was so scorched and burned by the sun that the ground looked white. Water was also scarce. Brooks, springs and even small rivers dried up. Many wells failed. The heat was so severe and everything was so dry, that when fragments of broken glass fell on the ground, they would cause any combustible material to catch fire. The drought came to an end towards the end of June.<sup>199</sup>

In 1749, a severe drought, attended in many places with swarms of devouring insects, caused great distress in New England in the *United States*. Many brooks and springs dried up. The first crop of grass harvested was one tenth of what had been normally harvested. Some of the inhabitants imported hay from Pennsylvania or *England*.<sup>174</sup>

On 29 September 1749, a hurricane struck the *Gulf of Honduras*. The *Centaur* from the Bay of Honduras for Leghorn, met with a violent hurricane soon after he left the Bay, in which he lost all the masts and sails, and put into Carolina to refit on 3 November. Captain Cullam, of the *Arthur*, writes from the Bay

on 18 September that the same storm put most of the vessels ashore at the Bay, but he rode it out without damage, and that several vessels bound for Europe & North America were not so fortunate.<sup>141</sup>

On 7-8 October 1749, a great storm struck the Ocanwik inlet on North Carolina in what was to become the *United States*. Nine vessels were lost. Two were drove over the bar and lost aground 5 miles [8 kilometers] to the northward of it. The water having rose above 10 feet [3 meters] higher than ever known. Several other vessels drove some miles upon the low lands, so that it was impossible to get them afloat. Scarce a vessel in the country escaped being driven on shore or lost. The same storm did very great damage at Boston [Massachusetts], and drove 7 ships ashore at the Vineyard, which were feared, would be lost. Several ships were also lost at Barbados, particularly the *Nancy* and *Bristol* to Jamaica.<sup>296</sup>

On 8 October 1749, an Atlantic hurricane struck Massachusetts and North Carolina in the *United States*. During the hurricane, seven were wrecked on Martha's Vineyard and many lives were lost. Two merchantmen were wrecked north of Ocracoke, North Carolina. The *John & Jane* foundered 9 leagues seaward of the Cape Fear, North Carolina bar.<sup>141</sup>

On 31 October 1749, the cattle plague again broke out in a vast number of places in most *English* counties.<sup>212</sup>

On 15 November 1749, there was a sharp frost in London, *England*.<sup>212</sup>

In 1749 and 1750 on the island of *Madeira* in the North Atlantic Ocean were extremely dry years. The corn [grain] was destroyed and the fruit trees suffered much, particularly the peach trees. The fruit either fell to the ground while green, or remained longer on the tree, being full of white worms.<sup>236</sup>

In 1749, floods struck several regions of *China* including:<sup>153</sup>

— During the period between 17 April and 15 May, floods struck Shantung (now Shandong province) on the east coast of *China* at Shou-kuang and Wu-ti; Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Ch'üan; and Anhwei (now Anhui province) in eastern *China* at T'ai-hu.  
— During the period between 12 September and 10 October, floods struck Hupeh (now Hubei province) in central *China* at I-tu, Mien-yang, Ch'ien-chiang, T'ien-mên, Chiang-ling, Chien-li and Han-ch'uan. At I-tu, over 100 families were flooded.

In 1749 during the period between 10 November and 9 December, a drought engulfed Shansi (now Shanxi province) in northern *China* at Tatung.<sup>153</sup>

The year 1749 was a year of abundance in the vicinity of Shanghai, *China*. Rice had double heads; some with six or seven.<sup>166</sup>

In 1749 during the 12<sup>th</sup> moon on the 8<sup>th</sup> day in the vicinity of Shanghai, *China*, a dragon was seen during a storm of great thunder and rain. The following winter night was very cold. Then followed a three days snowstorm. [In early *China*, tornadoes and waterspouts were commonly described as dragons.]<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 8<sup>th</sup> – the ground is fit for plowing. April 21<sup>st</sup> – planted potatoes. May 31<sup>st</sup> – a melancholy dry time. June 9<sup>th</sup> – the same. June 24<sup>th</sup> – the grasshoppers cause more spoilage than the drought. June 29<sup>th</sup> – they have eaten up entirely an acre of potatoes. July 3<sup>rd</sup> – I reckon my poultry (about one hundred) eat ten thousand grasshoppers every day; very hot; the most remarkable time that ever we or our fathers saw. July 13<sup>th</sup> – as many grasshoppers as ever, but they are a new growth. July 24<sup>th</sup> – the ground begins to look green, but there are many grasshoppers yet. August – I never saw the earth change its face so much any day as this; the whole country is renewed and revived. October 14<sup>th</sup> – our potatoes turn out universally small.<sup>78</sup>

---

**Winter of 1749 / 1750 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1749 on October 18<sup>th</sup> – snow. November 22<sup>nd</sup> – cold day. November 25<sup>th</sup> – severely and unusually cold. November 29<sup>th</sup> – it is thought winter never sat in so early; Presumpscot River is frozen so that a man can walk over it. (December does not appear to have been so severe.) January and February 1750 – nothing remarkable as to the weather. March 11<sup>th</sup> – warm, calm and pleasant for this time of the year. March 18<sup>th</sup> – raw [cold]. March 23<sup>rd</sup> – snow. March 28<sup>th</sup> – more snow.<sup>78</sup>

The winter in Philadelphia, Pennsylvania in the *United States* was very open and mild; but all the spring months were cold and stormy. As late in the season as the 30<sup>th</sup> of May, snow lay on the ground.<sup>1</sup>

In 17 March 1750, the Meuse River overflowed its banks from the melting of heavy snow from the winter. In *Austria*, Bohemia [now western *Czech Republic*] and *Hungary*, the winter was severe. In *France*, the cold was neither sustained nor severe.<sup>62</sup>

---

**1750 A.D.** On 16 January 1750, Manheim [Mannheim, *Germany*] reported, “The waters of the Rhine [River] being fallen much lower within these few months than they were ever known to be in the memory of man, hath given us an opportunity of discovering the ruins of an old castle in the middle of the Rhine, a league and a half [4.5 miles, 7.2 kilometers] from this place, near Neckerau [Neckarau], opposite to Altrip. Several lovers of antiquities have been curious to see it, as we have no historian that makes mention of a castle in that place. All the ancient history furnishes with relation thereto, can only serve for a foundation to conjecture that it is the fort which the Romans built on an eminence called Sandberg, near Altrip, then known by the name of Alta Ripa, and provided with a strong garrison; and that, consequently, it is one of the fifty castles which the celebrated Drusus [Nero Claudius Drusus Germanicus], general, in the reign of Augustus (and the first Roman general, who advanced on the other side of the Rhine as far as the ocean) erected to cover his conquests against the attempts of the Germans.”<sup>296</sup>

On 28 January 1750, there was a remarkably high tide at Hull, *England*. It caused a flood tide of 21 feet [6.4 meters]. On 27 February, there was another remarkable high tide at Hull. This time the flood tide was 21.5 feet [6.6 meters].<sup>212</sup>

On 30 January 1750, Cork, *Ireland* reported, “The tide here yesterday swelled to such a prodigious height, that all the streets were under water. In the houses on Dunscomb marsh the water was 4 feet [1.2 meters] deep, and 3 [0.9 meters] in the middle of the city. The damage to the merchants is incredible. At Carrickfergus, the key was almost leveled, and several houses, and part of the town wall washed down.”<sup>296</sup>

On 31 January 1750, Bristol, in southwest *England* reported, “this city were struck into a consternation by the most terrible claps of thunder, lightening [lightning], hail and rain, that the oldest man living can remember at this season of the year. The most shocking time of the thunder held about a quarter of an hour; but the continuance of this dreadful tempest, ‘tis computed, lasted about half an hour, or, more. The lightning continued the whole time to a surprising degree, flashing from the element at very short distances. It set fire to a hay-rick at Long-Ashton, the greatest part of which was consumed. A man who usually brings pork and bacon to our market, being at that time in the storm, was beat off his horse, which taking fright, ran into a drain of water, with his lading of pork, &c. and was drowned. The same afternoon they had at Norwich, a great shower of rain, attended with thunder and lightening.” At the same time, between Biddeford [Bideford] and Abbotsbury [in southwest *England*], a French 20 gun ship, called *Le Carpe* of about 400 tons was driven ashore. Captain Burel, with 35 of his hands were saved, and 14 drowned. Around 2,000 country people showed up in mass and plundered the ship.<sup>296</sup>

On 31 January 1750, there was a very violent thunderstorm at Bristol and Norwich, *England*. On 10 February, a southwest gale struck Bristol. It began on Sunday [8 February] at 5 a.m., with rain and hail. It caused much damage. It created floods for miles around. On 11 February, a violent thunderstorm with rain and hail struck Newport in Monmouthshire, *Wales*. On 20 February, it was very warm in London, *England*. The fruit was in blossom. On 25 February, there was a flood at Boston, *England* that did considerable damage. On 8 March, a thunderstorm struck London. On 3 June, a great thunderstorm struck Hertford, *England*. On 10 June a severe thunderstorm struck Sittingbourne, Kent and London. On 26 June, another thunderstorm struck London. On 30 June, another thunderstorm struck [near London]. It rained for 2 hours and the rainfall was 5.3 inches [13 centimeters].<sup>212</sup>

Bristol, *England* reported, “Last Sunday morning [4 February 1750, Julian calendar], about 5 o’clock, there came on such a violent storm of wind at S.W. that the houses in general were very much shaken, as were also several people in their beds, as if an earthquake had happen’d. A great many houses have received damage by the fall of chimnies [chimney’s], as well as by the impetuosity of the extreme forcing blasts, which carried off part of their coverings [roofs]. Several sheets of lead were blown down from St. Nicholas steeple; which falling on the house adjoining damaged the same; several other sheets of lead now hang loose. A chimney in George’s-street, without Lawford’s Gate, beat down the roof, ceiling and beam of a house, where a man and his wife were in bed, who were buried in the ruins near an hour before their cries could make any one sensible of their misfortune. The poor woman was the first they took out; but the man was so much press’d with the beam, and the weight upon it, which lay on his belly and thigh, that a carpenter was obligated to saw the beam in two before he could be released. He is greatly bruised, and also his wife, whose nose is fractur’d, but both are likely to recover. The country, for a large extent round, has also felt the effects of this storm, where several houses, we are inform’d are laid waste, and a great many trees blown down. This storm was intermixed with heavy showers of hail and rain, so that the waters were out [out of their banks].”<sup>296</sup>

On 11 February 1750, a violent storm of thunder, lightning, hail and rain struck Newport in Monmouthshire, *Wales*. In the moors near the seat of Vaughan, Esq. some hundreds of tame and wild ducks, geese and widgeons, were killed by the storm.<sup>296</sup>

On 20 February 1750, it was reported, “the season was so warm that the wall fruit was in blossom; a swarm of bees was taken and hived at Mr. Role’s in Bisham, near Maidenhead, Berks [*England*], and the ladybird insects were in plenty about London, and the roads very dusty.”<sup>296</sup>

Around 25 February 1750, great floods happened in several parts of *England*, corresponding to the moon’s perigeon [perigee], which produces very high tides. A letter from Boston in Lincolnshire indicated that cattle were saved by driving them to high ground.<sup>296</sup>

On 17 March 1750, Brussels reports, “Letters from Ostend [*Belgium*] acquaint us, that on Wednesday last between the hours of eleven and two, the sea was agitated with such violence, that the waves piercing the dykes [dikes] of the exterior platform, the ditches were immediately filled, and the whole town laid under water. The dykes have suffered very much; as well as the ships in the harbour, one of which, a three masted vessel, laden with salt, was sunk.”<sup>296</sup>

A ship journeying between *Canada* and *England* reported, “We arrived here [Boston, northern *England*] the 16<sup>th</sup> inst. [16 April 1750], after a tedious, hard passage. We had not thirty hours fair wind the whole time. Capt. Fonds arriv’d a fortnight, Capt. Frail ten days, and Capt. Dunn four days, before us, in good health. We all fell in with many large islands of ice [iceberg] on the banks of Newfoundland [*Canada*]. Capt. Frail, by running foul of one in foggy weather, and getting to leeward of it, becalm’d his sails, so that his main topsail got into a cavity of the island, and carried his yard away, and it was with great difficulty he got clear without other damage. Capt. Fonds likewise got in so far with it, that he lost his

cutwater, and, by many hard strokes amongst the ice, was very much damaged, and very leaky. Capt. Dunn also fell in with many ice islands, but got clear without any considerable damage. In lat. 42d. 20m. north, and long. 49d. 50m. W. of London [latitude 42° 20' North, longitude 49° 50' West], on the 8<sup>th</sup> inst. [8 April] we fell in with several of these islands, but by good fortune it was in the daytime, though hazy weather. We got very near one large island, which was a surprising sight, on account of the many cavities in it, and the great numbers of fowls upon it. We were then within musket-shot; so that we had a full view of it, indeed more than we desir'd; for the prospect was far from being pleasant. At the same time we saw another to the southward of us, which, as near as we could compute, was three leagues [9 miles, 14.5 kilometers] in length, and appear'd like a mountainous land, with many openings and valleys, and hills shaped like sugarloaves of a prodigious height. We saw many other small islands of ice but happily steer'd safe through them all.”<sup>296</sup>

On 21 April 1750, South Carolina in what would become the *United States* reported, “we have almost constant and very terrible thundering and lightning. Several Negroes (in different parts of the country) were last week killed by lightening [lightning], and many high pine trees were shiver'd to pieces.”<sup>296</sup>

On 31 May 1750, Philadelphia, Pennsylvania in what would become the *United States* reported, “This has been the coldest May in the memory of man. Last week there were frosts in several places, which have done considerable damage, and in some places snow.”<sup>296</sup>

On 3 June 1750, at Mile End in the parish of Rickmansworth in Hertfordshire, *England*, there was a great storm of thunder and lightning, which began at 9 and lasted until noon. Ten sheep were struck dead, others wounded. The bark of an elm was shivered, and much other mischief done in other places.<sup>296</sup>

On 10 June 1750, a great storm of thunder and lightning caused much damage in Kent, *England*. Near Sittingbourn [Sittingbourne], 17 sheep were killed, and a man walking in Kennington Lane was struck dead by the lightning. Another at Lambeth was struck blind and deaf. A drawer [a person who draws liquor] at the star and garter [Star and Garter Public House or Tavern] in New Palace Yard was dangerously burnt by the lightning. In Abingdon buildings Westminster, it split a stack of chimneys, and at the house of Davis, Esq.; while the family was drinking tea in the back parlor, the windows were shattered to pieces in an instant, the shutters fell into the room, the tea furniture was broke to pieces, and the partitions all scorched.<sup>296</sup>

On 26 June 1750, between 6 and 7 in the evening, at West End, by Harrow on the Hill [in northwest London, *England*], a barn, belonging to farmer Greentree filled with corn and hay, was set fire by the lightning, and entirely destroyed, together with a dove house and 2 stacks of hay. With difficulty the dwelling house was saved. Near Acton, a barn full of wheat, and 3 stacks of hay, were set on fire, and burnt to the ground. Several sheep killed on Finchley Common.<sup>296</sup>

On 28 June 1750, at Sydenham in Kent, *England*, a whirlwind [tornado] took up part of a haystack into the air, higher than the highest tree, and some of it was carried a mile [1.6 kilometers] from the place.<sup>296</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:  
 March 30<sup>th</sup> – pleasant. April – some cold and some pleasant weather. May 31<sup>st</sup> – a wet and cold month, and yet there are millions of little grasshoppers not killed [by the cold]. June 30<sup>th</sup> – there was a happy intermixture of heat and wet for three weeks past. July and August – nothing remarkable. September – cold the latter part of the month, but the corn is like to be good.<sup>78</sup>

The summer of 1750 in Denainvilliers, *France* was characterized by:

Hot days	45 days
Very hot days	9 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The maximum temperatures observed during the summer were:

Toulouse, <i>France</i>	( 95.7° F, 35.4° C)
Paris, <i>France</i>	( 95.0° F, 35.0° C) on 26 June and 22 July
Denainvilliers, <i>France</i>	( 93.9° F, 34.4° C) on 22 July
Moscow, <i>Russia</i>	( 84.7° F, 29.3° C) on 11 July

In Burgundy, the grape harvest began on 24 September. The harvest was fairly abundant and of very good quality. In the south, the harvest yielded very little wine or wheat, but the maize harvest was excellent. Fruit this year was rather abundant.<sup>62</sup>

On 5 July 1750, Sirkes in Lorraine [Lorraine], *France* reported, “a little rivulet [very small stream] which runs thro’ that town into the Moselle [River], rose in less than an hour, 22 feet [6.7 meters], carried away above 30 houses, damaged 27 others, and drowned 20 people. Supposed to be occasioned by a waterspout, or the eruption of water from the adjacent mountains.”<sup>296</sup>

[Another account gives what looks like a different date. But 5 July in the Julian calendar matches 16 July in the Gregorian calendar.] On 16 July 1750, a brook which runs through the little town of Sirkes, in Lorraine, *France* situated on the banks of the Moselle River flooded. The brook which is usually no more than two or three feet [0.6-0.9 meters] deep, swelled on a sudden so prodigiously, that the water rose to the height of 22 feet [6.7 meters], and the stream became 80 yards [73 meters] wide. It overturned the town wall, which was very thick, and all the houses that stood in its way. Having an arch of only 18 feet [5.5 meters] wide for its usual passage through the wall on the other side of town, it rose to such a height as to overset that also, together with a tower, and forced its way out of the breach with such impetuosity, as for some moments to stop the course of the Moselle River, and carry over to the other side of that river, the ruins of the buildings it had washed down. It was fortunate that this part of the wall was not able to resist the waters; otherwise the whole town would have been destroyed. Thirty-three houses were leveled with the ground, and 27 more so far undermined, that it was found necessary to pull them down. As this accident happened in the daytime, only 21 persons were drowned. But the unfortunate survivors lost their houses and all their effects.<sup>300</sup>

From 8 to 23 July 1750, a heat wave struck *England*. On 11 July at Norwich the temperature was 92° F [33° C] in the shade and 111° F [44° C] in the sun. Several horses dropped down dead [from the heat]. On 10 July, the temperature was 84° F [29° C] at Stoke Newington [a London Borough] and 84° F [29° C] in the shade at London. On 13 July, there was excessive heat in London. On 15 July, the temperature at Lyndon in Rutland in central *England* reached 85° F [29° C]. The first three weeks of July at Lyndon was the hottest ever known. In general, the summer (except for a few very hot days) was exceedingly cold, and there was scarcely a day without rain. The weather was similar at London and Plymouth, *England*, and Dublin, *Ireland*.<sup>212</sup>

On 11 July 1750, there was a thunderstorm in London, *England*. It caused great flood and hail damage. The hailstones were flat, three inches [8 centimeters] in circumference, and more properly called “ice cakes”. On 12 July, a thunderstorm struck Alnwick in Northumberland, *England*. On 16 July, a very violent thunderstorm struck Cambridge, Huntingdonshire, Northampton, Worcester, Gravesend, Gosport (very large hail), Epping (pieces of ice), and Darking in Surrey. On 24 July, a violent thunderstorm with hail and rain struck London and caused a great flood in houses.<sup>212</sup>

On 11 July 1750 in *England*, there was a hailstorm in Middlesex and Surrey.<sup>93</sup> [Middlesex today is mostly a part of the London metropolis.]

On 11 July 1750, at Tooting in south London, *England*, the temperature reached 88.75° F [31.5° C]. This same heat wave also struck Norwich from 8 July and continued for 12 days. On the 11<sup>th</sup>, the hottest day,

the temperature in the sun stood 11° above the heat of the human blood [109.6° F, 43.1° C]; and in the shade only 8° below it [90.6° F, 32.6° C]. Several horses dropped down dead under their masters, overcome by the violent heat.<sup>236</sup>

On 11 July 1750 about 5 o'clock in the afternoon, a violent storm struck London, *England*. The storm of thunder, lightning, rain and hail caused the streets of London to overflow and the water filled many cellars. Over 4,000*l.* of damage done to the gardeners in and near Southwark. [In present currency, that would be equivalent to £533,000 in damages based on the retail inflation price index.] Numbers of fish of all kinds were seen floating the next day in the river, and were taken out dead. Several hailstones measured over 3 inches [8 centimeters] about. They were of a flat form, so as to be more properly called ice cakes.<sup>296</sup>

On 12 July 1750, a violent shower of rain proceeded by thunder and lightning struck Alnwick in Northumberland, *England* that killed a man in a boat.<sup>296</sup>

On 13 July 1750, it was reported, “The excessive heat of this and some preceding days, so affected the fish in the [River] Thames, that they gather'd in shoals to the bank side, and bury'd [buried] themselves in the ooze [ooze] and mud, and were easily taken in great quantities; loads of fish perish'd in the fens of Cambridgeshire [*England*], and one person lost 300*l.* by the death of jacks and pikes.” [In present currency, that would be equivalent to £40,000 in damages based on the retail inflation price index.]<sup>296</sup>

On 16 July 1750, terrible storms swept through *England*.<sup>296</sup>

— “Was a terrible storm of thunder and lightening [lightning], by which the lead [roofing] of several houses in Bishopsgate-street were melted, and a turret on the top of a house shivered [vibrated]. In Cambridge and Huntingdonshires, it lasted with a heavy rain from 9 in the morning till 10 at night, a ball of fire fell on St. Ives steeple, and split it about the middle, burnt a house and damag'd others.”

— “At Harleston field, near Northampton, 9 sheep killed; 6 miles [10 kilometers] from Coventry, a barn was burnt, and 30 sheep and three calves killed, and a shepherd struck dead in Marton field, not far from them; at Worcester the storm began between 10 and 11 o'clock the night before, and continu'd till near 5 the next morning, and was very terrifying; numbers of cattle broke out of their pasture, and two were killed under a tree, the bark of which was much scorched.”

— At Worcester in Worcestershire, “Last night we had the greatest storm of thunder and lightning (attended with little rain) ever known. It began about ten, and continued, with short intermissions, 'til four this morning. So loud was the thunder, and the lightning so fierce, that every body was exceedingly terrified; several families that were gone to bed, soon arose, being shook in their beds. Balls of fire issued from the lightning, one fell in or very near one of our principal streets.”

— At Gosport in Hampshire, “Last night about 9 o'clock, it began to lighten [lightning], and continued at intervals, till past 2 o'clock, without either thunder or rain; but soon after it began to thunder, lighten, hail and rain, without intermission, till half an hour past 3. Such dreadful thunder the oldest man living declared they never heard. The lightning was so violent, that the firmament seemed a blaze of fire; the hail stones were of very uncommon sizes and forms, and fell with great impetuosity, did some damage to the corn [grain], gardens, and windows. Half an hour after four this morning the sky began to clear, and the sun shone bright. We had a fine day, but most sultry hot.”

— At Cambridge in Cambridgeshire, “About 9 in the morning began lightning and thunder, attended with heavy rain, and lasted most part of the day, and till 10 at night. Several fire balls were seen in the air. Great damage was done at Colton in Hildersham, and the neighbouring towns. Kill'd by the lightning at Broadbury, in the county of Durkaine, John Thompson; in Cambridgeshire, Mr. Neville Fuller, of Haddenham. Some pigeons [pigeons] at Halton, and the dove-house fired, but extinguished by timely help.”

— At Epping in Essex, “About 8 o'clock in the morning began a severe storm of rain, hail, thunder and lightning, and continued, (with some intermission) 'till the evening; in some places, pieces of ice fell

about an inch and a half square. I don't hear of any damage it has done, but laying the corn [grain], which is trivial, as it is so near harvest. In Belcham Roding [Beauchamp Roding?], half an oak was driven by the lightning at some distance from the tree; it was shivered into small withs [withes] of a great length, much resembling in shape and size a two penny cord, somewhat untwisted."

On 24 July 1750, a storm of hail and rain fell in London and Westminster, *England*. The storm did much damage to many people, by filling their cellars with water, which in some places stood a foot above the shop floors.<sup>296</sup>

In Norfolk and Suffolk, *England*, about the beginning of August 1750, there was a very great scarcity of water.<sup>296</sup>

Two Spanish register ships, which sailed from Havannah [Havana, Cuba] in August 1750 with a ship-of-war and a snow [a merchant sailing vessel] were driven ashore in a violent storm near Cape Hatteras off the coast of North Carolina in what would become the *United States*. Don Boneta, the Spanish commander, employed some of the country sloops to save his effects, and one of them Zebulon Wade, master, of [the ship] *New England*, went away with 55 chests of money, some trunks of gold and silver plate, and 155 bales of cochineal [a scale insect, from which the crimson-colored dye carmine is made]. Another sloop was under sail with the same base design, but was prevented. The snow, which had 200,000 dollars on register, went ashore at Cape Lookout, only three men and a boy saved. The ship-of-war sunk, and only four men drowned.<sup>297</sup>

On 5 August 1750, some miles above Altyr, in the county of Murray [Altyre in Muray or Elginshire county, *Scotland*], fell so much rain, "that a small river by that place rose 22 feet [6.7 meters] above the common level, and did incredible damage to the field soil, carrying off some and covering other, with sand and gravel, swept away several houses and mills, and corn [grain] off whole possessions. It is imagined that a waterspout fell."<sup>296</sup>

On 5 August 1750, heavy rains struck Murray, *Scotland*. It raised the river 22 feet [6.7 meters] and did incredible damage. On 2 September, heavy rains struck Gloucester in southwest *England*. It was the most violent rain ever known. It lasted for 3 hours. The streets were 3 feet [0.9 meters] deep in water. Large trees and hedges were washed away.<sup>212</sup>

In 1750, the price of wheat [in *England*] averaged 25 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

On 11 August 1750, Posnania [Poznań], *Poland* reported, "A prodigious quantity of locusts has appeared in the neighbourhood of Novogrodech; which within 4 days devour'd all the fruits of the earth, and even the leaves of the trees, and having nothing more to subsist on, went off in two flights, one towards Woynitz [Wojnicz], and the other toward Ynowadislow [Wodzisław?]."<sup>296</sup>

On 15 August 1750, Vienne in Dauphiny, *France* reported, "the little river that runs thro' [through] that city, swelled so prodigiously a fortnight [14 days] ago, that above 100 houses, with the powder-mills, flatting-mills, forges for arms, a fuller's mill and a paper-mill, were all carried away by the rapidness of the torrent, which overflowed the country for ten leagues [30 miles, 48 kilometers] round the city. This sudden inundation made terrible ravages in all the adjacent villages, and above 130 souls perished in the waters, and the damage is computed at 3 millions of livres."<sup>296</sup>

On 16 August 1750, Edinburgh, *Scotland* reported, "They write from Aberdeen, that last week the river Den rose to such a height, that, in the middle of the night, it carried off about half of a large house, furniture and all. The gentlewoman of the house was providentially abroad, and her youngest son narrowly escaped with his life, the water having surrounded his bed."<sup>296</sup>

On 17-18 August 1750, an Atlantic hurricane struck offshore in North Carolina in the *United States*. Four Spanish vessels were wrecked off the Outer Banks. No lives were lost from the *Nuestra de Solidad*, with unknown losses from the *El Salvador* and two other ships.<sup>141</sup>

Gloucester, *England* damaged by a violent rain on September 2, 1750.<sup>41</sup>

On 2 September 1750, the most violent rain ever known struck Gloucester in southwest *England*. The rainstorm “lasting 3 hours, with very little intermission, by which the principal streets were above 3 feet [0.9 meters] deep in water, so that most of the cellars were filled, and many of the shops. At Stroud and Painswick, several mills were much damaged, large trees and hedges carry’d away, and walls thrown down by the torrent; some had 30 ton of coal wash’d away, others their furnaces carry’d out of the stacks, and a bridge, called Dedbridge, was forced up; the damage computed at several thousand pounds.”<sup>296</sup>

On 3 September 1750, a violent rain fell on Neuschâtel [Neuchâtel, *Switzerland*], “by which the waters rose in the lower city to the first story, and carry’d away bridges, mills, walls, and even a tower, and made incredible ravages in the adjacent part of Swisserland [Switzerland].”<sup>296</sup>

On 12 September 1750, Genoa, *Italy* reported, “The weather is so extremely hot in this city, that most of its inhabitants have deserted it, in order to breathe a cooler air in the country. The great forest of Casetta is entirely destroyed by fire.”<sup>296</sup>

In Charlestown, South Carolina in the *United States*, there is little rain except during thundershowers. On 30 June 1750, during a thunderstorm, 5.335 inches of rain fell in 24 hours. On 16 September 1751, 9.955 inches of rain fell in 24 hours, but the greatest part in 6 hours. On 15 September 1752, during the time of the most violent hurricane that was ever felt in this town, the depth of rain which fell, was only 3.740 inches, and the greatest part of that was the spray of the sea.<sup>236</sup>

On 10 November 1750 at Charles-Town [Charleston], South Carolina in what would become part of the *United States*, A.B. wrote, “I have observed, that since I have been in Carolina, we never had so little lightning and thunder as this spring and summer. I think in those five months, we have not had 20 distinguishable claps, and I am sure they have been innumerable in the same space for years past. I have questioned some of the oldest settlers on this point, and they too observe, we never had near so little, (in 45 years of their remembrance). [Normally] thunder and lightning are very common, sharp, and dreadful here. About 3 years ago, 7 houses in different parts of the town were struck in one night, besides the church, and several vessels in the harbour. Every year there are some houses damaged, and the men of war [ships] were frequently.”<sup>297</sup>

On 30 November 1750, high winds on land and water caused much damage in *England*. A Gravesend boat was run down by a French [trader?], and 29 persons drowned; 10 or 11 were saved by boats, but one woman dy’d [died] soon after. Mrs. Slack of Finsbury had both her legs and several ribs broke by the fall of a stack of chimnies [chimneys], and she dy’d [died] on the 18<sup>th</sup> instant [December].”<sup>296</sup>

On 30 November 1750, a gale struck Gravesend, *England*. On 3 December, a gale struck Axbridge in Somerset, *England*. It produced a very high tide that did great damage.<sup>212</sup>

On 3 December 1750, an estate near Axbridge in Somersetshire, *England* was ruined by the wind and high waters, which broke down a great fence wall, and destroyed a whole warren of rabbits. About Chepstow, in Monmouthshire, *Wales*, and Berkley [Berkeley] in Gloucestershire, *England*, great numbers of sheep were drowned by the breaking of the sea banks.<sup>296</sup>

In 1750 during the period between 5 February and 6 May, a drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Hui-lai. During the period between 4 June and 3 July, a drought engulfed Hopei (now Hebei province) in northern *China* at Chiao-ho and at Ch'i-ch'êng [uncertain name and province]. During the period between 8 August and 8 November, a drought engulfed Kwangtung province at Lien.<sup>153</sup>

In 1750, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 7 April and 5 May, floods struck Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at P'ing-yüan [uncertain name]. Houses and fields were damaged by the floodwaters and innumerable people and cattle drowned.

— During the period between 4 June and 3 July, floods struck Hopei (now Hebei province) in northern *China* at Yüeh-t'ing, Su-ning and Fou-p'ing; Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin; Anhwei (now Anhui province) in eastern *China* at Fou-yang and Ying-shan; and Chekiang (now Zhejiang province) on the east coast of *China* at Ch'un-an. At Yüeh-t'ing and Ch'un-an, the crops were damaged by the floodwaters. At Ying-shan, houses and fields were damaged.

— During the period between 4 July and 1 August, floods struck Shantung (now Shandong province) on the east coast of *China* at Jih-chao; Hupeh (now Hubei province) in central *China* at Sui; Shensi (now Shaanxi province) in central *China* at Fu-p'ing; and Hopei province at Jung-ch'êng and An-kuo. At Sui, houses and fields were damaged by the floodwaters.

**Winter of 1750 / 1751 A.D.** From 26 January to 8 February 1751, there was a severe frost in London, *England*.<sup>212</sup>

**1751 A.D.** In France there was a flood. In January 1751, the Seine River in Paris, *France*, at the bridge “Pont de la Tournelle” reached a height of 6.7 meters (22.0 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

In the year 1751 Paris, *France* received 24.7 inches (627 millimeters) of annual rainfall instead of average 20.9 inches (530 millimeters).<sup>79</sup>

Around the beginning of January 1751, over  $\frac{3}{4}$  of the town of Fiume, a port in Istria, [now the city of Rijeka, *Croatia*] belonging to the emperor, was swallowed up, [by a tsunami] together with most of the churches, religious houses, and magazines. During the time of the earthquake, the sea, which was extremely agitated, swallowed up a small island near the town, and all the inhabitants of it perished. For the next day, when it was a profound calm, not the least traces of this island were to be perceived; so that it is imagined it was quite torn from its foundation by the violence of the earthquake.<sup>297</sup>

The maximum temperature during the summer in Cap [Cape Town, *South Africa*], was 110.8° F (43.8° C) on 23 February.<sup>62</sup>

On 26 February 1751, a severe gale struck *England*. At Oxford, it damaged the steeple of St. Mary's Church. At Lichfield, it caused much damage to the cathedral. At Worcester, it caused great damage. At Bromyard, the storm was very violent. At York, the storm did £500 damage to the minster. At Nottingham, it destroyed many trees and unroofed houses. This gale caused a large number of shipwrecks at Limerick and Dublin, *Ireland* and at London, *England*. On 27 February, a thunderstorm at Truro in Cornwall, *England* almost ruined the churches of St. Etham and Ladock. On 21 April, a hailstorm struck London. During the month of May in London, there was heavy rain until 18 May. The corn [grain] was much damaged and about 6 million acres were unsowed. On 6 May, there was much snow preceded by thunder and lightning at Newcastle-on-Tyne. On 9 May in London, there was a sharp frost. In Yorkshire, there was much snow and thick ice. On 20 May at Pontefract in west Yorkshire, there was a violent rain and terrible hail. The hailstones measured about 13 inches [33 centimeters] about

[in circumference]. The flood threw down walls. On 21 and 22 May it was warm in London. The temperature reached 64° F [18° C] at noon. On 6 June, at South Moulton in Devonshire in southwest *England*, the weather was extremely hot. In June in London, the weather was warm and dry. On 19 September in London, there was a thunderstorm with heavy rain. On 1 November at Whitby in North Yorkshire, there was a gale. On 21 November in London, there was a thunderstorm with snow, hail and much lightning and thunder. It caused a flood.<sup>212</sup>

The turbulent weather during the end of February 1751 has done great damage to edifices in several parts of *England*. On 27 February, a storm of thunder and lightning almost ruined the churches of St. Etham and Ladock near Truro in Cornwall. At Oxford, the high wind on the 26<sup>th</sup> so damaged the steeple of St. Mary's that it was expected to fall. At Litchfield, the gilt ball on one of the spires of the cathedral was blown down, and the vane on another spire, the glass and stonework of one of the windows greatly suffered. At Worcester, two prebendal houses [manors] near the cathedral were quite demolished, large stacks of chimneys were blown down, and a multitude of windows shattered to pieces. At Bromyard, in Herefordshire, a chimney fell upon an adjacent school, where the mistress was sitting in a chair with a child in her arms with several scholars, who were all buried in the ruins, but very little hurt. In York, a pinnacle of the northwest tower of the minster, with the battlements, fell through the roof and two lofts, and broke the pavement, the damage above 500*l*. In the adjacent country and in Nottinghamshire, the hurricane did much damage unroofing houses, blowing down some, dispersing stacks of corn [grain] and hay, and tearing up large trees by the roots, and throwing down park [pales?]. At Limerick in *Ireland*, in the hurricane, a Dutch dogger was beat to pieces, 5 or 6 vessels forced on shore, and all the shipping damaged. Many houses were blow down, besides loss of cattle, and much damage to the bank on both sides of the River Shannon. The same hurricane did considerable damage to the shipping in Dublin and other ports of *Ireland* and also on the River Thames. This storm was still more violent abroad, particularly at Nantz [Nantes, *France*] and its neighborhood, where on the 24<sup>th</sup> of February in the night a terrible hurricane began at southwest and at three the next morning turned to northwest, accompanied with thunder, lightning, and such terrible noises both at sea and land, as seemed to proceed from an earthquake. It did a great deal of mischief in the country, by overflowing of rivers, tearing up woods and corn mills, and overthrowing of houses; but the greatest damage happened in the road of Paimbœuf; where out of 70 ships, only 4 rode it out successfully. Several were left on the rocks. Some were forced upon the quay [wharf]. A few were driven out to sea and escaped. Some foundered [sunk], and others were forced on the shore in different places and lost. Nearly 800 sailors perished. The chamber of insurance loses 1,200,000 livres by this storm, and the town of Nantes ten million [livres].<sup>297</sup>

In 1751, it rained in Leyden [Leiden, *the Netherlands*] no less than 163 days during which 41 inches of total rain fell.<sup>236</sup>

On 7 March 1751, there was a terrible storm in Nantz (Nantes in western *France*), which destroyed 66 square-rigged vessels, and 800 seamen perished. On 8 December, a still more destructive storm occurred at Cadiz in southwestern *Spain* in which 100 vessels were lost, and three thousand sailors perished.<sup>1</sup>

The drought of 1751 was intense in southern *France*.<sup>79</sup>

There was a storm at Nantz (Nantes in western *France*), where 66 vessels and 800 sailors were lost on March 7<sup>th</sup>.<sup>40, 41, 43, 56</sup>

Charles Town, Carolina [Charleston, South Carolina in the *United States*] reported that there was no rain between the middle of January until 28 April 1751. Because of the dry weather, planters were able to plant rice in a great many swamps and lowlands that had never were planted before.<sup>297</sup>

On 6 May 1751, “Much snow fell in and about Newcastle on Tine [Newcastle upon Tyne in northeast *England*], preceded by thunder and lightening, by which near North Dissington, Northumberland, 9 ewes [female sheep] and a lamb were killed.”<sup>297</sup>

In May 1751, the cattle plague was raging in Yorkshire, Lancashire, Westmorland, Wiltshire, and Oxfordshire, *England*. In Cheshire, 30,000 cattle died since last October.<sup>212</sup>

On 20 May 1751 in *England*, there was a hailstorm in Yorkshire.<sup>93</sup>

On Monday, 20 May 1751 “At Pontefract [in West Yorkshire, *England*], by a violent shower of rain at this place, many cellers [cellars] were almost filled with water; a collection of waters at the meeting of two sloping streets in the market place, overflow’d and taking their course down a narrow lane, bore down some strong garden walls, and did incredible damage; the cut from the river that turns the mill, being filled with the flood from the hills descending with the mill dam drove down part of the mill, and what is most surprizing [surprising] carry’d one of the mill stones the distance of 15 yards [13.7 meters]; the rain which lasted about 4 hours, was preceded [preceded] by a terrible storm of hail which measur’d 31 inches [depth of hailstones?], and attended with loud claps of thunder, and lightening [lightning].”<sup>297</sup>

In May 1751, *England* reported, “The season has been very cold, and wet for most part of this month, the corn [grain] in the ground being much damaged in many places by the rain, and above 600,000 acres [243,000 hectares] were computed to remain unsowed; cattle also, especially the woolly kind, have suffer’d greatly by the inclemency of the weather; one farmer, particularly, in Sussex, lost 400 lambs by the cold dews.” “The great rains also have made land carriage so dear, that the poor and working people have been greatly distressed, by the high price of coals, which, in the wet season at Derby, rose from 4*d.* to 8*d.* per hundred; at Rugby, Warwickshire, from 8*d.* to 14*d.* at Northampton from 10*d.* to 18*d.* and in other places.”<sup>297</sup>

Meteorological observations taken at the royal observatory in Paris, *France* for the year 1751 provide the following: The depth of rainfall for the year was 23 inches 2 lines, which indicates a wet year. The mean annual depth is normally 16 inches 8 lines. The greatest cold occurred on 10 February in the open air taken with a Reaumur thermometer was [-10°Re, 9.5° F, -12.5° C]. The greatest heat occurred on 17 June was [29.5°Re, 98° F, 37° C]. The greatest height of the barometer occurred on 23 February at 28 inches 6 lines. The least height of the barometer occurred on 18 March at 26 inches 11 lines. On 16 & 17 June 1750, a 4-inch long [magnetic] needle declined from the North 17° 15’ westward.<sup>302</sup>

Around the beginning of July 1751, in and near Dublin, *Ireland*, there was a violent storm of hail, rain, lightning, and thunder, as had ever been known, which did incredible damage to the corn [grain], fruits, and gardens, cutting off the cabbages and other greens as if with a knife.<sup>297</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:  
January 6<sup>th</sup> – no snow on the ground. January 7<sup>th</sup> – snowstorm. January 12<sup>th</sup> – thaw. January 15<sup>th</sup> – the frost is entirely out of the ground. January 21<sup>st</sup> – weather like found in May. January 24<sup>th</sup> – this winter will go down memorable to posterity. February – this month has been more like spring than winter; moderate generally, and several days as warm as May. February 28<sup>th</sup> – pleasant weather still. Thus winter ends, a wonder through the whole. March 5<sup>th</sup> – snowstorm. March 13<sup>th</sup> – fine spring weather the rest of the month, except the four last days. April – a cold blustery month. May 8<sup>th</sup> – our English cherries did but today begin to bloom. May 17<sup>th</sup> – they are now in all their gaiety of blooming. May 23<sup>rd</sup> – growing season. May 30<sup>th</sup> – never did things grow faster, nor never a better prospect. June 5<sup>th</sup> – very cold. June 15<sup>th</sup> – a wonderful time for grass, but the Indian corn wants heat. June 26<sup>th</sup> – seasonable weather. July 31<sup>st</sup> – the freshets [floods] have carried away many bridges, hay, etc. on Presumpscot River. Saccaribig bridge and the Presumpscot great dam broke. October 4<sup>th</sup> – we began to dig our potatoes. November 16<sup>th</sup> – moderate weather. November 24<sup>th</sup> – another wonder of a day, so calm, warm and delightful.<sup>78</sup>

On 24 July 1751, a hurricane struck St. Kitts in the *West Indies*. During a violent gale, the brig *Friendship* was wrecked and none of the crew survived. The storm was also felt off Havana, *Cuba*.<sup>141</sup>

In August 1751, the cliffs at Charmouth in Dorset, *England* were on fire. “After some time of remarkably hot and dry weather, and a sudden heavy rain, the cliffs began to smoke, and soon after to burn like a subtle flame (only to be seen at a distance) and did so at intervals after heavy rain, till winter. (On examination in 1759, the cliffs were found to consist of much pyrites, marcasites, and yielding one-tenth of common sulphur [sulfur]. On putting 100 lb. [100 pound, 45 kilograms] weight in a heap, and sprinkling it every day with water, in ten days the heap grew hot, caught fire, and fell into dust. The same flame has been seen from the Lodes, in Cornwall.)”<sup>212, 237</sup>

In 1751, the price of wheat [in *England*] averaged 25 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

On 30 August 1751, it was reported, “The River Elbe at Hamburgh [Hamburg, *Germany*] having risen 16 feet [4.9 meters] by the late rain, has overflow’d all the ware houses [warehouses] and cellars in the city, and the damage done thereby is computed at 90,000*l*.<sup>297</sup> [In present currency, that would be equivalent to £12 million in damages based on the retail inflation price index.]

A hurricane struck *Jamaica* on August 10, 1751, causing 300,000 pounds of damage.<sup>40, 41, 42, 43, 56</sup>

On 2 September 1751, a hurricane struck *Jamaica*.<sup>124</sup>

A letter from a ship at Kingston in *Jamaica* reported, “On the 10<sup>th</sup> instant [10 September 1751] in the evening, the whole firmament appeared of a very livid colour, horrible to behold, and the greatest part of that night was attended with hard squalls of wind. About 6 in the morning of the 11<sup>th</sup> it blew very hard at north, which brought off great quantities of leaves and sprays of trees from the mountains to the ships which rode at anchor a mile and half [2.4 kilometers] distant from the town, and were seen in the air like flocks of birds. At half an hour after 8 the wind shifted to the east, and after that to the south-east, when instantly it blew a hurricane which raised the sea in the harbour to a most surprising height, and in a few minutes it grew totally dark, so that at noon day the ships cou’d [could] not be seen that were driving foul of each other, and we were scarce capable of keeping ourselves fixed to any thing, the wind roaring above us as if the most tremendous thunder had been bursting on our heads, so that no man could be heard to speak. The height of the gale lasted till between 11 and 12, when it something [somewhat] cleared; and looking round us, nothing was to be seen but death and destruction, numbers [of people] lying on the shore drown’d, and others floating on the sides and pieces of wrecks, till the following afternoon, when we ventured out our small boats to bring them off. The violence of the wind was so great, that only 3 ships out of 40 sail of vessels [sailing ships] rode out the gale, *viz.* the *Corwall*, [Capt.] Duncomb, the *Mercury*, [Capt.] Matthews, and the *Queen Mary*, who had suffered not the least damage. The proprietors of what small canoes [boats] were saved in the town, ask[ed] 6 and 8 pistoles each to carry any man aboard or ashore, or to endeavour to save those that were perishing on the water. Of the vessels that were lost; some were drove ashore in the woods, upset and stove to pieces, to the number of 27; and there are now riding before the town without mast 14 [ships]. Some days since several vessels arrived with jury masts [jury rigged masts] and in a very shatter’d condition, who met with the gale between Hispaniola [now the island of the Dominican Republic and Haiti] and Porto-Rico [Puerto Rico], so that it is to be feared the Windward Islands have suffered the same fate. At the same time the *Fox* man of war from the Havannah [Havana], Mr. Manning on board, with a great quantity of [newly discovered] species, was obligated to cut away all her masts, and let go all her anchors, and after driving over two or three keys, brought up between two rocks, where it pleased God to preserve their lives, although they had taken leave of each other, and were preparing for their last moments. She is bulged, and her hold full of water. They have saved some of the species, but whether they will get up the rest is doubtful. Another letter ads, that

the loss in the inhabitants of *Jamaica* have suffer'd amounts to 300,000 *l.*<sup>297</sup> [In present currency, that would be equivalent to £40 million in damages based on the retail inflation price index.]

On 11 September 1751 the following ships were lost at *Jamaica* in a hurricane: *Sally*, Captain Randal; *Jamaica Paquet*, Capt. Lindsey; *Molly*, Capt. Car; *Port Royal*, Capt. Penniston; *Mercury*, Capt. Snow; *Adventine*, Capt. Cawdwell; *St. Anne*, Capt. Nelson; *Betty*, Capt. McLean; *Self Interest*, Capt. Strahan; *Rebecca*, Capt. Neale; *Moses*, Capt. Craigs; all of *Jamaica*. *Dolphin*, Capt. Burchal; and *Virgin*, Capt. Smith, of New York. *Page*, Capt. Smith, of Glasgow. *Betty*, Capt. Williams; and *Fanny*, Capt. Dorham, of Bermudas. *Diamond*, Capt. Dorset, of Curasoa. *Mount Edgcomb*, Capt. Levers, of Plymouth. *Hazard*, Capt. Harris; *Charming Sage*, Capt. Silvester; and *Betty*, Capt. Macky, of Boston. *William*, Capt. Wright of Cape Fare. *Byrne*, Capt. Boats of Liverpool. *Adventure*, Capt. Brice, of Portsmouth. *Fox* man-of-war, 20 guns.<sup>297</sup>

On 21 November 1751 in *England* it was reported, "About this time fell heavy rains, which swelled the brooks and torrents, and several people were drowned in attempting to past the common road."<sup>297</sup>

The quantity of rain that fell on the island of *Antigua* was: 51.8 inches [132 centimeters] in 1751, 43.3 inches [110 centimeters] in 1752, 32.8 inches [83 centimeters] in 1753, and 75.1 inches [191 centimeters] in 1754.<sup>303</sup>

There was a storm at Cadiz, *Spain*, where 100 ships lost on December 8<sup>th</sup>.<sup>40, 41, 43, 56</sup>

In the hurricane that lately happened at Cadiz [Cádiz, *Spain*], above 100 ships, of different nations, were lost, among which were two French ships that had upwards of 500,000 dollars on board.<sup>298</sup>

In 1751, floods struck several regions of *China* including:<sup>153</sup>

- During the period between 27 March and 25 April, floods struck Shantung (now Shandong province) on the east coast of *China* at Wei and Yeh. At Yeh, there was a great storm and people & cattle drowned.
- During the period between 26 April and 24 May, floods struck Shantung province at P'ing-tu and Tzū-yang.
- During the period between 21 August and 18 September, floods struck Shantung province at Jih-chao, Liao-ch'êng, Li-ching, Chan-hua, Hui-min, P'u-t'ai and Shou-kuang; and Hopei (now Hebei province) in northern *China* at Cho and Luan.

In 1751 during the period between 6 May and 8 November, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chien-tê, Sui-an, Ch'un-an, Shou-ch'ang, T'ung-lu and Fên-shui. The drought damaged the crops. During the period between 21 August and 18 September, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Li-shui and Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Lien and Hui-lai.<sup>153</sup>

---

**Winter of 1751 / 1752 A.D.** In *China*, it was an ancient custom to celebrate the sixtieth year of the Emperor's mother, with the most amazing pomp. The last three months of the year 1751 were taken up in making preparations for this approaching grand festival. The whole distance from one of the Emperor's houses of pleasure, to his palace in the center of the Tartar city of Pekin [Peking, now Beijing, *China*], being about 12 English miles [19 kilometers], was to be decorated in the most superb manner; and as the procession would be, in great part, along the river, it was foreseen, that the barks constructed to carry the Emperor, the Empress Mother, and the whole court, were likely to be of very little use, on account of the ice, the time of the ceremony falling out in the most rigorous season of the year. However, certain Mandarins undertook the removal of these obstacles, by employing, night and day, for more than three weeks together, some thousands of hands in continually beating the surface of the water to prevent its

freezing, and a like number in breaking the ice already formed. But in spite of all these precautions, the cold prevailed; the whole river was set fast, and the project abandoned.<sup>305</sup>

On November 9 in 1751, Monsignor Demidoff measured the temperature at Soliskamsky on the border with Siberia, *Russia* and it stood at -34° F [-37° C]. Professor Gmelin spent 9 years on an expedition into Siberia. He observed the following cold temperatures. In the southern part of the country near Selinga, it fell to 226 on the de L'Isle's scale [-59.2° F, -50.7° C]. At Kirenginshi on 10 February 1738, the temperature fell to 240 de L'Isle [-76° F, -60° C]. At Kirenginshi on 11 December 1736, the temperature fell to 254 de L'Isle [-92.8° F, -69.3° C] and on 20 December, the temperature fell to 263 de L'Isle [-103.6° F, -75.3° C]. On 9 January 1735, the temperature fell to 275 de L'Isle [-118° F, -83.3° C] and on 6 January, the temperature fell to 280 de L'Isle [-124° F, -86.7° C].<sup>236</sup>

During the winter of 1752, in the area of Toulouse, *France* "We had unusually cold weather, very heavy frosts, very abundant and frequent snow. From the beginning of December to 14 April we had only seven to eight days bearable, and even in the latter days it was still cold and snowing." In Paris, *France* the lowest cold day was on 10 January with a temperature of 20.7° F (-6.3° C).<sup>62</sup>

Richmond in Yorkshire, *England* reported, "The snow began to fall the 15<sup>th</sup> [15 January 1752], and save very little intermission the next morning, hath continued falling ever since; and tho' [though] we have a strong north-east wind, which drives the snow into hollow, sheltered places, yet in the middle of a plain field, into which I got with some difficulty this evening, to measure the depth of the snow, I found it to be 27 inches [69 centimeters] deep, very heavy, and close. If it had fallen light, and with little wind, it must have lain above a yard [91 centimeters] deep upon the plain ground, which is more by above one half than most people here have ever seen, and it still continues snowing."<sup>298</sup>

In January 1752, the coldest temperature in Charles Town [now Charleston] South Carolina, in the *United States* was 18° F [-7.8° C].<sup>300</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1752 on January 1<sup>st</sup> – the harbor froze over this morning; the whole bay was shut up. January 12<sup>th</sup> – people, since the 1<sup>st</sup>, constantly passed over to Purpoodock [now Cape Elizabeth] on the ice. January 14<sup>th</sup> – went to Brunswick on the ice, and returned without Macqua's island (Mr. Smith gave an account of an excursion with his wife and others to North Yarmouth and Brunswick on the ice, passing over Harrisicket [Harraseeket] Bay in going, and venturing on their return to come directly from Brunswick across the Bay bypassing Marquoit Island to New Casco, and over thence to the beach home.) January 27<sup>th</sup> – ice broke up as far as Mr. Fox's wharf (Last night there was a smart southerly wind which brought in a swell and broke the ice, and the ebb tide carried it away, so that the harbor is all open as high as across Captain Pearsons' to Sawyer's Dock, and where the people were passing yesterday – and where teams and horses might have passed, there is no ice.) February – much snow; the roads blocked up, and travelling bad.<sup>78</sup>

---

**1752 A.D.** On 14 January 1752, there was a south gale in London, *England*. From 15-21 January at Richmond in Yorkshire, it snowed for 5 days with a northeast gale. The snow was 27 inches [69 centimeters] deep on the level. On 12-14, 16-17, and 21-23 January in London, it was windy. Then on the 23<sup>rd</sup> there was a violent gale. On 18 February at Oxford, it was very stormy and hailed. On 20 July, a thunderstorm struck London. This was the only thunderstorm in London during the year. At Vauxhall [the inner city area of Central London], this storm "and a whirlwind, which lifted two boats out of the [River] Thames many feet high; and one was dashed to pieces, falling on the shore." It was cool and damp during the summer of 1752 in London. The weather in October was dry and warm.<sup>212</sup>

*Scotland* reported, about the middle of January 1752, "at St. Andrews, for three days they had a most violent storm of wind, hail and snow, from the N.E. great quantities of fish of different kinds were drove

on shore, some dead, others alive, which the country gathered up, and great numbers of lobsters were cast on shore between Kinghorn and Anstruther [in Fife, *Scotland*].”<sup>298</sup>

Cadiz [Cádiz, *Spain*] reported, “On the 15<sup>th</sup> ult. N.S. [15 January 1752, new style – Gregorian calendar] at nine in the evening, wind E.S.E [east southeast] began the most furious hurricane that was ever remember’d in this bay, which drove all the ships from their anchors and foul of one another. All fired guns in signal of distress, but the night was so dark that none could help another; next morning nothing was to be seen but vessels wreck’d and others ready to be swallowed up in the waves, the horror of which was increased by the dismal cries of unfortunate men, who endeavoured to swim to the walls of this city, against which they were violently dash’d, and so perish’d. The night between the 16<sup>th</sup> and 17<sup>th</sup> was no less terrible, but on the 18<sup>th</sup> the wind fell, and the shore discover’d nothing but pieces of wreck and dead bodies. 50 vessels, large and small, with a prodigious number of small craft were lost in the bay. Above 200 houses were blown down at Ceuta [north coast of *Africa*]; a Dutch ship of war of 20 guns was cast away on the Barbary coast [*North Africa*], 10 persons drowned, and the captain and the rest of the crew in number 234 made prisoners.”<sup>298</sup>

On 8 March 1752 at Dublin, *Ireland*, there was a gale. More gales struck on 13-17 March. There were hailstorms in Dublin on 13, 15, 18, 22 and 28 March. On 22 and 30 March, more gales struck Dublin. On 23 and 25 March, there was snow. On 8, 21, 24 and 25 April, there was hail in Dublin. On 10 April, there was a gale. On 7 May, there was a thunderstorm with hail at Dublin. Another thunderstorm struck on 4 June. On 26 July, there was lightning at Dublin. On 9 August, there was another thunderstorm. On 14 and 26 August, there were gales. On 1, 19, 20 and 21 September, there were gales in Dublin. On 9 and 10 October, there was snow in Dublin. On 10 and 11 October, there were gales. From 19 to 29 October, there was fog. On 4, 8 and 10 November, there were gales in Dublin. These gales continued into December and struck on the 12<sup>th</sup>, 14<sup>th</sup>, 18<sup>th</sup>, 19<sup>th</sup>, 23<sup>rd</sup> and 26<sup>th</sup>.<sup>212</sup>

On 15 March 1752, by a violent high wind great damage was done in *England*. “Two tier of ships were blown from their anchors at Tower-Dock [London], many stacks of chimnies [chimneys] were blown down, a woman in Holborn [area of central London] was killed by a brick falling on her head, two chairmen were knocked down by the ruins of an alehouse beaten down by the fall of a stack of chimnies in St. James’s-street, and one of them died the next day in St. George’s Hospital; a man by a like accident had his leg broke, and a child was killed; the beautiful painted west window of Westminster-Abbey was greatly damaged; several hundred weight of lead was blown off Chelsea Hospital; 160 feet [49 meters] of the wall of the King’s-Bench prison fell down; several hundreds of trees were torn up by the roots, and many hundred yards of wall fruit blown down about Walton, Waybridge, and other places up the river; a Sandwich hoy [a heavy barge used for freight] was run down by a collier [a bulk cargo ship which carried coal], and all in it perished. Two servants of Lord Effingham Howard were killed at his house between Guildford and Leatherhead, by the fall of a stack of chimnies; a great number of windows were broke at Norwich, besides other damage.”<sup>298</sup>

In February 1752, there was a cattle plague in Gloucestershire, Buckinghamshire, Lincolnshire, Derbyshire, Yorkshire and Lancashire, *England*. In May, the plague struck Somersetshire and Berkshire.<sup>212</sup>

On 5 May 1752, there was a waterspout in Deeping Fen in Lincolnshire, *England*. “It spouted out water to the height of two yards, ascending with a terrible noise. It carried away straw and hay into the air, which fell down again in regular showers. It looked like a pillar of smoke; ending at Molton chapel, having passed over Flowbit Wash. The waterspout was succeeded by a violent storm of hail and rain.”<sup>212</sup>

On 5 May 1752, four waterspouts [tornadoes] were seen in the region of Deeping-Den in Lincolnshire, *England*.<sup>236</sup>

On 24 May 1752, a whirlwind, or tornado, struck Calvert County, Maryland in what would become the *United States*. The tornado passed in a very narrow vein, and in its course blew down all the buildings at the plantation of John Groves, Esq. By the fall of his dwelling house, his eldest daughter, and a child in her arms, were killed, and his wife and another child dangerously hurt.<sup>298</sup>

On 29 June 1752, a dreadful storm of thunder, lightning, rain, and hail struck Bristol, *England*. The storm turned the roads into rivers. Four men and two boys, retired for shelter into the body of the new church being erected at Kingswood. As they stood facing the church door, they were struck down by lightning. They soon recovered without injury, except for a boy who bled at the nose and ear. Six horses and the driver of a wagon were struck down in the Bath road, and three of the horses killed, and another blinded, a haymaker was also struck blind with a flash of lightning.<sup>298</sup>

Meteorological observations taken at the royal observatory in Paris, *France* for the year 1752 provide the following: The depth of rainfall for the year was 18 inches  $16 \frac{2}{3}$  lines, which indicates a near average year. The greatest cold occurred on 16 January in the open air taken with a Reaumur thermometer was  $[-5.25^{\circ}\text{Re}, 20.2^{\circ}\text{F}, -6.6^{\circ}\text{C}]$ . The greatest heat occurred on 29 June was  $[27^{\circ}\text{Re}, 92.8^{\circ}\text{F}, 33.8^{\circ}\text{C}]$ . The greatest height of the barometer occurred on 31 October at 28 inches 4.5 lines. The least height of the barometer occurred on 27 June at 27 inches 1 lines. On 15 & 16 June 1752, a magnetic needle declined  $17^{\circ} 15'$  to the northwest.<sup>303</sup>

In 1752, the price of wheat [in *England*] averaged 22 shillings 6 pence per quarter [quarter ton].<sup>212</sup>

In *England* and *Wales*, the land was so inundated with continuous rains that scarcely an article of food was raised.<sup>1</sup>

The maximum temperature during the summer in Aleppo, *Syria*, was  $95.0^{\circ}\text{F}$  ( $35.0^{\circ}\text{C}$ ).<sup>62</sup>

On 20 July 1752 in the afternoon, a storm of thunder struck London, *England*. At the neat houses opposite Vauxhall, a whirlwind lifted two boats out of the River Thames many feet high. One of them fell on the shore and was dashed to pieces. The other was heaved over the high causeway [causeway] into the gardens.<sup>298</sup>

On 23 July 1752, Charles Town [now Charleston] South Carolina, in the *United States* reported, "We have had the greatest drought here ever known, which still continues, where by the crops of rice, corn, and indigo have suffered extremely. It is so great that the beasts of the field are almost starved in the pastures, and travellers call in at houses to draw water out of the wells for their horses wherefore tomorrow is, by proclamation, appointed for a solemn fast on this occasion throughout the province." Another letter indicated that from the 23<sup>rd</sup> to the 28<sup>th</sup> of July, Charleston had very fine rains, so that their crops were recovering fresh vigor.<sup>298</sup>

In July 1752, the hottest temperature in Charles Town [now Charleston] South Carolina, in the *United States* was  $100^{\circ}\text{F}$  [ $37.8^{\circ}\text{C}$ ].<sup>300</sup>

On 23 July 1752, Annapolis, Maryland in what would become the *United States* reported, "For a week past we have scarcely had a day without lightening [lightning] and thunder; which, has done much damage. On Saturday evening we had as violent a gust as any that can be remembered, accompanied, as usual, with lightening and thunder, which struck several places in this city; particularly the house of Benedict Calvert, Esq.; taking off the top of a chimney, and descending between the chimney and the wainscot (which last it split in two of the rooms) it set fire to a bed, where Mr. Calvert and his wife usually lay, but they happened providentially to be out of town. It melted the blade of a hanger. It then

descended into a lower room, and split a looking glass in pieces, and the handle of a broom at the head of the cellar stairs. Mr. Inch's house was also struck, one of the chimnies [chimneys] split, and some of the bricks carried a considerable way; three persons sitting near the fireplace were much affected by it, but received little hurt. A large poplar tree near the dock, was much shattered, and set on fire." On 30 July, they reported, "Monday last in the afternoon, there was a most violent gust of thunder and lightening in Baltimore County, which enter'd the house of Mrs. Buchanan, about three miles [5 kilometers] from Baltimore town; whereby she was struck speechless for some time, and a young woman who was sitting in the room, was instantly struck dead. Two Negroes were likewise struck down in the kitchen, but the building received no damage. A decanter standing on a chest of drawers, was split to pieces and a china bowl was flung to the ground without being broke or crack'd." <sup>298</sup>

On 29 July 1752 in *England*, there was a hailstorm in Goucestershire and Somersetshire. <sup>93</sup>

On 31 July 1752, at Skellefsen [Ellefsen] in the western Bothnia [the northernmost arm of the Baltic Sea] in *Sweden*, wind at S.W. fell a prodigious shower of hail, many of the hailstones being as large as hens eggs. A thing very extraordinary in these cold climates. <sup>298</sup>

On 1 August 1752, Charles Town [Charleston], South Carolina [in the *United States*] reported, "As the dry weather began last Oct., I shall compare the quantity of rain, by its depth in inches and decimals, which fell in this town from the first of the month to this day, with that which fell in the same ten months, ever since 1738." The greatest quantity of rain, which fell in these ten months, was from 1 October 1748 to 1 August 1749, and amounted to 47.775 inches [121.4 centimeters]. The least quantity was 26.981 inches [68.53 centimeters], which fell from 1 October 1746 to 1 August 1747. The mean quantity, which fell in these ten months in the 13 preceding years, was 35.842 inches [91.03 centimeters]. But the total depth of rain, which fell in this town from 1 October 1751 to 1 August 1752 was 16.891 inches [42.9 centimeters], a quantity not equal to one half of that which fell, at a medium, in the same space of time, in the 13 preceding years. Last month we had no rain in the town till the 22<sup>nd</sup>, since which time, the whole quantity amounted only to 1.483 inches [3.77 centimeters]. But the mean quantity of rain in the month of July, taken from the last 14 years, was 6.482 inches [16.46 centimeters]. <sup>299</sup>

On 6 August 1752, Philadelphia, Pennsylvania in what would become the *United States* reported, "Last Friday morning, the lightning struck two houses on Society Hill, but hurt no person. In its passage from the roof to the ground, it seemed to go considerably out of a direct course, for the sake of passing thorough metal; such as hinges, sash weights, iron rods, the pendulum of a clock, &c. and that where it had sufficient metal to conduct it, nothing was damaged; but where it passed thro' plastering or wood work, it rent and split them surprisngly." <sup>298</sup>

On 26 August 1752 in the morning there was a violent wind, which blew down thousands of hop poles in Kent, *England* and drove a Dutch ship ashore near Ramsgate. <sup>298</sup>

On 25 and 26 August 1752, the violence of the storm so swelled the River Tyne at Newcastle in *England*, that the like cannot be remembered by the oldest man living. The flat ground about Newburgh is laid underwater, by which the farmers sustained great loss. <sup>298</sup>

Durham in northeast *England* reported, "The storm which was felt in the south on 26 August [1752], began here on the 24<sup>th</sup> at night, and continued without intermission till the 26<sup>th</sup> at night, and so swelled the River Wear, that it laid all the flat country under water, and rendered the roads impassable. The distress of the poor country people is very great; their standing corn [grain] is entirely ruined, and the whole stacks of it shorn, together with cocks of hay [a small cone-shaped pile of hay left in the field until dry enough to carry to the barn], sheep, swine, &c. swept away by the torrent." <sup>298</sup>

“By the storm on the 26<sup>th</sup> past [26 August 1752] great part of the hundreds of Essex [in Essex, *England*, the county was divided for administrative purposes into 19 *hundreds* or districts] were laid under water, and much damage done there.” Many vessels were lost on the coast of *England*, *Scotland*, and *Ireland*, and particularly in Bristol Channel the following: *Napps and Jeffery*; *Mary and Susannah*, Capt. Gwyther; *Two Friends*, Capt. Cunningham; *Endeavour*, Capt. Baney; *Lilly*; *Friendship*, Capt. Wilcox; two vessels with grocery; a vessel with coal from Penzance; *Satisfaction*, Capt. Hamet; *Elizabeth*, Capt. Christian. The following vessels have been wrecked on the coast of Cornwall in southwest *England*: *Daniel*, Capt. Pamouret; *William and John*, Capt. Dare; *Unity*, Capt. Diamond, and all her crew lost; *Two Brothers*, Capt. Gardiner; a new brig. Capt. Randal, and only one man saved; five vessels to the westward of St. Ives, and the crews of two of them entirely perished. The *Esther*, Capt. Ball; and the [?], Capt. Norman, are ashore, and the *Margaret*, Capt. Bongey, from Bristol, with all the crew.<sup>298</sup>

On 25 and 26 August 1752, there was a gale at Newcastle [Newcastle upon Tyne in northeast *England*]. “The [River] Tyne so swelled that the like cannot be remembered by the oldest man living. The flat ground round Newburgh laid under water. Gale violent. Kent. Thousands of hop poles [tall poles to support wires on which the hop plant is trained] blown down, and much of Essex flooded.” Another account from Durham in northeast *England* reports that from the night of August 24<sup>th</sup> to the night of the 26<sup>th</sup> a gale struck. The River Wear laid all the flat country under water, ruining the corn [grain], and where cut, sweeping it away by the torrent, together with sheep and swine. Many vessels were wrecked on the coasts of *England*, *Scotland*, and *Ireland*, especially in the *British Channel* and Cornwall.<sup>212</sup>

In September 1752, it was reported that vast quantities of rain that lately have fallen, have caused the Danube River to overflow its banks, and do incredible damage. The river Nesse, near Cologne [Cologne, *Germany*] also overflowed some time before, laying a great tract of land underwater, with such violence, that most of the bridges were carried away, and many of the inhabitants of the villages. An account from Prague [*Czech Republic*] relates great damage done by the overflowing of the Moldau [Vltava] River.<sup>298</sup>

In 1752, a great hurricane struck Charleston, South Carolina in the *United States*.<sup>204</sup>

On 15 September 1752, a hurricane struck South Carolina and North Carolina in the *United States*. [Various accounts give differing fatality figures of 103 and 28.]<sup>141</sup>

In 1752 there was a remarkably hot summer at Charlestown [Charleston], South Carolina in the *United States*. During the months of June, July and August, the temperature in the shade often rose above 90° F and at one time reached 101° F. Then the winds blew hard at the northeast during the night and continued with increased violence until the morning. At about 9 o'clock in the morning, a flood with great impetuosity came rushing in. In a short time, the water rose ten feet above the high water mark of the highest tides. The waters inundated Charlestown covering the streets with boats, boards, and the wrecks of houses and ships. Before 11 o'clock, all the ships in the harbor were driven ashore by the hurricane and the smaller vessels were dashed against the houses in Bay Street. The inhabitants, expecting the tide to flow until 1 o'clock in the afternoon, its usual hour, retired to the upper stories of their homes in despair. But soon after 11 o'clock, the winds shifted; in the space of 10 minutes, the water fell 5 feet; and the town was saved from destruction. “Had the waters continued to rise, and the tide to flow until its usual hour, every inhabitant of Charlestown must have perished.”<sup>174</sup>

In 1752, the most dreadful hurricane struck Charleston, South Carolina in the *United States*.<sup>124</sup>

[Another account refers to this event in 1753.] Charleston, South Carolina in the *United States*, was severely injured by a hurricane on September 15<sup>th</sup>, 1753.<sup>42</sup>

France reported, “The advices from our *American colonies* are very far from being agreeable. About the middle of September last [1752] they had such violent storms that upwards of sixty of our vessels most of them richly laden, have been lost.”<sup>299</sup> [This passage appears to describe the loss of French vessels and the American colonies may relate to the French colonies in the West Indies.]

Charles Town [Charleston], South Carolina [in the *United States*] was struck by a terrible hurricane on 15 September 1752. “On the 14<sup>th</sup> in the evening it began to blow very hard, the wind being at N.E. and the sky looked wild and threaten[ing]. It continued blowing from the same point, with little variation, ‘till about 4 o’clock in the morning of the 15<sup>th</sup>, at which time it became more violent, and rained, increasing very fast till about 9, when the flood came in like a boar, filling the harbour in a few minutes. Before 11 o’clock, all the vessels in the harbour were on shore, except the *Hornet* man of war, which rode it out by cutting away her main-mast; all the wharfs and bridges were ruined, and every house, store, &c. upon them beaten down, and carry’d away (with all the goods, &c. therein), as were also many houses in the town; and abundance of roofs, chimneys, &c. Almost all the tiled or slated [roofs] houses were uncovered; and great quantities of merchandise, &c. in the stores on the Bay-street damaged, by their doors being burst open. The town was likewise over flowed, the tide or sea having rose upwards of ten feet [3 meters] above the high-water mark at spring-tides, and nothing now was to be seen but ruins of houses canoes, wrecks of pettiaugas [small vessels generally propelled by rowing or poling] and boats, masts, yards, incredible quantities of all sorts of timber, barrels, staves, shingles, household [household] and other goods, floating and driving, with great violence, thro’ the streets and round about the town. The inhabitants finding themselves in the midst of a tempestuous sea, the wind still continuing, the tide (according to its common course) being expected to slow till after one o’clock, and many of the people being already up to their necks in water in their houses, began now to think of nothing but certain death. But (here we must record a signal an instance of the immediate interposition of the divine providence, as ever appeared) they were soon delivered from their apprehensions; for, about 10 minutes after 11 o’clock, the wind veered to the E.S.E. [east southeast] and S.W. [southwest very quick, and then (tho’ it continued its violence, and the sea beat and dashed every where with amazing impetuosity the waters fell above 5 feet [1.5 meters] in the space of 10 minutes, without which unexpected and sudden fall, every house and inhabitant in this town, must, in all probability, have perished. And before three o’clock the hurricane was entirely over. Many were drowned, and others much hurt by the fall of houses. At Sullivan’s island, the post house [a house or inn where horses were kept for postriders] was carried away, and of 15 people that were in it, nine were lost, the rest saved themselves by adhering strongly to some of the rafters of the house when it fell, upon which they were driven some miles beyond the island of Hobcaw. At Fort Johnson, the barracks were beat down, most of the guns dismounted, and their carriages carry’d away. At Craven’s and Granville’s bastions, and the batteries about this town, the cannon were likewise dismounted.”<sup>298</sup>

— “The *Mermaid* man of war, which had just gone up to Hobcaw to heave down, was drove ashore not far from the careening place. The ship *Lucy*, of and for London, John Bulman master, which lay wind bound in Rebellion road, dragg’d her anchors, drove by the fort and this town, and ran ashore upon a marsh about 7 miles [11 kilometers] up Cooper River. A new vessel was drove off the stocks, and wrecked at Mr. Wright’s. The schooner *Nancy*, John Braddelcy, three other schooners, and the sloop *Nancy*, John Babb master, all of this port, ashore in Col. Heron’s pasture. Another new vessel was wreck’d near Mr. Scott’s. And one but lately begun, with the snow *Industry*, belonging to Mr. David Brown, ashore on the green near his house. Capt. Walker’s pilot-boat against the governor’s house; and his sloop, the *Endeavour*, bound for Jamaica, after beating down his Excellency’s coach-house, stables, &c. was dash’d to pieces against Mr. Raper’s house, whose balcony door her mast entered. Two or three pettiaugas were wreck’d against Dr. Caw’s house. A small schooner drove up against the old Custom-house door; and one of Mr. Edward’s pilot-boats to Mr. Tho. Smith’s. Several boats, &c. against Mr. Price’s. The sloop *Katharine* of New York, Rich Manley master, bound for Halifax, and the sloop *Industry*, of and for Rhode Island, ashore upon the head of Mr. Beresford’s wharf. The snow *Charming Nancy*, of and for Hull, on the head of Capt. Simmons’s, near the Council-chamber. The brig. *Peggy and*

*Sally*, of and for Bristol, Wm. James master, against the curtain-line [sea wall], between Mr. Tho. Elliott's and Mr. Motte's. The sloop *Henry*, Henry Crepier master, of and for New York, against the Exchange or New-market; where Mr. Edward's other pilot-boat is wreck'd. The snow *Dove*, John Tuppen [master], bound for Cape-Fear, on the head of Mr. Eveleigh's wharf. A small schooner against the curtain-line near the *Dove*. The brig *Two Friends*, of and for Falmouth, Robert Johns master, beat down some houses, and lies on the west side of Church street, along side of Mr. John Mathews's. The ship *Upton*, of Liverpool, lately arrived from Rotterdam, which lay up Ashley River, was dove a great way into the marsh near Wappoo. The sloop *Polly*, George Gore [master], bound for Barbadoes [Barbados]; the schooner *Elizabeth*, Alexander McGilhivray [master], of this port, for Jamaica; the sloop *Susannah*, Amos Minet [master], also of this port; the schooner *Bank* with 8 or 10 other small schooners, own'd here, and 3 or 4 pilot-boats, are drove, some into the woods, some into corn-fields, and others far into the marshes, on and about James Island, Wappoo, &c.

— “For about 30 miles [48 kilometers] round Charles-Town, there is hardly a plantation that has not lost every house upon it. All our roads are so filled with trees blown and broke down, that travelling is rendered extremely difficult; and hardly a fence was left standing in the town or country. Our loss in fine timber-trees, is almost incredible; and we have suffered greatly also, in the loss of cattle, sheep, hogs, and all kinds of provision.”

— “From Winyaw and Port Royal [in South Carolina], our accounts are much more favourable than were expected, no damage having been done to the shipping in those harbours, and very little to the houses, as the hurricane was hardly felt at either place.”

— “Yesterday arrived Capt. Gardner, from Providence, who says he felt the hurricane near St. Augustine [Florida], but received no damage; that he spoke with a large brig. off this bar, in the morning, belonging to Whitehaven, and bound from Antigua for Cape Fear; and that he saw part of a wreck, whose quarter was painted green.”

— “This day arrived Capt. Comer, from Port Royal, who has brought in five Negroes and two seamen, which he took out of the ship *Africa*, of and from Barbadoes [Barbados] for this port, John Dorrington master, lying at anchor amongst the breakers off North-Edisto [river inlet]. And Miles Tedar, master of the snow *Debby and Betsy*, of and for this port, from Jamaica. Capt. Dorrington met with a violent storm, about 7 leagues [21 miles, 33.8 kilometers] to the eastward of this place, on the 13<sup>th</sup> that continued till the next afternoon, in which his ship lost all her masts, sails, and rigging, had one of her sides beat in, and five seamen, one negro, with all her boats, &c. wash'd over-board. On the 15<sup>th</sup> he came to an anchor off Edisto [River]; and the ship *Cunliffe*, of Liverpool, (with Germans from Rotterdam) coming to the same place in the evening, he with his mate quitted the *Africa* and went on board of her. Capt. Tedar has lost his masts, &c. and carried his vessel into St. Helena inlet, near which place he met with the hurricane. He spoke with the *Cunliffe*, and a sloop from Jamaica which she had in tow, on White master, that also with the sloop *Charles Town*, Capt Steel; which vessels are now coming in.”

— “A sloop is said to be ashore on Long Island; and great quantities of wreck have been met with upon the coast.”

— “The *Mermaid*, and most of the other vessels on shore here, may be got off again.”

The rain was so violent in *Wales* that it destroyed 10,000 sheep on 19 September 1752.<sup>40, 41, 47, 56</sup>

On 19 September 1752 in *Wales*, there was a great rainstorm; 10,000 sheep drowned.<sup>92</sup>

On 26 September 1752, a hurricane struck *Cuba*. During the hurricane, sixteen ships were lost near Havana. One of the ships lost was the *Speedwel*.<sup>141</sup>

On 22 October 1752, a hurricane struck off the coast of Florida in the *United States*. The ships lost during the hurricane included *Alexander*, *Lancaster*, *Dolphin*, *Q. Anne*, *May*, *Rhode Island*, *Stratia*, a Spanish schooner, and three other vessels. Ships missing included *Mary and Priscilla*, *Pompey*, *Phillis* (7 drowned), *Three Friends*, *Kingston*, *Ruby*, *Boston*, a schooner, a ship, and a Spanish Man of War.

Another account reported a total of 12 ships lost in the Gulf of Florida. The storm also affected North Carolina.<sup>141</sup>

Charles Town [Charleston], South Carolina [in the *United States*] was struck by a second hurricane on 30 September 1752. “On Sept. 30 we had another terrible hurricane, which began, with wind and rain, about 4 o’clock in the afternoon, but ceased soon after 7 in the evening. For 2 or 3 days before, the violence of the wind (which blew from N.E. and E. and at last settled at S.E.) and the great quantity of rain that had fallen, kept the tides from ebbing their due course and time, so that when this hurricane began to abate, tho’ the water should have been low, it was higher than at common spring-tides; and had the wind rose, as was expected, when the flood should have come in, our situation would have been most deplorable indeed! But the same providence that interposed before, was again visible here.” A later account reported, “The hurricane which happened on the 30<sup>th</sup> ult. has done greater damage at sea and to the southward, than that of the 15<sup>th</sup>. Abundance of trees and several houses having been blown down that did not suffer before. At Port-Royal [South Carolina], the water rose 4 feet and an half [1.4 meters] higher than usual, and a sloop was drove ashore that entirely beat away Mr. Purry’s wharf. A sloop from Rhode-Island, Waldron master, bound for this port, put into Edisto, lost all her anchors, bowsprit, sails, boat, &c. The captain wash’d out at one of the portholes, and thrown in again. The schooners *Betty*, John Mills master, from Maryland, with German passengers, and *Minerva*, Isaac Colrock [master], from Philadelphia, were obligated to put into Edisto. The snow *Bristol Merchant*, Capt. Parsons, from Bristol for this port, with a very valuable cargo on board, that sail’d to come round from Port-Royal after the first hurricane, lost her bowsprit, top-masts, sails, &c. in this; and is since beat to pieces upon Edisto-bar, the vessel and cargo entirely lost. A large sloop, whose quarter was painted green and white, drove ashore and beat to pieces upon Kaywab Island, none of the people, but many limes, found. Capt. Tedar’s snow, drove into a marsh at St. Helena; near which inlet another snow, from sea, is said to be beat to pieces. A large ship beat to pieces, upon the Hunting Islands. And another sloop said to be ashore upon the southern coast. ‘Tis reported, that a ship and sloop are also ashore upon the Racoon keys. The ship *Africa*, of Barbadoes [Barbados, and snow *Vine*, of Liverpoole, drove ashore on the 30<sup>th</sup> ult. are since beat to pieces; but their cargoes have been saved. Tucker’s schooner has been got off. All the books, surveys and papers &c. in the surveyor-general’s office, were 5 feet [1.5 meters] under water, in the first hurricane, many of them wash’d away, and the rest are in a perishing condition, tho’ the utmost care has been taken of them.” Then later it was reported, “By a storm that happen’d on the 1<sup>st</sup> of October, much damage has likewise been suffer’d in North Carolina and at Cape Breton, at the latter of which places no less than 57 vessels were driven on shore, none of which can ever be got off. On the 9<sup>th</sup> of October, much loss was sustained also, by a storm on the coast of New England amongst the shipping.”<sup>298</sup>

*Russia* reported, “The calamities of this empire are frequent and severe; the City of Petersburg [St. Petersburg] and the country adjacent have suffer’d greatly by a hurricane and inundation which happen’d on the 2<sup>nd</sup> and 3<sup>rd</sup> of November past [2-3 November 1752]. More than 1000 people have perish’d, the fortifications have been almost destroy’d, and most of the houses situated near the Neva [River] ruin’d; nor has the mischief, been less considerable at Cronstadt [Kronshtadt, *Russia*], Nerva, Revel [now Tallinn, *Estonia*], and other parts of the empire, where most of the ships at anchor were beaten to pieces against each other; more than 100 ships are damag’d, and will probably be detain’d so long, as not to be able to sail before the frost locks them up, which will be an incredible loss to their owners.”<sup>298</sup>

*Denmark* reports, “By a violent hurricane on the 10<sup>th</sup> of November [1752], much damage has been done upon our coasts; and many pieces of wrecks are daily driven on shore.”<sup>298</sup>

On Tuesday 12 December 1752 [Gregorian calendar], a terrible storm of thunder, lightning, rain and hail struck Bristol, *England*. The storm was attended with a hard gale of wind. One of the claps of thunder was exceedingly loud between 5 and 6 in the evening, and the lightning at the same time very much surprised many people in the streets and houses. A great ball of fire was seen to issue from the clouds,

which shot with great swiftness to the northward. Several people on the road, coming to this city, were struck with such a panick [panic], that, they got off their horses to shelter themselves from the tempest. 'Tis thought that the lightning came with such large flashes, as to exceed any thing of the kind ever seen here before.<sup>298</sup>

On [12 December] 1752, there was a terrible thunderstorm and gale at Bristol, *England*.<sup>212</sup>

On 20 December 1752, there was a thunderstorm at Ludgvan in Cornwall in *England*. There was a dreadful thunderstorm with hail at Penzance.<sup>212</sup>

On 20 December 1752 at Penzance, *England*, there was a dreadful storm of hail, thunder and lightning for two hours. At Gulval, about 3 miles [5 kilometers] distant, lightning entered a house, hurt a man and his wife, killed their son and a dog, and beat down the chimney.<sup>299</sup>

On 30 December 1752 at Bristol, *England*, there was a flood. "The road from Bristol to Oxford so flooded, the coaches stopped travelling along it."<sup>212</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 2<sup>nd</sup> – raw, cold; everything was backward. May 15<sup>th</sup> – the trees do but now begin to blossom. May 30<sup>th</sup> – raw, easterly weather, as it has been all the month. June 15<sup>th</sup> – there was a promising prospect of grass, and the Indian corn started wonderfully. July 9<sup>th</sup> – begun to mow the upper ground. August 12<sup>th</sup> – in the evening there was dismal thunder and lightning, and abundance of rain, and such a hurricane as was never the like in these parts of the world; it blew down houses and barns, trees, corn, and everything in its way. August 21<sup>st</sup> – there has been more thunder and lightning, and it has done more harm this summer all over New England, than ever was known. August 31<sup>st</sup> – dry weather. September – dry, dry, dry; melancholy drought. September 30<sup>th</sup> – it rained and stormed in the night a great deal. October 9<sup>th</sup> – a storm of rain. October 30<sup>th</sup> – we wonderfully fail in our sauce by reason of the drought.<sup>78</sup>

In 1752, there was a famine in *India*.<sup>156</sup>

In 1752, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 15 February and 15 March, floods struck Hupeh (now Hubei province) in central *China* at Yün, Chung-hsiang and Ching-shan.

— During the period between 14 May and 11 June, floods struck Shensi (now Shaanxi province) in central *China* at Lo-ch'uan.

— During the period between 11 July and 8 August, floods struck Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Hai-k'ang; Shantung (now Shandong province) on the east coast of *China* at Wên-têng, Jung-ch'êng, Ling, and Lin-i; and Hopei (now Hebei province) in northern *China* at Tsun-hua. [Lin-i is located at longitude 116.52° East and latitude 37.13° North.]

— During the period between 9 August and 7 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hangchow and Hai-ning. Crops were damaged by the floodwaters.

— During the period between 8 September and 6 October, floods struck Hupeh province at Hsiang-yang, Tsao-yang, I-ch'êng, Ku-ch'êng and Chün; and Kwangtung province at Lung-ch'uan.

— During the period between 8 November 1752 and 5 February 1753, floods struck Chekiang province at T'ung-hsiang.

In 1752, droughts engulfed many regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, a drought engulfed Hupeh (now Hubei province) in central *China* at Fang.

— During the period between 12 June and 7 September, a drought engulfed Shansi (now Shanxi province) in northern *China* at Chieh.

— During the period between 8 August and 8 November, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hai-ning, Yü-hang, Hangchow and Fu-yang; Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Hai-k'ang; and Shensi (now Shaanxi province) in central *China* at Hsiang-ning.

In 1752 during the 6<sup>th</sup> moon on the 16<sup>th</sup> day in the vicinity of Shanghai, *China*, there was a great typhoon that continued a day and a night. It threw down walls and houses innumerable; the sea overflowed.<sup>166</sup>

**Winter of 1752 / 1753 A.D.** This winter in December and January the weather was severe: the lowest measured temperature in Paris, *France* was 10.9° F (-11.7° C). The region of Toulouse, *France* had severe frosts.<sup>62</sup>

On 22 December 1752, a frost began at Aberdeen, *Scotland*. “Till this day it had been uncommonly mild; the magpies laid eggs and the July flowers were in full bloom.”<sup>212</sup>

On 22 & 23 December 1752 at Aberdeen, *Scotland*, the first frost of winter struck. Up until that time, the weather was so uncommonly mild, that on the 22<sup>nd</sup> [of December], a July flower was observed in full bloom in a gentleman's garden and on the Lovat estate; magpies laid eggs and hatched them.<sup>299</sup>

On 25 December 1752 at four in the afternoon, a remarkable meteor was observed in Glasgow, *Scotland*. The “meteor being a large ball of fire with a long tail, past over this place, in direction from the N.E. to the S.W. and after having exhibited, for some time, the various colours of the rainbow, it burst into a thousand sparks of fire, and was immediately follow'd by a great shower of hail.”<sup>298</sup> [Possible comet atmospheric impact]

On 30 December 1752, Bristol, *England* reported by the late rains, the roads from Oxford, &c. to this city, were so overflowed that the post [mail] from those places were detained 10 hours.<sup>299</sup>

On 1 January 1753, Boston [Massachusetts in the *United States*] reported, “A shower of rain fell lately, to the eastward, which turned into ice, or congeal'd, as it fell [freezing rain]; and many flocks of wild geese that were flying, had their wings suddenly frozen, and fell down as if shot.”<sup>299</sup>

On 1 January 1753 at Boston, *England*, there was a freezing rainstorm. “A shower of rain fell lately to the eastward, which turned into ice, or congealed as it fell; and many flocks of geese that were flying had their wings suddenly frozen and fell down as if shot.”<sup>212</sup>

On 24 January 1753, there was a severe frost in London, *England*. The frost continued to the middle of February with snow. The frost struck Lyndon in Rutland on 25 January and lasted until 9 February. The coldest day was 6 February, when the temperature fell to 15° F [-9° C].<sup>212</sup>

The weather in Dublin, *Ireland* in January 1753 was: on the 3<sup>rd</sup>, hail and snow; 5<sup>th</sup>, 6<sup>th</sup>, 7<sup>th</sup> and 8<sup>th</sup>, foggy; 10<sup>th</sup>, 11<sup>th</sup>, 12<sup>th</sup> and 13<sup>th</sup>, gales; 12<sup>th</sup>, hail; 19<sup>th</sup>, snow; 24<sup>th</sup>, 25<sup>th</sup>, 29<sup>th</sup> and 31<sup>st</sup>, gales. In February: on the 1<sup>st</sup>, there was a west-southwest gale; 2<sup>nd</sup>, north-northwest gale; 5<sup>th</sup>, 6<sup>th</sup> and 7<sup>th</sup>, snow; 11<sup>th</sup> and 12<sup>th</sup>, hail and snow; 13<sup>th</sup>, 14<sup>th</sup>, 16<sup>th</sup> and 24<sup>th</sup>, gales; 18<sup>th</sup>, hail. In March: on the 1<sup>st</sup>, snow; 11<sup>th</sup>, 12<sup>th</sup>, 14<sup>th</sup>, 15<sup>th</sup>, 16<sup>th</sup>, 19<sup>th</sup>, 23<sup>rd</sup>, 25<sup>th</sup>, 27<sup>th</sup>, 29<sup>th</sup> and 31<sup>st</sup>, gales; 18<sup>th</sup>, 26<sup>th</sup> and 31<sup>st</sup>, hail. In April: on the 1<sup>st</sup>, 2<sup>nd</sup> and 29<sup>th</sup>, gales; 3<sup>rd</sup>, 6<sup>th</sup>, 8<sup>th</sup>, 10<sup>th</sup>, 11<sup>th</sup> and 29<sup>th</sup>, hail.<sup>212</sup>

On 1 February 1753, there was a violent thunderstorm at Ludgvan in Cornwall, *England*.<sup>212</sup>

On 15 February 1753, in Edinburgh, *Scotland*, the roads were almost blocked up with snow.<sup>212</sup>

On 15 February 1753, “The post boy with the London mail, in his way from Edinburgh [*Scotland*] to Haddingtoun [Haddington, *Scotland*], fell into a snow wreath [snowdrift] where he almost perished. The mail did not arrive from London till late last night, the roads being almost impassable for snow. The post boy from Linlithgow with the Glasgow mail, lost his horse in the snow, and with much difficulty sav’d himself and the mail.”<sup>299</sup>

On 17 February 1753, there was a flood at Yarm in Yorkshire, *England*. The flood was caused by the sudden rain melting the snow. The water was seven feet [2.1 meters] deep in the highest part of town. Many houses were washed away, most of the bridges destroyed, and many persons, horses and cows drowned. Floods were also great at Doncaster and throughout the north of *England*.<sup>212</sup>

On 20 February 1753, there was a flood at Dublin, *Ireland*. “By great snow last Monday, and heavy rains next day, the river Liffey became overflowed.”<sup>212</sup>

---

**1753 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: January and February – though there has been some cold, blustering weather, this season, it was, upon the whole, a moderate winter. March – the first of this month mostly cold; the last, moderate and pleasant. March 31<sup>st</sup> – the spring surprisingly warm and forward. May 18<sup>th</sup> – the first pleasant day this spring. June – the season is uncommonly forward. August 26<sup>th</sup> – the grasshoppers have done much damage. October 24<sup>th</sup> – the frosts held off wonderfully.<sup>78</sup>

In February 1753, *Spain* reported, “We have a greater drought in this kingdom than has been remembered for many years. In Estremadura [Extremadura], they have killed all the lambs, in order to have subsistence enough for the sheep; and in Andalusia, provender [feed] is so scarce, that they have been obliged to send most of their horse into other provinces.”<sup>299</sup>

On 7 February 1753, Glasgow, *Scotland* reported, “The River Clyde rose here, last night, higher than has been known these 40 years, occasioned by the rains melting the great falls of snow, and happening at the full of the moon, and a strong wind from the south, all the lower part of the city was overflow’d.” “Much mischief has happened in many parts of the north of *England*, from the late snows and the succeeding heavy rains; particularly at Doncaster, where 4 men were lost crossing the river, which was swell’d to a surprising degree, and their post [mail] was detained by the floods, near a day and a half.”<sup>299</sup>

On 17 February 1753 at Yarm in Yorkshire, *England*, “At four this morning the banks of our river were broken, and the stream ran thro’ the town. The water continued rising till noon, and it was with great difficulty we got the [occupants of] houses out of the town to some higher ground. When the flood was highest we had 7 feet [2.1 meters] water in the highest part of the town; all the lowest part was under water, and the current thro’ the town so rapid, that many houses were wash’d away. Horses, cows, dogs, cats, and all sorts of household furniture were floating and no one able to save them; some horses indeed were saved in chambers. Most of the bridges are broken down, and many lives lost. It was occasion’d by a sudden rain melting the snow on the neighbouring hills.”<sup>299</sup>

On 17 February 1753, the great bridge over the Danube River in Vienna, *Austria* was carried away by the shoals of ice, which came down the river after the thaw, and the same day the like accident happened to another bridge at some distance.<sup>299</sup>

On 20 February 1753, Dublin, *Ireland* reported, “By the great fall of snow, last Monday, and the heavy rains of the next day, the [River] Liffey became so rapid, that many stairs were carried away, some lighters and ships were sunk, and several drove to sea which have not yet been heard of.”<sup>299</sup>

On 27 February 1753, the river dried up at Peebles, *Scotland*. “The river Tweed on Wednesday sev’night was dry’d up near Peebles, from 6 a.m. till 6 p.m., the current being entirely suspended.”<sup>212</sup>

In March 1753, *Portugal* reported, “the extraordinary drought which still prevails here, and the fear of an indifferent harvest, has induced the court to send for a [secure?] provision of corn to foreign countries, which is to be deposited in magazines in different parts of kingdom, from which it will be delivered at a reasonable price. (This drought has been since succeeded by plentiful rain.)”<sup>299</sup>

On 6 March 1753, Naples, *Italy* reported that in Sicily, the tides were so strong, and the sea so agitated, for some days past, that the waves rose above the dikes, and overflowed the city of Palermo, which occasioned much damage, especially to the fortifications.<sup>299</sup>

On 22 March 1753, [London, *England*] reported that a great spring tide overflowed the public offices and cellars about Whitehall and Westminster. Then on 24 March, it was reported that because of an inundation of the River Dee, several houses and works have been carried away.<sup>299</sup>

On 22 March 1753, there was a flood at Whitehall in the *United Kingdom* [might be Whitehall in Dublin, *Ireland*, Whitehall on Orkney Islands in *Scotland*, or the Palace of Whitehall in London, *England*].<sup>212</sup>

On 24 March 1753, there was a great flood on the River Dee. Several houses were carried away. [The River Dee flows through *Wales* and *England*.]<sup>212</sup>

In May 1753, *Spain* reported, “The plentiful rains we have lately had, promise a fine harvest, and the price of corn [grain] is since fallen one third. This rain has also corrected the unwholesomeness of the air, and put a period [end] to the fevers occasioned by the late great drought.”<sup>299</sup>

On 20 May 1753, a terrible hailstorm struck Hall [Halle], Mersburgh [Meersburg] and Luzen [Lützen] in *Germany*. The hailstones were of a prodigious size and made sad devastation in those parts.<sup>299</sup>

On 24 May 1753 in *England*, there was a great hailstorm at Hoxton near London; windows broken and trees greatly damaged.<sup>93</sup>

Beginning on 28 May 1753, a group including Sir Charles passed from Lanslebourg-Mont-Cenis, *France* over the Rhône-Alpes to Novalesa, *Italy*. On their journey “Then, tho’ the sky was clear when we passed the mountain, yet the cold wind blew quantities of frozen snow in our faces; insomuch that it seemed to me just as if people were employed, all the time we were passing, to wound us with the sharpest needles [diamond dust ice crystals]. They indeed call the wind that brings this sharp-pointed snow, *The Tormenta*.” The mountains were covered in deep snow and they took a sledge down the slope, like a toboggan ride, covering 4 Italian miles in less than 5 minutes. “Sir Charles observed to me, when we were on the plain or flat top of Mount Cenis, that, had not the winter been particularly long and severe, we should have had, instead of this terrible appearance of snow there, flowers starting up, as it were under our feet, of various kinds, which are hardly to be met with any where else.”<sup>299</sup>

On 30 May 1753 in *Saxony*, there was a terrible hailstorm in Mersburg and Luzen. The hailstones were of prodigious size and caused much devastation.<sup>93</sup> [Mersburg is now located in east-central *Germany*. Luzen, now Luzenau, is also in east-central *Germany*.]

On 31 May 1753 in Rome, *Italy*, there were hailstones as big as hens’ eggs; great devastation to grain and fruit crops. The storm was accompanied by a hurricane and shocks of earthquake.<sup>93</sup>

On 31 May 1753, Rome, *Italy* reported, “we had here a terrible hurricane, during which there fell a great quantity of hail, some of the stones were as big as a hen’s egg. The damage which it did to the vines and other fruits of the earth is very great.”<sup>299</sup>

On 1 June 1753, there was a thunderstorm at Tiverton in Devon, *England*.<sup>212</sup>

On 2 June 1753, there was a hailstorm at Sherborne in Dorset, *England*. “Prodigious hailstones, lasting two hours (weather very sultry); some stones 3 inches [8 centimeters] about; thunder and lightning. At Downton some stones 6 inches [15 centimeters] about. At Bridgewater many stones were 6, 7, 8 and 9 inches [15, 18, 20 and 23 centimeters] about [in circumference], which made holes in the ground. Persons were injured by the stones, and most of the windows were broken.”<sup>212</sup>

On 2 June 1753 in *England*, there were hailstorms at Bridgewater (Somerset). The day had been very sultry, and wind northwest. The storm began gradually about 6 o'clock; by 7 it was at its height, and hailstones measuring 6, 7, 8, and 9 inches in circumference were found. Many of these had made holes in the ground like cannon shot. The storm continued nearly half an hour effecting great damage to buildings, trees and grain crops. Broken windows estimated at £500. The storm extended into Dorsetshire.<sup>93</sup>

On 2 June 1753 about 7 o'clock in the evening, the weather extremely sultry, there fell a prodigious shower of hail, which lasted for nearly 2 hours at Sherborne, *England*. Some of the hailstones measured 3 inches [8 centimeters] about. The storm was attended with thunder and lightning. At Downton, in Wilshire, some of the hailstones measured 6 inches [15 centimeters].<sup>299</sup>

On 2 June 1753, Bridgewater, *England* reported, “This day, being exceeding hot, and the wind N.W. about 6 o'clock, a storm of rain and hail, with thunder and lightning [lightning], began moderately; but at 7 was at a dreadful height. Many of the hail stones were 6, 7, 8 and 9 inches [15-23 centimeters] about, and have made holes in the ground like cannon balls. It continued for half an hour with this rapidity, and made great devastation, to the ruin of many farmers. Divers [Diverse] persons were bruised by the larger hail stones.”<sup>299</sup>

On 8 June 1753, Francfort [Frankfort, *Germany*] reported, “the extraordinary heats [hot weather] we have had for sometime past, have done much damage to the corn and fruits, and have consequently raised the price of provisions.”<sup>299</sup>

During the summer of 1753, an immense swarm of locusts made havoc in Posnania [Poznań, *Poland*] with the corn [grain] and fruits of the earth. But while the inhabitants were mourning over their desolated fields, a flight of storks providentially came to their assistance, and devoured all those destructive insects.<sup>299</sup>

At Rouen in northern *France*, “The continual northerly winds of the year 1752 occasioned a long and dry winter. The ensuing March [1753] was mild and rainy, but in April the wind fixed again in the northern quarter, and made the ground so hard, that the hopes of a plentiful harvest which March seemed to promise were then much abated. May brought on great heats [hot weather], which continued all June, July, and the beginning of August, during which space there were for the most part southerly winds, with very little rain. It is remarkable however, that on June 23 the thermom. [thermometer] was something below the freezing point, and the cold so sharp, that the plants were frozen on our hot beds [sunboxes], and many sheep, which had been lately shorn, died in the meadows. But suddenly again the heat and drought was so considerable, that the herdsmen were obliged to fetch water for their cattle from the rivers. The corn [grain] ripened so fast, as to be cut a month before the usual time, and the vine-dresser [a person who cultivates and prunes grapevines] had the satisfaction of filling his casks by the 20<sup>th</sup> of September.

The autumn proved so dry as to last till November, but then incessant rains came on, except seven or eight days of hard frost. A thick fog arose the 21<sup>st</sup> of this month [December], in the morning, of a very stinking, sulphureous [sulfurous] smell, which increased to that degree in the evening, that the lights could not be discerned in the streets. Three or four days after this fog our epidemic disease made its first appearance, and advanced so rapidly as to threaten a great mortality [dying].”<sup>301</sup>

On 24 June 1753 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 24 June 1753, a great storm of hail fell, by which the windows on the west side of the haberdashers alms houses, Haxton [a district on the east end of London, *England*], were all broke. And the trees were cut, as if done with a knife. Most of the hailstones measured an inch and a half about.<sup>299</sup>

In 1753, the price of wheat [in *England*] averaged 32 shillings per quarter [quarter ton].<sup>212</sup>

In July 1753, *France* reported, “On the 7<sup>th</sup> the heat was so excessive that the thermometer rose to 30.5 [° C, 86.9° F], being a degree higher than has been known here in the warmest summers, such as those of 1706, 1748, and 1749.”<sup>299</sup>

On 9 July 1753, a terrible storm [and tornado?] struck Sandomir [Sandomierz], *Poland*. Most of the houses in the city were overturned, the roof of the churches torn off, bridges broken down, and much cattle, and some of the inhabitants, were lifted from the ground, and carried by the violence of the wind into the Vistula [River] and drowned.<sup>299</sup>

On 11 July 1753 in Toul in northeastern *France*, the hailstones were 3 inches in diameter.<sup>93</sup>

On 27 July 1753, *Russia* reported that a strong north wind began to blow and four days after snow fell to the depth of 18 inches [0.5 meters], and the succeeding night was as hard a frost as can be remembered.<sup>299</sup>

In August 1753, Bohemia [now western *Czech Republic*] reported that such a large quantity of hailstones of enormous size upon the village of Strechow, near Tabor [Tábor, *Czech Republic*], belonging to Prince Lobkowitz, as to entirely ruin the fruits of the earth for 2 miles [3 kilometers] round.<sup>299</sup>

In July 1753 in *Bohemia*, hailstones of enormous magnitude fell at Streckow near Tabor [now in the *Czech Republic*], estate of Prince Labkowitz, destroying fruit and grain for some miles round.<sup>93</sup>

In August 1753 in *France*, there was a violent hailstorm near Lyons; some of the stones weighing over a pound.<sup>93</sup>

In *Ireland*, there were great inundations through the country.<sup>47, 92</sup>

In *Germany* and Holland [now *the Netherlands*], there was a great overflow of the Rhine River.<sup>47, 92</sup>

On 4 August 1753, heavy rains caused a flood in the River Liffy [Liffey] in *Ireland*. It caused considerable damage to the shipping. The bridge of Turvey near Drogheda, and several hay-ricks, were washed away.<sup>299</sup>

On 22 October 1753, Halifax in Nova Scotia, *Canada* reported, “At Cape Breton, for six hours, on the 7<sup>th</sup> instant [7 October], the wind at S.E. [southeast] they had so violent a storm that near 40 sail of vessels [sailing ships] were drove ashore and some of them lost. The same storm did great damage here also, and tore up all the trees on the Citadel hill.”<sup>300</sup>

On 12 October 1753, a most violent storm of rain struck Honiton in Devonshire, *England*. It swelled the rivers to such a degree, that the floodwaters swept away several hayricks and a great number of cattle and also several bridges and houses. Some people were drowned. Many of the people that lived near the bridge in town were obliged to get out at the tops of their houses. The damage done here and in the neighborhood cannot be less than 3000*l*.<sup>299</sup> [In present currency, that would be equivalent to £387,000 in damages based on the retail inflation price index.]

On 18 October 1753, there was a prodigious swelling [flood] of the River Teame [Teme], that the waters overflowed all the meadows, and low grounds about Powick, &c. near Worcester, in the West Midlands of *England* and drowned a great number of sheep.<sup>299</sup>

This year was one of the hottest summers of the 18<sup>th</sup> century. The summer of 1753 in Denainvilliers, *France* was characterized by:

Hot days	70 days
Very hot days	2 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

These figures indicate a very high average temperature of the summer in the middle of *France*. The maximum temperatures observed during the summer were:

Toulouse, <i>France</i>	(101.1° F, 38.4° C)
Denainvilliers, <i>France</i>	( 97.3° F, 36.3° C) on 7 July
Mulhouse, <i>France</i>	( 96.4° F, 35.8° C) on 8 July
Paris, <i>France</i>	( 96.1° F, 35.6° C) on 7 July

A severe drought prevailed in the south from June to November. The corn harvest was mediocre, but the grain harvest pretty good along with the crop of grapes. In Burgundy, the grape harvest began on 19 September, the wine was available and the quality good. In the area around Orleans the harvest of cereals was equal to half of a good harvest, and grapes three-quarters of a good harvest.<sup>62</sup>

In December 1753, *Denmark* reported, “We have had very stormy weather lately, in the Sound, by which many ships of different nations have been driven ashore on our coasts.”<sup>299</sup>

In 1753, there were an unusually high number of reports of fires across *Europe* from *Russia* to *England* that reduced entire cities to ash.<sup>299</sup> The drought and hot temperatures that were recorded in this year may have been a contributing factor.

In December 1753, *Spain* reported, “Many provinces are still in the greatest want of rain, particularly those in the inland part of the kingdom, where man and beast are daily perishing for want of a necessary supply of provisions, on which account the king, to prevent as much as possible the miseries of famine, has ordered quantities of corn [grain] to be bought up in Naples and Sicily [in Italy], at his expence [expense], to be sold to the people at a moderate price.”<sup>299</sup>

On 12 December 1753, Navan, *Ireland* reported, “The floods have carried away the nearer and further arches of the new bridge over the [River] Boyne; great damage has been done, and the roads are almost impassable.”<sup>299</sup>

In 1753, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 8 November 1752 and 5 February 1753, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at T’ung-hsiang.

— During the period between 5 March and 3 April, floods struck Kiangsi (now Jiangxi province) in southern *China* at Hsia-chiang and Chi-an; and Hupeh (now Hubei province) in central *China* at Mien-yang, Ch’ien-chiang, T’ien-mên and Ch’i-shui.

— During the period 1-29 July, floods struck Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Jao-p'ing. Over 650 house-sections damaged by the floodwaters.

— During the period between 28 August and 26 September, floods struck Shantung (now Shandong province) on the east coast of *China* at Wu-ti, Lin-i, T'an-ch'êng [possible misprint, "Yen-ch'êng"], Shou-kuang, Pin, Li-ching, Chan-hua, and Jih-chao. [Lin-i is located at longitude 118.24° East and latitude 35.07° North.]

— During the period between 27 September and 25 October, the Huai River in Anhwei province flooded damaging houses and the Su River in Shantung province flooded causing several villages to flood.

During the same time period, floods struck Anhwei (now Anhui province) in eastern *China* at T'ai-hu, Fêng-yang and Wu-ho; and Kwangtung province at Hsin-i. At Hsin-i, over 200 house-sections were damaged by the floodwaters and over 50 persons drowned.

— During the period between 26 October and 24 November, floods struck Hopei (now Hebei province) in northern *China* at Ch'ing-yün. During the same time, the Yellow River flooded damaging many houses.

— During the period between 24 December 1753 and 22 January 1754, floods struck Hupeh province at T'ien-mên.

In 1753, droughts engulfed several regions of *China* including:<sup>153</sup>

— During the period between 5 February and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at T'ung-lu. Crops were damaged. Wells and springs dried up.

— During the period between 2 June and 25 October, a drought engulfed Shansi (now Shanxi province) in northern *China* at Kuang-ling.

— During the period between 8 August and 8 November, a drought engulfed Hopei (now Hebei province) in northern *China* at T'ang-shan and Chekiang province at Yüeh-ch'ing and P'ing-yang.

The year 1753 was a year of abundance in the vicinity of Shanghai, *China*. A *tau* of rice cost less than one hundred cash.<sup>166</sup>

**Winter of 1753 / 1754 A.D.** Just before the opening battles of the French and Indian War in December 1753, George Washington, then 21 years old, crossed the Allegheny River (*United States*). In their first attempt, Washington and a guide used a raft to cross the ice-choked river and this ended in disaster as Washington was knocked overboard in deep water and saved himself only by catching the raft as it swept by. The severe cold that night froze their clothes and the guide's fingers. The river also froze, however, allowing them to walk across on the ice the next morning. Soon they reached the safety of an English trader's settlement.<sup>11</sup>

The *Baltic Sea* froze.<sup>37</sup>

In 1754 in *Denmark* and *Poland*, the frost was very severe.<sup>93</sup>

During the winter of 1753-54, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

The winter in *England* in 1754 was very severe.<sup>2</sup>

Frost in *England*.<sup>40, 41, 43</sup>

During the winter of 1753-54 [in *England*], the coldest day was on 6 February when the temperature fell to 15° F [-9° C].<sup>236</sup>

During the winter in *England* in 1754, the frost was very severe; especially at Bath in *Sommerset* and in the southwest of *England*.<sup>47, 93</sup>

The winter of 1753-54 was severe everywhere in *France*. The frost began in November and lasted until April. There were 52 frost days. The lowest temperature observed in Paris, *France* was 5° F (-15° C). The snow was very abundant. Many cattle perished. In *England*, the winter was also severe in London where the lowest observed temperature was 16° F (-8.9° C).<sup>62</sup>

On Thursday, 13 December 1753 at Manchester, in northwest *England*, all the rivers hereabout have been frozen over. A number of men and boys, a few days since, sliding on a milldam, between Wigan and Chorley, the ice broke, and every soul perished, as also 5 or 6 women in endeavoring to save their children.<sup>299</sup>

On 15 December 1753, Dublin, *Ireland* reported, “By the late frosts and snow and the heavy rains that have continued ever since, many rivers have overflowed their banks, and particularly the Liffey, by which great damage has been done to ships and boats, and several sailors were crushed to death amongst them, and many limbs broken.”<sup>299</sup>

On Monday, 17 December 1753 at Worcester in the West Midlands of *England*, “Upon going off of [melting] the snow, we had a great flood, which laid the lower part of the city under water, and the inhabitants were obligated to take to their upper rooms.”<sup>299</sup>

On 19 December 1753, the river Lecq [Lek] has risen considerably within these few days at Utrecht, *the Netherlands*. At Wyck, it rose 37 inches [0.9 meters], and at Schalwyck [Schalkwijk], it rose 46 inches [1.2 meters] above the high water mark, which makes us apprehensive that the dykes [dikes] will give way; the consequence of which would be the drowning of the neighboring country.<sup>299</sup>

On 22 December 1753, Flanders reported that at Liege [Liège, *Belgium*], “the rivers are so swell’d, within this fortnight, by the great rains, that most of them have overflowed and laid a great extent of the country under water.”<sup>300</sup>

On 28 December 1753, Francfort [Frankfort, *Germany*] reported, “Incredible damage has been done by the overflowing of the rivers Taubur [Tauber], Kocher, Jaxt [a tributary of the Neckar River] in Franconia, Fielde [Felde] and Unstrut [Saale-Unstrut?]. The latter broke through the dikes, and the inhabitants of Alten and Gotteren [Göttingen?] had scarce time to save themselves upon an eminence, before the town was overflowed; nay, the torrent following them, their neighbours were forced to relieve them, by floats of beams fastened together. In short, the whole face of that part of the country is ruined.”<sup>300</sup>

In *Scotland*, “The river Tay was locked up some weeks by the late frost, and on Dec. 28 [1753], the thaw caused such an inundation, that Perth, for two or three days was a peninsula. Whole ridges of fine land were torn away by the rapidity of the river, and bulwarks, built at great expense for the security of the town and adjacent places, destroyed.” “Also great damages have been done about Aberdeen, by the swelling and overflowing of the rivers Dee and Doveran [Deveron], from the great rains.”<sup>300</sup>

Clerkenwell [in central London] observed a temperature of 17° F [-8.3° C] at 9 a.m. on 11 December. On 30 December 1753 at 10 p.m., the temperature at Bath, *England* [in the open air] fell to 2° F [-16.7° C]. At this point, the thermometer was relocated inside. “I have no doubt, had I suffer’d it to remain without two or three hours longer, the mercury would have subsided to 0 deg.” “So intense a cold, in these southern parts of *England* has not, I believe, been known in any of the hard winters of this century, tho’ we have had some very severe ones.” On the night of 30 December the temperature near Hereford, *England* [16 miles from the border with *Wales*] fell to 4° F [-15.6° C] and by 9 o’clock the next morning it had not quite reached 6° F [-14.4° C]. The coldest temperature at Lydon in Rutland, *England* occurred at 8 a.m. on 31 December, when the temperature dropped to 18° F [-7.8° C].<sup>300</sup>

On 31 December 1753 it was reported, “The frost has been very severe in many parts this month, and the succeeding thaw, attended with heavy rains, caus’d great floods, which have done much mischief; and a great number of vessels have been wreck’d on the *English, Scotch, Irish, and Welch* coasts, in the late stormy weather.”<sup>299</sup>

In January 1754, *Russia* reported, “The season, since October [1753], has been excessively mild; so that we have had neither frost nor snow, whereby the method of travelling by sledges is render’d impracticable, and with any other carriages the road cannot be passed [probably due to excessive mud].”<sup>300</sup>

In January 1754, *Denmark* reported, “The snow this season has been excessive deep, and the frost is so severe, that 3 East India Men [ships] and 18 merchant ships are frozen up in the [sea] road of Copenhagen.”<sup>300</sup>

In January 1754, *Bohemia* [now within the *Czech Republic*] reported, “By as severe a frost as was ever known, the Moldau [River] has been so frozen, as to bear [the weight of] all sorts of carriages, and the vast quantities of snow have almost render’d the roads impassable.”<sup>300</sup>

A letter from R. Brooke, M.D. in Maryland in what would become the *United States* recorded temperature during the period September 1753 to August 1754. The lowest temperature of 10° F [-12° C] occurred on 12 February 1754. The highest temperature of 88° F [31° C] occurred on 25 August 1754. The thermometer was hung out of doors in a place where the sun never shone upon it. He remarked that this period did not produce a remarkable cold day last winter; nor hot day the succeeding summer. He remarked “the oldest people among us [observed], that the winter succeeding a hard winter in Europe is very severe here [in Maryland].” The summer of 1754 in Maryland was the wettest summer that is remembered by any man.<sup>301</sup>

On 1 January 1754, *Hamburgh* [Hamburg], *Germany* reported, “The neighbourhood of Bremen is all under water, by the overflowing of the Weser [River].”<sup>300</sup>

On 2 January 1754, *Ireland* reported, “Greater damages have been done by the late floods and storms, than has been remember’d; lands being overflowed, people, bridges, houses and trees carried away, and the rivers and roads rendered impassable.”<sup>300</sup>

On 2 January 1754, *Spain* reported, “the late tempests have done great damage on our coasts, where several vessels have been cast away, particularly a French ship of 24 guns.”<sup>300</sup>

In January 1754, *Holland* [*the Netherlands*] reported, “Two dikes in the neighbourhood of Deventer, in the province of Overyssetl [Overijssel], have given way by the late inundations, and threw the water of the Rhine [River] into the river Yssel [Ijssel], with so great rapidity, that most part of the lower town of Deventer was laid under water. The inundation was also great in the county of Twent [Twente], and the county of Zutphen; the environs [neighborhood] of the town of Zwooll [Zwolle] were overflowed [flooded] for about five leagues [15 miles, 24 kilometers], and a great number of cattle and people drowned. Half the city of Emmerick has been under water, and it would have been totally overflowed, but for a dike raised in haste in the middle of the old market, and the giving way of the dikes of Halem [Haarlem] and Leuven, by which means the districts of Limers [Lemmer], Latum, Doesburgh [Doesburg], &c. are entirely overflowed; and many thousand inhabitants ruined. At Leuven, the parsonage house was carried away, and the parson, and his sister, and a maid servant drowned.” Then on 15 January, *Hague* in *the Netherlands* reported, “The wind coming about to the southward, the waters in the several provinces have fallen so very considerably, that in some places the land that was overflowed is already dry.”<sup>300</sup>

In February 1754, *Poland* reported, “An odd accident lately happened in Posnania [Poznań]. A severe frost succeeding some days rain, fifteen bustardi [bustard], a bird next in size to the ostrich, having alighted in a field, had all their wings and feathers so strongly froze, that they could not fly; some were kill’d by the country people with blugeons [bludgeons], and others were taken with dogs; but they made so much resistance that a man was wounded and two dogs kill’d.”<sup>300</sup>

On 6 February 1754, “the river was so frozen above Kingstonbridge [over the River Thames in London, *England*], that people passed and repassed it [the frozen river] with safety.”<sup>300</sup>

On 8 February 1754, Paris, *France* reported, “It has, for two days past, froze so violently that, by observation, it is colder by a degree than it was in 1740; nor has so much snow fallen for 60 years, it being near two feet [0.6 meters] deep at Paris, and three [0.9 meters] in the country, and the Seine [River] is frozen over above Charenton. In the road leading to Beauvais, several holes, particularly upon the mountains, were filled with the snow [avalanches], and thereby several travelers perished.”<sup>300</sup>

On 9 February 1754, Copenhagen, *Denmark* reported, “The sea is now frozen over quite too the Swedish coast, so that people pass it on foot, and [army] deserters, on both sides, have taken advantage of it to change their service.”<sup>300</sup>

On 20 April 1754, Copenhagen, *Denmark* reported, “A great quantity of snow has cover’d the ground for some months past, and the last winter has been the longest that any person can remember.”<sup>300</sup>

In May 1754, *Sweden* reported, “The weather continues very severe in this country, the rocks are still covered with snow, and the earth frozen as in the middle of winter, an instance of which the oldest person cannot remember.”<sup>300</sup>

**1754 A.D.** In *England and Scotland*, there were great rainstorms in early spring.<sup>47, 92</sup>

In March 1754, *Spain* reported, “We have had violent storms for a fortnight past in which many ships of divers [diverse] nations have been lost on our coast.”<sup>300</sup>

In *Germany* and Holland [now *the Netherlands*], there were serious floods.<sup>47, 92</sup>

On 23 April 1754, Berlin, *Germany* reported, “A terrible storm of thunder and lightning happened lately at a village call’d Sonnenburgh [Sonnenberg], which set fire to Scharnow church, by which that building, and almost the whole town, was reduc’d to ashes.”<sup>300</sup>

In 1754, there was an inundation in Holland [now *the Netherlands*].<sup>43</sup>

On 13 May 1754, Exeter, New Hampshire in what would become the *United States* reported, “It is a melancholy time in regard to drought, and the terrible burnings there are in the woods. It is feared Nottingham will be almost destroyed. Several houses and barns are burnt already. The meeting house hardly escaped. 100,000 boards burnt at one mill; almost all the pine timber in the town destroyed; and the fire still raging. It seems unless providence should interpose, the country above us must be laid waste. We hear also that the fire has made great destruction of the woods at and about Chester, in the said province.” On 20 May 1754, Portsmouth, New Hampshire reported, “The woods have been on fire between Merrimack and Kennibek rivers, for thirty days past, which has done great damage to the fences, and the houses in several towns were with difficulty preserved.” [We are since informed, that the late plentiful rains have put a stop to the progress of the flames.].<sup>300</sup>

On 16 May 1754, “an inundation between Heilbron [Heilbronn] and Fouthenborough, *Germany*, has lately done great damage; before which a more terrible storm happened than the oldest man can remember; all the dykes [dikes] and causeways were broken down, and the fields and meadows ruined; houses, stables and cow-houses were overturned, and the cattle drowned. The damage done is computed at 100,000 flor. [florins]”<sup>300</sup>

On Friday, 14 June 1754 [Julian calendar], “In Monmouthshire and Gloucestershire [*Wales*] was the most violent storm of hail known in the memory of man, which did great damage to the corn [grain], fruit, and windows, some of the hail stones measuring 4 and 6 inches [10-15 centimeters]. Immediately after the hail, fell a prodigious shower of rain, which occasion’d such a flood, that many houses were filled four feet [1.2 meters] deep with water, and the rivers overflowed and cast out fish. At Coventry [*England*] the flood was so great, that for some time, waggons [wagons] and carriages were stopt [stopped] from passing through the town.”<sup>300</sup>

On 14 June 1754, there was a terrific hailstorm in Monmouthshire, *Wales* and Gloucestershire, *England*. Some of the hailstones measuring from 4 to 6 inches in circumference. Grain, windows, and fruit trees were severely injured. The storm was followed by prodigious quantities of rain, flooding the country seriously. At Coventry there was also a great hailstorm.<sup>93</sup>

On 15 June 1754 in *England*, there was a great hailstorm in Devonshire.<sup>93</sup>

On 18 June 1754, Dublin, *Ireland* reported, “Last Thursday [June 13<sup>th</sup> in the Julian calendar] and the two following days, the rains did great damages, and Rathfarnham bridge was thrown down, which was one arch of 100 feet [30 meters] wide. Many people and cattle were drown’d, and boats drove to sea.”<sup>300</sup>

On Thursday, 16 July 1754, *England* reported, “A violent rain began about Worcester, which held near 12 hours, without intermission. It beat down the grain and fruit, and made sad havock [havoc] in the country. The rivers Tame and Severn overflow’d their banks, and it being the midst of hay harvest, great crops of hay were carried off the meads [meadows] down the stream. The Severn never rose so high in the memory of man.”<sup>300</sup>

On Sunday, 28 July 1754 between 6 and 7 in the evening, Walton in Suffolk, *England* was struck by a violent storm of thunder, lightning, rain and hail. The hailstones were as large as pigeon’s eggs, which did great damage to the corn [grain] and other fruits of the earth, and scarce a whole quarry of glass [a pane of glass having a square or diamond shape.] is remaining in the windows of the town. The damage is supposed to amount to 500*l*. The hail fell about a mile [1.6 kilometers] in length and half a mile [0.8 kilometers] in breadth.<sup>300</sup>

On 28 July 1754 in *England*, there was a violent storm in Suffolk, with rain and hail. The hailstones were as large as pigeons’ eggs, and inflicted great damage upon the grain and fruit crops. The effect of the storm extended for about 1 mile in length, and half a mile in breadth.<sup>93</sup>

The year 1754 was very dry in Paris, *France*. This occurred mainly in the winter and the spring. The year produced only 14.7 inches (372 millimeters) of rainfall compared to typical yearly average of 20.9 inches (530 millimeters). The water level [on the Seine River] fell on October 7 to the zero water mark of 1719.<sup>79</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:  
January and February – generally moderate and pleasant. March 6<sup>th</sup> – the frost seems almost out of the ground. March 15<sup>th</sup> – cold, and froze hard. April 6<sup>th</sup> – this is the 13<sup>th</sup> day of fair, dry, and therefore pleasant weather. April 18<sup>th</sup> – this is the 25<sup>th</sup> day of pleasant weather. April 31<sup>st</sup> – cold, but dry. May 13<sup>th</sup> – cloudy and foggy; the grass

grows surprisingly well. May 23<sup>rd</sup> – a remarkable hot day. July 1<sup>st</sup> – I have no grass growing in my mowing ground, and there is no feed on the Neck [peninsula]; the reasons are, the open winter, three weeks early drought, and the grasshoppers. September 1<sup>st</sup> – we have no potatoes growing this year, because of grasshoppers. September 22<sup>nd</sup> – there was a melancholy drought. October 24<sup>th</sup> – a great storm; the earth is filled with water. November 5<sup>th</sup> – a smart storm with a deluge of rain and thunder and lightning in the night. There has been less thunder this summer than during many years past. November 23<sup>rd</sup> – unusually moderate and pleasant all this fall. December 13<sup>th</sup> – since the second day of this month, the weather has been pleasant, and the ground bare. December 27<sup>th</sup> – no sledding yet.<sup>78</sup>

In August 1754, *Poland* reported, “Great havock [havoc] has lately been made by the locusts, in the neighbourhood of Biala [Bielsko-Biala] in Posnania [Poznań], and in upper *Poland*. Much damage has been done by some late floods.”<sup>300</sup>

On Monday, 12 August 1754, Northampton in East Midlands region of *England* reported, “The floods have been so extraordinary since the great rains, that the cross roads, in many places, are impassable.”<sup>300</sup>

On 26 August 1754, Bonne [Bonn], *Germany* reported, “A serious storm of thunder, lightning, and hail, which happened in our neighbourhood last Thursday, has done very considerable damage to both sides of the Rhine [River]. The hail beat off the fruits of the trees, and the torrents of rain, which tore up and carried away the vines which the hail spared, has ruined whole vineyards for a long time to come.”<sup>300</sup>

On 13 September 1754, a violent hurricane struck the Leeward Islands, in which 25 vessels were run on shore at *Montserrat* and *Antigua*; and 5 at *St. Kitt's*, which had received great damage. Another account reports, “Twelve ships were drove ashore on the island of St. Domingo [now the *Dominican Republic* and *Haiti*] in the hurricane of last September, and on computation 1700 hogsheads of sugar were lost. Great damage was also sustained in the sugar and indigo plantations.”<sup>300</sup>

In September 1754, a hurricane did great damage in St. Domingo to the sugar and indigo plantations. Twelve ships were driven on shore and 1,700 hhd of sugar were lost.<sup>143</sup> [hhd is an abbreviation for hogshead – a large cask or barrel holding 63 gallons.] [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

In 1754, seven feet three inches [87 inches or 2.21 meters] of rain fell in Barbados in the *Lesser Antilles* during the year.<sup>143</sup>

On 14 October 1754, a hard gale from the northeast caused great damage in North Carolina that would become part of the *United States*. The town of Portsmouth at Ocrick bar was overflowed, so that they went round it in boats.<sup>300</sup>

On Monday, 29 October 1754, York, *England* reported, by a sudden inundation of the river Rye, at Helmsley, *England*, two houses were washed away, and 13 persons drowned. Two other houses were greatly damaged, as also the stone bridge at the entrance of the town. Much damage was likewise done at Rivaulx [Rievaulx], where many cattle drowned, and haystacks washed away or driven down the river to a great distance.<sup>300</sup>

A letter from Maryland in what would become the *United States* dated 22 November 1754 reported, “At the time of the full moon in the latter end of last month, there fell such prodigious quantities of rain in our mountains, that the low grounds both in Maryland and Virginia, near Potowmack [Potomac] river, were under water, four people were drowned, many horses, cows, sheep, corn, tobacco, &c. were washed down with the current. These inundations frequently happen above the falls, but never do any damage below

navigable water. This year the flood rose 37 feet 9 inches [11.5 meters] perpendicularly, which is 4 feet 9 inches [1.4 meters] higher than it was ever known before.”<sup>301</sup>

On Tuesday, 5 November 1754, Gloucester, *England* [near the Welch border] reported, “The heavy rains which fell from Friday last to Sunday night, so much swelled the river Toway [Towy] in Carmarthenshire, *Wales* as to drown all the low lands between Landoverly [Llandoverly] and Carmarthenshire, and in the Vale the water was six feet [1.8 meters] high.”<sup>300</sup>

On Thursday, 7 November 1754, Glamorgan, *Wales* reported, “The rains in this county have been lately very heavy, and the floods have carried away an arch built over the river Tuaf [Taff], 144 feet [44 meters] wide, and supposed to be the largest in Europe.”<sup>300</sup>

On Saturday, 9 November 1754, Sherborne, *England* reported, “The rains have been so violent about Honiton in Devonshire, that the rivers have overflowed their banks, broke down several bridges, carried away some houses, and did other damage. The like accounts are received from several parts of Cornwall.”<sup>300</sup>

On 12 December 1754, Edinburgh reported, “The water of [River] Dee was so swelled last week by the break of the storm, that all the meadows were overflowed, and the cattle and sheep swept away; the poor found 55 dead sheep in different places, and many more are missing.”<sup>300</sup> [The River Dee flows through *Wales* and *England*.]

On Friday, 13 December 1754, “By a storm of wind, the glass-house at the Falcon stairs [in London, *England*] was blown down, boats on the river overset, barges, &c. damaged, and many chimneys blown down in different parts of the town.” On Monday 16 December, it was reported, “Several cellars, kitchins [kitchens], &c. in the low part of Westminster, were filled with water, and considerable damage done by the high tide, occasioned by the land floods, and late great wind.”<sup>300</sup>

On 14 December 1754, a thunderstorm struck Lorrain, *France*. “At 7 in the morning, a cloud of fire, followed by a most dreadful clap of thunder, covered the whole village of St. Aubin [Saint-Aubin-sur-Aire], situated in Lorrain [Lorraine], between Ligny and Void. The terror it occasioned was so great, that horses and other cattle broke their bridles and halters, and ran wildly about the streets and fields. The lightning fell upon the church, in which there were then two young women, who fell senseless to the ground; by the same flash the top of the confession-box, the steeple door, and the lower windows were beaten down, and the walls of the church shaken & crack’d. The lightning made its way thro’ the loft of the steeple, and broke down the timbers that supported the great bell, which fell upon the second bell, and broke that, together with the clock. The covering of the steeple was carried away, and the south and west angles beaten down. The materials were dispers’d with so prodigious a force, that stones weighing above eighty pounds [36 kilograms] were thrown upon the isle of the church above 22 yards [20 meters] from the steeple, and some upon adjacent houses, the roofs of which they broke thro’. The mayor of the village, who was then standing in his yard, at a good distance from the church, found himself suddenly surrounded with fire and smoke, and remained about a minute without either sight or senses. The same day they had terrible claps of thunder at Commercy, which is three leagues [9 miles, 14.5 kilometers] from St. Aubin, but no damage done.”<sup>301</sup>

On Friday, 20 December 1754, it was reported that there “was a terrible storm of wind and rain at Hollinburn [Hollingbourne] in Kent [*England*], which did great damage to the parish church, and the houses; a barn was blown down, and 30 large trees torn up by the roots.” Then on Tuesday 31 December, it was reported, “The late winds and tides have had such an effect on the banks at Romney-Marsh [in Kent], that the consequence is much apprehended.”<sup>300</sup>

On Tuesday, 31 December 1754, it was reported, “The weather has been very stormy for some time past in North and South Wales, attended with excessive heavy rains, and the floods were out so about Montgomery [*Wales*] as to render travelling difficult and dangerous.” “At Liverpool [*England*] they have also had exceeding stormy weather, and their shipping were in imminent danger.”<sup>300</sup>

In 1754, a severe drought of long duration engulfed Hupeh (now Hubei province) in central *China* at Ching-mên.<sup>153</sup>

The year 1754 was a year of abundance in the vicinity of Shanghai, *China*.<sup>166</sup>

In 1754 during the 8<sup>th</sup> moon, there were three tides in one day at Tsingpu, *China*.<sup>166</sup>

**Winter of 1754 / 1755 A.D.** In January 1755, *Sweden* reported, “There has fallen such a quantity of snow lately in the western provinces that it is near 6 feet [1.8 meters] deep, which renders the roads in many places impassable.”<sup>301</sup>

On 6 January 1755, *France* reported, “At 7 [o’clock] in the morning, a thermometer of Reaumur’s construction, placed at Versailles, in a window of the Archbp [Archbishop] of Lewis’s cabinet, was fallen to 11 one half [-11.5°Re, 6° F, -14.4° C], which is 2 degrees lower than in 1740. This thermometer is exposed to the W. [west] and sheltered from the North wind, by one of the stairs of the orangery, and, for these reasons, is always a degree higher than that in the king’s apartments, which is exposed to the N. [north] so that the cold on that day was two degrees lower than in 1740. The snow has very deep, even in the mild temperature of Marseilles.”<sup>301</sup>

The cold on January 6<sup>th</sup>, 1755 lead to much ice on the Seine River; on the 8<sup>th</sup> the ice surrounding the Isle Louvier in Paris, *France* was firm. The ice held until the 20<sup>th</sup> of January. The Seine River froze a second time beginning on the 26<sup>th</sup> but on the 29<sup>th</sup> it thawed again. On February 5<sup>th</sup> it froze again but on the 7<sup>th</sup> the river thawed for the third time. On January the 7<sup>th</sup>, the temperature on the Garonne River was (5° F, -15° C). The Garonne River was passable on foot.<sup>62</sup>

The winter of 1755 produced an excessive cold in the central and the southern *France*. This cold was less intense in the north. The Rhône River was frozen in Arles and Avignon to the thickness that carts pass over the frozen rivers safely. The river ceased to be navigable even in Lyon during the first half of January. Thermometers in the shade and exposed to the air in Lyon recorded -4° F (-20° C) and -5.8° F (-21° C) on the 17<sup>th</sup> of January. In Arles, another thermometer, if we believed the suspects reports, saw the largest temperature drop with a recording of -17.5° F (-27.5° C). The observations performed in Montpellier deserve more confidence. The cold struck in Montpellier suddenly on January 5, by a very violent northwest wind and the frost lasted until February 7, almost without interruption. This produced a total of 33 days of frost of which 25 days were a very heavy frost. The last fortnight fell so much snow that the snow level in the streets reached a height of 1.4 to 2.1 feet (438 to 649 millimeters). The coldest days at Montpellier were the 7 & 28 January and 1 & 5 February. The thermometer sank three times to 16.3° F (-8.7° C). The severity of this winter spread over Nimes and Toulouse. At Nimes, the cold reached 11.8° F (-11.2° C) on January 7. The coldest temperature in Toulouse was 10.6° F (-11.9° C). The north of *France* could not completely escape this harsh winter. In Paris the thermometer sank to 3.9° F (-15.6° C), but the cold was relatively less harsh and less durable than in the South.<sup>79</sup>

The winter of 1754-55 was severe in *France* and *Italy*. The Seine River in *France* froze twice. The lagoon at Venice, *Italy* froze twice and the ice bore the weight of people. The frost in Denainvilliers, *France* lasted from November to March, producing 51 frost days. The lowest temperatures observed were:

Geneva, *Switzerland* (-13.0° F, -25.0° C).

Frankfurt, *Germany* ( -5.8° F, -21.0° C)  
 Paris, *France* ( 3.9° F, -15.6° C) on 6 January  
 London, *England* ( 10.9° F, -11.7° C)

In southern *France* there was a lot of snow, and a number of olive trees froze in Languedoc.<sup>62</sup>

On 19 March 1755 in the neighborhood of Demonte, as in the upper valley of Stura, in the province of Cuneo in *Italy*, there was a great avalanche of snow from the mountain at Bergemoletto. Twenty-two people were buried in the avalanche under 60 feet of snow. Before the avalanche, there had been 3 days of continuous snowfall. Joseph Rochia tried to dig down to his house and barn to find his family. The month of April was very hot. On 25 April, he dug down to his barn and located his wife, sister and daughter within and still alive.<sup>237</sup>

In March 1755, three people were buried alive in an avalanche at Bergemoletto, *Italy* and survived over 5 weeks buried under 60 feet [18 meters] of snow.<sup>303</sup>

— “A small cluster of houses at a place called Bergemoletto near Demonte in the upper valley of Stura, was on the 19<sup>th</sup> of March 1755, entirely overwhelmed by two vast bodies of snow that tumbled down from a neighbouring mountain. All the inhabitants were then within doors, except one Joseph Rochia and his son, a lad of 15, who were on the roof of their house clearing away the snow which had fallen for 3 days incessantly. A priest going by to Mass, advised them to come down, having just before observed a body of snow tumbling from the mountain towards them. The man descended with great precipitation, and fled with his son, he knew not whither; but scarce had he gone 30 or 40 steps, before his son, who followed him, fell down; on which looking back, he saw his own and his neighbours houses in which were 22 persons in all, covered with a high mountain of snow. He lifted up his son, and reflecting that his wife, his sister, two children and all his effects were thus buried, he fainted away; but soon reviving got safe to a friend’s house at some distance.”

— “Five days after, Joseph being perfectly recovered, got upon the snow, with his son, and two of his wife’s brothers, to try if he could find the exact place where his house stood; but, after many openings made in the snow, they could not discover it. The month of April proving hot, and the snow beginning to soften, he again used his utmost endeavours, to recover his effects, and to bury as he thought, the remains of his family. He made new openings and threw in earth, to melt the snow, which on the 24<sup>th</sup> of April was greatly diminished. He broke through ice six English feet [1.8 meters] thick, with iron bars, thrust down a long pole & touched the ground, but evening coming on, he desisted.”

— “His wife’s brother, who lived at Demonte dreamed that night, that his sister was still alive, and begged him to help her; the man affected by his dream, rose early in the morning and went to Bergemoletto, where Joseph was; and after resting himself a little, went with him to work upon the snow, where they made another opening, which led them to the house they searched for; but finding no dead bodies in its ruins, they sought for the stable, which was about 240 English feet [73 meters] distant, which having found, they heard a cry of, *help, my dear brother*. Being greatly surprised as well as encouraged by these words, they laboured with all diligence till they had made a large opening, through which the brother who had the dream immediately went down, where the sister with an agonizing and feeble voice told him, *I have always trusted in God and you, that you would not forsake me*. The other brother and the husband then went down, and found still alive the wife about 45, the sister about 35, and a daughter about thirteen years old. These they raised on their shoulders to men above, who pulled them up as it was from the grave, and carried them to a neighbouring house. They were unable to walk, and so wasted, that they appeared like mere skeletons. They were immediately put to bed, and gruel of rye-flour and a little butter was given to recover them. Some days after, the Intendant came to see them, and found the wife still unable to rise from her bed, or use her feet, from the intense cold she had endured, and the uneasy posture she had been in. The sister, whose legs had been bathed with hot wine, could walk with some difficulty; and the daughter needed no further remedies.”

— “On the Intendant’s interrogating the women, they told him, that on the morning of the 19<sup>th</sup> of March they were in the stable, with a boy of 6 years old and a girl about 13. In the same stable were six goats,

one of which having brought forth two dead kids the night before, they went to carry her a small vessel of rye-flour gruel; there were also an ass, and five or six fowls. They were sheltering themselves in a warm corner of the stable till the church bell should ring, intending to attend the service. The wife related, that wanting to go out of the stable to kindle a fire in the house for her husband, who was clearing away the snow from the top of it, she perceived a mass of snow breaking down towards the east, upon which she went back into the stable, shut the door, and told her sister of it. In less than three minutes they heard the roof break over their heads, and also part of the ceiling. The sister advised to get into the rack and manger, which they did. The ass was tied to the manger, but got loose by kicking and struggling, and threw down the little vessel, which they found, and afterwards used to hold the melted snow which served them for drink.”

— “Very fortunately the manger was under the main prop of the stable, and so resisted the weight of the snow. Their first care was to know what they had to eat. The sister said she had 15 chesnuts [chestnuts] in her pocket; the children said they had breakfasted, and should want no more that day. They remembered there were 30 or 40 cakes in a place near the stable, and endeavoured to get at them, but were not able, for the snow. They called often for help, but were heard by none. The sister gave two chesnuts [chestnuts] to the wife, and eat [ate] two herself, and they drank some snow water. The ass was restless and the goats kept bleating for some days; after which they heard no more of them. Two of the goats, however, being left alive, and near the manger, they felt them, and found that one of them was big, and would kid, as they recollected, about the middle of April; the other gave milk, wherewith they preserved their lives. During all the time they saw not one ray of light, yet for about 20 days they had some notice of night and day from the crowing of the fowls, till they died.”

— “The second day, being very hungry, they eat all the chestnuts, and drank what milk the goat yielded, being near two pounds [0.9 kilograms] a day at first, but it soon decreased. The third day, they attempted again, but in vain, to get at the cakes. So resolved to take all possible care to feed the goats; for just above the manger was a hay-loft, whence through a hole the sister pulled down hay into the rack, and gave it to the goats as long as she could reach it, and then, when it was beyond her reach, the goats climbed upon her shoulders, and reached it themselves.”

— “On the sixth day the boy sickened, and six days after desired his mother, who all this time had held him in her lap, to lay him at his length in the manger. She did so, and taking him by the hand, felt it was very cold; she then put her hand to his mouth, and finding the cold likewise, she gave him a little milk; the boy cried, *Oh my father in the snow! Oh father, father!* and then expired.”

— “In the mean while the goats milk diminished daily, and the fowls soon after dying they could no more distinguish night and day; but according to their reckoning, the time was near when the other goat should kid, which at length they knew was come, by its cries. The sister helped it, and they killed the kid, to save the milk for their own subsistence. So they found that the middle of April was come. Whenever they called this goat, it would come and lick their faces and hands, and gave them every day two pounds [0.9 kilograms] of milk, on which account they still bear the poor creature a great affection.”

— “They said, that during all this time, hunger gave them but little uneasiness except for the first five or six days; that their greatest pain was from the extreme coldness of the melted snow-water, which fell on them, from the stench of the dead ass, goats, fowls &c. & [et cetera and] from lice; but more than all from the very uneasy posture they were confined to, the manger in which they sat squatting against the wall, being no more than 3 feet 4 inches [1 meter] broad.”

— “After the first two or three days they had no evacuation by stool. The melted snow-water and milk were discharged by urine. The mother said she had never slept, but the sister and daughter declared they slept as usual.”

In 1755, there was a severe winter in *Switzerland*.<sup>193</sup>

---

**1755 A.D.** In the north of *England*, there were floods.<sup>40, 41, 43</sup>

Thunderstorms or rainstorms and an earthquake desolated *Provence, France* in 1755.<sup>79</sup>

On 17 May 1755 in *England*, there was a hailstorm in Huntingdonshire and Staffordshire.<sup>93</sup> [Huntingdonshire is a district of Cambridgeshire in eastern *England*. Staffordshire is a landlocked county in the West Midlands region of *England*.]

On Tuesday, 10 June 1755, “at Newmarket [in Suffolk, *England*] was such an inundation of water as was never known before, occasioned, it’s thought, by the breaking of a cloud between Chevely [Cheveley] and that town; for the torrent was so sudden that the inhabitants had no time to help themselves; and so rapid that it beat down two people in the street. It displaced grave stones in the church-yard, and removed pews in the church. The water was four feet [1.2 meters] deep in several houses; at the Star Inn, 28 hogsheads of beer and two pipes of wine were staved and lost. The damage is computed to be 1300*l*.”<sup>301</sup> [In present currency, that would be equivalent to £171,000 in damages based on the retail inflation price index.]

On Saturday, 5 July 1755, a terrible thunderstorm struck Bristol, *England*. The next day, thunder and lightning killed 12 sheep in the parish of Isterton near Devizes [in Wiltshire, *England*], and 6 more in the parish of Coat [Coate], two miles [3 kilometers] from that town. Then on Monday 7 July, “At Margate in Kent in the forenoon was a prodigious tempest of lightning and thunder, followed with heavy rain and hail, such as had not been known in the memory of man. At a place called Shallows, the water was near five feet [1.5 meters] deep in the houses. Between five and six in the evening, Capt. Morrison, in his ship, being about a league [3 miles, 4.8 kilometers] below the Nore Lands, saw two water spouts, one towards the Isle of Shepey [Sheppey], at about a mile [1.6 kilometers] off, which lasted about eight minutes; the other, a large one, toward the Essex coast, which lasted about 14 minutes. The sea was all in a break with them.”<sup>301</sup>

On 7 July 1755 in *England*, there was a hailstorm in Kent and Sussex, near Rye. "Hop grounds entirely stripped of all their leaves and branches, the bare poles only left standing; corn and mowing grass beat flat, as if trampled upon by a thousand horses; hedges and fruit trees bruised in such a manner as if purposely and with great force beaten to pieces; hailstones 6 or 7 inches round, and in such quantity as to reach near to the mid-leg; and which, by their continuing on the ground all night, and in many places for several days after, so chilled the earth as to render it very frigid and unkindly." Poultry was killed.<sup>93</sup>

On 13 July 1755, a dreadful storm of hail and thunder struck almost every part of the kingdom of *Denmark*. In Copenhagen, the lightning destroyed a chimney. In the duchies of Holstein and Sleswick [Schleswig] [now part of *Germany*], it reduced 13 houses to ashes. The corn [grain] was destroyed in several districts by the hail, which was as large as walnuts. Three days after they had another storm, which likewise did some damage to the fruits of the earth, but much less than the former.<sup>301</sup>

On 29 July 1755, a most terrible storm of thunder and lightning struck the Cape of Good Hope [now Godthåb or Nuuk] in West *Greenland*. “This being perfectly new, at least to the present inhabitants of that climate, terrified them to such a degree, that, after two or three repeated claps of thunder, they ran in the greatest confusion, and making the most terrible howlings, to their caves, from whence the most timorous could hardly be prevailed on to come out for some days, while other, more courageous, during the storm fired loaded muskets at the black clouds that hung over the entrance of their caves. The same accounts add, that on the 16<sup>th</sup> of August happened a like storm, and that the summer was so excessive hot, that the snow which some valleys had been accumulating for several years past, entirely dissolved; that the herbage arrived to great perfection, and the fruit to a degree of ripeness, which neither natives nor others remember to have seen before.”<sup>301</sup>

On Monday, 1 September 1755, Edinburgh, *Scotland* reported, “was the greatest fall of rain ever known in this country, which swelled all the rivers, and did a great deal of damage to the neighbouring fields; in particular the rivers of Spey and Findhorn rose upwards of 12 feet [3.7 meters] perpendicular more than

usual, and carried off a great deal of timber, grain, cattle, &c. A woman and a boy perished in the water of Dolnan in Strath Spey [Strathspey]; and a woman in the water of Lossie near Elgin. The small rivulets [very small streams] likewise rose to a great height, and several cattle pasturing on the banks of some of them were carried down, and perished.”<sup>301</sup>

On 29 September 1755 in *England*, there was a great hailstorm in Devonshire, and in Kent and Sussex.<sup>93</sup>

In October 1755, a sudden inundation produced great destruction in most of the valleys of Piedmont, *Italy*. The River Po overflowed. The disaster was preceded by horrible thunder. The inundation was due to the immense volume of water, which during the storm, suddenly issued through a new opening from underground in the mountains.<sup>205</sup>

The summer of 1755 in Denainvilliers, *France* was characterized by:

Hot days	57 days
Very hot days	5 days
Extremely hot day	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The maximum temperatures observed during the summer were:

Denainvilliers, <i>France</i>	( 97.3° F, 36.3° C) on 20 June
Paris, <i>France</i>	( 94.5° F, 34.7° C) on 6 July
Mulhouse, <i>France</i>	( 88.9° F, 31.6° C) on 21 June and 12 July

The summer was very hot in the region around Toulouse; and the year was rich in cereals except oats and corn. But the harvest was minimal. While in the lower Languedoc wine was abundance, but there was a grain shortage. In Burgundy, the grape harvest began on 16 September; the yield was of sufficient quantity, but mediocre quality. In the middle of *France* the corn harvest was weak; the grape harvest was about the size of half a normal crop; vegetables were abundance; fruits production poor.<sup>62</sup>

On 27 December 1755, it was reported, “The waters of the Rhone [Rhône River] in Normandy [*France*] swelled to a height never before known, by which a surface of more than 40 square leagues [305,000 acres, 1,235 square kilometers] comprehending the territory of Arles, has been totally laid under water, the summits of a few hills only excepted. The two branches of the river which surrounded the island of Camargue, united and made but one stream, by which more than 30,000 sheep were drowned, besides horses and mules. The city of Arles suffered much; the great causeway at Terascon was overflowed, and the country adjacent laid under water to the height of eight feet [2.4 meters]. Avignon has likewise been exposed to the like misfortune, and the whole country of Venaisien [Venaissin] as well as Provence, has sustained losses in cattle, corn, wine, and oil, to an incredible value.”<sup>302</sup>

In 1755, floods struck Shantung (now Shandong province) on the east coast of *China* at Chin-hsiang and Yü-t'ai; and Hupeh (now Hubei province) in central *China* at Ch'ien-chiang, Mien-yang, Ching-mên, Chiang-ling, Chien-li and Kuang-hua. During the period between 11 April and 10 May, a drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Chieh-yang. During the period between 10 June and 8 July, a drought engulfed Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Ts'ang-wu. During the period between 8 August and 5 September, a drought engulfed Shantung province at Huang. During the period between 3 December 1755 and 1 January 1756, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

January – several snowfalls, and some sledding. January 21<sup>st</sup> – the ground almost bare. January 22<sup>nd</sup> – moderate; it hardly freezes a night. January 25<sup>th</sup> – the ground bare. February 11<sup>th</sup> – no snow this month yet. February 20<sup>th</sup> – some sledding, having had two or three inches (5 or 8 centimeters) of snow. February 30<sup>th</sup> – fine walking, and very

good sledding. March 20<sup>th</sup> – very good sledding. March 29<sup>th</sup> – it snowed all day. May 8<sup>th</sup> – we have done gardening. May 25<sup>th</sup> – the creatures were put on the Neck [peninsula]. June 14<sup>th</sup> – it rained abundantly. June 28<sup>th</sup> – very hot until the afternoon, when there arose a severe hurricane, with rain; Captain Bennett's frame [house] was blown down. July 18<sup>th</sup> – the Indian corn (by heat and alternate showers) grows finely. August 26<sup>th</sup> – no hot weather this summer (except eight days) until today. September 12<sup>th</sup> – a wonderful growing season. September 19<sup>th</sup> – there was a frost. October 6<sup>th</sup> – warm. October 14<sup>th</sup> – digging potatoes. October 26<sup>th</sup> – cold. December 6<sup>th</sup> – a true winter's day. December 15<sup>th</sup> – a fine summer's day.<sup>78</sup>

---

**1756 A.D.** In *England* and *Europe*, there were great floods.<sup>47, 92</sup>

On Tuesday, 10 January 1756, “By the violence of the wind several barges were driven from their mooring below the bridge [in London, *England*] and running athwart [across] one another received great damage.” Worcester in the West Midlands reported, “By the high wind one of the pinnacles on the Malvern church was blown down, and other damage done to the noble antique building. At Kidderminster a very large tree, at the entrance of that town from Stowerbridge [Stourbridge], was blown up by the roots. And from other parts of the country we hear of great damage done to churches, dwelling-houses, and out-buildings; and that many trees were forced up by the roots, and carried to an incredible distance from the place where they grew. Some people affirm, they saw several flashes of lightning, that the sky seemed to separate, and that several lucid streams emitted from the opening. The hurricane caused a general consternation, and people’s fears naturally suggested to them the apprehensions of an earthquake or inundation.”<sup>302</sup>

On Friday, 13 January 1756, “At Stamford [in Lincolnshire, *England*] was a violent hurricane; two windmills broke loose, and were set on fire, and one of them burnt to the ground.” “At Liverpool [in Merseyside, *England*], about one in the morning began a most violent gale of wind at N.W. which lasted about four hours. Numbers of chimneys were blown down, houses stript [stripped] of their roofs, and two or three buildings levelled with the ground. In the height of the gale a fire broke out in a warehouse adjoining to the custom-house, but was happily extinguished without much damage.” “At Birmingham [in the West Midlands of *England*] considerable damage was done by the high wind. Several chimneys were blown down; some windows of the new church and chapel blown out; the roof of the church at Handsworth was stripped of its leaden covering, and several trees broke and thrown down.”<sup>302</sup>

A letter from Tuam, *Ireland* on 19 January 1756 reported, “We have here the most dreadful season your idea can form; nothing but lightening and thunder, hail, and rain, & such terrible storms, that the very houses crack and shake. Scarcely a week passes that we do not hear of some persons being drowned, the floods are risen to such a pitch. The Archbishop was five miles on his way to Dublin last Monday, but obliged to turn back, the roads being quite impassable.”<sup>302</sup>

From Echt, *Scotland* they write, that on the 26<sup>th</sup> of January [1756], many in the parish of Lumphanan and Kincarden [Kincardine] were surprised with thunder and lightning, which were more frightful than ever they had heard and seen, but especially the last. They imagined the loch of Auchlossen all on fire, as also some of the hills around them, and that it was either an earthquake or the day of judgement.<sup>302</sup>

In February 1756, *Scotland* reported, “Tempest, storms, hurricanes, thunder, lightning, and other terrifying phenomena have never been known so frequent throughout the kingdom as in the present winter.”<sup>302</sup>

On 11 February 1756, the most violent storm ever known struck Ross in *Ireland*.<sup>302</sup>

On Thursday, 18 March 1756, Saffron Walden in Essex, *England* reported a very unusual noise in the air. It was “attended by the descent of hailstones of an extraordinary size, some measuring three inches and a

half [9 centimeters] round, and in shape like a pear. The hailstorm went northward, the noise gradually decreasing for some minutes, and then entirely ceasing. As there was not the least breath of wind, every body apprehended an earthquake.”<sup>302</sup>

On Tuesday, 20 April 1756, “The heavy rains that fell this day rais’d the waters in the road at Edmonton [a borough in London, *England*] in some places 8 or 9 feet [2.4-2.7 meters] high. A bridge at Tuckey-Street near Enfield, was carried away. The Enfield, Cheshunt, and a great many other stage coaches and carriages were oblig’d to stop all night at Tottenham and Edmonton. The Hadham stagecoach was overset, and a woman passenger, the only one in the coach, was drowned.”<sup>302</sup>

In April 1756, it was reported that “At Romsdvalen [Romsdalen] in *Norway*, a torrent of water suddenly rushed out of a neighbouring mountain, by which not only the greatest part of the houses were destroyed, and all the cattle for about two miles [3 kilometers] round drowned, but many of the inhabitants were likewise born away by the stream. They do not attribute this strange event to an earthquake, as the nature of such phænomena are but little known in that remote country.”<sup>302</sup>

In April 1756 on the *Island of Minorca* in the Mediterranean Sea, a storm arose on the 13<sup>th</sup> that scattered transports and disordered a military convoy. In this storm, a merchantman and 14 tartans received so much damage that there was a necessity for sending them back, after taking out the troops and provisions they had on board. The roads became impassable and the weather so hot, that the cattle fainted under their labor. Then the heat grew intolerable.<sup>302</sup>

On 10 May 1756 in *England*, there was a hailstorm in Staffordshire.<sup>93</sup>

In 1756 [in *France*] there were early May frosts, which were strong enough to damage the [grape] vines. June was cold and damp. The month of July was so damp and cold that individuals dressed for winter and warmed themselves from time to time. August and September were still cold. In Denainvilliers, *France* the maximum summer temperature was 89.4° F (31.9° C) on 16 July. In Burgundy, *France*, the grape harvest began on 4 October. The harvest produced a normal yield; but because the grapes were rotten, the wine was mediocre. In the south of *France* the seasons fell into disorder. Rain and winds followed each other continuously. The year was unfavorable to agriculture. There were many floods, especially in November. In Berlin, *Germany*, it was very hot in June.<sup>62</sup>

On Thursday, 24 June 1756, a poor man and his child going to Wrestlington feast in Cambridgeshire, *England*, was killed by lightning. The next day a house at Mulner in Suffolk was set on fire by lightning. Then on 27 June, a most violent storm of lightning, thunder and rain struck London, and its neighborhood, in which a large tree, about 2 feet [0.6 meters] in diameter, that stood in a public yard in Petticoat Lane, was snapped into two.<sup>302</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

January – moderate and pleasant month, generally. January 28<sup>th</sup> – the season seems so altered that the fish were struck in, as in May. February – much delightful weather. March – some blustering weather, but unlike March. March 19<sup>th</sup> – rainy and warm, like May. April 12<sup>th</sup> – the robin visited us several springs past. May 11<sup>th</sup> – our heart cherry trees and pear plums are blossoming. May 19<sup>th</sup> – they are all in the bloom. Hot and rainy. June 2<sup>nd</sup> – things were never so forward; plenty of rain this month. June 27<sup>th</sup> – a hot Sabbath. July 12<sup>th</sup> to 15<sup>th</sup> – foggy. July 20<sup>th</sup> – a fine growing season. July 22<sup>nd</sup> – we are visited with worms, as we were thirteen years ago, which have destroyed whole fields of English and Indian corn in divers [diverse] places. July 30<sup>th</sup> – a wet summer this! August 10<sup>th</sup> – I never saw such grass, so tall and thick. August 26<sup>th</sup> – very hot. September 11<sup>th</sup> – extremely hot, but come on very cold. September 24<sup>th</sup> – the frost has killed the brakes and leaves of Indian corn. November 12<sup>th</sup> – fine weather.<sup>78</sup>

In 1756, the climate of *Syria* is described as: “The seasons in general are regular, particularly at Aleppo, where the air is usually very healthy, and so pure and free from damps [damp weather], that the

inhabitants of all ranks not only sup [eat supper] but sleep in their court yards, or on the tops of their houses, exposed to the open air, from the end of May to the beginning of September. The severity of winter is reckoned to last but 40 days from the 12 of Dec. [December] to the 20<sup>th</sup> of Jan. [January]. The air during this time is found to be very piercing, even by strangers that come from a cold climate; and yet the ice is very rarely hard enough to bear [the weight of] a man. The snow seldom lies above a day, and when the sun shines out, and there is no wind, the weather is not only temperate, but almost hot, in the depth even of this winter, during which narcissus's are in flower, and hyacinths and violets begin to blow [blossom] before it is over. The fields are covered with a new verdure in Feb. [February] and the trees in March; but the beauty of this early spring quickly fades, and before the end of May the whole face of the country is so parched, that it looks like a barren heath, incapable of producing any but the few robust plants, which the excessive heat of a *Syrian* summer cannot kill. From this time till the middle of Sept. [September] no shower refreshes the thirsty ground, and no intervening cloud shades it for an hour from the burning sky. About the autumnal equinox the air is cooled by the first showers, and if they are plentiful, tho' [though] they continue only a few hours, the whole country assumes a new aspect. After this there is generally an interval of about 30 days before the second rains, and during this season the weather is temperate, serene, and extremely delightful. After the second rains the weather becomes variable, and winter sensibly approaches, tho' by so gentle a pace, that the trees retain their leaves till the middle of November, and till the end of this month the most tender and delicate constitutions feel no want of fire; some indeed pass the whole winter without it." <sup>302</sup>

On 1 July 1756, Jamaica on Long Island, New York in what would become the *United States* reported, "We had here the most violent hurricane [tornado] that perhaps ever happened in this part of North America. It began on the north side, and run in a straight course across the island to the south, being about 15 miles [24 kilometers] in length, and not exceeding 80 rods [1/4 mile, 0.4 kilometers] in breadth, making incredible havock [havoc], destroying almost every thing in its way. The largest oak and hickory trees were not able to withstand its violence, but were torn up by the roots, split into innumerable pieces, and many large limbs of several hundred weight carried into open fields near half a mile's distance from the woods. Several houses are damaged, six barns destroyed, upwards of 800 bearing apple-trees blown down near 8[0] acres of excellent timber entirely ruined, and several lengths of fence blown down and broken. A grind-stone of upwards of 150 lb. [68 kilograms] weight, was removed by the force of the wind, with the frame it was fixed on, 12 or 15 feet [3.7-4.6 meters], an iron chimney back several feet; a barn shattered into innumerable pieces, and the iron hinges of the doors weighing several pounds, were found a quarter of a mile [400 meters] from the place where [where] the barn had stood. Two apple trees were removed whole with a great quantity of earth sticking to their roots upwards of 30 rood [rod, 495 feet, 151 meters]." <sup>302</sup>

A letter dated 30 July 1756 stated; "The thunder has broke upon a rock at Langleford [in Northumberland, in northeast *England*], near Cheviot [highest summit in the Cheviot Hills], split it to pieces, and killed 40 sheep." <sup>302</sup>

On Tuesday, 17 August 1756, "The most terrible hurricane [tornado?] happened at Padua [in northern *Italy*] that was ever heard of in Europe. About noon it grew dark all on a sudden, and lightned [lightninged] and thundered to that degree, that a general dessionation [desolation] seem'd to be at hand. Several houses were thrown down, and many more had their roofs carried away by the violence of the wind. The town house, which was admired by all foreigners as a fine building, was blown down, and its fall occasioned that of the neighbouring buildings. The effects of the storm were not less dreadful in the country, where several of the inhabitants who fled to the churches for refuge, were crushed under the ruins." <sup>302</sup>

A storm struck Martinico (*Dominican Republic*) on September 12, 1756 and did great damage.<sup>40, 41</sup> [Martinico (Dominican Republic) is a nation on the island of La Hispaniola, part of the Greater Antilles archipelago in the Caribbean region. The western third of the island is occupied by the nation of Haiti.]

On 6 October 1756, a most violent hurricane struck Wigton in Cumberland, *England*. The damage done was deplorable. Stacks of hay and corn [grain] were entirely swept away; houses unroofed, and in several places driven down by its fury; trees without number torn up by the roots; others snapped off in the middle, and their fragments scattered over the adjoining fields. Some of the trees were twisted almost round, or split down to the very ground. After the storm, every herb, every plant, and every flower had its leaves withered, shriveled up, and turned black. In order to ascertain the cause, the dew and rain on the windows were analyzed by taste and found to be brackish as any seawater.<sup>237</sup>

On 6 October 1756, a most violent hurricane struck Wigton in Cumbria, *England*, “such a one perhaps as has not happened in these parts, in the memory of man. It lasted full 4 hours from about 11 till 3. The damage it has done over the whole county is very deplorable. The corn [grain] has suffered prodigiously. Houses were not only unroofed, but in several places overturned by its fury. Stacks of hay and corn were entirely swept away. Trees without number torn up by the roots, others snapt [snapped] off in the middle, and scattered in fragments over the neighbouring fields. Some were twisted almost round; bent, or split to the roots, and left in so shatter’d a condition as cannot be describ’d.” “I immediately examined the dew or rain which had been left on the grass, windows, &c. in hopes of being enabled, by its taste, to form some better judgment of the particles; with which the air had been impregnated, and I found it as salt as any seawater.” The wind was westerly, and consequently in its passage swept the Irish Sea.<sup>302</sup>

On Wednesday, 6 October 1756, “This day about one in the morning a dreadful hurricane happened, the effects of which were very extraordinary and extensive. Fifteen passengers, and twelve horses were lost in the Old Passage cross the [River] Severn from *Wales*. At Bath [in Somerset in southwest *England*], a tree that stood in Dr. Harrington’s garden was broken short off in the middle. At Penrith in Cumberland [*England*], it blew down the N.W. [northwest] battlement of the church, and the battlements of Mrs. Gaitsgarth’s tower, which fell upon the roof of the Tower house, and broke thro’ it into a room where two young ladies, Miss Molly Bolton, and Miss Dawson of Blencoe were in bed. Miss Bolton was unfortunately killed, and Miss Dawson buried in the ruins, but afterwards taken out unhurt. Almost every house in the town was damaged, and almost all the trees in the neighbouring country shivered to pieces, or blown up by the roots. The corn [grain] was all laid flat and damaged to the amount of a thousand pounds. A gentleman near this place observed that the barometer fell two degrees and a half in less than 3 quarters of an hour [45 minutes]. At Sunderland [in Tyne and Wear in northeast *England*] above 40 keels are missing, and several ships damaged, and driven to sea; the bodies of 12 men were taken up the next morning, and there is therefore much reason to fear that some of the vessels that were driven to sea are lost. At Newcastle [Newcastle-upon-Tyne in northeast *England*] many houses were blown down, others unroofed, and scarce a chimney left standing; above 40 keels, and several vessels from London were either sunk or driven to sea, and many men on board perish’d. A Danish vessel loaded with iron was sunk. The *Bussing*, of Whitby, was overset, and four boys drowned. At Aldstone Moor [Addlestone Moor in Surrey, *England*] the people imagined the earth shook, and therefore ran out for safety, but were driven by the wind against banks and hedges, where they suffered much by the breaking of trees, and the falling of stones. Gibside Wood [now a National Trust Wood in *England*], a place much visited by persons of taste, has suffered great damage; great numbers of the stately trees are either torn up, or shiver’d to pieces, large branches of others were twisted off, and scattered on the neighbouring hills, walks, lawns, and roads. Great part of the south front and roof of the elegant banquetting [banqueting] house is ruined, tho’ a column near 140 foot high, surrounded with scaffolding almost to the top, suffered no damage, nor was one rafter removed. At Greenock and Port Glasgow [in *Scotland*], the shipping both in the [sea] road and harbour broke from their moorings, and ran foul of one another, by which they lost their heads, boltsprits and masts. At Greenock, 500 trees are blown up by the roots, and two women who

went out to look after their friends on ship board, were blown into the water and perished. At Dumfries [Scotland], both the churches and many houses have suffered, and some thousand pounds worth of timber has been destroyed. In the midst of the storm, a vessel drove away with only the master and one boy on board, but happily put on shore at the English side without damage, but several other vessels were lost with all their hands. At Senwick [Fenwick], near Kircudbright [Kirkcudbright, Scotland], the storm was felt with great violence, and besides the common effects it divided two very large hay-stacks in the middle, and carried the upper part to a very considerable distance, several corn stacks were intirely [entirely] carried away, and all the thatched houses uncovered. At Belfast, in Ireland, several vessels were driven on the Giant's causway [causeway], several houses blown down, and many persons killed. The storm was also very violent all along the coast of Holland [now *the Netherlands*]. In the district of Warmund [Warmond, *the Netherlands*] and Leidendorp [Leiderdorp, *the Netherlands*], a whirlwind took up several stacks of hay, the remains of which were no where to be found; ten cows that were grazing in the same meadow were blown into the water, and several carts and waggons [wagons] that were going along the road were blown down and rolled over and over with their drivers and horses into the water, which was taken up in great sheets and scattered over the land to a considerable distance. Above sixty ships on the coast were stranded and lost. On the day after this hurricane, it was observed that the tide at Long Drax [Drax, North Yorkshire, England] did not flow above 5 or 6 inches [13-15 centimeters], tho' it flowed above 6 or 7 feet [1.8-2.1 meters] perpendicular the night before; there have been former instances of the tide being stopped by the wind, but none equal to this."<sup>302</sup>

On 20 October 1756, black dust fell all over the country in the island of Zetland [Shetland, Scotland]. It had the appearance of lamp-black, but smelled strongly of sulfur. People in the fields had their faces, hands, and linen, blackened by it. It was followed by rain.<sup>237</sup>

In 1756 during the period 2-30 January, floods struck Hupeh (now Hubei province) in central *China* at Ch'ien-chiang and Kuang-hua; Anhwei (now Anhui province) in eastern *China* at Shou and Fêng-yang; and Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Ch'ao-an. At Ch'ien-chiang, the dikes were damaged. During the period between 5 February and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chin-hua. During the period between 29 May and 26 June, a drought engulfed Chekiang province at T'ung-hsiang and Hupeh (now Hubei province) in central *China* at T'ien-mên.<sup>153</sup>

---

**Winter of 1756 / 1757 A.D.** The winter of 1756-57 started early and ended late with a few interruptions due to milder weather. The frost in Denainvilliers, *France* lasted from November to March, producing 64 days of frost. The lowest temperature observed in Paris, *France* was 9.5° F (-12.5° C) on 8 January. The Seine River was frozen over from 9 until 20 January 1757.<sup>62</sup>

On the first of January 1757, drifting ice began to appear on the Seine River in *France*. On the 6<sup>th</sup> of January, the river was completely frozen. On the morning of the 9<sup>th</sup>, individuals traveled on the ice between Pont Neuf and Pont Royal in Paris, along with many other locations. On the 20<sup>th</sup> the ice conditions ended.<sup>62</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1756 on November 30<sup>th</sup> – it snowed very fast. December 7<sup>th</sup> – severe cold. December 10<sup>th</sup> – a thaw. December 23<sup>rd</sup> – a severe snowstorm. December 29<sup>th</sup> – fine warm weather for three days past. In 1757 on January 4<sup>th</sup> – cold. A fall of snow three-inches (8 centimeters). January 14<sup>th</sup> – it can't be better sledding. January 18<sup>th</sup> – the harbor frozen over. January 31<sup>st</sup> – it rained all last night. February 6<sup>th</sup> – deep snow. (The snow was so deep in drifts that there was no possibility of getting to the meetinghouse.) The rest of the month partly cold and blustering, partly rainy, and partly pleasant. March – begins pleasant but windy. March 5<sup>th</sup> – the snow is five-feet (1.5 meters) deep in the woods. March 22<sup>nd</sup> – a severe snowstorm. March 26<sup>th</sup> – more snow. March 29<sup>th</sup> – pleasant and warm. April 3<sup>rd</sup> – more snow.<sup>78</sup>

In Philadelphia, Pennsylvania in the *United States* the winter of 1756 was very mild; the first snowstorm occurred on 18 March.<sup>1</sup>

---

**1757 A.D.** In February 1757, it was reported, “a sudden change of weather has spread unspeakable distress over many of the most fertile provinces of *France*. The fatal effects of the melting of the snow had been apprehended long before the thaw happened, yet the calamities that have followed have exceeded all that were foreseen. The province of Artois [in northern *France*] in particular has suffered severely. The rivers everywhere swelled with such incredible rapidity, that men, women, and children were carried away by the violence of the torrent. All the valleys were immediately overflowed. Causeways, houses, churches, bridges, mills, all were born down and mingled in one promiscuous ruin. Nothing was able to resist the fury of the water. In the country, vast numbers of cattle of all kinds have perished, and the corn [grain] fields have been torn up and ruin’d in a most astonishing manner. In short, there is no expressing the miserable condition of this most fertile province.”<sup>303</sup>

On Sunday, 6 February 1757, “The river Clyde swelled to such an amazing height by the melting of the snow on the mountains, that the lower part of the city of Glasgow [*Scotland*] was overflow’d to the height of 5 feet [1.5 meters].”<sup>303</sup>

On 11 February 1757 about 10 o’clock at night, “the stream of the Elve [Elbe River], that rises in the mountains of Bohemia [now western *Czech Republic*], came down with such rapidity, that it broke up the ice, and threw very large pieces of it upon the land at a surprizing [surprising] distance. The noise it made was unspeakable. Next morning the ice meeting with some obstruction between Dresden and Miessen [in eastern *Germany*], the current rose so high, that it came up to the iron rails of the bridge. This lasted about an hour, when it began to separate and go off with the stream. His Prussian majesty, and the princes his brothers, went into the garden of the palace, in order to look at so strange and extraordinary a sight.”<sup>303</sup>

On Sunday, 3 March 1757 it was reported, “The squadron at Port l’Orient and Brest put to sea with a fair wind. It has since been reported that the Brest [in northwest *France*] squadron was presently dispersed, and almost wholly dismantled by a violent storm, and obligated to return to port to refit.” On the 9<sup>th</sup>, the Brest squadron consisting of 16 ships of the line, with 12 frigates, fireships and transports were ready to return to sea.<sup>303</sup>

On Tuesday, 6 March 1757 arose the greatest storm of wind on the western coast of this island [*England*] that was ever known.<sup>303</sup>

— At Liverpool it began about 9 [o’clock], preceded by a dreadful roaring of the sea. At 10 it blew a hurricane, and about 11 veered to the W.N.W. [west northwest] and was attended with such heavy squalls of wind, that the oldest person here don’t remember the like. The sloop *Duke*, [Captain] Thomas Deaz, for Drogheda; a river sloop [Captain] Tarlton, for Preston; and brigantine *Quester*, [Captain] Potter, for Africa, sunk. Brigantine *Drogheda Merchant*, [Captain] James Heys, for Drogheda; and the brigantine *Manchester*, [Captain] Randle McDonald, for Londonderry, overset, sunk, and were stranded all of them opposite to the town.

— The snow *Monmouth*, [Captain] Twentyman; ship *Johnson*, [Captain] Gawith; and snow *Swale*, [Captain] Pollard, for Virginia; ship *Trafford*, [Captain] Clarke, for Philadelphia; snow *Hopewell*, [Captain] Langford, for Barbadoes [Barbados]; snow *Mears*, [Captain] Barrel, for Africa; and a sloop, [Captain] Williams, from Holyhead, all riding at anchor at the Black Rock, parted their cables, and were put ashore in Bottle Bay. The *Marlborough*, [Captain] Ward, for Virginia; *Rainbow*, [Captain] Harrison, for Africa; and *St Andrew*, [Captain] Burton, for New York, were the only vessels that rode it out there. The ship *Great Britain*, [Captain] Hicks, from Riga, and the brig *John*, [Captain] Clifton, for Yarmouth, were put on shore near Knott’s Hole. The *Liverpool Exchange*, [Captain] Urmson; the *Smithson*,

[Captain] Salisbury, from London; and *Barnevest*, [Captain] Howard, for London, were forced on shore near Highlake; a Dutch vessel, name unknown and all her crew perished. A pilot-boat, William Cerlett, late owner and master, met with the same fate. *Duke of Argyl*, [Captain] Hardy, for Virginia; *Carolina*, [Captain] Erskine, for Barbadoes, with many others, parted their cables. Ship *Alice*, [Captain] Brigs, from London, cut away her masts, and the *Ince* boat, with several others were bulged and stranded.

— The damage in the town was very considerable, numbers of chimneys, some houses, and many walls, were levell'd [leveled] with the earth. Roofs unstripped, and showers of broken [roof] slates, bricks, &c. rendered the streets impassable. About 42 feet [12.8 meters] of the lofty spire of St Thomas's church, (which was esteemed one of the most beautiful in Europe) fell upon the body of the church, broke through the roof, and has tore down the west galleries.

— In the different parts of the adjacent country, barns, houses, and other buildings were stripped, and many levelled with the ground. Considerable damage is done at Knowsley-hall, the seat of the Earl of Derby. Croshie, Sephton, Woolfall, Spellow, and several other mills are blown down, ricks of hay entirely destroyed and carried away. Happily for the sea coast the tides were at the lowest, or in all probability there would have been considerably more damage done; for though it was ebb tide in course, yet the flood returned, or rather did not go out of the river. The gale abated and backed to N.N.W. [north northwest] and N. about one o'clock in the afternoon.

— At Chester above 100 chimnies [chimneys] were blown down, most of the houses stripped of their slating [slate roofs]; the chimnies at the minster, and all the windows on one side are blown to pieces; and all along the adjacent road the houses and barns were stripped, and hundreds of large trees torn up by the roots. At a little town called Acton, within a mile of Nantwich [in Cheshire, *England*], the top of the church steeple beat in the roof of the church, and damag'd it to the amount of 2000*l*. [In present currency, that would be equivalent to £227,000 in damages based on the retail inflation price index.] At Nantwich the church is much shattered, and the houses mostly stripped.

— At Worcester the wind blew down a stack of chimnies at the Town-hall, which beat thro' [through] the roof, and thence through the ceiling over the nisi prius bar [all legal actions tried before judges of the King's Bench Division], while the court of assize [criminal court] was sitting. Mr. Justice Wilmot was on that bench, but his lordship happily received no hurt, and there happened to be only five of the counselors present, four of whom were hurt, but not dangerously, *viz.* Mr. Moreton, Mr. Aston, Mr. Nares, and Mr. Ashurst; Mr. Aston prevented further damage to himself by instantly slipping under the council table; but Mr. Moreton was presently jammed in by the rubbish, and remained so some time. The six following persons lost their lives on this occasion, *viz.* Mr. Lawes, the cryer of the court; Mr. Chambers, an attorney of Kidderminster; Mr. Freme, an ironmonger; Hr. Hurtle, of Hartlebury; and Mr. Shaw, of Ombersley; all of whom were taken out dead from amongst the rubbish, and most dismal spectacles they were, as was likewise Mr. Wainwright of Bromsgrove, who did not die till some time after he was carried out of the hall. Divers [diverse] other people were greatly hurt. It is not to be conceived what confusion the court was presently in, or what mischief ensued from the people's hurrying out of the hall, and in going down the hall steps, whereby several were thrown down and trampled upon a considerable time; nor is it easily to be described the anxiety of such people who happened to be at home, while some of the family were out and supposed to be gone to the hall. Mr. Baron Adams, who sat at the crown-bar, at the other end of the hall, had adjourned the court, and was gone to his lodgings but a few minutes before this melancholy accident happened, which put an entire stop to the business of the assizes.

In March 1757, due to the defect of last year's crop in *England* and *Ireland*, bread had become so excessively scarce, that the nation was in dread of a famine.<sup>304</sup>

On Friday, 1 April 1757, "A most violent hurricane arose in *France*, which threw down chimneys at Paris, tore up trees by the roots in the adjacent country, and at Havre de Grace [Le Havre] the play-house was blown down while the opera of Sampson was performing, and above 100 persons perished in the ruins, &c. The candles setting fire to the timber, the whole was reduced to ashes."<sup>303</sup>

The summer of 1757 was unusual in Paris, *France* because of a series of intensely hot days. The following temperatures were observed in Paris: on 10 July (95.0° F, 35.0° C); on 11 July (95.5° F, 35.3° C); on 12 July (95.5° F, 35.3° C); on 13 July (95.5° F, 35.3° C); and on 14 July (99.9° F, 37.7° C). On 20 July at the Observatory of the College of France, the following temperature was observed: 101.8° F (38.8° C).<sup>62</sup>

The summer of 1757 in Denainvilliers, *France* was characterized by:

Hot days	29 days
Very hot days	13 days
Extremely hot day	4 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The following temperatures were observed in Denainvilliers: on 11 July (97.3° F, 36.3° C); on 12 July (93.9° F, 34.4° C); on 13 July (97.3° F, 36.3° C); on 14 July (95.0° F, 35.0° C); on 17 July (88.3° F, 31.3° C); and on 20 July (95.5° F, 35.3° C).<sup>62</sup>

The maximum summer temperatures this year were:<sup>62</sup>

Paris, <i>France</i>	( 99.9° F, 37.7° C) on 14 July
Denainvilliers, <i>France</i>	( 97.3° F, 36.3° C) on 11 & 13 July
Mulhouse, <i>France</i>	( 92.8° F, 33.8° C) on 14 July

Similar high temperatures were observed in *Germany* in July but that means temperature in July in Berlin rose to 75.7° F (24.3° C). The drought in northern *France* was very strong. The Seine River was down to 0.13 meters (5.1 inches) deep. In Burgundy, the grape harvest began on 26 September. The grape harvest was of common quality and pretty good quantity.<sup>62</sup>

In the area around Orleans, *France*, the heat began in late June and lasted through July and into August. The air was refreshed by frequent rains. Wheat and rye produced a good harvest; but barley and oats were less productive. The wine produced only one third of a normal harvest, and the quality was very mediocre. Fruits were available in abundance.<sup>62</sup>

In July 1757 at Plymouth, [*England*], the weather was extremely hot. “From the beginning of June last we have had a very dry season, generally very warm, and sometimes excessively hot. From the 7<sup>th</sup> to the 14<sup>th</sup> of this month [July] the heat was violent; greater indeed than has been known here in the memory of man. I have talked with several persons, who have lived a considerable time in Jamaica, Gibraltar, and Minorca; and they severally [individually] assert, that they never felt such intense heat in any of these places. On the 11<sup>th</sup>, 12<sup>th</sup>, and 13<sup>th</sup> of this month, Fahrenheit’s thermometer, in the shade, about 3 o’clock in the afternoon, was at 87[° F, 30.6° C]; nay, on the 12<sup>th</sup> it was even above 88[° F, 31.1° C]. Abundance of people have suffered very severely from these excessive heats: putrid, bilious, petechial [rash], nervous fevers, are exceedingly common everywhere. Dysenteries, haemorrhages [hemorrhages], most profuse sweats, affect not only those in fevers, but a vast many others. The days and nights were so intolerably hot, that little or no sleep was to be gotten. The wind we had, like, the Campsin, actually blew hot, though strong.” At Edystone, which is 16 miles from Plymouth, the temperature during this time period was mild. London also experienced hot temperatures during this period. The highest was on 14 July when the temperature reached 85° F [29.4° C]. But another heat wave struck London between 8-10 August when the temperature reached 85° F [29.4° C]. On the 9<sup>th</sup>, it was near 86° F [30° C].<sup>237</sup>

On Wednesday, 13 July 1757, a violent rainstorm struck London, *England*. It so suddenly filled the shores, that five men employed in cleaning the main shore at Fleet-Ditch, were forced down by the rush of the water, one of who perished, notwithstanding the utmost efforts were made to save him.<sup>303</sup>

On Monday, 15 August 1757, “Great part of Lady Peters’s house near Brentwood, in Essex [*England*] was burnt down by lightning. This tempest was so terrible at Lewis [Lewes] in Sussex, that a whole farm belonging to Mr. Venn, in that neighbourhood, was in a manner destroyed by it.” “A ball of fire [lightning] was seen between five and six in the evening to fall on a house near Woodbury Hill, Dorsetshire, which broke thro’ the roof and the chamber floor, and burst by the woman of the house on the bricks of the under floor. It appeared to her as if the room was in a flame, which soon set fire to the inside of the house, & in less than 2 hours consum’d [consumed] it.”<sup>303</sup>

Hurricane at *Malta* on October 29, 1757.<sup>43</sup>

On Thursday, 3 November 1757, “about 3 in the afternoon, a storm of thunder and lightning arose in Dublin [*Ireland*], that astonished the inhabitants; one of the pinnacles on the north square of Christ-Church steeple was thrown down by it, and the great ball and iron work about the weathercock, lately gilded were turned quite black by the force of the lightning. This storm was attended by a great fall of hail-stones of a very large circumference.”<sup>303</sup>

In 1757 during the period between 20 January and 17 February, floods struck Anhwei (now Anhui province) in eastern *China* at Wu-ho; and Shantung (now Shandong province) on the east coast of *China* at Tê, Chin-hsiang, Yü-t’ai, Shou-chang and Liao-ch’êng. During the period between 5 February and 6 May, a severe drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Lung-ch’uan. During the period between 5 February and 8 November, a drought engulfed Kwangtung province at Hui-lai. During the period between 6 May and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at T’ung-hsiang and Ch’ung-tê; and Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Ts’ang-wu.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: April 12<sup>th</sup> – rain. April 15<sup>th</sup> – more rain. April 25<sup>th</sup> – rainy. May 10<sup>th</sup> and 11<sup>th</sup> – the spring is very backward. April 25<sup>th</sup> – raw, cold. June 1<sup>st</sup> – a very dry time producing a severe drought. June 19<sup>th</sup> – though there were two or three small showers, the drought awfully increases. June 28<sup>th</sup> – it rained most of last night and this morning. The grain and grass are much cut short [limited growth]. August 16<sup>th</sup> – we have refreshing rains, and it is now a growing season. August 30<sup>th</sup> – it was constantly hot, and became dry again. September 17<sup>th</sup> – a refreshing rain. October – much fine weather this month. October 31<sup>st</sup> – cloudy and cold.<sup>78</sup>

---

**Winter of 1757 / 1758 A.D.** During the winter of 1757-58, fairly abundant snow fell, which drove the development of ice floes on the Seine River from 21 to 26 January. In *Italy* and in *Spain*, there was severe cold. The following were the minimum temperatures observed during the winter:<sup>62</sup>

Leipzig, <i>Germany</i>	(-4.0° F, -20.0° C)
Hague, <i>the Netherlands</i>	( 3.2° F, -16.0° C)
Paris, <i>France</i>	( 7.3° F, -13.7° C) on 22 January

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: November and December 1757 – common winter months. In 1758 on January 29<sup>th</sup> – the snow is 3½ feet (1.1 meters) upon a level. February – some pleasant weather, but in general a cold month. March – alternately cold and pleasant. March 26<sup>th</sup> – horses and sleighs go everywhere over the snow, which is as high as the fences. April – a cold month. April 30<sup>th</sup> – a very cold spring thus far. May – generally raw and cold.<sup>78</sup>

---

**1758 A.D.** In July 1758, over 5 inches [13 centimeters] of rain fell in London, *England*, a quantity surpassing any in the same month perhaps in the memory of man. The mean annual depth of rainfall in *England* is 23.5 inches [60 centimeters], of which the largest proportion usually falls in the winter months.<sup>304</sup>

On 4 July 1758, Williamsburg, Virginia in what would become the *United States* reported, “Last Sunday, about four in the afternoon, we had a gust of wind [tornado?], which tore up large trees by the root, and blew down several old houses, chimnies [chimneys], &c. It was accompanied with the most violent shower of hail ever known here, which destroyed everything in its way; not a house in the town whose windows are not broke to pieces, our gardens entirely leveled, our fruit-trees, Indian corn, tobacco and indigo, totally ruined wherever it reached; several of the hailstones were as large as hens eggs. Its direction was from N.W. to S.E. but we do not find it extended itself fat.”<sup>304</sup>

On 9 July 1758 about 4 o'clock in the afternoon, a hailstorm struck Williamsburg [Williamsburg, Virginia in what would become the *United States*] to the southeast after some thunder and lightning passed over. The hailstones were of an oblong square form, an inch and a half long, and the sides were three quarters of an inch wide. From one of the sides there proceeded sharp spikes that protruded at least a half an inch. The governor cooled his wine and froze cream with some of them the next day. And they were not quite dissolved when he went to bed the next night. They broke every pane of glass on the north side of his house, and destroyed all his garden entirely.<sup>305</sup>

On 9 July 1758 in the Colony of Virginia [now the *United States*] there was a hailstorm, which arose about 4 P.M., proceeded from a cloud not more than a mile in length, which (after a storm of thunder and lightning) passed over the town of Williamsburg to the southeast. The hailstones were of an oblong square form, 1½ inches long, and the sides were ¾ inches wide, so that each would have made two cubes ¾ inch square; from one of the sides sharp spikes protruded at least half an inch. The Governor cooled his wine, and froze cream with some of them the next day, and they were not quite dissolved when he went to bed the next night.<sup>93</sup>

On July 17, a storm damaged Williamsburg, Virginia in the *United States*.<sup>41</sup>

In 1758 in Savannah, Georgia in the *United States*, the Governor of Georgia writes: “One cannot here sit down to any thing that requires much application but with extreme reluctance; for such is the debilitating quality of our violent heats at this season (July), that an inexpressible languor enervates every faculty, and renders even the thought of exercising them painful. It is now about 3 o'clock; the sun bears nearly S.W., and I am writing in a piazza, open at each end, on the N.E. side of my house, perfectly in the shade: a small breeze at S.E. blows freely through it; no buildings are nearer to reflect the heat than 60 yards: yet in a thermometer hanging by me, made by Mr. Bird, and compared by the late Mr. George Graham with an approved one of his own, the mercury stands at 102° F [38.9° C]. Twice it has risen this summer to the same height; viz. on the 28<sup>th</sup> of June, and the 11<sup>th</sup> of July. Several times it has been at 100° F [37.8° C], and for many days successively at 98° F [36.7° C]; and did not in the nights sink below 89° F [31.7° C]. It is highly probable that the inhabitants of this town breathe a hotter air than any other people on the face of the earth. The greatest heat we had last year was 92° F [33.3° C], and that but once. . . In my cellar the thermometer stands at 81° F [27.2° C], in the next story at 102° F [38.9° C], and in the upper one at 105° F [40.6° C]. . . Yet but few people die here out of the ordinary course; though indeed one can scarcely call it living, merely to breathe, and trail about a vigorless body, yet such is generally our condition from the middle of June to the middle of September.”<sup>237</sup>

On 17 July 1758, the Governor of Georgia, Henry Ellis Esq., gave the following account of the hot weather he encountered in Savannah, Georgia in what would become the *United States*.<sup>305</sup>

— It is now about three o'clock; the sun bears nearly southwest and I am writing in a piazza, open at each end, on the northeast side of my house, perfectly in the shade. A small breeze at southeast blows freely through it. No buildings are nearer, to reflect the heat, than 60 yards [55 meters]; yet Fahrenheit's thermometer stands at 102° F [38.9° C]. Twice it has risen this summer to the same height; viz on the 28<sup>th</sup> of June, and the 11<sup>th</sup> of July. Several times it has been at 100° F [37.8° C], and for many days successively at 98° F [36.7° C]; and did not in the nights sink below 89° F [31.7° C]. I think it highly

probable, that the inhabitants of this town breathe a hotter air than any other people on the face of the earth. The greatest heat we had last year was but 92° F [33.3° C], and that but once; from 84° to 90° F [28.9° to 32.2° C] were the usual variations; but this is reckoned an extraordinary hot summer. The weather-wise of this country say it forebodes a hurricane; for it has always been remarked, that these tempests have been preceded by continual and uncommon heats [hot weather]. I must acquaint you, however, that the heats we are subject to here are more intense than in any other parts of the province. The town of Savannah being situated upon a sandy eminence, and sheltered all round with high woods. But it is very sufficient, that the people breath so hot an air as I describe, and no less remarkable, that this very spot, from its height and dryness, is reckoned equally healthy with any other in the province.

— I have frequently walked a hundred yards under an umbrella, with a thermometer suspended from it by a thread to the height of my nostrils, when the mercury has risen to 105° F [40.6° C]; which is prodigious. At the same time I have confined this instrument close to the hottest part of my body, and have been astonished to observe, that it has subsided several degrees. Indeed, I never could raise the mercury above 97° F [36.1° C] with the heat of my body.

— This same thermometer I have had thrice in the equatorial parts of Africa, as often at Jamaica, and the West India Islands [West Indies]; and, by my journals, I do not find, that the quicksilver ever rose in those parts above the 87<sup>th</sup> degree [30.6° C], and to that but seldom. Its general station was between 79° and 86° F [26.1° and 30° C]; and yet I think I have felt those degrees, with a moist air, more disagreeable than what I now feel.

— In my cellar the thermometer stands at 81° F [27.2° C], in the next story at 102° F [38.9° C], and in the upper one at 105° F [40.6° C]. And yet these heats, violent as they are, would be tolerable, but for the sudden changes that succeed them. On the 10<sup>th</sup> of December last [1757], the mercury was at 86° F [30° C]. Then on the 11<sup>th</sup> it was so low as 38° F [3.3° C] of the same instrument. What havoc must this make with a European constitution? Nevertheless, but few people die here out of the ordinary course.

On 7 August 1758, Boston, Massachusetts in what would become the *United States* reported, “Last Monday about noon, a violent hurricane, or whirl-wind [tornado] passed thro’ [through] part of Chelsea (or Ramney-Marsh) which arose and came off the water from the S.W. bending its course about N.E. supposed to extend in width but about four or five rod [66-83 feet, 20-25 meters], and seemed to carry all before it, tearing up by the roots a great number of stately oaks, and elms above 60 feet [18 meters] in height, as also a great many apple-trees in several orchards; particularly in one orchard only, 63 fine trees were torn up leaving the ground about the roots open 20 or 30 feet [6-9 meters] over. With great fury it came against some of their stone-fences and threw them down, in some places hardly leaving one stone upon another. A cart standing in the midst of a barn loaded with hay was forced a considerable way out; and some of the posts or rafters of the barn broke off. In one place, the gust seem to rise so that the limbs and branches of lofty trees were broke off as if cut with an axe. It passed by one corner of a dwelling house, and shook it so violently, that the people expecting it would be turned over, ran out to save their lives. So violent a hurricane was scarcely ever known in these parts.”<sup>304</sup>

During August [1758] in Virginia in the *United States*, the heat was greater than usual during the summer. On 9 August, the temperature reached 97° F [36.1° C] and on other days it was 94° and 95° F [34.4° and 35° C].<sup>237</sup>

On August 23, a violent storm struck the island of Barbados, in the Lesser Antilles in the *West Indies*.<sup>40, 41, 56</sup>

On Sunday, 8 October 1758, “It blew a perfect hurricane in the channel [*English Channel*], by which several of our [British] ships of war and merchantmen suffered much. The *Edystone* storeship, in particular, was driven from her moorings near the rock when the light-house was within three working days of being habitable.”<sup>304</sup>

On Tuesday, 31 October 1758, it was remarked that “In a garden at the Abbey-Hill, near Edenbourg [Abbeyhill near Edinburgh, *Scotland*], there is at this time an apple-tree with the second crop of fruit quite formed, and also several roses in full bloom; an uncommon instance of the mildness of the season in that northern climate.”<sup>304</sup>

In 1758, a hurricane struck St. Marks, Florida in the *United States* causing 40 deaths.<sup>141</sup>

Before 10 November 1758, a hurricane struck St. Kitts in the *West Indies* causing 200 deaths.<sup>141</sup>

In southern *France* during the year 1758, it was wet, cold and variable.<sup>79</sup>

During the whole summer of 1758, heavy rains fell in *Switzerland*.<sup>193</sup>

In 1758, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at Ch’ing-p’u; Shantung (now Shandong province) on the east coast of *China* at Chin-hsiang, Yü-t’ai and Chi-ning; and Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at P’u-ning. During the period between 8 April and 6 May, a drought engulfed Shantung province at Tung-p’ing. During the period between 5 July and 3 August, a drought engulfed Kansu (now Gansu province) in northwest *China* at Ch’ing-yang.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 31<sup>st</sup> - people everywhere planting. June – some pleasant days, but mostly raw and cold. July – little or really no hot weather this month. Very wet. August 19<sup>th</sup> – fine weather, but not hot. August 31<sup>st</sup> – very cold all this week. September 28<sup>th</sup> – the greater part of the Indian corn in this town is spoiled, it was planted so late; it has been such a wet summer. October – mostly cold and unpleasant. November – some pleasant, but mostly cold weather.<sup>78</sup>

**Winter of 1758 / 1759 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1758 on December 25<sup>th</sup> – the harbor froze over to the Islands. In 1759 on January 20<sup>th</sup> – incomparable sleighing. January 31<sup>st</sup> – a severe cold winter thus far. February – some comfortable pleasant weather this month. March – same; but there were snowstorms the 22<sup>nd</sup> and 26<sup>th</sup>.<sup>78</sup>

In February 1759, it was reported, “The city of Petersbourg [St. Petersburg, *Russia*], has suffered prodigiously from the mildness of the winter; the sledges [sleighs] that usually supplied the inhabitants with all the necessaries [necessities] of life from immense distances, have been rendered useless for want of frost and snow to level the roads; provisions have therefore risen to the most extravagant prices, and the poor citizens have felt all the calamities of a famine, notwithstanding the abundance with which the people of the country are everywhere supplied.”<sup>305</sup>

**1759 A.D.** On Saturday, 10 March 1759, “A violent storm did incredible damage to the shipping, as well as to the houses and churches all along the western coast, more particularly at Falmouth [in Cornwall, *England*], where many vessels drove from their anchors, and suffered considerably. Some lost their masts, others went upon the sand, and one or two filled with water. In this storm 19 persons in a passageboat from Pool [Poole] to Wareham, were forced upon the beach, 13 of whom perished in endeavouring to recover the shore. Nothing could be more dismal than to see the poor souls half-buried in the mud, with the sea beating over them, without being able to afford them any relief, and their piercing cries were terrible.”<sup>305</sup>

On Wednesday, 11 April 1759, “The steeple of Great Billing church in Northamptonshire [in East Midlands region of *England*] was demolished by lightning, and some stones of a very large size driven to a great distance with astonishing force. The pews in the church were likewise very much shivered. The

minister by a special providence, found himself impelled to quicken the reading of the service on that day, by which the lives of many of the parishioners were preserved.”<sup>305</sup>

On Monday, 7 May 1759, lightning struck the steeple of Reverend Haven’s meetinghouse at Portsmouth in New Hampshire in what would become the *United States*. The lightning strike caused extensive damage to the meetinghouse and also killed 3 cows and a hog in a stable 60 feet [18 meters] from the steeple. The meetinghouse is situated on a small elevation and this is the 2<sup>nd</sup> or 3<sup>rd</sup> time it was struck by lightning.<sup>305</sup>

The summer of 1759 in Denainvilliers, *France* was characterized by:

Hot days	36 days
Very hot days	15 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The heat was intense in July. The maximum temperatures observed during the summer were:<sup>62</sup>

Denainvilliers, <i>France</i>	( 92.8° F, 33.8° C) on 9 and 24 July
Neuenbürg, <i>Germany</i>	( 92.1° F, 33.4° C)
Neuchâtel, <i>Switzerland</i>	( 92.1° F, 33.4° C)
Mulhouse, <i>France</i>	( 90.3° F, 32.4° C) on 25 July

On Sunday, 1 July 1759, “A violent tempest happened in *Denmark*, the effects of which were felt even in the bowels of the earth. The combustible matters in the territory of Ladegard took fire; a high wind drove the flames and smoke into the town of Ripen, which would have been intirely [entirely] destroyed, had not the wind suddenly shifted.”<sup>305</sup>

On Monday, 9 July 1759, a dreadful storm of thunder and lightning broke forth in the neighborhood of Kirk?dy [Kirkcaldy, *Scotland*], which lasted without intermission, from [five?] in the morning till five in the afternoon; during which space, two women who attended a bleaching ground [a stretch of grass where off-white linen was set on the ground to bleach in the sun], were struck dead by the lightning. One of them was sitting on a [tilted] ground, with a child sucking at her breast, by her fall the little infant was tumbled down the hill, but received no manner of hurt.<sup>305</sup>

On Sunday, 15 July 1759, “A most dreadful storm of thunder and lightning began in the evening in the neighbourhood of Bristol [in southwest *England*], by which a man was struck blind in Hallier’s lane. The lightning was the most terrifying, and the claps that succeeded the loudest that has been heard in those parts many years.” The next day on the 16<sup>th</sup>, “The chimnies [chimneys] of the house of Mr. Whitfield, lord of the manor of Rickmansworth [in southwest *England*], were beaten down by the thunder and lightning, and the windows on one side broken. As a lady was combing her hair at the window, the comb in her hand was shivered to pieces, and the bed in her room split and rent in a surprising manner, yet she did not receive the least hurt. Some of the bricks of the chimnies were carried 100 yards [91 meters] from the house.”<sup>305</sup>

In Burgundy, *France*, the grape harvest began on 24 September. The harvest amounted to almost nothing because of the hailstorm that struck on 1 & 21 June. The hail was about 6 decimeters (23.6 inches) deep in Dijon after the hailstorm.<sup>62</sup>

In the area around Orleans, *France*, the wheat harvest was abundant and the grains were of a very good quality. The wine harvest was of an average annual yield, and the fruit harvest was good. The summer was very hot in the Languedoc. Very little wheat, corn, wine, vegetables and fruit were harvested.<sup>62</sup>

In 1759, a tornado struck Leicester, Massachusetts in what was to become the *United States*.<sup>199</sup>

In September 1759, a great hurricane struck the Florida Keys in the United States. "In the month of September, of the year 1759, a heavy gale of wind from the N.E. so greatly impeded the current of the Gulf stream, that the water, forced at the same time into the Gulf of Mexico by the trade-winds, rose to such a height, that not only the Tortugas [cluster of seven islands making up the Dry Tortugas] and other islands disappeared, but the highest trees were covered on the peninsula of Larga [Key Largo]; and at this time (William Gerard de Brahm, Esq. surveyor-general of the southern district of North America, states), the *Litbury* snow, John Lorrain, master, being caught in the gale, came to an anchor, as the master supposed, in Hawke Channel [in the Florida Keys]; but, to his great surprise, found his vessel, the next day, high and dry on Elliot's Island [Elliot Key], and his anchor suspended in the boughs of a tree." <sup>143</sup> [A snow is a sailing ship that is generally used as a merchant ship but were also capable of being used as warships.]

On 9 November 1759, Halifax in Nova Scotia, *Canada* reported, "Last Saturday night and Sunday morning we had here the most violent gale of wind that has been known. It has done vast damage to the wharfs in this town and suburbs. Great quantities of salt and sugars which were in the cellars near the beach, are almost wholly ruined and two schooners were driven ashore, some thousands of trees in the woods were blown down, and in some places the roads rendered impassable. The damage sustain'd at the wharfs &c. is computed at several thousand pounds. As the storm happened at the height of the spring tide, and the wind in the southern board, it drove the tide in to that degree, that 'tis suppos'd the water rose near six feet [1.8 meters] perpendicular above its ordinary flowing." <sup>306</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 4<sup>th</sup> – the robin visited us today. The spring birds have been here singing several days. The month has been generally fair and pleasant, but cold and dry. May 11<sup>th</sup> – a warm day; the first this spring. May 16<sup>th</sup> – the cherry trees are blooming. May 19<sup>th</sup> – the grass is forward. May 24<sup>th</sup> – a delightful warm day. May 31<sup>st</sup> – cold weather. There has been but one warm, and one hot day, all this spring. June 5<sup>th</sup> – charming hot. June 7<sup>th</sup> – May storm. June 14<sup>th</sup> – raw, cool. June 25<sup>th</sup> – a happy growing season. July 2<sup>nd</sup> – a frost. July 18<sup>th</sup> – a deluge of rain. Cherries begin to be ripe. July 31<sup>st</sup> – it was so wet a season we are in no haste to cut our grass. August – a fruitful summer, especially in pasturing and hay. September 1<sup>st</sup> – abundance of pigeons. September 18<sup>th</sup> – gale of wind that blew down the apples, etc. September 26<sup>th</sup> – wonder of a hot day. September 30<sup>th</sup> – no frost yet. October 18<sup>th</sup> – no frost yet. October 22<sup>nd</sup> – charming day. October 30<sup>th</sup> – cold weather. November – generally moderate this month. December – snows and cold weather, but not more than common for the season. <sup>78</sup>

In 1759, there was a famine in Bombay in *India* and Scinde (now Sindh, *Pakistan*). <sup>156</sup>

In 1759, droughts engulfed several regions of *China* including: <sup>153</sup>

— During the period between 5 February and 8 August, a severe drought engulfed Shansi (now Shanxi province) in northern *China* at P'ing-ting, Hsi-yang and Yü.

— During the period between 25 June and 23 July, a drought engulfed Shansi province at Taiyuan; Hupeh (now Hubei province) in central *China* at Chih-chiang; and Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-yu.

— During the period between 25 June and 23 July, a drought engulfed Shansi province at Tai, I-ch'êng, Chung-yang, An-i, Chiang, Yüan-ch'ü, Ch'ang-ch'ih, Ho-ching, Ying, Tatung, Huai-jên, Shan-yin and Ling-ch'iu; Kansu (now Gansu province) in northwest *China* at Ning [uncertain name]; Suiyuan province (now part of *Inner Mongolia*) at Fêng-chên; Shensi (now Shaanxi province) in central *China* at Kan-ch'üan; and Hopei (now Hebei province) in northern *China* at Hsin-yüeh.

In 1759 during the period between 21 September and 20 October, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at T'ai; Shantung (now Shandong province) on the east coast of *China* at Lin-ch'ing; and Anhwei (now Anhui province) in eastern *China* at T'ai-hu and Ch'ien-shan. A typhoon hit T'ai and resulted in crop damage. <sup>153</sup>

In 1759 during the summer, there was a flood in the vicinity of Shanghai, *China*.<sup>166</sup>

---

**Winter of 1760 / 1761 A.D.** On 14 December 1759, there was a great frost at Petersburg [Saint Petersburg, *Russia*]. De Lisle's thermometer stood at 205 [-34° F, -36.7° C].<sup>237</sup>

At Bareith [Bayreuth, *Germany*?] in the night between 16 and 17 December 1759, the cold was insupportable. Reaumer's thermometer was at [-]15 [-15° Re, -1.8° F, -18.8° C], which is precisely the same degree it was at in 1709. Many birds dropped down dead as they were flying in the air. At Leipsic [Leipzig, *Germany*] it was still more severe, insomuch that [10?] sentinels were frozen to death. The severity of the cold is equally felt at Dresden [*Germany*] for want of firing. The Austrian troops have cut down all the fine trees, without exception, that adorned the garden of Zinzendorff [Zinzendorf] without the Pirna gate of Dresden.<sup>306</sup>

On 27 January 1760, between 3 and 4 in the afternoon, one of the dikes of the Rhine River about a league [3 miles, 4.8 kilometers] distant from Cleves [Kleve, *Germany*], was broken down by the ice, and in less than a quarter of an hour all the neighboring countryside to the west of that city was overflowed, quite from Calcar [Kalkar, *Germany*] to Nimeguen [Nijmegen, *the Netherlands*]. A great number of country people were left destitute both of houses and provisions, and reduced to a state of the most deplorable poverty and distress.<sup>306</sup>

In February 1760, it was reported that 4,000 Prussians soldiers died by the cold [in *Eastern Europe*] in a space of 15 or 16 days.<sup>306</sup>

During the winter, the River Thames in *England* was frozen below Gravesend.<sup>1</sup>

The winter in *Germany* in 1760 was very severe.<sup>2, 40, 41, 43, 47, 93</sup>

On 25 May 1760, Honorable James Murry, governor of Quebec, *Canada* wrote that within the walls of the city under siege during the winter, that due to "the excessive coldness of the climate, and constant living upon salt provisions, without any vegetables, introduced the scurvey [scurvy] among the troops, which, getting the better of every precaution of the officer, and every remedy of the surgeon, became as universal as it was invertebrate, in so much, that before the end of April, 1000 [soldiers] were dead, and above 2000 of what remained, unfit for service." Even by the 26<sup>th</sup> of April, the earth was still covered with snow in many places and everywhere the ground was impregnably bound up by frost.<sup>306</sup>

---

**1760 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: January and February – no weather unusual in winter months. March 13<sup>th</sup> – pleasant. March 17<sup>th</sup> – cold and windy. March 23<sup>rd</sup> – snow. March 30<sup>th</sup> – the robin and spring birds came a week or ten days sooner than usual, so much forwarder is the spring than common. April – several cold days. April 27<sup>th</sup> – severe thunder and lightning. May 1<sup>st</sup> – the trees shoot out their leaves. The heart-cherry trees begin to blossom (earlier than last year, and then earlier than usual.) May 31<sup>st</sup> – no hot weather this spring. Indian corn looks poorly. June 26<sup>th</sup> – there has been but 24 hours of hot weather this year. July 12<sup>th</sup> – hot weather for a week past. August 12<sup>th</sup> – hot and peerless growing season. September 1<sup>st</sup> – multitudes of grasshoppers. September 16<sup>th</sup> – extremely hot. September 17<sup>th</sup> – extremely cold. November 8<sup>th</sup> – a gay morning and a warm day.<sup>78</sup>

On Friday, 15 February 1760, a hurricane struck London, *England* by which much damage was done both on land and in the river.<sup>306</sup>

— A stack of chimneys that fell in at Newcastle court near Grosvenor Square, demolished the bed and furniture of two rooms. The lead was blown off the house of Earl Cowper, in Great George Street into the street. A house in Hanover Street had the gable end blown off. One of the pinnacles of a building adjoining to the House of Commons was blown down, which broke through the roof of the room over the

Speaker's chamber. The Mall in St. James's Park was covered with branches of trees. Upwards of twenty-seven feet [8.2 meters] of lead on the Admiralty roof was rolled up like a scroll by the force of the wind. A great number of chimneys, fences, etc. were blown down in Westminster.

— Many ships in the river were driven from their anchors; some lost their rudders, and received considerable damage by running foul of one another. The *Mary*, [Captain] Whitson, was driven ashore below Limehouse, but by taking out her guns, etc. they are in hopes of getting her off with little damage.

— The [news]paper from the country are filled with the terrible effects of this storm. In many places it was attended with thunder, lightning, hail, and rain. It untiled the roofs of houses and blew trees down by the roots. It swept away ricks of corn [grain], hay, and cottages.

— At sea it did incredible damage to the shipping. In almost every harbor some persons perished in boats and in ships. But the loss most regrettable was the unfortunate *Ramillies*, Captain Tayler, with 734 men. Being embayed [enveloped] within the Bolt-head (which they had mistaken for the Ram-head, and imagined they were going into Plymouth Sound) and close upon the rocks, they let go their anchors, and cut away all their masts, and rode safe till five in the evening, when the gale increased so much it was impossible to describe. They parted, and only one midshipman and twenty-five men out of the whole, jumped off the stern on the rocks and were saved.

On Monday, 27 February 1760, it was reported, "During the late hard gales of wind, most of the springs in and about Chatham [in southeast *England*], were dried up; a phenomenon not easy to be accounted for."<sup>306</sup>

On 26 April, a thunderbolt ignited the famous Abbey of Royaumont in *France* and the Church of Our Lady in Hamburg, *Germany* during a lightning storms.<sup>62</sup> [The Abbey of Royaumont is 30 kilometers from Paris.]

On 22 May 1760, a corp of British infantry (six regiments) arrived safe in the Weser [River], off Gurtendorff [Gutendorf, Thüringen, *Germany*], fortunately escaping a violent storm, which came soon after.<sup>306</sup>

On 28 June 1760 in *England* there was a great hailstorm in Cambridgeshire.<sup>93</sup>

On 20 July 1760 in southwestern *France* in the neighborhood of Auseli and Comminges, hailstones 5 inches in diameter fell. Men and cattle were killed.<sup>93</sup>

On 20 July 1760 a hailstorm struck Comminges, *France* with 5-inch (13 centimeter) hailstones. Men and sheep were killed.<sup>28</sup>

[At the Observatory of the College of *France*], several days of unusual heat were observed during the summer: (99.9° F, 37.7° C) on 18 July; (99.9° F, 37.7° C) on 19 July; (93.6° F, 34.2° C) on 20 July; and (84.9° F, 29.4° C) on 21 July. The maximum temperatures observed during the summer were:<sup>62</sup>

Beijing (Peking), <i>China</i>	(109.6° F, 43.1° C) on 5 June
Mulhouse, <i>France</i>	( 92.8° F, 33.8° C) on 19 July

In Burgundy, *France*, the grape harvest took place between 15 and 22 September. The harvest was ordinary but the wine was of a very good quality. In the south of *France* this year the harvest was bad for all crops.<sup>62</sup>

On 19 September 1760, a waterspout [large deluge] struck Brackenthwaite in Cumberland [now Cumbria], *England*. To the east was a ridge of lofty mountains. Three small brooks, Lizza, Hopebeck and Hubcorton were all affected simultaneously by the inundation. In a field of 10-12 acres [4-5 hectares], the flood produced a sandbank of such thickness as never to be removed. The old channel

which did not exceed five or six feet [1.5-1.8 meters] in breadth, and one [0.3 meters] in depth, became at least 18 or 20 yards [16.5-18.3 meters] in breadth and one and half [1.4 meters] deep. The water remained the next morning at a widow's cottage, twelve feet [3.7 meters] perpendicular above the ordinary surface of the water; 30 yards [27 meters] from the brook.<sup>306</sup>

In October 1760 during the war, there were heavy rains in Westphalia, *Germany*, which cause the Rhine and the [Lippe?] rivers to overflow their banks and rendered the roads impracticable. The excessive rains, and the scarcity of provisions caused the French to abandon Landgraviate of Hesse Cassel [Hesse-Kassel, now part of the German state of Hesse].<sup>306</sup>

On 25 October 1760, a hurricane struck the *Caribbean* island of Barbuda causing 50 deaths.<sup>141</sup>

In Holland [*the Netherlands*] from Michaelmas [29 September] 1760 until 1 January 1761, the number of vessels lost by storms amounted to upwards of 300.<sup>243</sup>

On Friday, 5 December 1760, a storm struck the coast of *England*. "By the violence of the wind this morning at N.N.E. north-northeast] great mischief was done at sea, the *Prince of Orange* man of war at Spithead parted from her cables, and drove down to St. Helens, but without farther damage. The expedition fleet rode it out safe. Two ships were driven on shore on Deal beach, and eight in Hearn Bay. Several others in the Downs cut and parted [their cables]." <sup>306</sup>

On the 30th of December 1760, during the siege of Pondicherry, *India*, a tremendous cyclone drove on shore and wrecked three British ships belonging to the besieging squadron. The crews were saved.<sup>191</sup>

In 1760 during the period between 13 June and 11 July, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ing-yüan; Shensi (now Shaanxi province) in central *China* at Hsün-yang; and Hopei (now Hebei province) in northern *China* at Pai-hsiang. During the period between 8 August and 8 November, floods struck Szechwan (now Sichuan province) in southwest *China* at P'ing-shan.<sup>153</sup>

**Winter of 1760 / 1761 A.D.** In Philadelphia, Pennsylvania in the *United States* the winter of 1760 was alternately very cold and very mild. In the month of March there was the heaviest fall of snow ever remembered so late in the season.<sup>1</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1760 on November 14<sup>th</sup> – snow. November 19<sup>th</sup> – exceeding cold. November 23<sup>rd</sup> – moderate weather. December 7<sup>th</sup> – pretty cold. December 20<sup>th</sup> – much colder. December 26<sup>th</sup> – calm mornings all this week and moderate through the days. In 1761 on January 11<sup>th</sup> – the harbor froze over yesterday and today. January 26<sup>th</sup> – a fine level [not drifted] snow, and enough of it. February – wonder of a month. The snow went away on the 7<sup>th</sup>. March – unusually moderate weather this month.<sup>78</sup>

On Christmas day [25 December] 1760 at Eshgill near Alston in Cumberland in northwest *England*, a gentleman there had marigolds, and ten other different kinds of flowers, in full bloom (the same as in the months of May or June) and all the trees in his garden in bud, owing to the mildness of the season: a circumstance never known before in the memory of man, so far north.<sup>243</sup>

On 1 January 1761, the wind blew a perfect hurricane at Leeds in Yorkshire, *England*. A great number of chimneys, corn and haystacks, were blown down, and [roof] slates torn off houses. But the greatest damage was done to straw thatched buildings. A poor man at Holbeck in this parish, finding his house ready to fall, immediately stepped out of bed, and setting his shoulder to the beam that solely supported the roof, held up the house till his wife and children crept out between his legs (having no other way) and he had but just time to get off himself before the whole fabric fell to the ground.<sup>243</sup>

The season is so forward [early], that on the 14<sup>th</sup> instant [January 1761], there was in Comb-Wood, between Wimbledon and Streatham in Surry [Surrey], *England*, a thrush's nest with four eggs in it, some of which were laid ten days before, and the hen thrush sitting very close upon them. Primroses and daisies have appeared in great plenty, and at a place near Ryegate [Reigate], a plate of strawberries was produced a few days since at a gentleman's table. And from Swansea [Swansea, Wales] to South Wales, we have the following letter dated the 23<sup>rd</sup>. "Last week several flocks of swallows, and other summer birds, were seen here, occasioned by the mildness of the season; but 'tis thought the present frost (which came pretty sudden and severe) must have destroyed the greatest part of them, as many have been since found frozen to death. A few days since there was a pear tree in full blossom, in a gentleman's garden not far from this town; and a gooseberry bush, which stood under a wall, and was fenced from the north wind, had gooseberries as large as cherry stones; and 'twas thought, had the mild weather continued, several sorts of summer fruit would have been ripe before Easter."<sup>243</sup>

As of 19 January 1761 at Boston, *England*, the winter was extremely cold. For 2 or 3 days, the harbor was filled with ice.<sup>243</sup>

On 20 January 1761, a frost set in at Ratisbon [now Regensburg in Bavaria, *Germany*] that was very excessive and sudden. The River Danube froze over within 24 hours, which was hardly ever known before, the swiftness of the current of that river being very great.<sup>243</sup>

---

**1761 A.D.** In *England*, there were great rain and floods.<sup>47, 92</sup>

In *Ireland*, there were great floods; especially in Cork and Dublin.<sup>47, 92</sup>

There were great rains and floods in *Southern Europe*.<sup>47, 92</sup>

At Thessalonica [Thessaloniki, *Greece*] "Yesterday [March 1761?] we were terribly alarmed by a prodigious ball of fire, which rose from the earth in the southeast part of the city, and directed its course horizontally towards the west, where entering a dark black cloud, it burst with a prodigious loud noise, attended with thunder and flashes of fire; so that it seemed as if heaven and earth had been coming together. This was followed by so violent a shower of rain, that it threatened a second [Great] deluge. God preserve us, my dear friend, amidst this complication of troubles!" On 31 March 1761, many events happened almost simultaneously. At Fort Augustus, *Scotland* on 31 March, Loch Ness [an unusually deep lake] suddenly rose about 2 feet in height. The King's galley broke from her mooring. Several boats were cast very high on dry land. On 31 March, an earthquake struck Cork, *Ireland*. On 31 March, an earthquake struck Madrid and the coast of *Spain*. On 31 March, an earthquake struck at Corunna [A Coruña, *Spain*]. On 31 March, an earthquake was felt at Bayonne, *France*. On 1 April, an earthquake was felt at Bourdeaux, *France*. On 31 March, an earthquake was felt at Amsterdam, *the Netherlands*. On 31 March, on his Majesty's ship Gosport located about 80 leagues [240 miles, 386 kilometers] east-southeast of Lisbon, Portugal, felt the shock of an earthquake. On 31 March, an earthquake struck at Lisbon, *Portugal*. On 31 March and 9 April, earthquakes struck [Fort] Santa Cruz in South Barbary [in *Algeria*]. On the island of Barbadoes [*Barbados* in the Lesser Antilles] on 31 March, there were fluxes and refluxes of the sea. At Barbadoes, the same fluxes and refluxes of the sea were noted for the Lisbon earthquake of 1755. On 31 March, an earthquake struck *Madeiras* in the Canary Islands. The island of *Terceira*, one of the Azores, seems to have been the center of all these violent shocks, as they ended there in a dreadful eruption [of a Stratovolcano on 17 April 1761]. At *Terceira* on 31 March, the sea rose to a great height; on 14 April, there were 4 small earthquakes; on 15 April, there was a very violent shock in the morning followed by continuous trembling until the 17<sup>th</sup>.<sup>243</sup>

A missionary at Salonica [now Thessaloniki], the capital of Macedon [Macedonia] in *Greece*, described the wretched situation of that country during the last two years [prior to 1761]. He said that a plague carried off at least 200,000 souls; and seven successive earthquakes have overthrown most of the cities in that province. The capital is reduced to a heap of rubbish. The plains, once so famous, are now a desert. The inhabitants have abandoned their dwellings; nor will any return to bury his friend or relation. On 8 April 1761, the miserable people were terrified beyond description, at the rising of an extraordinary phenomenon. The heavens after sunset appeared as if all on fire. They discovered trains of fire, and left a suffocating smell of brimstone and bitumen, which they thought portended the general conflagration. But about midnight, the whole vanished in the most dreadful claps of thunder.<sup>243</sup>

The hurricane of 8 April 1761 in the south of *France* was very deadly. It tore up one six thousand olive trees, and eighteen hundred feet of fruit trees.<sup>79</sup>

A violent storm struck Charleston, South Carolina in the *United States* on May 4, 1761. The storm caused the loss of ships worth 20,000l.<sup>40, 41, 56</sup>

In May 1761, a whirlwind [tornado], the most violent and dreadful that ever had been known, was experienced near Charlestown [Charleston], South Carolina, in the *United States*. The tornado passed down the Ashley River, ploughing the waters to the bottom and laying bare the channel. The town was in imminent danger of being destroyed, but the danger passed and the town escaped. A fleet of forty sail of loaded ships lay at anchor in Rebellion Road about four miles from town. The whirlwind passed in an oblique direction and only struck part of this fleet, sinking five vessels in an instant and dismasting eleven ships.<sup>174</sup>

On 2 May 1761, a tornado struck Charleston, South Carolina in the *United States* at 2 o'clock in the afternoon. "The tornado crossed the Ashley River, and swooped down upon the shipping at Rebellion Wharf, with such fury as to threaten the destruction of the entire fleet. From the city it was seen coming [coming] at first rapidly toward Wappo Creek [Wappoo Creek], like a column of smoke, with a very irregular and tumultuous movement. The quantity of [water] vapor that composed this column, and its prodigious velocity produced so intense a commotion that it agitated Ashley River to its depths, and left the channel bare. The ebb and flow made the shipping float off to a great distance. When it struck the river, it made a noise like continuous thunder; its diameter, at that moment, was estimated at fifteen hundred feet [457 meters], and its height, as seen from Charleston, at twenty-five degrees. It was met, at White Point, by another whirlwind, which descended Cooper River, but was not equal to the first. When they came together, the commotion in the air was much greater still; the foam and the vapor seemed to be thrown to the height of forty degrees, while the clouds, that hurried from all directions toward that point, seemed to rush thither and whirl about, at one and the same time, with incredible velocity. The meteor [tornado] that darted upon the shipping in the roadstead, and reached them in three minutes; although the distance was nearly six miles [10 kilometers]. Out of forty-five vessels, five were sunk on the spot; The State ship *Dolphin* and eleven others were dismasted. The damage, estimated at more than £200,000, was done in a moment, and even the vessels that sank were swallowed up so rapidly that the people who were below had scarcely time to scramble up on deck. The whirlwind of Cooper River changed the course of the one that came from Wappo Creek [Wappoo Creek], which, had it not been for that, would, proceeding in the same direction, have swept away the city of Charleston before it like so much straw." "This terrible column was first perceived about noon, at more than fifty miles [80 kilometers] west-southwest of the roads [roadstead]. It destroyed every thing in its way, making a complete avenue when it passed through the woods. The loss of the five ships was so sudden that it is not known whether it was the weight of the column of wind, or the mass of the water driven upon them, that made them go down."<sup>205</sup>

A letter from Boston in New England described the tornado that struck South Carolina [in the *United States*] in May 1761. "We have advice from Charlestown in South Carolina, that on the 4<sup>th</sup> of last month

[4 May 1761] at half past two p.m. a most violent whirlwind, of that kind commonly known by the name of typhoons [typhoons] passed down Ashley river, and fell upon the shipping in Rebellion road with such fury and violence, as to threaten the destruction of the whole fleet. This terrible phenomenon was first seen from the town, coming down Wappo creek, resembling a column of smoke and vapour [vapor], whose motion was very irregular and tumultuous, and came with great swiftness. The quantity of vapour which composed this impetuous column, and its prodigious velocity, gave such a surprising momentum, as to plough Ashley river to the bottom, and laid the channel bare; this occasioned such a sudden flux and reflux, as to float many boats, pettiaugers [periauger], and even sloops and schooners, which were before lying dry at some distance from the tide. When it was coming down Ashley river, it made a noise like constant thunder; its diameter at the time, was judged to be about 300 fathoms, and its height about 35 degrees. It was met at White Point by another gust [tornado], which came down Cooper's River, but was not equal to the other; but upon their meeting together, the tumultuous agitation of the air was much greater, insomuch that the froth and vapour seemed to be thrown up to the height of 40 degrees, while the clouds that were driving in all directions to this place, seemed to be precipitated, and whirled round at the same time, with incredible velocity. Just after this it fell upon the shipping in the road, and was scarce three minutes in its passage, though the distance was near two leagues [6 miles, 10 kilometers]; there were forty five sails [sailing ships] in the road, five of which were sunk outright, and his majesty's ship Dolphin, with eleven others, lost their masts, etc. The damage done to the shipping, which is valued at 20,000 l. sterling, was done almost instantaneously, and some of those that were sunk, were buried in the water so suddenly, as scarcely to give time to those that were below to get upon deck; and it is remarkable, that but four lives were lost in them. The strong gust which came down Cooper's river, checked the progress of that pillar of destruction from Wappo creek, which had it kept its then direction, must have driven the town of Charlestown before it like chaff. This tremendous column [tornado] was first seen about noon, upwards of fifty miles W. by S. from Charlestown, and has destroyed, in its course, several houses, negro huts, etc. on the plantations, and many, both white people and negroes, were killed and hurt; besides many cattle have also been found dead in the fields. In several parts of its course it left an avenue of a great width, from which every tree and shrub was torn up: great quantities of branches and limbs of trees were furiously driven about, and agitated in the body of the column as it passed along. The fleet lying in the road, ready to sail for Europe, was the largest and richest that ever cleared out from Charlestown. About four o'clock the wind was quite fallen, the sky clear and serene, so that it was scarce credible that such a dreadful scene had been so recently exhibited, were not the sinking and dismasted vessels so many shocking and melancholy proofs of it. The sinking of the five ships in the road was so sudden, that it was a doubt whether it was done by the immense weight of this column pressing them instantaneously into the deep, or whether it was done by the water being forced suddenly from under them, and thereby letting them sink so low, as to be immediately covered and ingulphed [engulfed] by the lateral mass of the water. Most of the disabled ships were towed up to the town the next day, and captain Scot, of the Scarborough, is appointed to convoy those that are able to put to sea, in the room of the Dolphin." <sup>243</sup>

On 21 June 1761 in *England*, there was a hailstorm in Surrey.<sup>93</sup>

On 25 June 1761, great damage was done near Kingston in Surry, *England* by a storm of thunder, lightning, and rain. The country around Harrow [now in Greater London] in Middlesex was laid underwater. Six deers were struck dead by lightning in Bushy Park. At Bourn in Lincolnshire, hailstones fell as big as pigeons' eggs, and very great damage was done, as well as in many other parts of the kingdom.<sup>243</sup>

[On 25 June 1761], a violent storm struck the neighborhood of Durham, *England*. It leveled and stripped most of the trees in a nearby woods.<sup>243</sup>

On 27 June 1761 in *England*, at Bourne (Lincolnshire), about 5 P.M., it having been very black and

cloudy for some two hours, rain began to fall in large drops, succeeded by large hailstones, mixed with pieces of ice of irregular shape, some of which measured 8 inches in circumference; the windows were broken, fruit trees damaged, and grain crops destroyed in a line of about 3 miles in width. The thunder was very severe; and some sheep were killed. The storm extended into Cambridgeshire.<sup>93, 243</sup>

On 5 August 1761 in *England*, there was a violent hailstorm at Benfield (Northamptonshire) damaged and destroyed the grain crops. Many of the pieces of ice weighed a pound each.<sup>93</sup>

On 5 August 1761, a most violent storm of thunder and lightning attended with hail did incredible damage to the corn [grain] in the neighborhood of Benfield in Northamptonshire, *England*. Many of the hailstones or rather pieces of ice weighed a pound each, and broke the windows wherever they fell.<sup>243</sup>

On 14 August 1761 in *Scotland* at Cumbernauld, there was a great hailstorm, which killed more than 1,000 crows, the bones of which were found broken, and the flesh black.<sup>93, 243</sup>

On 4 September 1761, a hurricane struck South Carolina in the *United States*. The prodigious influx of the sea created a new channel 18 feet deep at high water and nearly half a mile over. As a result, navigation of Cape Fear River, from being the most difficult, has changed to the easiest and safest on that part of the continent. This was a massive hurricane and threatened destruction to the whole country.<sup>243</sup>

On 25 September 1761 in *England*, there was a hailstorm on Enfield Marsh, lasting about 3 minutes. The hail did great damage to trees, fruit, etc., killing birds and poultry. Some of the stones measured 5 inches in circumference.<sup>93, 243</sup> [Enfield Marsh is now the Tottenham Marshes in Greater London.]

The summer of 1761 in Denainvilliers, *France* was characterized by:

Hot days	38 days
Very hot days	6 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The maximum temperatures observed during the summer were:<sup>62</sup>

Denainvilliers, <i>France</i>	( 92.8° F, 33.8° C ) on 24 June and 8 September
Mulhouse, <i>France</i>	( 88.3° F, 31.3° C ) on 25 June

In the area around Orleans, the majority of the harvest is very poor in quantity and quality. The grape harvest began in Burgundy on 14 September; the yield was quite abundant, but of medium quality. In the south of *France* a terrible hurricane took place on 8 April. This year was very productive in those lands not exposed to the southwest winds.<sup>62</sup>

On 4 October 1761, a storm struck the coast of New England in the *United States* causing incredible damage.<sup>243</sup>

On Wednesday last [14 October 1761] at Great Malvern in Worcestershire, *England*, “we had the most violent thunder ever known in the memory of man. At a quarter past four in the afternoon, I was surprised with a most shocking and dismal noise; a hundred forges (the nearest resemblance I can think of) were they all at work at once, could scarce equal it; I ran to the fore-door, and casting my eyes upon the side of the hill about 100 yards to the south west of my house, there appeared a prodigious smoke, attended by the same violent noise [tornado]. I ran back into the house, and cried out a volcano (for so I thought) had burst out of the hill; but I had no sooner got back again, that I found it had descended, and was passing on within about a hundred yards of the south end of my house; it seemed to rise again in the meadow just below it, and continued its progress to the east, rising in the same manner four different times, attended with the same dismal noise as at first; the air was filled with a nauseous, sulphureous [sulfurous] smell. I saw it gradually decrease till quite extinguished, in a turnep [turnip] field about a

quarter of a mile below my house. The turnep leaves, with leaves of trees, dirt, sticks, etc. filled the air, and flew higher than any of these hills. The thunder ceased before this happened, and the air soon afterwards became calm and serene. The surprise and astonishment of all ranks of people, during the appearance of this strange phenomenon, is scarcely to be expressed.” The vast column of smoke, mentioned in the above letter, was so large, that a physician of eminence at Worcester, saw it in its progress down the hill, about a mile from Feckenham, which is about twenty miles from Malvern.<sup>243</sup>

On the 20 October 1761, the British fleet, then lying in Madras Roads [now near Chennai, *India*], encountered a violent cyclone. The men of war put to sea, and were thus providentially saved; but all the vessels, which still lay at anchor were lost, and scarcely a soul on board saved.<sup>191</sup>

On 23 October 1761, a most violent storm of wind and rain did great damage to the houses, stores, wharves, and merchandise, and to the shipping in Boston harbor in the *United States*.<sup>174</sup>

On 20 November 1761, by a sudden hurricane of wind, several merchant ships below bridge [London Bridge in *England*?] were driven from their anchors, and received great damage. Several of the small craft were stove in pieces [completely destroyed], a corn lighter was sunk off East Lane stairs.<sup>243</sup>

On 2 December 1761, the fog was so thick in and about London, *England*, that even the chairmen lost their way in the streets, and carriages ran against carriages, by which much mischief [damage] was done.<sup>243</sup>

A drought in the summer of 1761 and 1762 was so great in the northern American colonies [*United States*], as to cut short the crops, and render supplies from abroad absolutely necessary. During the drought of 1761, a fire raged in the woods, in the towns of Barrington and Rochester, in New Hampshire, and passed over into the county of York, burning several weeks with irresistible fury. A plentiful rain, falling in August, extinguished it. An immense quantity of the most valuable timber was destroyed by this conflagration.<sup>174</sup>

In 1761, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 3 June and 1 July, floods struck Hupeh (now Hubei province) in central *China* at Ch’ien-chiang and Mien-yang.

— During the period 2-30 July, floods struck Kiangsi (now Jiangxi province) in southern *China* at Hsia-chiang; Kiangsu (now Jiangsu province) on the east coast of *China* at Sung-chiang; Hopei (now Hebei province) in northern *China* at Nan-kung, Yung-ch’ing, Ning-ho, Wên-an, Wang-tu, Jung-ch’êng, Ku-an and Lu-lung; Shantung (now Shandong province) on the east coast of *China* at Yüeh-ling, Yü-t’ai, Chin-hsiang, Ning-yang, Wên-shang and Shou-chang; and Hupeh province at Chiang-ling and Yün-mêng. At Yün-mêng, all the houses and fields were damaged by the floodwaters and innumerable people drowned.

— During the period between 30 August and 27 September, floods struck Shantung province at Liao-ch’êng.

The year 1761 was a year of abundance in the vicinity of Shanghai, *China*.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 1<sup>st</sup> – the season is uncommonly forward, warm and pleasant. April 22<sup>nd</sup> – fine weather continually. April 30<sup>th</sup> – cold. June 25<sup>th</sup> – it is as melancholy dry a time as ever I saw. July 5<sup>th</sup> – as great a drought as in 1749. July 11<sup>th</sup> – gentle showers. July 17<sup>th</sup> – plenty of peas. July 20<sup>th</sup> – raspberries. August 1<sup>st</sup> – the drought awfully continues. August 12<sup>th</sup> – no feed on the Neck [peninsula] a great while. August 16<sup>th</sup> – the drought increases. August 19<sup>th</sup> – a great storm of rain. August 31<sup>st</sup> – marvellous growing time; surprising change on the face of the earth. September 25<sup>th</sup> – the earth has a most beautiful green face. October 6<sup>th</sup> – the grass is better set than in the spring.<sup>78</sup>

---

**Winter of 1761 / 1762 A.D.** In *England*, a London newspaper of 29 January 1762 read, “The Thames had been frozen so firmly since Christmas, that horses and carriages were driven thereon. Also, that booths were erected, and fairs held thereon.”<sup>1</sup>

In *England*, it snowed for 11 days in 1762.<sup>40, 41, 43, 56</sup>

On 11 December 1761, the frost at Hamburgh [Hamburg], *Germany* was so severe, that they began to compare it with the frost of 1740. The Elbe River was frozen over for several days. The magistrates have doubled the guards because of the French and Hanoverian deserters who flocked there. It was feared that if the frost should continue, soon there would be 10,000 deserters of different nations.<sup>243</sup>

During the winter in 1761 at Solikamsky in Siberia, *Russia*, the cold was extreme. The temperature using de L’Isle’s thermometer sunk down to 280 [-124° F, -86.7° C]. “This extreme, and almost incredible degree of cold appeared to me astonishing indeed, as the thermometer on which it was observed was exposed on a wall to the north, in an open yard, so that I did not conceive it was possible a man could live in the degree of cold he must necessarily be exposed to. In crossing the yard to take the observation, my breath froze to my lips, and made an icicle of my beard. Sometimes the cold is so excessive as to strike both men and horses dead, who happen to be at too great a distance from any house to shelter themselves from it. The extreme condensation of air prevents the smoke of chimnies [chimneys] from rising; sparrows and magpies drop dead on the ground; nor can either skins or dung defend the huts of the natives. A man, who only walked about eighty steps from his own door, had his nose and his hands so frozen, that both would have mortified, had not the greatest care been taken. Though thus attacked by the weather, he was covered with few, and his hands were wrapped in a fur hood.”<sup>249</sup>

The winter of 1762 was remarkably mild in *Switzerland*. Severe cold came from the northeast as far as Lake Geneva but did not enter it. A constant fog suspended its operation or rather prevented it from passing mount Jura. Nine or ten inches of snow fell in the valley surrounding Geneva and this snow lay five or six weeks on the ground. At that time there was scarcely any snow on the mountains and very little in *Switzerland*.<sup>193</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1761 on December 31<sup>st</sup> – we never had such a December; it began with snow, and the snow is now two-feet (0.6 meters) upon a level. It gives fine sledding. Marblehead, Massachusetts reported that on February 8, 1762 the snow was more than 5 feet (1.5 meters) deep. On February 11<sup>th</sup> the snow is so deep that it is impossible to pass from the windmill to the meetinghouse. February 28<sup>th</sup> – the snow at Portland began falling as early as the 3<sup>rd</sup> of December; since which it kept snowing continually. Entries for March frequently mention the difficulty of travelling on account of the depth of the snow. April 4<sup>th</sup> – there is no riding on horseback, nor in a sleigh or chaise, but only on narrow bad footpaths [due to the depth of the snow]. April 12<sup>th</sup> – the robin and spring birds visited us. April 28<sup>th</sup> – the last of the huge mountain of snow behind the garrison disappeared.<sup>78</sup>

---

**1762 A.D.** In *England*, there was a great flood in the Thames Valley, and other parts of *England*.<sup>47, 92</sup>

On 22 February 1762 in northern *France* at Valenciennes near the border with Belgium, there was a great storm of hail, snow, and rain, accompanied with thunder. The lightning set fire to St. Gray's church.<sup>93</sup>

In Lisbon, *Portugal*, there was great destruction from a flood.<sup>47</sup>

In northern *Spain*, floods caused 3,000,000 livres damage at Bilboa, in April 1762.<sup>40, 41, 43</sup>

On 28 April 1762 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

In *France* in May, floods caused great damage.<sup>40, 41, 43</sup>

In May 1762 in *Switzerland*, there were no dews, which normally fall plentifully in that month. Instead there was a northeasterly wind, which held for twenty-two days.<sup>193</sup>

On 21 July 1762 in *England*, there was a hailstorm in Yorkshire.<sup>93</sup>

A drought struck eastern Massachusetts in what was to become the *United States* in 1762. There was scarcely any rain from 9 April to 18 August. At Danvers, the rains didn't come until 22 September. Wells went dry, the grass dried up and numerous fires prevailed. When rains finally came, farmers were forced to slaughter their cattle because of a lack of hay. Many people became destitute and suffered for want of food.<sup>199</sup>

In Dublin, *Ireland* on the 21<sup>st</sup> of October, there was a serious flood and much damage.<sup>47, 92</sup>

The summer of 1762 was very nice and very hot in July and most of the autumn. The summer in Denainvilliers, *France* was characterized by:

Hot days	54 days
Very hot days	5 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

A maximum temperature of 96.1° F (35.6° C) was observed in Denainvilliers on 2 August. In Burgundy, the grape harvest began on 15 September; 7 days earlier than average. The harvest was very plentiful and the wine of very good quality. The grain was of excellent quality and the year was very productive in terms of food.<sup>62</sup>

In 1762 in Burhanpoor (Burhanpur in north-central *India*), the River Taptee (Tapti) was greatly swollen in consequence of heavy rains, and one-fourth of the city inundated and one-tenth of the houses destroyed.<sup>47, 92</sup>

On 19 October 1762 in Detroit, Michigan in the *United States* there was a period of remarkable darkness. During most of the day, Detroit was under almost total darkness. "The darkness continued until 9 o'clock [a.m.], when it cleared up a little. We then for the space of about a quarter of an hour saw the body of the sun, which appeared as red as blood, and more than 3 times as large as usual. The air all this time, which was very dense, was of a dirty yellowish green colour [color]. We were obligated to light candles to see to dine, at one o'clock [p.m.], though the table was placed close by two large windows. About 3 [p.m.] the darkness became more horrible, which augmented till half past 3 [3:30 p.m.], when the wind breezed up from the S.W., and brought on some drops of rain, or rather sulphur [sulfur] and dirt, for it appeared more like the latter than the former, both in smell and quality. Mr. S. took a leaf of clean paper, and held it out in the rain, which rendered it black whenever the drops fell upon it; but when held near the fire turned to a yellow colour; and when burned it fizzed on the paper like wet [gun] powder. During the shower the air was almost suffocating with a strong sulphureous smell; it cleared up a little after the rain."<sup>237</sup> [There were several volcanic eruptions in 1762. These included the Pavlof Sister stratovolcano eruption in Alaska and the Kliuchevskoi stratovolcano eruption in Russia, the Epomeo eruption on the Isle of Ischia in Italy and the Planchón-Peteroa volcano eruptions in Chili/Argentina.]

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:  
June 5<sup>th</sup> – melancholy dry time. All are now looking for an absolute famine. June 23<sup>rd</sup> – a dark day. July 5<sup>th</sup> – [The dry conditions may have led to fires.] The woods are all afire; six houses, two saw mills, several barns and cattle were burnt at Dunston. Six families burnt out at North Yarmouth, and a vast deal of damage done in fences burnt,

and fields and pasture laid open. On August 13<sup>th</sup>, 16<sup>th</sup>, 18<sup>th</sup>, and 21<sup>st</sup>, there were showers. The earth is now wonderfully soaked and refreshed, and the grass begins to look green. October – it was a very cold day, but no frost yet. November – the last 11 days have been moderate and comfortable. December – several delightful days this month.<sup>78</sup>

In the *United States*, the severest drought ever experienced in the American northeast was in the summer of 1762. Scarcely a sprinkle of rain fell for nearly four months, May-September. Vegetables of every description perished.<sup>1</sup>

A drought struck New England in the *United States* in 1762. There was scarcely any rain from April 9 to August 18, and in some places, as at Danvers, Massachusetts until September 22. The month of April was cold. There was a slight drizzling rain at Boston, Massachusetts on May 7 and June 3 and showers on June 18. On July 7, a fast was held at Falmouth, Maine, and at Milton, Massachusetts. On July 28, being fearful that a famine would ensue, a public fast was proclaimed in a number of cities. Refreshing showers occurred near Falmouth, but not elsewhere until August 18, when abundant rain descended throughout New England. Crops were, of course, very light and cattle were generally slaughtered because of the difficulty of keeping them through the winter.<sup>138</sup>

On 9 December 1762, a storm from the southwest struck Carthagena, *Colombia*, which was followed by an earthquake, destroyed great part of the walls of the town, and many houses. The floods from the mountains came down with a rapidity never before seen, and vast quantities of mud choked up the entrance of Boca Chica [Bocachica]. Two Spanish men-of-war were driven on shore, and the castle of Santa Maria was entirely destroyed.<sup>143</sup>

In 1762 during the period between 24 April and 23 May, floods struck Hopei (now Hebei province) in northern *China* at Ch'ing-yün, Tsao-ch'iang, Hsü-shui and Wang-tu. Then during the period between 19 August and 17 September, floods struck several regions of *China* including:<sup>153</sup>

- Shantung (now Shandong province) on the east coast of *China* at Liao-ch'êng, P'u-t'ai [possible misprint, "T'ai-p'u"], Ch'iu, Tê-p'ing and Huang. At Ch'iu, the crops were damaged by the floodwaters.
- Chekiang (now Zhejiang province) on the east coast of *China* at Hai-yen, Hangchow, I-wu, Hai-ning, Yü-hang and P'ing-hu. At Hai-ning and Yü-hang, there was a great storm and the crops were damaged. At Hai-yen, houses were damaged by the floodwaters.
- Kiangsu (now Jiangsu province) on the east coast of *China* at Ch'ing-p'u.

In 1762 during the 6<sup>th</sup> moon, there was a flood in the vicinity of Shanghai, *China*.<sup>166</sup>

In 1762 during the period between 6 May and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou and Kansu (now Gansu province) in northwest *China* at Hui-ning.<sup>153</sup>

**Winter of 1762 / 1763 A.D.** During the winter, the River Thames in *England* was frozen below Gravesend. The winter was recorded as being intensely cold throughout *Europe*.<sup>1</sup>

The frost in *Britain* lasted 94 days.<sup>41, 43</sup>

In *England*, the frost lasted ninety-four days, and produced terrible effects. The frost set in on Saturday, 25 December 1762: "A most intense frost with easterly wind, which has since continued, with very little intermission, until the end of January. Some experiments have been tried during the course of it . . . On Friday, 31 December, a glass of water placed upon a table in the open air, in six minutes froze so hard as to bear 5 shillings upon it; a glass of red port wine placed upon the same table froze in two hours; and a

glass of brandy in six, both with hard ice. In *Cornwall, Wales, and Ireland* this frost was felt but slightly.”<sup>47, 93</sup>

The winter of 1762-63 was mild in Cornwall, *England*. This is in sharp contrast with the cold weather experienced at London. The coldest days at Cornwall were on 14 and 15 December and on 9 January. But the temperature did not fall below 38° F [3.3° C]. As a result, the myrtles are in perfect health; the mignonettes in flower; the cluster rose and white violet in bloom at Christmas; and the scarlet double ranunculus in full bloom; the double hyacinths have formed their bells, and some are now ready to unfold.<sup>237</sup>

In *Germany*, the frost seems to have set in sooner. On the 18<sup>th</sup> of December at eight in the morning, the cold was -2° F (-19° C) – the same as in 1740; the next day a half degree more, “which answers exactly the same degree of cold at Paris (*France*) in 1739”.<sup>47, 93</sup>

The winter of 1762-63 produced intense cold in Berlin, *Germany* and throughout the whole country. On 27 December 1762, the temperature dropped down to -4° F [-20° C].<sup>237</sup>

In *France*, the olives and vines suffered much; the Seine and Rhône Rivers being frozen over, the navigation was stopped, and provisions rose in Paris to famine prices.<sup>47, 93</sup>

In *France* the Seine River froze on 29 December 1762. On 1 & 2 January 1763 it was frozen at the first gate of the Louvre in Paris. The river thawed on the first of February. The river was frozen for 35 days. The lowest recorded temperature was 10° F (-12.5° C).<sup>62</sup>

The winter of 1762-63 was remarkable for its early onset and its long duration. [In *France*] the frost began in November 1762 and lasted to the end of January 1763. In Paris, *France*, the Seine River was frozen 25 continuous days. On 29 December 1762, the temperature read (14.7° F, -9.6° C). The Loire River was frozen near its mouth. In the south of *France* the temperature remained very mild. In Brussels, *Belgium*, the lowest observed temperature was (7° F, -13.9° C); the Canal in the city was frozen so solid that horse-drawn carriages, two wheel cabriolets and wagons drove across the ice safely. In London, *England*, the Thames River was so frozen that wagons could cross it on the ice. Two sentries were found frozen to death in January 1763. From north *Holland* individuals on sleighs safely crossed over the sea to Friesland on the ice. In *the Netherlands* at Utrecht on 27 December the low temperature was (8.4° F, -13.1° C); in Leyden (11.8° F, -11.2° C); in Amsterdam (14° F, -10° C); and in Vienna, *Austria* (-4° F, -20° C). In Rome, *Italy*, the cold was so strong that all the wells in the city froze.<sup>62</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1762 on December 26<sup>th</sup> – the Fore River froze over. December 31<sup>st</sup> – winter sets in. In 1763 on January 12<sup>th</sup> – incomparable sledding. January 26<sup>th</sup> – the harbor froze over all this week. January 31<sup>st</sup> – the harbor broke up. February 4<sup>th</sup> – the harbor is frozen over. February 6<sup>th</sup> – our people generally spent yesterday shovelling snow to the meetinghouse and elsewhere. February 9<sup>th</sup> – We are everywhere shut up [indoors]; people are discouraged making paths. They say there is now five-feet (1.5 meters) of snow upon a level but on clear ground, it has drifted to the size of mountains. It is a melancholy time, near a famine for bread. February 12<sup>th</sup> – the harbor is frozen over. February 26<sup>th</sup> – the harbor is frozen over. February 28<sup>th</sup> – there is no path anywhere through the country further than Stroudwater and up to Windham. Mr. Marston was obligated to leave his horse at Hampton and come home with snowshoes. Thus ends February, as it did last year, a severe winter as any we have had. March – a cold, blustering month. March 1<sup>st</sup> – today in God’s gracious providence we were relieved by the coming in of Mayhew’s schooner from Connecticut with 1,000 bushels of Indian corn. People were reduced to the last and extremist distress; scarce a bushel in the whole eastern country. March 8<sup>th</sup> – yesterday and today we had the coldest and longest storm this winter; there fell 19 inches (48 centimeters) [of snow], about as much as has been consumed. On 10 March, Rev. Smith married Samuel Green and Jane Gustin; they came on snowshoes across the Cove from Captain Ilsley’s to his house. March 28<sup>th</sup> – it has been a cold, tedious winter. April 15<sup>th</sup> – there has been no rain this spring. The snow

goes away kindly. April 12<sup>th</sup> – the robin and spring birds begin to tune up. April 30<sup>th</sup> – the roads and ground as dry as summer. May 1<sup>st</sup> to May 18<sup>th</sup> – fine weather. May 20<sup>th</sup> – cold, which prevents the cherry trees from blossoming. May 24<sup>th</sup> – the freshets [floods waters caused by spring thaw] are raised higher than ever known.<sup>78</sup>

---

**1763 A.D.** In *England*, there were great rains and floods.<sup>92</sup> “A remarkable year for floods and high waters.”<sup>47</sup>

In southeastern *Ireland*, there were floods. “Above 200 persons perished on the River Nore.”<sup>47, 92</sup>

In the *Gentleman’s Magazine* there are melancholy accounts of the damage resulting from the thaw, after the six weeks’ frost, and by the rains which followed in *England* in January: “Rivers have overflowed their banks, and laid vast tracts of land under water, cattle in many places have perished, and in some are deprived of food; people have been forced to leave their dwellings and take refuge in the neighbouring towns; in short, such a scene of calamity and distress as is to be seen in the counties of Lincoln and Cambridge has never been known in this island by the oldest man [in] it. The vast extent of meadow from the source of the Thames to the river’s mouth is almost covered in water. The great bank between Peterborough and Wisbeach in Cambridgeshire has been broken down, and near 400,000 acres of land overflowed. The river Welling in Lincolnshire has likewise broke its banks, and overflowed Porsend and Crowland fens. . . . The River Severn has likewise risen to an uncommon height, and laid the meadows on each side its banks under water to an immense extent. About Birmingham the floods are inconceivable. In short such general floods were never known.”<sup>47</sup>

On 26 February 1763 in *England*, there was a violent hurricane at Broadway in Worcestershire from southwest to northeast, tearing up trees by the roots, and beating down a house. The hail devastation extended about  $\frac{3}{4}$  of a mile in length and 25 yards in width.<sup>93</sup>

On 1 March 1763 in *England* at Harrow [now part of London], there was hail and rain, accompanied with lightning and thunder, doing great damage.<sup>93</sup>

On 23 June 1763 in *England*, there was a great hailstorm in Essex.<sup>93</sup>

On 26 June 1763 in *France*, a hailstorm struck in the province of Macconnois [now the Mâconnais district in Burgundy, *France*], from the frontiers of Beaujolais to the frontiers of Burgundy. The fruit and grain of 36 villages was destroyed and the vines were permanently broken.<sup>93</sup>

On 15 July 1763 in eastern *France* at Bensaçon, the whole country in some 200 communes laid waste by a hailstorm. There were hailstones as large as fowls’ eggs. Trees were torn up, and people killed and wounded.<sup>93</sup>

On 19 August 1763 in *England*, there was a great hailstorm in the neighborhood of London, Essex, Hertfordshire, Middlesex, and Kent. Great darkness followed by storm of hail, wind, and rain, driving in the direction of Kent. Poultry and sheep were killed, and crops destroyed. Damage was estimated at £50,000. *A Kentish Garland* provided the following detailed account of the devastation of this storm: On Friday, August 19, 1763, a storm arose at sea, off the Sussex coast. The moraine was still, with scarcely a breeze of air; and so excessively hot, that it was suffocating. About ten o’clock in the forenoon, a black cloud arose towards the west; soon after which the wind blew in like a hurricane; the clouds came on with amazing velocity, throwing out in their course dreadful flashes of lightning; and the thunder was almost one continued roar. About half-past eleven, the rain poured in torrents, and in a few minutes was intermixed with some detached hailstones, which were very large, as an introductory of what were to follow: the hail, wind, lightning and thunder, soon came on so furiously, that all was one dreadful scene of horror. The boughs, branches, and leaves of trees, broken and stripped off, flying in the wind, still

more darkened the air; the tiles and windows rattling, and dashing to pieces; trees torn up, and falling, struck all with a terror not easily to be expressed; some running distractedly about, wringing their hands, while others stood like inanimate beings. The storm lasted about half an hour. What a scene ensued! A universal desolation everywhere presented itself; some houses filled with water; others, with their barns, blown down; roofs and walls shattered; the windows quite destroyed: the waters roaring in torrents down the streets, plowing up the stones in their course, and leaving deep chasms; the surface of the earth covered with prodigious hailstones and water; corn, fruit, and hops destroyed; the fields and hop-gardens everywhere disfigured; trenches formed by the rushing water; the roots of the hops bared, and the poles thrown down in all directions; heaps of stone and sand driven through the hedges; boughs and branches scattered; the fruit-trees stripped of their bark. The smaller animals, such as hares, pheasants, and other game, lay dead in the fields; and a large hog was killed by the hail upon Banning Heath. The larger quadrupeds, endowed with superior instinct, saw their danger; horses, bullocks, and sheep ran, and sheltered themselves from the coming storm. In Maidstone, on one side of the High Street, not only the glass, but also the lead and frames, of the windows, were forced in and destroyed, particularly by the hail. It was like fragments of ice, and of very irregular shapes; at Banning, one piece was taken up formed like an oyster; Sir Philip Boteler measured, and found it nine inches round at the extremity: and even ten days after, some hailstones were taken up four inches and a half in circumference. One of the largest struck the stile of a horizontal post-dial of brass, and bent it near thirty degrees towards the east. Posts, bars, and gates had deep impressions from them. They were of different shapes; some flat, irregular, and very much jagged; others an assemblage of pieces of ice; whilst a few were globular, with a small cavity in the center; and if they were held together, they immediately froze, and were not easily separated. The storm commenced in this county at Tunbridge Wells, whilst the people were at prayers in the chapel, and passed quite across to Sheerness, a distance of forty miles, its breadth not exceeding four miles: the direction of it was from southwest by west, to northeast by east; and it was severely felt in the parishes of Tunbridge, Speld-Hurst, Penshurst, Tudely, Capel, Pcmbury, part of Hadlow, Yalding, Hunton, Brenchley, Mereworth, East and West Peckham, Wateringbury, Nettledsted, East Malling, Teston, East and West Farleigh, Barming, Loose, Maidstone, Boxley, and Detling; after which its violence was spent, and only little injury was occasioned. Numbers [of people] came from all parts to witness the melancholy scene. The inhabitants of the vicinity humanely raised £3000 in a few months, which in some measure relieved the unhappy sufferers: but the cruel effects long remained; most of the hop-hills died; the filbert and apple trees swelled in knots where they had been bruised; and some were so injured, that the branches and shoots long after continued to die: the cherry-trees bore it the best, owing perhaps to the strength of their outward bark.<sup>93</sup>

In August 1763 in *Ireland*, there was a great hailstorm in Kinnegad.<sup>93</sup>

In *Europe*, there were great floods.<sup>47, 92</sup>

The summer [in *France*] of 1763 had unusual high temperatures in August but the heat wave only lasted a short period of time. This season exhibited a severe drought, especially in the south. The summer in Denainvilliers, *France* was characterized by:

Hot days	22 days
Very hot days	3 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

Up until August, there had only been 10 hot days. The high temperatures observed during the summer were:

Paris, <i>France</i>	( 94.5° F, 34.7° C ) on 18 August
<i>Ibid.</i>	(102.2° F, 39.0° C ) on 19 August
Denainvilliers, <i>France</i>	( 95.5° F, 35.3° C ) on 19 August
Mulhouse, <i>France</i>	( 90.1° F, 32.3° C ) on 10 August

Brussels, *Belgium* ( 81.0° F, 27.2° C) on 19 August

In Burgundy, the grape harvest began on 5 October. The yield was fairly plentiful, but the wine was of a very poor quality. In the area around Orleans, the grapes did not even ripen. The grain harvest was excellent in northern and central *France*; but in the south the harvest was poor.<sup>62</sup>

There was an excessive drought in 1763 in southern *France*.<sup>79</sup>

In 1763, a drought engulfed Hupeh (now Hubei province) in central *China* at Ao-ch'êng. During the period between 11 June and 10 July, floods struck Kiangsi (now Jiangxi province) in southern *China* at Kao-an and Szechwan (now Sichuan province) in southwest *China* at Shih-yang.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 27<sup>th</sup> – warm weather is much wanted. July 1<sup>st</sup> – there is no summer yet. July 14<sup>th</sup> – not a hot night this summer; indeed, no hot weather at all, but constantly wet. July 21<sup>st</sup> – cold northeast storm. There has not been for two months past, 48 hours of fair weather at one time. August 9<sup>th</sup> – the weather continues foggy and wet. August 26<sup>th</sup> – fair weather; a great favor and rarity. August 27<sup>th</sup> – by reason of the wet weather, my books and clothes have become mouldy, and we were not able to shut our inner doors, being swelled so through the whole summer. September 10<sup>th</sup> – a frost last night. September 18<sup>th</sup> – plenty of rain, after a fortnight of dry seasonable weather. September 28<sup>th</sup> – we began to dig our potatoes. November 10<sup>th</sup> – a long storm.<sup>78</sup>

**Winter of 1763 / 1764 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1763 on November 14<sup>th</sup> – very cold. November 18<sup>th</sup> – a great northeast snowstorm. November 26<sup>th</sup> – there was a week of moderate, pleasant weather. December 2<sup>nd</sup> – moderate weather. December 8<sup>th</sup> – raw. December 13<sup>th</sup> – pleasant. December 18<sup>th</sup> – blustering. In 1764 on January 11<sup>th</sup> – harbor froze over. January 26<sup>th</sup> – there fell just as much snow as was wanted and desired. Much business done this month.<sup>78</sup>

**1764 A.D.** In *Ireland* in January, there were great floods in Dublin, Cork, and other parts.<sup>47, 92</sup>

On 23 June 1764 in *England*, there was a great storm of hail, rain, lightning and thunder, in Middlesex, Berkshire, Wilts, Oxford, Buckinghamshire, Worcestershire, Hampshire, Essex, Durham, and Yorkshire. The hail caused immense damage to fruit and grain crops; also to buildings and livestock. In Berkshire alone damage was estimated at £20,000.<sup>93</sup>

On 25 June 1764 in *England*, there was a hailstorm in Northamptonshire.<sup>93</sup>

On 25 June 1764 in northern *France* at Douay [now Douai], there was a hailstorm. The hailstones were as big as fowls' eggs.<sup>93</sup>

On 25 June 1764 in southwest *Germany* at Heidelberg, there was a dreadful hailstorm. The Electoral Palace caught fire by lightning, and was in a great part consumed.<sup>93</sup>

The summer of 1764 in Denainvilliers, *France* was characterized by:

Hot days	42 days
Very hot days	7 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The highest temperatures occurred in June. The high temperatures observed during the summer were:

Paris, <i>France</i>	( 99.5 ° F, 37.5° C) on 22 June
Lausanne, <i>Switzerland</i>	( 95.0 ° F, 35.0° C)
Denainvilliers, <i>France</i>	( 92.8 ° F, 33.8° C) on 19 June
Mulhouse, <i>France</i>	( 88.9 ° F, 31.6° C) on 19 June
Brussels, <i>Belgium</i>	( 79.0 ° F, 26.1° C) on 13 July

In Burgundy, the grape harvest began on 12 September. The yield was fairly plentiful, and the wine was of a very good quality. The grain would have produced a good harvest; except in a good many places, hailstorms destroyed the crop. In the area around Orleans, the harvest produced little fruits and vegetables.<sup>62</sup>

In France there was a flood. On 15 November 1764, the Seine River in Paris, *France*, at the bridge “Pont de la Tournelle” reached a height of 7.0 meters (23.0 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

During 1764-1766, there was a famine on the coast of *India* between 16 degrees and 18 degrees Latitude.<sup>182</sup>

In 1764, floods struck many regions of *China* including:<sup>153</sup>

— During the period 3-31 March, floods struck Hupeh (now Hubei province) in central *China* at Hanyang, Han-ch’uan, Ao-ch’êng and Wuchang; and Kiangsi (now Jiangxi province) in southern *China* at Nan-ch’ang, Chi-an and Kiukiang.

— During the period 1-30 May, floods struck Hupeh province at Huang-an, Huang-kang, Ch’i-shui, Kuang-chi and Shih-shou; and at Tung-t’ing Lake in Hunan province in south-central *China*. At Tung-t’ing Lake, innumerable houses were damaged.

— During the period between 31 May and 28 June, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p’ing and Szechwan (now Sichuan province) in southwest *China* at Ta.

In 1764 during the period between 6 May and 8 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Ning-ching and Tung-kuang.<sup>153</sup>

In 1764 during the 11<sup>th</sup> moon on the 11<sup>th</sup> day in the vicinity of Shanghai, *China*, there was a storm with hail. But as harvest was already gathered so it did no damage.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

February – generally moderate weather this month. March 12<sup>th</sup> – cold and windy. March 15<sup>th</sup> – warm. March 25<sup>th</sup> – uncomfortable. March 28<sup>th</sup> – charming pleasant. April 14<sup>th</sup> – the spring is marvellously forward. April 26<sup>th</sup> – pleasant day. May – generally a pleasant month. May 25<sup>th</sup> – the cherry trees are in full bloom. June 14<sup>th</sup> – the earth is sufficiently soaked. June 18<sup>th</sup> – the earth has a most beautiful green face. June 30<sup>th</sup> – the fruits of the earth are promising. August 18<sup>th</sup> – a very dry time seems to be coming on. August 31<sup>st</sup> – a very dry time indeed. September 7<sup>th</sup> – there has been a great deal of very cold weather. September 18<sup>th</sup> – cold still. September 19<sup>th</sup> – a hot day. September 26<sup>th</sup> – very cold. September 30<sup>th</sup> – delightful Sabbath. October 3<sup>rd</sup> – fine weather. October 13<sup>th</sup> – pleasant. October 22<sup>nd</sup> – very warm. October 24<sup>th</sup> – cold and windy. October 26<sup>th</sup> – a great storm, wind southeast. November 1<sup>st</sup> – pleasant. November 5<sup>th</sup> – dry travelling. November 16<sup>th</sup> – very cold. November 27<sup>th</sup> – a fine day.<sup>78</sup>

---

**Winter of 1764 / 1765 A.D.** On 31 December 1764, the Delaware River near Philadelphia, Pennsylvania in the *United States* was frozen completely over in one night, and the weather continued cold until the 28<sup>th</sup> of March with snow two and a half feet (0.8 meters) deep. The winter was intensely cold. The Delaware River was so frozen solid that on 19 February, a whole ox was roasted on the Delaware.<sup>1</sup>

The winter of 1764-1765 was very cold and snowy in the *United States*. A holiday snowstorm hit Philadelphia on 25-26 December 1764, another heavy snowfall struck on 5-6 January 1765. The snow in Germantown was 2 feet (0.6 meters) deep at that time. During the last week in January, the weather turned intensely cold. The Delaware River was closed to navigation due to ice from 24 December 1764 to 24 February 1765. On 7 February, “an ox was roasted whole on the river Delaware, which, from the novelty of the thing drew together a great number of people.” A great snowstorm buried Philadelphia on 24 March. Snow was “said to be between 2 and 2½ feet (0.6-0.8 meters) on the level”. After this late

March storm, surveyors Charles Mason and Jeremiah Dixon measured the depth of snow at the Maryland-Pennsylvania border and found it to be near 3 feet (0.9 meters) deep.<sup>27</sup>

During the winter of 1764-65, the Hudson River between New York and Powles' Hook [now called Paulus Hook, Jersey City, New Jersey] in the *United States* was frozen and was crossed on the ice. [Manhattan, New York is located 1 mile across the Hudson River from Powles' Hook. "Crossed on the ice" generally means the ice was sufficiently thick to allow foot and wagon traffic.] [This is only one of four winters when the Hudson River was completely frozen over during the century from 1740-1840. The other winters were 1740-41, 1779-80, and 1820-21.]<sup>202</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1764 on December 17<sup>th</sup> – about 15 inches (38 centimeters) of snow upon the ground. December 27<sup>th</sup> – there is between 2 and 3 feet (61 and 91 centimeters) [of snow]. December 31<sup>st</sup> – it has thus far been a severe winter; nothing like it since 1747 and 1748, then it was more so. January 1765 – the bay is skimmed over. January 14<sup>th</sup> – pleasant. January 22<sup>nd</sup> – the heart of the winter seems broken; incomparable sledding. January 23<sup>rd</sup> – a charming day. January 26<sup>th</sup> – very cold. January 31<sup>st</sup> – a great storm. February 5<sup>th</sup> – tempestuous and cold. February 12<sup>th</sup> – the ice lies over the harbor still. February 14<sup>th</sup> – a thaw. February 18<sup>th</sup> – fine, warm weather. February 25<sup>th</sup> – there has been no snow all this month. March 2<sup>nd</sup> – winter returns upon us. March 13<sup>th</sup> – a charming day. March 22<sup>nd</sup> – raw; cold. March 24<sup>th</sup> – dismal snowstorm.<sup>78</sup>

The winter in 1765 [in *Europe*] was moderate and in *Italy* of extraordinary gentleness.<sup>62</sup>

---

**1765 A.D.** In *England* and *Europe*, there were general rainstorms and floods.<sup>47, 92</sup>

In *Ireland*, there were great floods throughout the south.<sup>47, 92</sup>

In *Ireland* in 1765, there was great scarcity. Distilling and exportation of corn [grain] prohibited by Act of Parliament.<sup>57, 91</sup>

On 10 June 1765 in *England* at Lower Brails (Warwickshire), there was hail, rain, and thunder. Some of the stones measured 7½ inches in circumference; and lay 14 inches deep upon the ground, destroying crops, fruit, poultry, and vegetation generally.<sup>93</sup>

In July 1765, a hurricane visited the *Caribbean* island of St. Eustatius [Statia]. The storm reached the *Caribbean* island of Martinico [Martinique], where thirty-three ships were lost. At Guadeloupe in the *Lesser Antilles*, six ships and ten small vessels were lost.<sup>143</sup>

On 2 August 1765 in *England*, there was a great hailstorm in Kent. Hail and ice lying 3 feet deep in some places. Crops were destroyed. The hailstorm also struck in Cambridgeshire and Suffolk.<sup>93</sup>

The summer of 1765 in Denainvilliers, *France* was characterized by:

Hot days	41 days
Very hot days	2 days
Extremely hot days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The hottest days occurred in August. The high temperatures observed during the summer were:

Paris, <i>France</i>	( 96.8° F, 36.0° C) on 24 August
<i>Ibed.</i>	( 99.9° F, 37.7° C) on 25 August
<i>Ibed.</i>	(104.0° F, 40.0° C) on 26 August
Denainvilliers, <i>France</i>	( 95.0° F, 35.0° C) on 24 August
Mulhouse, <i>France</i>	( 85.8° F, 29.9° C) on 16 June
Brussels, <i>Belgium</i>	( 84.9° F, 29.4° C) on 26 August

In Burgundy, the grape harvest began on 23 September. But the wine was bad because on 1 September the area was hit with a hailstorm. In the area of Orleans, the grape harvest produced good vintage wine, because of the hot days at the end of August and early September. The harvest in the south because of heavy rains were plagued with a lot of weed in the sheaves; and as a result, the yield of wheat was bad and a mediocre crop of corn was produced.<sup>62</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

March 31<sup>st</sup> – hot and pleasant, though it has been raw and cold for some time past. April 9<sup>th</sup> – the robin this morning first made his appearance. April 10<sup>th</sup> – the spring bird, with the robin, gave us a serenade. April 11<sup>th</sup> – the wind blew fresh and cold. April 19<sup>th</sup> – warm. April 22<sup>nd</sup> – raw; cold. April 30<sup>th</sup> – the dry time continues and increases. May 1<sup>st</sup> – plentiful rain. May 12<sup>th</sup> – the spring is uncommonly forward. May 14<sup>th</sup> – the cherry [trees] blows [blossom]. May 25<sup>th</sup> – cold for 9 days past. May 27<sup>th</sup> – an extremely hot day. May 29<sup>th</sup> – a growing season. June – a growing season. June 30<sup>th</sup> – a great prospect of rain and grass, though the Indian corn very much wants heat. July – alternately warm and cold. August – the pastures are dried up. September 2<sup>nd</sup> – plentiful rains: the earth has a new [green] face. September 15<sup>th</sup> – very cold. September 24<sup>th</sup> – a delightful day.<sup>78</sup>

In 1765, there was a famine in Bombay in *India* and Scinde (now Sindh, *Pakistan*).<sup>156</sup>

In 1765 during the period between 20 April and 19 May, floods struck Shantung (now Shandong province) on the east coast of *China* at Ch'ang-ch'ing and Hui-min. During the period between 6 May and 8 August, a drought engulfed Shensi (now Shaanxi province) in central *China* at Lo-ch'uan. During the period between 16 August and 14 September, floods struck Shensi province at Fu-ku and Hopei (now Hebei province) in northern *China* at Chi. At Chi, houses were damaged by the floodwaters. [Chi is located at longitude 117.24° East and latitude 40.03° North.]<sup>153</sup>

---

**Winter of 1765 / 1766 A.D.** At Ratisbon (*Bavaria*) the frost was so severe that birds fell down dead with cold. On 13 January, Reaumur's thermometer was 2° lower than in the severe weather in 1709.<sup>47, 93</sup>

At Lisbon, *Portugal*, Reaumur's thermometer was 3½° below freezing point (-4° C, 24° F).<sup>47, 93</sup>

At Naples, *Italy* also the weather was so excessively severe that the snow laid knee deep in the streets; Mount Vesuvius was also covered with snow, at the same time throwing up fire and black smoke, which made a most astonishing appearance.<sup>47, 93</sup>

On 30 January 1766 in *Gibraltar*, there was a dreadful hailstorm, which commenced about 4 P.M. Hailstones were of immense size. The hailstorm terminated in a rainstorm, which flooded the town and caused the loss of many lives.<sup>93</sup> [Gibraltar is a British overseas territory located on the southern end of the Iberian Peninsula at the entrance of the Mediterranean Sea.]

*Gibraltar* nearly destroyed by a storm on February 3, 1766.<sup>40, 41</sup>

In 1766, the frost was most terrible from 25 December to 16 January and from 18 to 22 January.<sup>90</sup>

In *England* on 15 February, a great snowstorm hit Nottinghamshire, which lasted fifty hours. In other parts of *England* rain storms [freezing rain], which froze upon the trees, and caused great destruction of timber; the immense weight breaking off the largest arms and branches.<sup>47, 57</sup>

In *England* on February 14<sup>th</sup> and 15<sup>th</sup>, there was a great rainstorm in the south and southwest of *England*, which, by reason of a northeast wind, became frozen as it fell, and thus weighing down large timber trees, produced terrible destruction. In the northern part of *England* there was snow, accompanied by severe frost.<sup>47, 93</sup>

The Seine River in *France* was entirely frozen over.<sup>38</sup>

During the winter of 1765-66, the rivers froze in the southern *France*, even the River Gave, despite his speed. The Seine froze on 1 January 1766, at a temperature of 16° F (-9° C) between the Pont Neuf and the Pont Royal in Paris. The next day the sky was completely clear.<sup>62</sup>

In *France* on the 20<sup>th</sup> of April 1766, the frost was so severe in the province of Dauphiny, that it destroyed the vines, and cut off the blossoms of the early fruit trees.<sup>47</sup> [Dauphiny is a former province in southeastern *France* which extended up to what is now the center of Lyon.]

The winter of 1765-66 was severe in *France*. The frost in Denainvilliers, *France* lasted from 20 December 1765 to 25 January 1766, producing 36 days of frost in succession. The coldest day was 10 January with a measured temperature of 8.4° F (-13.1° C). The lowest temperature observed in Paris was 9.5° F (-12.5° C). The Seine River froze on 1 January 1766. The River Gave and the other rivers in southern *France* were covered with ice. The Rhône River at the Heiligen-Geist Bridge froze so solid that carriages traveled across the ice. In Languedoc, *France*, many olive trees were damaged. In Madrid, *Spain* people were ice-skating outdoors, and snow fell in Cadiz.<sup>62</sup>

The winter of 1766 produced harsh frosts in January and February. These froze the Seine River in Paris, *France* by a cold 9.5° F (-12.5° C). There were thirty-two days of frost at Viviers, and thirty-seven days of frost at Montpellier. The cold reached 11.8° F (-11.2° C) in Viviers and 14° F (-10° C) at Montpellier. A constant drought reigned during the course of these frosts.<sup>79</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1765 on December 16<sup>th</sup> – snow. December 31<sup>st</sup> – last night was as cold as (perhaps) it ever was, in this country, and continues so. In 1766 on January 6<sup>th</sup> – the harbor remains shut up [due to the ice]. January 9<sup>th</sup> – fine weather. January 17<sup>th</sup> – severely cold. January 21<sup>st</sup> – rain. January 30<sup>th</sup> – incomparably pleasant. February 4<sup>th</sup> – fine sledding. February 9<sup>th</sup> – this is the 14th day since there has been any falling weather. February 19<sup>th</sup> – pleasant day. February 26<sup>th</sup> – fair and pleasant. February 28<sup>th</sup> – very cold. March 14<sup>th</sup> – a great northeast snowstorm as ever was known, perhaps greater.<sup>78</sup>

In Philadelphia, Pennsylvania in the *United States* the winter of 1765 was intensely cold. On the 19<sup>th</sup> of February, a whole ox was roasted on the frozen Delaware River.<sup>1</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

The earliest authentic record we have of severe cold weather in Florida in the *United States* is in the year 1766, just after the transfer of the Florida to England. The night of January 2, 1766, John Bartram, the botanist, says, "was the fatal night that destroyed the lime, citron, and banana trees in St. Augustine, many curious evergreens up the river that were nearly twenty years old and in a flourishing state, the young green shoots of the maple, elm, and pavia [red buckeye or firecracker plant], with many flowering plants and shrubs never before hurt." Bartram, who was then camping on the St. Johns River above Volusia, says: "The morning of the 3d was a clear, cold morning; thermometer, 26° F; wind, northwest. The ground was frozen an inch thick on the banks." Bernard Romans, in his *Natural History of Florida* (1775), says: "On January 3, 1766, a frost destroyed all the tropical productions in the country, except the oranges. The Spaniards called this a judgment on the place for having become the property of heretics, as they never had experienced the like."<sup>115</sup>

*The Modern Part of an Universal History from the Earliest Account of Time* published in 1766 describes the climate of *North America* during that period of time. This is of interests because it is shortly after the end of the last Little Ice Age, which corresponded to the reduced period of solar activity known as the Maunder Minimum (1645-1715 A.D.) The following was observed:<sup>290</sup>

— Severe cold is commonly known in the winter months as low as 34 or 35 degrees North latitude. Vast shoals of ice are seen floating, and the sea frequently is frozen to a small distance from the shore, in the latitude of 44 or 45 degrees North.

— Virginia has winters that are fine clear air and dry, which renders it very pleasant. Their frosts are short, but sometimes so very sharp, that it will freeze the rivers over three miles [5 kilometers] broad. Snow falls sometimes in pretty great quantities, but rarely continues above a day or two. Their spring is about a month earlier than in England. In April, they have frequent rains. May and June the heat increases. The summer is much like in England, being mitigated with gentle breezes that rise about nine o'clock, and decrease and increase as the sun rises and falls. July and August, those breezes cease, and the air becomes stagnant. In September, the weather usually breaks suddenly, and heavy rains fall, when many people fall sick. This becomes the time of the fluxes, scorbutic dropsies, gripes, or the like.

— In Maryland, the air is excessively hot some part of the summer, and equally cold in winter, when the northwest wind blows. Their winters are not of more than three or four month's duration, and in these they seldom have one month of bad weather. All the rest they are happy in a clear air, and bright sun, and are scarce ever troubled with fogs.

— New England (the colonies of Massachusetts, New Hampshire, Connecticut, Rhode Island and Providence Plantation) have north and northwest winds blowing over a long tract of frozen country, are excessive cold, which makes the winters there much severer and longer than in Old England. The ground is also covered with snow and the shipping on the coast frozen up several months. But then the weather is more constant, and not variable as in Old England, and the short summer much hotter.

— The country called New Britain or Eskimaux and British Canada borders the Hudson Bay. There are high mountains to the north which being perpetually covered with snow. The winds blow from the north three fourths of the year. It is an area of excessive cold. The soil in the countryside around Fort Nelson is frozen six feet [1.8 meters] deep even in the summer. In lakes and standing waters, which are not ten feet [3 meters] deep, the water is frozen to the bottom in the winter and the fish killed. But in waters of greater depth, and rivers near the sea, the fish are caught all winter, by cutting holes in the ice to which they come up for air. As soon as they are taken out of the water, they are immediately frozen stiff and are thawed out again by being immersed in cold water.

— Canada proper (bordered by Terra de Labrador, Hudson Bay and New Britain; on the east by the River Saguenay; and on the south by the great province of Louisiana and the Iroquois and Etechemins) greatest hardship is the winter cold, which is there so excessive from December to April, that the greatest rivers freeze over, and the snow lies commonly two or three feet [0.6-0.9 meters] deep on the ground.

---

**1766 A.D.** On 10 July 1766 in *England*, there was a great hailstorm in Greenwich [now a suburb of London]. The hailstones were very large.<sup>93</sup>

On 13 July 1766 in *England*, there was a hailstorm in Yorkshire.<sup>93</sup>

On 17 July 1766 in *England*, there was a hailstorm in Suffolk.<sup>93</sup>

On 21 July 1766 in southern *France*, there was a hailstorm at Verdun-sur-Garonne. Hail, accompanied by torrents of rain, fell, and destroyed and carried away all the crops not previously gathered. The water courses were thus choked, and a great flood ensued, placing more than 100 houses under water. Trees were uprooted by the force of the hurricane; and the church at Pilleport was blown down and 12 persons killed.<sup>93</sup>

The summer of 1766 was remarkable for an extremely high temperature. In July at the Observatory of the College of *France*, a temperature of 100.0° F (37.8° C) was recorded. However, in Paris there were only 24 hot days and one very hot day. And in Denainvilliers, *France* only 40 hot days were observed. The grape harvest began in Burgundy on 27 September. The yield of wine was ordinary and the quality pretty good. This summer was excessively rainy in southern *France*. In the countryside around Orleans in September, many vines froze to death.<sup>62</sup>

The rains of 1766 were epoch-making in the southern *France*. They occurred during the autumn over much of these lands. They ravaged Alby [now Albi], Montauban, Cette [now Sète], Montpellier, Provence and Roussillon. These rainstorms broke out in October. In Montpellier on the 13<sup>th</sup>, it rained for eight consecutive hours. Thereafter, all its rivers overflowed and swamped fields, vineyards and whole herds. These early rains were still very mild compared with November. A furious storm broke out on November 14, about ten o'clock in the evening. The storm was violence during all the next day and continued almost without interruption until 22<sup>nd</sup>. At Montpellier, they measured 32 inches (812 millimeters) of rainfall in the months of October and November. This broke down to 6.4 inches (163 millimeters) in October and 25.6 inches (649 millimeters) in November. This was 1.9 inches (47 millimeters) above the average for these two months. November 14 alone produced at least 15.4 inches (392 millimeters) of rainfall. The period of November 14<sup>th</sup> to the 17<sup>th</sup> produced a total of 21.3 inches (541 millimeters).<sup>79</sup>

Lightning and tempest storms of 1766 sowed grief and terror. They began in October and were repeated with increasing violence in the month of November. The storm of 14 November surpassed all others. No feature was missing from this terrible scene. There were fierce winds, heavy shots of thunder, hail and torrents of rain. These storms struck mainly the southern provinces of *France*.<sup>79</sup>

In *Scotland* in 1766, "The magistrates of Edinburgh and Glasgow have put an stop to the exportation of grain, tallow, and butter, in their respective jurisdictions; a power which the magistrates of London do not seem to possess."<sup>57</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April – generally pleasant. April 27<sup>th</sup> – the spring comes on finely. May 5<sup>th</sup> – a long spell of raw, cold weather. May 16<sup>th</sup> – our cherry trees begin to blossom. May 26<sup>th</sup> – the cherry trees are in full blow [bloom]. May 31<sup>st</sup> – the spring it uncommonly forward, the Indian corn, in many places, has come up. June 14<sup>th</sup> – an uncommon growing season. July 30<sup>th</sup> – rain every day; never such a season but the old grass [covered] grounds have but poor burdens, owing to the last winter's frost, which killed the grass. August 18<sup>th</sup> – such a growing season through the whole summer never was known. September 1<sup>st</sup> – cabbages are beginning to head. September 10<sup>th</sup> – Michaelmas storms. September 30<sup>th</sup> – the earth has a most beautiful face; the English grass is now set, and grows more than at any time this year, and there has been no frost yet. October – pleasant weather most of the month. October 31<sup>st</sup> – a surprising warm summer's day. November 1<sup>st</sup> and 2<sup>nd</sup> – two more similar days. November 9<sup>th</sup> and 13<sup>th</sup> – cold. November 14<sup>th</sup> – moderate again.<sup>78</sup>

On 13-14 August 1766, a hurricane struck the *Caribbean Islands* of Martinique. [Various accounts give differing fatality figures of 440, 400, 100, and 90.]<sup>141</sup>

On 13 August 1766 a dreadful hurricane struck the *Caribbean* island of Martinico [Martinique]. The hurricane began at ten in the evening with a gale from the northwest. At midnight, the shock of an earthquake added to the horrors of the increased hurricane. At three in the morning, the gale abated, and at daylight the streets of St. Pierre's appeared covered with ruins. The roads were blocked up with trees blown up by the roots. The rivers had brought down stones of an enormous size; and the shore was covered with wrecks and dead bodies. At five a.m., a waterspout burst upon Mount Peleus, and overwhelmed the neighboring plains. At six it was quite calm, and the sea smooth. Twenty-eight French and seven English vessels were wrecked, besides twelve passage canoes. Ninety persons were said to

have perished, many under the ruins of their own houses, and twice that number were wounded. The writer says, "The above is a genuine recital of what has happened at St. Peter. In going over the island, we shall find nearly the same calamities, and in some places still worse."<sup>143</sup>

On 4 September 1766, a hurricane struck Texas in the *United States* and the *Gulf of Mexico*. During the hurricane, 5 ships were wrecked on Galveston Island, Texas and a majority of the treasure and persons from these ships were saved. In the *Gulf of Mexico*, it is believed that one merchantman vessel from the Spanish Fleet was lost in the storm. But the date of the loss of the merchantman vessel varies by the account. One ascribes the date as the 1<sup>st</sup>-4<sup>th</sup>, or in the middle of September.<sup>141</sup>

[Due to a hurricane] On 13-15 September 1766, all the vessels at Montserrat [located in the Leeward Islands, part of the chain of islands called the Lesser Antilles in the *West Indies*], and thirteen vessels at St. Kitts in the *West Indies*, were driven on shore and lost. At Montserrat, half the town was destroyed and upwards of two hundred persons reduced to distress, by the torrents from the mountains.<sup>143</sup>

On 21 September 1766, the provision grounds and sugar cane plantations at *Caribbean* island of St. Eustatius [Statia] were destroyed by a violent hurricane. Several vessels were lost. The salt works at Tortuga were also destroyed by a hurricane, and three French and five Newfoundland, Canada vessels driven on shore there.<sup>143</sup>

On 6 October 1766, a hurricane struck Guadeloupe in the *Leeward Islands*. Twelve inbound slave ships from Africa traveling to the Isle de Saints were totally lost during the storm.<sup>141</sup> [Îles des Saintes is a small archipelago of French Antilles located to the south of Guadeloupe island.]

On 6 October 1766, five vessels were driven on shore at Dominica in the *Lesser Antilles* in a gale of wind, and upwards of fifty sail [sailing ships] at Guadeloupe in the *Leeward Islands*.<sup>143</sup>

On 22-23 October 1766, a violent hurricane did considerable damage in the harbor of Pensacola, Florida in the *United States*. The Spanish fleet from Vera Cruz [Veracruz, Mexico] bound for Havana, Cuba and then Spain, consisting of five large register ships richly laden, was driven ashore in the bay of St. Barnard [where the Mississippi River enters the Gulf of Mexico].<sup>143</sup>

On 23 October 1766, a hurricane struck northwest Florida in the *United States*. All the crew drowned except for three in the brig *Wetherill* during the most terrible hurricane.<sup>141</sup>

In 1766 during the period between 8 August and 8 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Liao-ch'êng, Tsinan, Yü-ch'êng, Hui-min, Shang-ho, Li-ching, Chin-hsiang and Yü-t'ai. During the same period of time, a drought engulfed Shantung province at Wên'têng and Jung-ch'êng.<sup>153</sup>

**Winter of 1766 / 1767 A.D.** The Seine River in *France* was entirely frozen over.<sup>38</sup>

In *Denmark* at Copenhagen in January 1767, the cold was reported to be as intense as it had been in 1740. The Sound was frozen over, and there was communication with *Sweden* on the ice.<sup>47, 93</sup>

In *Russia* in January 1767, the cold was unusually intense; many, both rich and poor, perished; while many more were devoured by wolves in the forests.<sup>47</sup>

In *Prussia* (now *Germany*) at Berlin in January 1767, the cold was more severe than it was in 1740. The Rhine River was frozen near Coblenz – a circumstance which the annals of that city record as a

memorable event. The artificers [artistic craftsman] again followed their several trades upon the ice [ice fair on the Rhine].<sup>47, 93</sup>

In *Italy* in January 1767, the cold was so severe as to drive the poor from their habitations in the country; and some were said to have perished.<sup>47</sup>

In *England*, “The snow was so deep throughout the whole kingdom that the like has not been remembered by the oldest man living; many people perished, cattle and horses have been buried and dug out; the stage wagons have been delayed; the post boys have been bewildered, and some frozen to death; in short the severity of the season is universally felt; and the distresses of the poor in many places are inexpressible.”<sup>47, 57</sup>

In 1767, there was a severe frost [in *Great Britain*].<sup>128</sup>

In 1767, the Rhine River in *Germany* was driven by wagons. The Seine River in *France* was very low, and froze at a very moderate cold. On the Seine, the frost began on 4 January, a thaw came on 22 January, the ice conditions ended on the 26th. The thickness of the ice was 19 centimeters (7.5 inches).<sup>62</sup>

The cold during the winter of 1766-67 during the month of January was especially severe. Many vines and plants were frozen to death. But the cornfields were protected by the large amount of snow that fell during the winter. The following are lowest temperatures observed during the winter:

Warsaw, <i>Poland</i>	(-22.0° F, -30.0° C)
Utrecht, <i>the Netherlands</i>	( -4.0° F, -20.0° C)
Frankfurt, <i>Germany</i>	( -2.9° F, -19.4° C)
Cologne, <i>Germany</i>	( -1.7° F, -18.7° C)
Derby, <i>England</i>	( -1.5° F, -18.6° C)
Brussels, <i>Belgium</i>	( 0.0° F, -17.8° C) on 7 January
Dijon, <i>France</i>	( 0.5° F, -17.5° C)
Denainvilliers, <i>France</i>	( 1.6° F, -16.9° C) on 12 January
Vienna, <i>Austria</i>	( 1.6° F, -16.9° C)
Paris, <i>France</i>	( 4.5° F, -15.3° C)
London, <i>England</i>	( 15.4° F, -9.2° C)

The Rhine River in *Germany* was frozen so hard that loaded wagons passed between Cologne and Deutz on the ice. Also Lombardy, *Italy* was very cold.<sup>62</sup>

In *France* on 20 April 1767, the frost was so severe in the province of Dauphiny that it destroyed the vines, and cut off the blossoms of the early fruit trees.<sup>93</sup>

On 2 January 1767, the temperature at New Haven, Connecticut in the *United States* fell to -26.5° F [-32.5° C].<sup>207</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1766 on November 17<sup>th</sup> – a great snowstorm. November 29<sup>th</sup> – geese and chickens plentiful at 2s. a pound; turkeys 2s. 6d. Cold weather. December 5<sup>th</sup> – butter 5s. a pound. A moderate month for December. In 1767 on January 6<sup>th</sup> – a deluge of rain carried away most of the snow. January 11<sup>th</sup> – snow. January 13<sup>th</sup> – more rain. The last snow entirely carried away. January 17<sup>th</sup> – more snow. January 21<sup>st</sup> – the roads are all ice again. January 26<sup>th</sup> – more snow. January 30<sup>th</sup> – incomparable sledding. February – a cold month.<sup>78</sup>

---

**1767 A.D.** In *England* in January 1767, there was an apparent irruption of the sea. The tide rose so high in the Thames that the damage occasioned was estimated at 50,000*l.* On the seaboard of Essex several islands were submerged. At Aldborough (Suffolk) the sea flowed in at the windows of several houses, bore down a few, and damaged many. The inhabitants were driven to the greatest distress. Much damage

done near Ipswich. Ayrmouth, *Scotland*, the sea breached over many of the houses, the high street was like a sea, and the consternation of the inhabitants' inexpressible.<sup>47</sup>

In *England* in February 1767, "The floods are every where out; but the most melancholy effects of these inundations are almost always felt in the fen counties, where a breach in the banks generally lays whole districts under water. By a breach in Deeping Bank, several thousand acres are now under water; and by the north bank of the River Glen giving way, the north fens are overflowed, by which the inhabitants of the villages between Peterborough and Lincoln are reduced to the most deplorable circumstances: their cattle carried away, and their houses three or four feet under water. Many other places have shared the same fate; and in short their consternation and distress is such as none can conceive but those who have been in the like situation."<sup>47</sup> [Deeping Bank is now Deeping Fen, a low-lying area in Lincolnshire in the east of *England*.]

In *Wales*, "No man living ever saw such floods."<sup>47</sup>

In *Scotland* in February, the inundations on the breaking up of the snow did incredible damage. At Lochinabar the waters of the River Annan came down with such rapidity as to take houses, cattle, corn, and everything along with them.<sup>47</sup> [Lochinabar is now Lochinvar, a loch in southwestern *Scotland* that is a reservoir.]

In *Ireland*, the waters of the River Liffey overflowed, doing great damage.<sup>47</sup>

In 1767, riots [in *Great Britain*] ensued on account of the high price of bread, at 7¼ *d*. In 1768, a quarter of a loaf of bread cost 7¼ *d*. In 1769, a quarter of a loaf of bread, at 6½ *d*.<sup>128</sup>

In *France* on the 8<sup>th</sup> of April, there was a dreadful storm of thunder and lightning, which did considerable damage at Provence. The lightning set fire to the Royal Abbey of St. James, by which one of the main beams in the steeple was burnt, so as to give way in the angle. Two other churches were set on fire in the neighborhood; the bells of one melted, and the other was entirely consumed.<sup>57</sup>

On 4 May 1767, at Hitchin in Hertfordshire, *England* after a violent thunderstorm, a black cloud suddenly arose in the southwest and was almost instantly followed by a shower of hail. Several of the hailstones, which fell measured from seven to fourteen inches in diameter. The extremity of the storm fell near Offley, where a young man was killed, and one of his eyes was beaten out of his head, his body being in every part covered with bruises. Another person, nearer to Offley, escaped with his life, but was extremely bruised. At a nobleman's seat in the vicinity, seven thousand squares of glass were broken, and great damage was done to all the neighboring houses. The large hailstones fell in such immense quantities, that they tore up the ground, and split many large oaks and other trees, cutting down extensive fields of rye, and destroying several hundred acres of wheat, barley. Their hailstones had various shapes, some being oval, others round, others pointed, and others flat.<sup>191</sup>

In 1767, Potsdam, *Germany* was devastated by hailstones that were the size of ordinary gourds.<sup>190</sup>

On 20 July 1767 in *France*, there was a terrible hailstorm at Valenciennes. This storm did great damage to houses, trees, grain, and cattle. It began a few miles southwest of that city, and proceeded in a northeast direction as far as the province of Holland [now *the Netherlands*], causing great destruction in its progress. There were 19 villages being more or less destroyed.<sup>93</sup>

In August 1767, a great Atlantic hurricane struck the island of Martinique in the *Caribbean* causing approximately 1,600 deaths.<sup>107, 141</sup>

On 1 September 1767 in Genoa, *Italy*, there was great damage done to the city by hail and lightning.<sup>93</sup>

On 21 September 1767, an Atlantic hurricane struck off the coast of North Carolina in the *United States*. A number of vessels were lost during this violent storm.<sup>141</sup>

The year 1767 was no less dry. In Paris, *France*, the Seine River fell to 10.6 inches (27 centimeters) below the zero water mark of 1719. This was significantly lower than ever seen before. In Bordeaux, *France* 18.5 inches (469 millimeters) of rain fell instead of the typical 25.8 inches (656 millimeters). In Denainvilliers, *France*, Duhamel described this year as cold and dry. In Montpellier, *France*, the amount of rainfall was 4.2 inches (106 millimeters) less than the typical yearly rainfall. The total number of rainy days was twenty-three days less than seen in a common year.<sup>79</sup>

In 1767, a powerful cyclone struck Backerganj (Barisal), *Bangladesh* causing 30,000 deaths.<sup>98</sup>

In 1767, floods struck Hupeh (now Hubei province) in central *China* at Wuchang, Ao-ch'êng, Huang-p'o, Hanyang, Ching-mên, Huang-kang, Ch'i-shui, Lo-t'ien, Kuang-chi, Chiang-ling, and Chih-chiang. During the same year, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou.<sup>153</sup>

In 1767 during the summer, there was a flood in the vicinity of Shanghai, *China*.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: February 28<sup>th</sup> – warm and pleasant. March 3<sup>rd</sup> – a great rain. March 4<sup>th</sup> – storm. March 12<sup>th</sup> – cold. March 17<sup>th</sup> – charming day; good walking. March 24<sup>th</sup> – rainy. March 30<sup>th</sup> – we had smelts [fish] today; two coppers a dozen. March 31<sup>st</sup> – charming spring-like weather. April 6<sup>th</sup> – the robins came and began to sing. May 12<sup>th</sup> – strangely cold. May 15<sup>th</sup> – the heat breaks in upon us. May 22<sup>nd</sup> – the heart cherries are in the blow [bloom]. May 27<sup>th</sup> – cold. June 5<sup>th</sup> – Curtis Chute and one Young were killed instantly by lightning, at the widow Gooding's; Harrison and others hurt and near being killed, and the house near being destroyed also. June 11<sup>th</sup> – a growing season, but poor prospect of grass. June 16<sup>th</sup> – cold. June 21<sup>st</sup> – extremely hot; shower in the evening. June 27<sup>th</sup> – no rain since June 21<sup>st</sup>. June 30<sup>th</sup> – showers. July 20<sup>th</sup> – people are concerned about the drought. July 23<sup>rd</sup> – great showers. July 31<sup>st</sup> – deluge of rain. [There appears that a tornado swept through Falmouth on the 31<sup>st</sup> of July. “It commenced near Sebago Pond, took an easterly direction, passing through Windham, and directly over the Duck Pond, passed through the north part of Falmouth, and the south part of North Yarmouth, (now Cumberland) to the sea. It appears to have been the most violent in the town of Falmouth. It took the roof off the house of Mr. Purrington, situated near the Duck Pond, and prostrated every tree in its way, except a few sturdy oaks, but abated in some measure after it entered North Yarmouth, so as not to do much damage in that town. It extended in breadth about three quarters of a mile.”] August 18<sup>th</sup> – the grass grows more than in the spring. August 23<sup>rd</sup> – extremely hot. August 26<sup>th</sup> and 28<sup>th</sup> – extremely hot. September 28<sup>th</sup> – we began to dig our potatoes; moderate fall.<sup>78</sup>

The maximum temperature during the summer in Manila, *Philippines*, was 113.5° F (45.3° C) on 20 June.<sup>62</sup>

---

**Winter of 1767 / 1768 A.D.** Extreme frost in *England*. “A severe frost set in from the east-southeast, which was followed by a deep snow, by which the navigation of the River Thames has been obstructed, and the posts retarded all over the kingdom.” The frost was especially severe in the west of *England*.<sup>47, 93</sup>

In *England* in January 1768, “We have had very severe frost and deep snow this month; my thermometer was one day 14 ½° below freezing point, within doors. The tender evergreens were injured pretty much. It was very providential that the air was still, and the ground well covered with snow, else vegetation in general must have suffered prodigiously. There is reason to believe that some days were more severe than any since the year 1739-40.”<sup>47, 93</sup>

In Selborne, Hampshire in the southern coast of *England*, in 1768, the year began with a fortnight's [14 days] frost and snow. On the 3<sup>rd</sup> of January, a thermometer indoors, in a closed parlor, where there was no fire, fell at night to 20° F (-6.7° C). On the 4<sup>th</sup>, it measured 18° F (-7.8° C). On the 7<sup>th</sup>, it read 17.5° F (-8.1° C). The cold was very severe. It froze under people's beds for several nights. Meat was so hard frozen that it could not be spitted and could only be secured in cellars. Thereafter wet and rainy weather prevailed to the end of February.<sup>70</sup>

In 1768 in *Scotland* there was a very severe frost.<sup>47,93</sup>

The frost began on 21 December 1767. By the 23<sup>rd</sup>, the cold 19° F (-7.5° C) drove the Seine River in *France* to ice. The ice held on until 13 January 1768.<sup>62</sup>

A bitter cold raged during the winter of 1768. In Paris, *France*, the thermometer fell to -0.8° F (-18.2° C), in Viviers 9.5° F (-12.5° C) and at Montpellier 14° F (-10° C). The cold this winter, with snow, began in December, reached its maximum during the first days of January.<sup>79</sup>

During the winter of 1767-68, in *America*, in all of *Europe* and especially in *France* there was very severe cold. But the winter was not of long duration and did not bring much snow. The intense cold was generally felt between 20 December and 9 January. During these 26 days it froze constantly. The Seine River froze between the bridges, however, at Pont-Royal the river remained open in the middle of the flow. The lowest observed temperature during the winter were:

Warsaw, <i>Poland</i>	(-13.0° F, -25.0° C)
Cologne, <i>Germany</i>	( -6.9° F, -21.6° C) on 6 January
Brussels, <i>Belgium</i>	( -2.9° F, -19.4° C) on 5 January
Namur, <i>Belgium</i>	( -0.2° F, -17.9° C)
Paris, <i>France</i>	( 1.2° F, -17.1° C) on 5 January
Denainvilliers, <i>France</i>	( 1.6° F, -16.9° C) on 6 January
Utrecht, <i>the Netherlands</i>	( 1.9° F, -16.7° C)
Leyden, <i>the Netherlands</i>	( 3.9° F, -15.6° C) [now Leiden]
Amsterdam, <i>the Netherlands</i>	( 7.7° F, -13.5° C)
London, <i>England</i>	( 16.9° F, -8.4° C)

In Provence, the cold was also very severe. In the area of Toulouse, *France*, the corn was completely frozen. On 5 January, at 7 o'clock in the morning near Denainvilliers, *France* in a well of 16 meters deep and 2 meters wide was found ice 4.5 millimeters thick. At Montmorency, *France*, another well, this one 10 meters deep was also frozen.<sup>62</sup> [Montmorency is now in the northern suburbs of Paris.]

On 5 January 1768, 30, 50 and 55 foot deep wells in Paris, *France* froze.<sup>80</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1767 on October 13<sup>th</sup> – cold weather. October 28<sup>th</sup> – snowstorm. October 30<sup>th</sup> – charming pleasant since the storm. December 14<sup>th</sup> – snow. December 19<sup>th</sup> – snow. December 21<sup>st</sup> – exceeding cold; the thermometer down to 0° F (-18° C). In 1768 on January 20<sup>th</sup> – we rode to Windham and round Gorham in sleighs. February 1<sup>st</sup> – there was a great body of snow on the ground. February 10<sup>th</sup> – four and a half feet (1.4 meters) [of snow] in the woods, so that people beat out [paths], and [retrieve] wood with their teams. February 27<sup>th</sup> – all the week has been warm like April, and indeed all the month. The winter must be accounted moderate, except December, and a week in November; the thermometer in generally between 36 and 40 degrees. March – generally cold and windy. March 20<sup>th</sup> – a terrible snowstorm. April 1<sup>st</sup> – a great snowstorm. April 9<sup>th</sup> – it continues cold and windy.<sup>78</sup>

---

**1768 A.D.** On 9 May 1768 in northwestern *France*, there was a great hailstorm at Laval. The hailstones resembled fowls' eggs. Fruit and crops were destroyed. Also trees were broken and cattle killed. "In some places the hail was found 3 or 4 feet deep after it fell. The damage was incredible."<sup>93</sup>

In June 1768 in *England*: "By letters from different parts it appears that the thunder and hailstorms of last week [1st week in June] were felt more or less throughout the Kingdom; and that great damage had been sustained by them. They also reached the [European] Continent, and the Island of Guernsey, where considerable damage was done." <sup>93</sup> [Island of Guernsey is one of the British Channel islands off the coast of Normandy.]

On 6 June 1768 in *England*, there was a hailstorm in Hertfordshire and Kent. <sup>93</sup>

On 7 June 1768 in *England*, there was a hailstorm in Middlesex and Surrey. <sup>93</sup>

On 8 June 1768 in *England*, there was a hailstorm in Wiltshire. <sup>93</sup>

On 21 June 1768 in *England*, there was a great hailstorm in Devonshire and Yorkshire. <sup>93</sup>

The summer of 1768 in New England in what was to become the *United States* was noted for an extreme number of lightning strikes that destroyed people, houses, barns, taverns, businesses, trees, and animals in the cities of Boston, Rehoboth, Mendon, Uxbridge, Charlestown and Wrentham, Massachusetts, and in Hartford and Norwalk, Connecticut. <sup>199</sup>

On 9 July 1768 in *England*, there was a hailstorm in Northumberland. <sup>93</sup>

On 14 July 1768 in *England*, there was a hailstorm in Norfolk. <sup>93</sup>

On 18 July 1768 in *England*, there was a hailstorm in Kent. <sup>93</sup>

On 19 July 1768 in *England*, there was a hailstorm in Somersetshire. <sup>93</sup>

On 23 July 1768 in *England*, there was a hailstorm in Gloucestershire. <sup>93</sup>

On 30 July 1768 in *England*, there was a hailstorm in Norfolk, Suffolk, and Worcestershire. <sup>93</sup>

In July in *Scotland*, there was a great hailstorm in Selkirk. Cattle and crops were severely damaged; some persons injured. <sup>93</sup>

On 1 October 1768 in *France*, there was a great hailstorm in Laval. The hailstorm only lasted 6 minutes, but it destroyed fruit and ungathered grain and also trees in 5 parishes. Pieces of ice fell in different shapes, some weighing 2 pounds. <sup>93</sup>

On 15 October 1768, a hurricane struck Havana, *Cuba*. Most accounts give the number of deaths as greater than 1,000. <sup>141</sup>

A hurricane struck Havana, *Cuba* on 25 October 1768. It destroyed 96 public offices and 4,048 houses. One thousand inhabitants almost instantly perished. <sup>174</sup>

On 25 October 1768, a hurricane struck Havana, *Cuba* destroying 96 public edifices and 4,048 houses. Above 1,000 persons perished almost instantaneously. The storm began from the southward, and died away from the north. It did not continue more than two hours. The harbor was also very much injured. <sup>143</sup>

In Havannah (Havana, *Cuba*) on the 25<sup>th</sup> of October, there was a dreadful hurricane; 4,048 houses and many public edifices destroyed. About 1,000 inhabitants perished. <sup>57, 90</sup>

On 25 October 1768, a hurricane struck Havana, *Cuba*. The storm killed 1,000 persons and destroyed 4,048 houses.<sup>197</sup>

On the 29 October 1768, a cyclone struck the coast of Coromandel in southern *India*, fatal to the Chatham Indiaman [A large merchant ship formerly used on trade routes to India], which neglected to put to sea.<sup>191</sup>

There were heavy floods in Behar and the district Bengal in August.<sup>47</sup> [Behar remained part of *India* after “The Partition of India” in 1947. Bengal today is West Bengal in *India* and East Bengal in *Bangladesh*]

On 4 December 1768, a gale struck the coast of New England in what was to become the *United States*. At New Haven, Connecticut, two ships were driven ashore. At Guilford, Connecticut, one ship went ashore. A brigantine was driven on the rocks near the lighthouse in Boston harbor and instantly dashed to pieces. Another brigantine was cast away near Cape Ann in Massachusetts. A coaster was lost before it reached Pownalborough, Maine and every person onboard drowned. Another vessel was wrecked at Fox Island. Many other vessels were also wrecked by this storm.<sup>199</sup>

In 1768, droughts engulfed many regions of *China* including:<sup>153</sup>

— During the period between 16 May and 14 June, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin and Kao-yu.

— During the period between 6 May and 8 November, a severe drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Lien.

— During the period between 14 July and 11 August, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Jih-chao and Chekiang (now Zhejiang province) on the east coast of *China* at Ch’ung-tê and Chia-hsing.

— During the period between 12 August and 10 September, a drought engulfed Hupeh (now Hubei province) in central *China* at Hsiao-kan, Yün-mêng, Ying-ch’êng, Ying-shan, Ao-ch’êng, Chung-hsiang, An-lu and Tsao-yang.

— During the period between 11 September and 10 October, a severe drought engulfed Kiangsu province at T’ai. The rivers dried up.

In 1768 during the period between 12 August and 10 September, floods struck Shansi (now Shanxi province) in northern *China* at Taiyuan; and Hopei (now Hebei province) in northern *China* at Wu-ch’ing, Ch’ing-yün [“Ch’ing” possibly the word “yün” was left off by mistake], Ning-ho, Nan-yüeh, Hsü-shui and Wang-tu.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 21<sup>st</sup> – a backward spring. April 29<sup>th</sup> – thermometer rose to 64° F (18° C) then sunk to 47° F (8° C). May 13<sup>th</sup> – cold still, and the spring unusually backward. May 20<sup>th</sup> – the thermometer up to 72° F (22° C). May 21<sup>st</sup> – now 76° F (24° C), but in the afternoon it dropped 20 degrees. The cherry and damson [plum] trees begin to blow [blossom]. May 28<sup>th</sup> – the face of the earth is renewed and beautifully green. June 1<sup>st</sup> to 12<sup>th</sup> – frequent showers. June 14<sup>th</sup> – a great storm, as ever we knew; wind S.S. E. that did a great deal of damage. June 20<sup>th</sup> – warm; here we may reckon summer begins. July 16<sup>th</sup> – it rains almost every day. July 22<sup>nd</sup> – a happy season for Indian corn. July 25<sup>th</sup> – very hot. July 26<sup>th</sup> – the cherries are a good deal colored. July 31<sup>st</sup> – hot weather continues. September 16<sup>th</sup> – seasonable weather all the week. September 29<sup>th</sup> – a great frost last night spoiled the unripe corn. November 6<sup>th</sup> – pleasant. November 20<sup>th</sup> – a great rainstorm.<sup>78</sup>

---

**Winter of 1768 / 1769 A.D.** In *England* in April 1769, there was a severe frost.<sup>47, 93</sup>

In *England*, “Last month [April] we had such a series of cold turbulent weather, such a constant succession of frost and snow, and hail and tempest, that the regular migration or appearance of the summer birds was much interrupted.”<sup>57</sup>

In Selborne, *England*, from the middle of November to the end of 1768 there were alternating periods of rain and frost. In January and February 1769, the weather was frosty and rainy with gleams of fine weather in the intervals; then to the middle of March, wind and rain.<sup>70</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1768 on November 27<sup>th</sup> – snow. November 30<sup>th</sup> – it has been an uncommon cold, cloudy, rainy fall, as well as summer. December 31<sup>st</sup> – the snow is all gone and the ground bare. January 1769 – very moderate weather most of the month. February – cold weather came on. February 17<sup>th</sup> – the harbor and whole bay frozen up. February 18<sup>th</sup> – warm, like summer. February 21<sup>st</sup> – still warmer. February 28<sup>th</sup> – here the weather changes to winter again. March 31<sup>st</sup> – a spell of true winter weather.<sup>78</sup>

### 1769 A.D. – 1770 A.D. Bangladesh and India. Famine

During the famine of 1769-70, it is estimated that a fully 15,000,000 souls, a full third of the population of Bengal perished. [Bengal today is West Bengal in *India* and East Bengal in *Bangladesh*.] This famine resulted from a failure of rain, supplemented by bad administration by the East India Company.<sup>84</sup>

In *India*, there was a great famine that devastated the lower valley of the Ganges in 1769-70. One-third of the population is reported to have perished.<sup>54</sup>

In 1770 in Bengal [*India* and *Bangladesh*], the area was devastated by famine; “one-third of the population reported as perished.”<sup>91</sup>

The maximum temperature during the summer in Puducherry, *India* was 109.0° F (42.8° C) in June.<sup>62</sup> [Pudcherry is known today as Pondicherry located on the southern peninsula of *India*.]

In *India* (Hindustan) during 1769-70, there was the first great Indian famine of which we have record. It was estimated that 3,000,000 people perished. The air was so infected by the noxious effluvia of dead bodies, that it was scarcely possible to stir abroad without perceiving it; and without hearing also the frantic cries of the victims of famine who were seen at every stage of suffering and death. Whole families expired; and villages were desolated. When the new crop came forward in August it had in many cases no owners. Other estimates have been that one-third of the population perished.<sup>57</sup>

In *India* (Hindustan) during 1769-70, “Alarming want of rain was also reported throughout all the upper parts of Bengal [*India* and *Bangladesh*]. Madras [Chennai] was also suffering from drought, and from the ravages of the enemy, and the demands for grain caused a scarcity also in Calcutta. During September, October, and November [1769], the drought continued nearly all over Bengal [*India* and *Bangladesh*], the calamity being most severely felt in Behar and the Bengal districts north of the Ganges. A plentiful rain fell in June 1770; but the hopes of relief from the next crop which were thereby raised, were disappointed by the overflowing of the rivers in the eastern provinces; but the new crops in all the districts not greatly injured by floods were good.” The famine ceased by the end of the year [1770].<sup>57</sup> [In 1769-70, historical Hindustan is usually applied to the Ganges Plain of North *India* and sometimes used to denote the whole of *India*. Madras is the southwestern coast of *Indian* sub-continent. Calcutta is now Kolkata, capital of the northwestern *Indian* state of West Bengal. Behar is a state in northeastern *India*.]

There was a great famine in *India* in 1769-70.<sup>155</sup>

In 1769-70, there was a great famine in Bengal [Bengal today is West Bengal in *India* and East Bengal in *Bangladesh*]. During this famine, it was estimated that a third of the inhabitants of Bengal died.<sup>156</sup> — Bengal, previous to 1769, had been prosperous for some time; both its physical and moral wants were supplied. But in 1768 a warning note of alarm arose in Behar – first the destructive flood, and afterwards an all but total cessation of the rains from August. In 1769, due to a total failure of the rains throughout

the whole of Bengal proper, except the southeast corner and Behar, the region was laid to waste. Want was felt in Madras at the same time. The famine did not prevail in the Northwest Provinces.

— During the winter of 1769, the effects of the drought became more palpable and widespread. Reports said the plough was standing still, and numbers of husbandmen [farmers] deserted their homes. By March it was reported that the “most affecting scenes of poverty and distress were visible” and that “depopulation in the interior was now much more rapid than could well be imagined.” In Patna, no less than 150 died daily. Purneah, in the northeast, which was once a plentiful country, retained nothing but the name of its former abundance. The living fed on the dead. The famine lasted till the harvest in December 1770, and the results of the famine was the death of 30,000,000 human beings. [This figure appears too high. During this time period the population of Bengal was 30 million. If 1/3 of the inhabitants died in the famine, the death toll would be about 10 million.]

In 1770, a great famine struck Bengal [today this is *Bangladesh* and the state of West Bengal in *India*]. On 9 May 1770, the Government of Bengal wrote that not a drop of rain fell in most districts during the past six months. The ensuing famine, the mortality, the beggary, - exceeded all description. Over 1/3 of the inhabitants perished in the once plentiful Province of Purneah [now Purnia]; and in other parts the misery was equal. Also Behar [now Bihar in northern *India*] suffered in an extreme degree from famine at this time. Northern Bengal especially suffered. Even reports from the usually moist northeastern districts of Rungpore [now Rangpur, *Bangladesh*] and Dinagepore [now Dinajpur, *Bangladesh*] were distressing. Rajeshye, Moorshedabad, Rajmahal, Jessore, Hooghly, Bheerbhoom, Burdwan and Calcutta were all affected at some time during this famine. Even Dacca [now Dhaka, *Bangladesh*] was affected but in this case it was caused by a dreadful inundation that destroyed a considerable part of the crops.<sup>183</sup>

This famine first appeared in Behar [now Bihar in northern *India*], which suffered two bad years. There had been floods in August 1768 and from that time until the beginning of January, there had been no rain. By July 1769, there had been only a few trivial showers. The sown grain was entirely spoiled. Grain prices skyrocketed.<sup>183</sup>

On 26 December 1769, a resident of the city of Patna, *India* wrote, “From fifty to sixty people have died of absolute hunger in the streets every day for these ten days past.” On 16 March 1770, a resident of Behar [now Bihar in northern *India*] wrote, “The depopulation of the interior parts of the country is now more rapid than can well be imagined by any person who has not been witness to it; and such is the disposition of the people that they seem rather inclined to submit to death than extricate themselves from the misery of hunger by industry and labour.” Patna reported, “The miseries of the poor of this place increased in such a manner that no less than 150 have died in a day in Patna.” On 30 March, Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] reported, “The distress of the inhabitants does not only proceed from scarcity of provisions, but in many parts they are without water to drink.” The European Supervisor, Mr. Daniel, reported that in the higher pergunnahs “I do not believe I should in anywise exaggerate in saying that half of the ryots [peasant farmers] were dead, for if I were to speak from reports or what I have seen, I should judge the number to be rather more than less.” At Jessore [in *Bangladesh*], the land became as hard as a rock, then things went from bad to worse till “mankind are employed in bringing the leaves of the trees from the jungle for food, and they offer for sale their sons and daughters.” In June, a resident of Moorshedabad [now Murshidabad, *India*] wrote, “in several parts the living have fed on the dead”.<sup>183</sup>

In 1769 in a year of the famine, so many cattle perished that the tigers, deprived of their ordinary food, attacked the town of Bhawapar in Gorakhpur, *India* and killed about four hundred people. The inhabitants fled, and the place remained for some years deserted.<sup>181</sup>

There was a terrible famine that ravaged Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and Bihar [in northern *India*] in 1770.<sup>181</sup>

In 1770, there was a famine in Bengal [today this is *Bangladesh* and the state of West Bengal in *India*], which destroyed nearly half of the inhabitants.<sup>182</sup>

In 1769-70, a great famine struck *India*. It ravaged primarily the northern portions of the continent. The rice crops of December 1768 and August 1769 were both minimal and the crop for December 1769 almost failed due to the lack of periodic rains which usually fall in October. The drought caused the destruction of the crops of inferior grain and pulse generally reaped between February and April. The famine was felt in the northern districts of Bengal [*Bangladesh*], as early as November 1769 and was general by the end of April. During the most severe period of the famine, rice was 10 times its usual price, and in some places, was not to be had at any price. Large numbers of people, after vainly trying to obtain subsistence from leaves and the barks of trees, perished miserably of starvation. The fields and highways were strewn with their bodies. The number of people who perished during these 12 months was estimated at three million, or a fifth of the whole population of Bengal [today this is *Bangladesh* and the state of West Bengal in *India*], Behar [now Bihar in northern *India*] and Orissa [now Odisha on the east coast of *India*]. In many cases, the starving sustained themselves with the flesh of forbidden and abhorred animals, and there were instances in which child fed upon its dead parent, and the mother on her child.<sup>188</sup>

---

**1769 A.D.** In May 1769 in Calcutta, *India*, it is recorded that in the month of Muharram [1183 A.H.] such showers of hailstones fell that the whole of that part of the city where the English resided was reduced to ruins. Many of the inhabitants perished.<sup>93</sup>

On 16 July 1769 in *England*, there was a hailstorm at the Isle of Ely in Cambridgeshire. As a result of this hailstorm, 8 farmers were reported to have suffered an aggregate loss of £3,000. Some of the hailstones measured 6 inches round. Others fell in square pieces. The hailstones killed crows, lapwings, etc. This storm extended into Norfolk and Yorkshire.<sup>93</sup>

In Venice, *Italy* in August, a flash of lightning penetrated the theater at Venice, during the performance with 600 people in the house, several of whom were killed; it put out the candles; melted a lady's gold watch case; the jewels in the ears of others, which were compositions, and split several diamonds.<sup>56</sup>

The summer of 1769 in New England in what was to become the *United States* was unusual. At Salem, Massachusetts on 10 May, the temperature in the shade reached 84.5° F [29.2° C]. The next day, there was a snowstorm that dropped 6 inches [15 centimeters] of snow. A severe frost struck on 2 June. Two days later in Boston, the temperature reached 99.5° F [37.5° C]. On 5 July, a severe rainstorm struck Northampton, Massachusetts. The meadows were covered with water to a depth of 3 - 4 feet [0.9-1.2 meters]. A severe hailstorm struck Massachusetts, Rhode Island and Connecticut on 31 July. A day later at Scituate, Massachusetts, the hail lay on the ground a foot [30 centimeters] deep in many places. At Newport, Rhode Island, the hailstones were the size of musket balls; at West Greenwich they were the size of pullets' eggs. Some of the hailstones that fell at Scituate were the size of goose eggs.<sup>199</sup>

The summer of 1769, at the Observatory of the College of *France* observed a high temperature of 98.4° F (36.9° C) in August. However, the mean temperature of the summer was very low. In Paris, there were only 13 hot days, 4 days of very high heat and one extremely hot day. In Denainvilliers, *France* only 26 hot days and 5 very hot days were observed. The grape harvest began to Burgundy on 27 September; the harvest was small in quantity and quality was mediocre.<sup>62</sup>

On 5-6 September 1769, a hurricane struck coastal North Carolina in the *United States*. The *Neptune* from North Carolina to London, failed on the 4<sup>th</sup> of September during a violent storm on that coast, and it is thought that all perished. One entire street of houses was washed away, along with several residents.<sup>141</sup>

In 1769, floods struck many regions of *China* including: <sup>153</sup>

— During the period between 4 June and 2 July, floods struck Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Ts'ang-wu and Huai-chi; Hopei (now Hebei province) in northern *China* at Hsin-yüeh; and Kiangsu (now Jiangsu province) on the east coast of *China* at Li-shui.

— During the period between 3 July and 1 August, floods struck Kiangsu province at Wu-chin; Anhwei (now Anhui province) in eastern *China* at Ch'ien-shan; and Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou and Chia-shan.

— During the period between 29 October and 27 November, floods struck Hupeh (now Hubei province) in central *China* at Wuchang, Ao-ch'êng, Ch'ung-yang, Huang-p'o, Hanyang, Huang-kang, Kuang-chi, Chiang-ling and Chih-chiang.

In 1769 during the period between 3 July and 1 August, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-ch'un. <sup>153</sup>

The year 1769 was a year of abundance in the vicinity of Shanghai, *China*. <sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 15<sup>th</sup> – we set out our cabbage stumps. April 20<sup>th</sup> – very cold spring so far. April 29<sup>th</sup> – very dry and very cold weather. May – generally cold and rainy. June – generally cold. June 25<sup>th</sup> – fine hot weather. June 29<sup>th</sup> – cold again. July 5<sup>th</sup> – raw; cold. July 14<sup>th</sup> – very dry. July 22<sup>nd</sup> – thermometer at 83° F (28° C). From this time, much rain to the end of the month. August – a full and good crop of hay, and success in making it; and there is as good a prospect as the latter harvest. September – foggy days. September 8<sup>th</sup> – dreadful northeast storm. September 12<sup>th</sup> – cold nights but pleasant days. September 16<sup>th</sup> – an extraordinary week of warm days. September 26<sup>th</sup> – delightful weather. September 29<sup>th</sup> – charming weather every day. October 12<sup>th</sup> – a deluge of water. October 17<sup>th</sup> – another cold day. October 27<sup>th</sup> to 31<sup>st</sup> – pleasant weather. November 7<sup>th</sup> – we had a cold fall. <sup>78</sup>

*Also refer to the section 1769 A.D. – 1770 A.D. for information on the drought and famine in Bangladesh and India during that timeframe.*

---

**Winter of 1769 / 1770 A.D.** In Selborne, *England* during the last half of November 1769, the weather was dry and frosty. During December it was windy, with rain and intervals of frost, and the first fortnight [14 days] very foggy. The first fortnight of January 1770 was frosty, but on the 14<sup>th</sup> and 15<sup>th</sup>, all the snow melted and to the end of February mild hazy weather prevailed. March was frosty and bright. <sup>70</sup>

In 1769 during the winter in the vicinity of Shanghai, *China*, Tien Lake rose into an ice hill; several tens of *tsiang* (50 feet) high, and two *li* (approximately two thirds of a mile) long. Just before it occurred the residents heard a noise as of a myriad of soldiers [sheets of ice crashing into each other]; looking out of the windows by night, they saw more than a thousand lights; in the morning they saw the ice hill, it remained a month before melting. <sup>166</sup>

New England in what was to become the *United States* experienced a great freshet in 1770. On 8 January 1770 due to a combination of rainstorm, wind and tide many regions experienced flooding. <sup>199</sup>

— The Connecticut River overflowed its banks and flooded ½ mile [0.8 kilometers] on either side of the river. At Hartford, Connecticut, the river was impassable for several days.

— The Tunxis or Farmington River was much swollen and very rapid. At Simsbury, Connecticut, it destroyed an ironworks; entirely destroying the whole plant.

— On the Androscoggin and Kennebec Rivers, the freshet was great and caused serious damage. At Bowdoinham, Maine, the tide rose 30 to 40 feet [9-12 meters] higher and in some places 50 feet [15 meters] higher above its usual heights. The thick ice covered river broke up and smashed huge sheets of ice weighing several tons each. The floodwaters and icebergs created a deluge pulling along whole trees,

immense logs, timbers, boats, barns, houses and small buildings, crushing and grinding them against each other in a thundering torrent.

— At Swan Island, huge ice dams were created that cause the river to overflow its banks

— On the Androscoggin River, the freshet was extremely destructive. At Brunswick Falls, Maine, the flood destroyed two double sawmills, a gristmill, two other sawmills, and a monstrous dam. The broken ice below the falls measured 60 feet [18 meters] high above the water.

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1769 on November 16<sup>th</sup> – very cold. November 29<sup>th</sup> – last night the thermometer was down to 12° F (-11° C). December 2<sup>nd</sup> – more moderate. December 8<sup>th</sup> – severe cold. December 13<sup>th</sup> – thermometer at 3 o'clock down to 3° F (-16.1° C). December 23<sup>rd</sup> – at 4° F (-15.6° C). December 31<sup>st</sup> – at 2° F (-16.7° C), but fair weather and good walking. In 1770 on January 5<sup>th</sup> – thermometer -2° F (-19° C). January 7<sup>th</sup> – storm of rain; thermometer 47° F (8° C). January 18<sup>th</sup> – thermometer -3° F (-19° C). January 23<sup>rd</sup> – the harbor remained shut up [due to the ice]. January 24<sup>th</sup> – John went over the Ferry in a sleigh, and back in six minutes. January 25<sup>th</sup> – colder still. The Dutch sleigh went over the Ferry four times and returned in thirty minutes. January 28<sup>th</sup> – a warm day. February 1<sup>st</sup> – thermometer -3° F (-19° C). February 15<sup>th</sup> – thaw. February 23<sup>rd</sup> – snowed all last night. February 27<sup>th</sup> – thermometer -3° F (-19° C). We had a closed [overcast] winter, as cold perhaps as ever was. March 9<sup>th</sup> - delightful fair morning. March 14<sup>th</sup> – very cold, and good sledding. March 18<sup>th</sup> – the last sleighing. March 31<sup>st</sup> – snow gone. Not much windy weather the month past.<sup>78</sup>

---

**1770 A.D.** In *India*, there were heavy floods in the Eastern Provinces, Bengal [today eastern Bengal is in *Bangladesh*] by which much of the benefit, which would have followed a two years' drought, was diverted.<sup>47</sup>

In Holland [now *the Netherlands*] in 1770-71, “there were terrible floods, combined with an infectious disease rife among the cattle.”<sup>47, 92</sup>

The summer of 1770 in New England in what was to become the *United States* was noted for its heat, for the drought and the severe thunderstorms it spawned. The lightning in these summer storms destroyed houses, barns, buildings, churches and trees, killed people and livestock. On 1 August, the temperature reached 100° F [38° C] in deep shade at Sharon, Connecticut. A tornado ripped through Rochester, New Hampshire on 19 July. Another struck Salem, Massachusetts on 18 August.<sup>199</sup>

The summer of 1770 in central *France* was cold. The month of May was cold and damp and in the beginning of May, it snowed and froze. June and July were cold and damp. On the 20<sup>th</sup> of July, the grain was still green, as in the springtime. On 10 August the wheat harvest began: which was delayed by three to four weeks compared to a normal year. This harvest was not completed until the end of August. During the first days of September, the corn was cut. September was dry and cold. In short, this summer passed without heat, and the harvest was very late. The maximum temperature in Paris was 95.0° F (35.0° C) which was higher than in Denainvilliers where the peak was 89.4° F (31.9° C). In the south the cold of winter was felt in September. The grape harvest began in Burgundy on 6 October. The wine was plentiful and of quite good quality. This demonstrated the fact that Burgundy was much warmer than Orléans.<sup>62</sup>

In 1770, in Montpellier, *France*, the annual rainfall decreased 17 inches (431 millimeters) below the average. The average number of rainy days dropped by 17 days. In Marseille, during the month of January there was not a drop of rain. The mistral wind [strong, cold and usually dry regional wind in *France*] blew for fourteen consecutive months from 24 November 1769 to 13 October 1770. During this interval, there was only 6.4 inches (162 millimeters) of rainfall. Abundant dews fortunately helped out and made up for this desperate drought.<sup>79</sup>

At Coventry in the West Midlands of *England*, 70 persons drowned, and much damage done from floods, as well as in Cambridgeshire, Gloucestershire, etc. in November.<sup>41, 43</sup>

In Bohemia [now western *Czech Republic*] in 1770, there was a famine and pestilence said to have killed 168,000 people.<sup>57, 91</sup>

In *Russia* and *Poland* in 1770, famine and pestilence killed some 20,000 people.<sup>57, 91</sup>

In 1770, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ningpo and Ch'ing-yüan [“Ch'ing”, possible that the word “yüan” was left off by mistake.].

— During the period between 6 May and 8 August, floods struck Hopei (now Hebei province) in northern *China* at Mi-yün, Ts'ang, Pao-ti, Wu-ch'ing and Wang-tu; Shensi (now Shaanxi province) in central *China* at Hsün-yang and Pai-ho; Jehol province at Luan-p'ing; Kiangsi (now Jiangxi province) in southern *China* at Wu-ning; and Hupeh (now Hubei province) in central *China* at Yün-hsi. Jehol (formally Rehe province) was located north of the Great Wall, west of Manchuria, and east of Mongolia. In 1955, the area was divided between Hebei province, Liaoning province and *Inner Mongolia*.

— During the period between 8 August and 8 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Tsinan, Liao-ch'êng and Shou-kuang. At Shou-kuang, innumerable people and cattle drowned.

In 1770 during the summer, there was a flood in the vicinity of Shanghai, *China*.<sup>166</sup>

In 1770 during the period between 6 May and 8 August, a drought engulfed Shensi (now Shaanxi province) in central *China* at Lin-t'ung and Szechwan (now Sichuan province) in southwest *China* at Kung. During the period between 21 August and 18 September, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ang-shan.<sup>153</sup>

On 19 October 1770, a severe storm from the northeast swelled the tide at Boston, Massachusetts in the *United States* considerably higher than anytime during the past 50 years. It filled the cellars and stores, and did much damage. Fifty or sixty sail of vessels were cast ashore at Plymouth and elsewhere, and many lives lost.<sup>174</sup>

A violent and destructive storm struck New England in what was to become the *United States* on 20 October 1770. The wind blew down stores, barns and sheds, unroofed houses, and tore up fences and trees. Many of the goods stored along the wharves and in the warehouses that fronted the ports were damaged and destroyed. Along the coast, a large number of vessels were wrecked and many lives lost. Two schooners were driven ashore at Cape Ann. Another schooner was smashed to pieces on the rocks near Thatcher's Island. Another schooner was driven on the eastern point of Duck Island and dashed to pieces. Several vessels were riding at anchor in the Shoals road, and were sunk at their mooring. Three or four other schooners were lost off the Shoals. In the bay at Portsmouth, New Hampshire, two schooners left the harbor and were never seen or heard from again. A new ship left Newburyport, Massachusetts and was driven onto Plum Island. Prior to this during the storm, this ship collided with a sloop, breaking it into pieces. At Salem, Massachusetts many vessels in the harbor and at the wharves were damaged during the storm. A large schooner broke away from its mooring and dashed against the North Bridge causing considerable damage to the bridge. Another schooner, which was fastened to the wharf, broke her cables and was driven ashore across a sandy beach and up onto the grassy upland. Another schooner, which recently arrived from the West Indies, broke away from the wharf and was driven ashore to a great height. In the southern section of the harbor was anchored a ship, a snow, a brig, and nine other vessels. Only one ship *Antelope* rode out the storm successfully. In the harbor of

Marblehead, Massachusetts, twenty-one brigs, schooners and sloops were cast ashore. In the harbor of Boston, Massachusetts, 15 or 16 vessels were cast ashore on the several small islands in the harbor. A schooner, with no one onboard, was driven ashore on Deer Island. In Plymouth, Massachusetts, sixty-one vessels were driven ashore and from forty to fifty lives were lost. At the backside of Eastham, Massachusetts, on Cape Cod, a vessel was driven ashore. A Rhode Island sloop was wrecked at nearly the same place. Another sloop was driven ashore at Race Point [a lighthouse on Cape Cod]. A whaling schooner was smashed to pieces on a sand bar at the entrance to the harbor of Chatham. At Tarpaulin Cove, on Martha's Vineyard, a brig [a sailing vessel with two square-rigged masts] and a schooner were cast away. More than a hundred vessels were wrecked and a hundred lives lost.<sup>199</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 8<sup>th</sup> – pleasant. April 19<sup>th</sup> – windy and cold. April 28<sup>th</sup> – very hot; thermometer up to 23° F (-5° C). May 5<sup>th</sup> – thermometer 74° F (23° C). May 16<sup>th</sup> – English cherries began to blow [blossom]. May 25<sup>th</sup> – rainy. May 29<sup>th</sup> – showery; the spring was unusually forward. June – some raw cold days. June 25<sup>th</sup> – hot growing season. June 29<sup>th</sup> – thermometer 90° F (32° C). July 11<sup>th</sup> – hot, dry weather since the 25<sup>th</sup> of June; after which, there were frequent rains. September 8<sup>th</sup> – dry again. September 14<sup>th</sup> – a deluge of rain. September 20<sup>th</sup> – Indian corn was thought to be out of danger. October 1<sup>st</sup> – a delightful day. October 3<sup>rd</sup> – stormy and cold. October 11<sup>th</sup> – a deluge of rain. October 20<sup>th</sup> – an exceeding great northeast storm. October 29<sup>th</sup> – pleasant; most of the month has been raw, cold, rainy and stormy. November – generally moderate and pleasant till the 27<sup>th</sup>.<sup>78</sup>

*Also refer to the section 1769 A.D. – 1770 A.D. for information on the drought and famine in Bangladesh and India during that timeframe.*

---

**Winter of 1770 / 1771 A.D.** In *England*, “Dreadful springs.” Frost and snow.<sup>47, 93</sup>

On 11 January 1771, the River Thames froze at Fulham [now southwest London], *England*.<sup>128</sup>

On 2 February 1771, there was a storm at Whitehaven in Cumbria in northwest *England*, which undermined and destroyed nearly one half of the fort.<sup>128</sup> [The fort was a historical Roman fort.]

On 16 February 1771 [in *England*], the frost was so intense, that within a few days several persons were found frozen to death in the streets.<sup>128</sup>

In Selborne in Hampshire in southeast *England* from the middle of October 1770 to the end of the year, there were incessant rains. Then in January 1771, there were severe frosts. After that rain and snow prevailed for a fortnight [14 days], followed by spring weather until the end of February. March and April were frosty. The spring of 1771 was so exceptionally severe in the Isle of Skye that it was called the Black Spring; in the south it was also severe.<sup>70</sup> [Isle of Skye is an island in the Hebrides, an archipelago off the west coast of *Scotland*.]

During the winter of 1770-71 in the months of January, February and March there was severe cold in northern *France* and a lot of snow. There were ice floes on the Seine River at Paris in the month of February. The lowest recorded temperature observed during the winter were:

Cambridge, <i>England</i>	( 6.0° F, -14.4° C) on 12 February
Paris, <i>France</i>	( 7.7° F, -13.5° C) on 13 February
Denainvilliers, <i>France</i>	( 8.4° F, -13.1° C) on 13 February
Brussels, <i>Belgium</i>	( 9.0° F, -12.8° C) on 13 January

In *Italy*, there was very abundant snow.<sup>64</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1770 on November 18<sup>th</sup> – an exceedingly great northeast snowstorm, with a vast abundance of rain and very high tides. November 20<sup>th</sup> – we hear that the late snowstorm was much more severe in Boston, Massachusetts than here,

and the greatest that ever was there. The tides rose two-feet (0.6 meters) higher than ever was known. From the Conduit through the lower and Maine-streets, they sailed in boats, where the water was up to a man's chin. The cellars were all full. Some warehouses afloat. The vessels were damaged. One schooner thrown on Clark's wharf. December – generally moderate and pleasant, and (no snow); thermometer almost down to 0° F (-18° C). In 1771 on January 13<sup>th</sup> – the frost seemed to be getting out of the ground. January 17<sup>th</sup> – a vast deal of rain. January 31<sup>st</sup> – it began to snow; thus far an unusually moderate winter; but February has paid us off. February 21<sup>st</sup> – thermometer down to 0° F (-18° C). February 27<sup>th</sup> – a terrible and terrifying night, the last was; a prodigious tempest that seemed as if it would blow down our houses; the wind easterly and a great storm of rain and then snow, and very cold today, and continues snowing.<sup>78</sup>

---

**1771 A.D.** The inundation in the north of *England* (Northumberland) causing the Newcastle Bridge to be carried away.<sup>40, 43, 47</sup>

On 28 May 1771, the Susquehanna River rose to unprecedented heights, inundating both the towns at Sheshequin and Wyalusing, Pennsylvania in the *United States*. At Wyalusing, the flood swept away fences and livestock. At Sheshequin (Ulster), the inhabitants were compelled to take to their canoes and retire to the wooded heights in back of the town.<sup>178</sup>

The summer of 1771 in New England in what was to become the *United States* was the last of four consecutive summers, in which showers with thunder and lightning were unusually frequent. A considerable number of lives were lost and great amounts of property destroyed. The lightning destroyed or damaged houses, a business, barns, churches, a tavern, ships in harbor, trees and killed people and livestock (horses, cattle, oxen, sheep, swine, and geese). These thunderstorms took place between April and 3 September. Some of the places that received damage were in Massachusetts at Danvers, Boston, Petersham, Abington, Hopkinton, Westford, Ipswich, and Andover; in Connecticut at Stonington, New Haven, North Haven, Fairfield, Wallingford, and Stratford; in Rhode Island at Warwick, Newport, and Providence; in New Hampshire at Durham, and Kensington. The summer had been very oppressively warm for a long time. On 6 August, the temperature at Salem, Massachusetts reached 91° F [33° C] indoors.<sup>199</sup>

The maximum temperature during the summer in Lyon, *France* was 94.3° F (34.6° C).<sup>62</sup>

During the summer of 1771 Provence, *France*, felt very strong heat, due to the absence of breezes.<sup>79</sup>

The year 1771 was among the dry years in southern *France*.<sup>79</sup>

The years 1771 produced excessive rainfall and heat in southern *France*.<sup>79</sup>

In *Italy* in 1771, failure of the harvest produced a famine.<sup>57, 91</sup>

[In 1771, a great famine occurred in the Bay of Honduras by locust. Bay of Honduras is a large inlet of the Caribbean Sea, indenting the coasts of *Belize*, *Guatemala*, and *Honduras*. They ate up every green thing, and said in some parts, to have laid upon the ground a foot thick. It was computed that upwards of 80,000 Indians died from the famine.<sup>143</sup>]

In 1771, *Germany* suffered greatly from a bad harvest. The winter had been uncommonly severe. The spring was unfavorable and the rains of summer spoiled the grain and caused inundations in many parts.<sup>128</sup>

On 1 August 1771, there was incredible damage done in the neighborhood of Hamburg [Hamburg, *Germany*] by an inundation.<sup>128</sup>

In 1771, the area surrounding Namur, *Belgium* was ravaged by hailstones that weighed nearly eight pounds (3.6 kilograms).<sup>190</sup>

In Bengal [*India and Bangladesh*] in 1771 there was a devastating famine.<sup>90</sup>

In 1771, floods struck several regions of *China* including:<sup>153</sup>

— During the period between 15 February and 15 March, floods struck Anhwei (now Anhui province) in eastern *China* at Fêng-yang.

— During the period between 13 June and 11 July, floods struck Shantung (now Shandong province) on the east coast of *China* at Ning-yang, An-ch'iu, Shou-kuang and Po-hsing.

— During the period between 8 August and 8 November, floods struck Anhwei province at Wu-ho and Shantung province at Tsou-p'ing, Shang-ho, Hui-min, Liao-ch'êng and Tê-p'ing.

In 1771 during the period between 16 March and 14 April, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Chi-mo. During the period between 6 May and 8 August, a drought engulfed Anhwei (now Anhui province) in eastern *China* at Wu-ho. During the period between 8 November 1771 and 5 February 1772, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Shui-an and Hupeh (now Hubei province) in central *China* at Tang-yang and I-ch'êng.<sup>153</sup>

Towards the end of April 1771, Sir Josph Banks on the ship *Endeavour* observed a very dry climatic period [at the Cape of Good Hope as defined as the southern part of Africa as far as 30° latitude] in *South Africa* resulting in major sandstorms/duststorms, “The Climate tho not at all too hot for those who come from India would doubtless appear sufficiently warm could any one be transported immediately from England to this place; upon the whole it seems much of the same temperature as the Island of Madera tho scarce quite so hot, this I judge from the productions in general. During the whole Summer the air is frequently fanned by SE winds which come off the hills above the town with vast violence and during the time of their blowing, especialy at the beginning, are very troublesome to such as are obligd to be abroad in them by raising the Sand with which the whole countrey abounds and filling their eyes with it; nor are the houses quite free from its effects however close they are shut up, the Sand will find an entrance and in a short time cover every kind of furniture with a thick dust.”

“Nor does the Countrey immediately in the neighbourhood of the Cape give any reason to Contradict the idea of immense barrenness which must be formd from what I have said. The Countrey in general is either bare rock, shifting sand or grounds coverd with heath etc. like the Moors of Derbishire, Yorkshire etc. except the very banks of the few rivulets, where are a few plantations cheifly employd if well shelterd in raising Garden stuff, and if rather less so in vineyards; but if expos'd nothing can stand the violence of the winds which blow here through the whole summer or dry season. During my whole stay I did not see a tree in its native soil so tall as myself; indeed Housekeepers complain of the Dearnnes of firewood as almost equal to that of provisi[o]ns, nothing being burnt here but roots which must be dug out of the ground. What indeed proves the influence of the wind in prejudice to vegetation is that a stem not thicker than my thumb will have a root as thick as my arm or leg and thicker they never are.”<sup>168</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April – (until towards the last of the month) was generally cold and unpleasant. May 6<sup>th</sup> – the spring was thought to be very forward. May 20<sup>th</sup> – the heart cherry trees were all in blossom. June 17<sup>th</sup> – unusual cold days hitherto. June 30<sup>th</sup> – a remarkable growing season for everything but Indian corn, which was exceeding backward. July 4<sup>th</sup> – thermometer up to 84° F (29° C). July 11<sup>th</sup> – cool day. July 18<sup>th</sup> – cool still. July 30<sup>th</sup> – very hot. August 14<sup>th</sup> – people admired the seasonableness of the weather through the summer, and the universal fruitfulness. October 19<sup>th</sup> – a delightful summer day. October 20 and 23 – the same.<sup>78</sup>

**Winter of 1771 / 1772 A.D.** The winter of 1771-72 was one of the most severe, one has witnessed since time immemorial in the southern parts of *Russia* and the environments of the Caspian Sea. In the month of December 1771, it snowed for three consecutive weeks. The orange trees in the *Persian* province of Ghilan were frozen and the weather was ruled by consistently strong east winds. [Ghilan is currently located in northern *Iran*.] This severe weather stopped in the first days of January and spring weather followed immediately. In *France*, the winter was not very strict, and the lowest temperature observed in Denainvilliers, *France* was 19.6° F (-6.9° C), on 19 January. And the months of December, February and March were very mild. In Brussels, *Belgium* the lowest temperature occurred on 31 January at 7.5° F (-13.6° C).<sup>62</sup>

In Selborne, *England* in November 1771, there was frost with intervals of fog and rain. December was mild and bright weather with hoar frosts. During January and the first week of February 1772, there was frost and snow. And then to the end of the first fortnight [14 days] in March, there was frost, sleet, rain and snow.<sup>70</sup>

On 2 December 1771, there were land floods in Northumberland and Durham, *England*, which did great mischief, and the like in the Isle of Ely. The bridges on the Tyne were all carried away. Several ships were driven on shore, and some collieries filled with water. Solway Moss [a lowland peat bog], near Carlisle, overflowed its banks, and did great mischief.<sup>128</sup>

The following are excerpts from the diary of a 12-year-old schoolgirl who lived in Boston, Massachusetts in what was soon to become the *United States* of America. Her name was Anna Green Winslow. These excerpts describe the winter of 1771-72 in Boston.<sup>12, 65</sup>

December 6<sup>th</sup>, 1771 – “Yesterday I was prevented dining at unkle Joshua’s by a snow storm which lasted till 12 o’clock today, I spent some part of yesterday afternoon and evening at Mr. Glovers. When I came home, the snow being so deep I was bro’t home in arms. My aunt got Mr. Soley’s Charstown to fetch me. The snow is up to the peoples wast in some places in the street.”

December 24<sup>th</sup> – “Elder Whitwell told my aunt, that this winter began as did the Winter of 1740. How that was I dont remember but this I know, that to-day is by far the coldest we have had since I have been in New England. . . . Every drop [of rain] that fell froze, so that from yesterday morning to this time the appearance has been similar to the description I sent you last winter.”  
[freezing rain]

February 13<sup>th</sup>, 1772 – “Eveybody says that this is a bitter cold day, but I know nothing about it but hearsay for I am in aunt’s chamber (which is very warm always) with a nice fire, a stove, sitting in Aunt’s easy chair, with a tall three leav’d screen at my back, & I am very comfortable.”

February 21<sup>st</sup> – “This day Jack Frost bites very hard, so hard aunt won’t let me go to any school. I have this morning made part of a cobby with the very pen I have now in my hand, writting this with. Yesterday was so cold there was a very thick vapor upon the water, but I attended my school all day. My unkle says yesterday was 10 degrees colder than any day we have had before this winter. And my aunt says she believes this day is 10 degrees colder than it was yesterday; & moreover, that she would not put a dog out of doors. The sun gives forth his rays through a vapor like that which was upon the water yesterday.”

February 22<sup>nd</sup> – “Since about the middle of December, ult. we have had till this week, a series of cold and stormy weather – every snow storm (of which we have had abundance) except the first, ended with rain, by which means the snow was so hardened that the strong gales at N.W. soon turned it, & all above ground to ice, which this day seven-night was from one to three, four & they say, in some places, five feet (1.5 meters) thick, in the streets of this town.”

February 25<sup>th</sup> – “This is a very stormy day of snow, hail & rain.”

February 27<sup>th</sup> – “This day being too stormy for me to go to any school.”

March 4<sup>th</sup> – “We had the greatest fall of snow yesterday we have had this winter.”

March 6<sup>th</sup> – “I think the appearance this morning is as winterish as any I can remember, earth, houses, trees, all covered with snow, which began to fall yesterday morning & continued falling all last night. The Sun now shines very bright, the N.W. wind blows very fresh.”

March 9<sup>th</sup> – “This has been a very snowy day today.”

March 11<sup>th</sup> – “Uncle said yesterday that there had not been so much snow on the ground this winter as there was then – it has been vastly added to since then, & is now 7 feet deep (2.1 meters) in some places round this house; it is above the fence in the court & thick snow began to fall and continu’d till about 5 o’clock P.M. (it is about 1/4 past 8 o’clock) since which there has been a steady rain.”

March 14<sup>th</sup> – “This morning the sun shines clear (so it did yesterday morning till 10 o’clock.) It is now bitter cold, & such a quantity of snow upon the ground, as the Old people don’t remember ever to have seen before at this time of the year. . . . It is now ½ after 12 o’clock noon. The sun has been shineing in his full strength for full 6 hours, & the snow not melted enough anywhere in sight of this house, to cause one drop of water.”

March 17<sup>th</sup> – “While I was out, a snow storm overtook me.”

March 21<sup>st</sup> – “Yesterday, we had by far the gratest storm of wind & snow that there has been this winter. It began to fall yesterday morning & continued falling till after our family were in bed.”

April 1<sup>st</sup> – “The snow is near gone in the streets before us, & mud supplys the place thereof.”

April 3<sup>rd</sup> – “The wind was high at N.E. all day yesterday, but nothing fell from the dark clouds that overspread the heavens, till 8 o’clock last evening, when a snow began which has continued falling ever since. The bell being now ringing for 1 o’clock P.M. & no sign of abatement.”

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1771 on October 28 and 29 – two very cold freezing days. November – very similar to last November. December paid us severely; the whole of it (except two or three days) was steadily cold, extraordinarily so, and stormy and snowing. December 24<sup>th</sup> – the thermometer was -4° F (-20° C). In 1772 on January 17<sup>th</sup> – peerless sledding. January 31<sup>st</sup> – though it has snowed very often this month, there has been no deep snows. February 12<sup>th</sup> – thermometer at 0° F (-18° C), and in the evening, -4° F (-20° C). February 13<sup>th</sup> – thermometer at -16° F (-27° C). February 14<sup>th</sup> and 15<sup>th</sup> – thermometer at -8° F (-22° C). February 16<sup>th</sup> – a moderate day. February 20<sup>th</sup> – a deluge of rain. February 25<sup>th</sup> – easterly storm. February 28<sup>th</sup> – a beautiful gay morning. There have been many storms and gales of wind through the winter, and three severe snaps of cold weather as ever was. February 29<sup>th</sup> – it has snowed more than twenty-one times [this winter]; all of them except the last, very level [not drifted]. March – a cold, stormy, blustering month. March 11<sup>th</sup> – we lived upon [a killed] moose several days. March 15<sup>th</sup> – (Sunday) I rode down through the town to meeting. There was a good footpath as far as Mr. Codman’s; and from a canal [tunnel] very narrow, dug through the deep snow, so that most of the people went through it singly in a long continued string, close upon the heels of one another. March 29<sup>th</sup> – (Sunday) I could not see any way to get to the meeting [church service], and therefore did not attempt it. There is no sleighing through the Main Street, and through the other streets. The snow is up to the fences. April – several storms and a number of pleasant days. May 1<sup>st</sup> and 2<sup>nd</sup> – very hot. May 12<sup>th</sup> – frosts and ice.<sup>78</sup>

In Philadelphia, Pennsylvania in the *United States* during the winter of 1772, the Delaware River was covered with ice for three months.<sup>1</sup>

---

**1772 A.D.** On 22 March 1772, there was a violent storm of hail, which did great damage in London, *England*. One man was killed.<sup>128</sup>

On 22 March 1772 in London, *England*, there was a great storm of hail during Sunday afternoon. The congregations in the churches on the south side of the Metropolis were in great terror. Windows were broken, etc.<sup>93</sup>

A hailstorm struck Girgenti (Agrigento), *Italy* on April 18<sup>th</sup>; the hailstones weighed twenty ounces.<sup>41, 43</sup>

On 18 April 1772 in Sicily, *Italy*, there was a great hailstorm at and near Girgenti. The hailstones weighed 20 ounces. The hailstones killed a great number of cattle, while lightning killed 84 persons. "The Commandant of the Castle, in order to dispel the cloud, fired several cannons, but fresh lightning issued from it and killed several of the gunners."<sup>93</sup>

In Leeds, (Yorkshire) *England* on the 20<sup>th</sup> of June, there were hailstones as large as nutmegs.<sup>40, 41, 43, 57</sup>

On 20 June 1772 in *England*, there was a hailstorm in Northumberland and Yorkshire. "Hailstones as large as nutmegs" at Leeds.<sup>93</sup>

On 16 July 1772 in *Cuba*, there was a hailstorm at St. Jago. The "hailstones as large as oranges."<sup>93</sup>

In St. Jago, *Cuba* on the 16<sup>th</sup> of July, there were hailstones as large as oranges. The hailstorm did great damage.<sup>40, 41, 43, 56, 57</sup>

On 17 July 1772 in *France*, there was a hailstorm at Belford [Belfort in northeastern *France*]. The storm lasted 12 minutes, and destroyed all the fruit and grain of the district. Some of the hailstones weighed half a pound. Several persons wounded, glass and buildings damaged. On the same day another storm caused great ravages at Sarguemines [Sarguemines is now Sarreguemines in northeastern *France*], and 29 neighboring villages of Lorraine; extending also into the principality of Nassau (Rhine).<sup>93</sup>

On 18 July 1772 in *Saxony*, there was a violent hailstorm in district of Zittau (Upper Lusatia) [now located in the southeastern corner of *Germany*], destroying all the grain and fruit crops and beating down some ten villages, several of which were utterly despoiled. The stones were of a prodigious size.<sup>93</sup>

In the little kingdom of *Saxony* [now part of northwest *Germany*], in the famine of 1772, it is said that 150,000 died of starvation.<sup>155</sup>

In July in Holland [now *the Netherlands*], there was a hailstorm at Brome, in the district of the Zell [Today Brome might be Brohl in the Cochem-Zell district in Rhineland-Palatinate, *Germany*]. This storm not only destroyed all the fruit and grain crops, but "whole villages, besides the loss of their harvest, had all their fowls killed or dangerously wounded, and the cattle of all sorts have suffered greatly. The linen which was spread in order to be whitened [bleached] was torn in pieces, and several persons who were not able to reach shelter were killed or mortally wounded."<sup>93</sup>

On 21 August 1772 in London, *England*, the water in the River Thames was so low, that people might have waded across the Thames at Pepper Alley Stairs.<sup>128</sup>

Between 28 August and 3 September 1772, one or more hurricanes struck the islands of Hispaniola [now *Haiti* and the *Dominican Republic*], *Puerto Rico*, *Jamaica*, *Dominica*, *St. Kitts*, *St. Eustatius*, *Suba*, *St.*

*Martin, Antigua, Montserrat, Nevis, Saint Croix, St. Thomas* and North Carolina, Alabama and Louisiana in the *United States*. Refer to the following entries:

On 28 August to 3 September 1772, a hurricane struck *Hispaniola, Puerto Rico* and *Jamaica* causing approximately 280 deaths.<sup>141</sup>

On 30 August 1772, a hurricane struck *Dominica* in the *Lesser Antilles* and *St. Kitts* in the *West Indies*. The storm killed a large number of people.<sup>141</sup>

On 31 August 1772, a hurricane struck *St. Kitts* in the *West Indies* causing £ 500,000 worth of damage.<sup>144</sup>

On 31 August 1772, a hurricane caused wide destruction in the *Caribbean*.<sup>143</sup>

— At daylight upon the 31<sup>st</sup> of August, a heavy gale of wind from the N.E., at *St. Christopher's island* [*St. Kitts*], blew down several sugar works, and destroyed most of the plantations. At noon the gale abated, and the inhabitants thought the storm was over; but the wind shifted suddenly to the S.W. by S., and came on with increased violence. Almost every house, sugar-mill, tree, and plant at *Basse Terre* [*Basseterre*], *Sandy Point*, and *Old Road* was blown down or very much damaged — several persons were killed, and a great number dangerously wounded. The damage was estimated at £ 500,000 sterling.

— At *St. Eustatius*, 400 houses, on the higher grounds, were destroyed or rendered untenable; all the plantation houses, except two, were blown down; and the Dutch church was blown into the sea.

— At *Saba*, 180 houses were blown down.

— At *St. Martin's*, very few houses were left standing, and all the plantations were destroyed.

— At *Antigua*, all the men of war, except one, were driven on shore, and several ships foundered at their anchors in *St. John's roads*.

— At *Dominica*, eighteen vessels were driven on shore and lost.

— *Montserrat* and *Nevis* had scarcely a house left standing.

— At *Santa Cruz*, [*Saint Croix, Virgin Islands*] the sea rose seventy feet above its usual height, and carried away every thing before it. Large stones were washed down from the mountains; meteors, like balls of fire, made visible the horrors of the night; 460 houses were thrown down at *Christianstadt* [*Christiansted*]. All the houses in *Frederickstadt* [*Frederiksted*], but three, were destroyed; and all the magazines and stores quite ruined. Every ship at the island was driven on shore, some of them 100 yards on the land. The damage was estimated at 5,000,000 of dollars.

— At *St. Thomas*, the damage was estimated at 200,000 dollars.

On 1 September 1772, a hurricane struck *North Carolina* in the *United States* causing 50 deaths.<sup>141</sup>

On 2 September 1772, a hurricane struck *Louisiana* in the *United States*. The ship *El Principe de Orange* was wrecked by the hurricane at the entrance of the *Mississippi River*, where she quickly went to pieces, only six survivors.<sup>141</sup>

The town of *St. Johns* in *Antigua* [an island in the *West Indies*, in the *Leeward Islands* in the *Caribbean*] was destroyed by a storm, August 17 and 31, 1772.<sup>40, 56</sup>

On 31 August 1772, a hurricane struck *Jamaica*.<sup>124</sup> [A devastating hurricane struck *St. Kitts* on 31 August 1772. Another followed three days later.]

On 22 November 1772, reports were received of a dreadful hurricane at the *Island of St. Christopher* (now *Saint Kitts*), which destroyed most of the houses and sugar-works in the island; the neighboring islands also suffered severely, especially at *St. Eustatius*.<sup>128</sup> [*St. Eustatius* is an island in the *West Indies* in the *Caribbean*.]

From 31 August to 3 September 1772, the most destructive storm [hurricane] as yet experienced; vessels, boats, and logs driven into the heart of *Mobile, Alabama* in the *United States*. The sea [storm surge] rose

to a prodigious height; all the vessels at the Belize blown on shore; salt spray was carried inland 5 miles.<sup>117</sup>

A terrible storm struck *St. Kitts* [an island in the *West Indies* in the Caribbean Sea] and did immense damage in that island and the adjoining islands on August 30.<sup>40, 41</sup>

On 7 September 1772, there was a terrible flood at Inveraray in western *Scotland*, which carried away trees of vast magnitude, and all the Duke of Argyle's cascades, bulwarks, and bridges at his seat there.<sup>128</sup>

On 25 September 1772, there was great damage done on the Thames, and in and near London, *England*, by a storm of wind.<sup>128</sup>

The summer of 1772 in Paris, *France* was characterized by:

Hot days	25 days
Very hot days	5 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The summer in Denainvilliers, *France* was characterized by:

Hot days	41 days
Very hot days	4 days

The month of June was very warm. The high temperatures observed during the summer were:

Paris, <i>France</i>	( 98.2° F, 36.8° C)	on 24 June
Auxerre, <i>France</i>	( 96.6° F, 35.9° C)	on 26 June
Montmorency, <i>France</i>	( 96.1° F, 35.6° C)	on 26 June
Denainvilliers, <i>France</i>	( 95.0° F, 35.0° C)	on 26 June
Brussels, <i>Belgium</i>	( 95.0° F, 35.0° C)	on 26 June
Mulhouse, <i>France</i>	( 92.8° F, 33.8° C)	on 27 June
Berlin, <i>Germany</i>	( 88.3° F, 31.3° C)	on 27 June
St. Petersburg, <i>Russia</i>	( 87.1° F, 30.6° C)	on 26 July

In northern *France* and in the region of Toulouse, they suffered from a huge drought. In September, the Seine River was 24 centimeters (9.4 inches) above the lowest water level in the [dry] year 1719. But in the south, abundant rain fell. In Burgundy, the grape harvest began on 24 September. Montmorency wine production was around twice that of a normal year, but in the region around Orleans, *France* the yield of wine was low.<sup>62</sup>

During the summer of 1772 Provence, *France*, felt very strong heat, due to the absence of breezes.<sup>79</sup>

Abundant rains fell in 1772, mainly in southern *France*. The annual rainfall in Montpellier was 45.9 inches (1,167 millimeters), which was approximately 15.9 inches (403 millimeters) above the average annual rainfall. The rainfall in Marseille was 48.9 inches (1,243 millimeters) or 30.3 inches (770 millimeters) above the annual rainfall. The rivers overflowed in Lyon, in the Languedoc, Roussillon and Provence. Rains began in September, redoubled in November, and became excessive in December.<sup>79</sup>

In 1772 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Wên-têng. During the period between 8 August and 8 November, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p'ing.<sup>153</sup>

In 1772 during the 6<sup>th</sup> moon on the 18<sup>th</sup> day, a typhoon struck in the vicinity of Shanghai, *China*. The storm of great wind and rain tore up trees, overturned vessels and houses.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 20<sup>th</sup> – growing time, the plum and cherry trees are blooming. May 25 to 30<sup>th</sup> – raw, cold and rainy. May 31<sup>st</sup> – a summer day. June – several cold days, yet a growing season. July 28<sup>th</sup> – extremely hot. The thermometer at the highest. July 29<sup>th</sup> – there was a prodigious tempest, with thunder and lightning in all the neighboring towns. August 12<sup>th</sup> – the grass uncommonly well grown and good. August 26<sup>th</sup> – a deluge of rain. August 30<sup>th</sup> – hot weather, and a growing time as ever was. September 30<sup>th</sup> – it has been a remarkable fruitful summer. October 8<sup>th</sup> – there is a famine of bread in town, no Indian [maize] and no flour; no pork in town or country. October 30<sup>th</sup> – it is thought that near a quarter of the spring, summer and fall, has been rainy weather, and most of it stormy. December – several summer-like days this month.<sup>78</sup>

From 1772 to 1777, the northern part of St. Domingo experienced five years of extraordinary drought. The plains covered with sugar canes and the hills cultivated with coffee were afflicted with a desolating sterility.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

---

**Winter of 1772 / 1773 A.D.** During the winter of 1772-73, the month of February was very cold in northern *France*. The Seine River produced ice floes. The lowest temperature observed during the winter were:<sup>62</sup>

Paris, <i>France</i>	( 12.9° F, -10.6° C) on 5 February
Denainvilliers, <i>France</i>	( 15.6° F, -9.1° C)
Brussels, <i>Belgium</i>	( 15.6° F, -9.1° C) on 6 February

In Selborne, *England* the winter of 1772-73 would fairly compare with the mildest in recent years, except for a fortnight [14 days] of hard frost in February 1773. From the end of September to 22 December, there were rain and mild weather. The first ice appeared on 23 December but then to the end of the month it was foggy. During the first week of January there was frost but the rest of the month was dark rainy weather. During the first fortnight in February there was a hard frost, but this was followed by misty showery weather until the end of the first week in March. Then there were bright spring days till April.<sup>70</sup>

On 4 February 1773, in that neighborhood [Flintshire, in northeast *Wales*?], there was a fall of snow that was so great that it buried cottages, men and cattle, and some have perished.<sup>128</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: February 1773 – a cold, blustering, uncomfortable month, except the three last days, which were pleasant and moderate. Extremely cold this winter. March 1<sup>st</sup> – very moderate. March 14<sup>th</sup> – pretty cold.<sup>78</sup>

In Philadelphia, Pennsylvania in the *United States* on 9 January 1773 the mercury was -9.0° F (-22.8° C), and there was much snow and cold weather until the 10<sup>th</sup> of March.<sup>1</sup>

---

**1773 A.D.** In *England* on the 22<sup>nd</sup> of February, there was a violent gale of wind, made havoc among the shipping in the British Channel. It is more than twenty years since the like happened in this island.<sup>57</sup>

In *England* on the 26<sup>th</sup> of February, it blew a hurricane in London by which the shipping in the Thames is said to have sustained damage to the amount of 50,000l.<sup>57</sup>

In February 1773, a famine prevailed in *Moravia* and *Bohemia* [now *Czech Republic*].<sup>128</sup>

In 1773, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

A storm struck *France* and *England* in March 1773.<sup>40, 41</sup>

In *Ireland*, there were great mountain torrents of water.<sup>47, 92</sup>

In Calcutta, *India*, there was great destruction from rain and floods.<sup>40, 41, 43, 47</sup>

In *Cuba*, there was a terrible storm in July 1773.<sup>40, 41, 56</sup>

On 26 July 1773, it was reported that during a storm in Moscow, *Russia*, a great fire happened which spread nearly a mile round destroying the palaces of nobility and many public buildings.<sup>128</sup>

In Boston, Massachusetts in the *United States* in August, there was a most terrible storm.<sup>40, 41, 56</sup>

On 14 August 1773, a very violent tornado struck Salisbury, Massachusetts in the *United States* and vicinity. It lasted about 3 minutes and destroyed or damaged upward of 40 buildings in Salisbury, and about the same number in Almsbury. It first struck Salisbury Point, and then followed the course of the Merrimac River. Its devastation were one mile wide to about ¼ mile wide above Almsbury Ferry.<sup>174</sup>

On 14 August 1773, a tornado struck Massachusetts in what was to become the *United States*, cutting a path ¼ mile [400 meters] wide. It first appeared along the Merrimack River above Deer Island then struck Salisbury Point, the town of Amesbury, and then it swept through Haverhill. More than 150 buildings were blown down or damaged by the tornado. Within those buildings were two hundred people, many of them trapped and injured in the debris field left behind. At Salisbury Point, eight houses were completely leveled, fifteen others were unroofed and twenty-six more considerably damaged. In Amesbury, one house was leveled, eight more lost their roofs, and twenty-two others were considerably damaged. Sixteen barns were leveled and five others considerably damaged. Three blacksmith shops were leveled and another unroofed. A millhouse was blown down and a hatter shop was unroofed. A cooper's and a barber's shop were significantly damaged. A large workhouse and a large storehouse were leveled. Two large vessels, each of 90 tons burden, were lifted off their blocks and hurled through the air 22 feet [6.7 meters]. At Haverhill, a large dwelling house and a barn were destroyed.<sup>199</sup>

On 14 August 1773, there was a storm of thunder and lightning in *England*, which did much damage to St. Peter's Church, Cornhill and did other damage.<sup>128</sup> [St. Peter upon Cornhill is an Anglican church in the city of London.]

On 16 October 1773, a hurricane storm at Oxford, *England* damaged many of the public buildings and the Church of All Saints was completely unroofed.<sup>128</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

March 31<sup>st</sup> – spring-like day. April showers and melodious singing of the birds; among which were two robins, in such a manner, as I never knew the like. April 3<sup>rd</sup> – raw; cold. April 8<sup>th</sup> – spring-like weather. April 15<sup>th</sup> – raw; cold. April 21<sup>st</sup> – some warm days. April 25<sup>th</sup> – rainy. April 30<sup>th</sup> – raw, cold easterly weather. May 1<sup>st</sup> – the spring is thought to be a month forwarder than usual. May 10<sup>th</sup> – wonderful hot summer weather. May 12<sup>th</sup> – the heart cherry and pear trees in blow [blossom], and the common cherry and plum trees are just upon it. May 22<sup>nd</sup> to 26<sup>th</sup> – rainy. June 3<sup>rd</sup> – a hot day. June 7<sup>th</sup> – cooler. June 11<sup>th</sup> – cold. June 15<sup>th</sup> – strawberries plentiful. June 23<sup>rd</sup> – wonderful weather. June 28<sup>th</sup> – extremely hot, thermometer at 92° F (33° C). July 7<sup>th</sup> – a melancholy dry time. July 8<sup>th</sup> – the thermometer was up to 100° F (38° C). July 12<sup>th</sup> – a smart thundershower. July 20<sup>th</sup> – a great rain. September 9<sup>th</sup> – Damsons [plums] begin to be ripe. September 12<sup>th</sup> – very cold. September 18<sup>th</sup> – very hot. September 27<sup>th</sup> – the wells fail [the wells went dry]. September 28<sup>th</sup> – extremely hot. September 29<sup>th</sup> – a storm of rain. September 30<sup>th</sup> – there has been no frost to do any damage. October 31<sup>st</sup> – this month has been a wonderful moderate, pleasant season. December 10<sup>th</sup> – a storm of rain. December 11<sup>th</sup> – surprising pleasant day.<sup>78</sup>

In Venice, *Italy*, a flood caused a village to be carried away.<sup>47</sup>

In Naples, *Italy*, there was great damage from the sea.<sup>47</sup>

At Venice and at Naples, *Italy* on the 10<sup>th</sup> of November an inundation carried away a whole village and drowned 200 of the inhabitants.<sup>40, 41, 43, 56</sup>

On 10 November 1773, there was an inundation at Venice and Naples, *Italy*. Many lives were lost.<sup>128</sup>

A storm struck Oxford, *England* on November 15.<sup>40, 41</sup>

The summer of 1773 was remarkable for extremely high temperatures, but they were always short-lived. In Denainvilliers, *France*, there was a series of 15 successive hot days (from 4 to 18 August). The summer in Paris, *France* was characterized by:

Hot days	18 days
Very hot days	2 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The summer in Denainvilliers, *France* was characterized by:

Hot days	45 days
Very hot days	4 days
Extremely hot day	2 days

The highest temperatures occurred in the month of August. The high temperatures observed during the summer were:

Paris, <i>France</i>	(102.9° F, 39.4° C) on 14 August
Denainvilliers, <i>France</i>	( 96.6° F, 35.9° C) on 15 August
Berlin, <i>Germany</i>	( 90.5° F, 32.5° C) on 23 May and 15 August
Brussels, <i>Belgium</i>	( 89.1° F, 31.7° C) on 14 August
Mulhouse, <i>France</i>	( 88.7° F, 31.5° C) on 14 August
Moscow, <i>Russia</i>	( 88.3° F, 31.3° C) on 20 June
The Hague, <i>the Netherlands</i>	( 87.8° F, 31.0° C)
St. Petersburg, <i>Russia</i>	( 87.1° F, 30.6° C) on 24 July

The summer was very dry [in *France*]. In Burgundy, the grape harvest only began on 27 September. In the region around Orleans, the wine was of medium quality. In Provence, it was very hot this year. In Languedoc the grape harvest was immensely damaged in July by a very heavy fog.<sup>62</sup>

During the summer of 1773 Provence, *France*, felt very strong heat, due to the absence of breezes.<sup>79</sup>

The years 1773 produced excessive rainfall and heat in southern *France*.<sup>79</sup>

From 1772 to 1777, the northern part of St. Domingo experienced five years of extraordinary drought. The plains covered with sugar canes and the hills cultivated with coffee were afflicted with a desolating sterility.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

In 1773 during the period between 6 May and 8 August, a drought engulfed Shensi (now Shaanxi province) in central *China* at Lo-ch'uan. During the period between 18 August and 15 September, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Shou-kuang; Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p'ing; and Hopei (now Hebei province) in northern *China* at Tientsin, Ch'ing, Ching-hai, Wu-ch'ing, Tung-kuang and Ning-ching.<sup>153</sup>

In 1773 during the 7<sup>th</sup> moon on the 20<sup>th</sup> day in the vicinity of Shanghai, *China*, a group of dragons burnt [rice] paddy in the fields, drew houses into the air and travelers also; hailstones of two or three catties weight fell, killing horses and animals. [A catty or Chinese pound was historically about 605 grams weight. Therefore these individual hailstones weighed around 2.7 to 4.0 pounds.] [In early *China*,

tornadoes and waterspouts were commonly described as dragons.]<sup>166</sup>

The year 1773 was a year of abundance in the vicinity of Shanghai, *China*.<sup>166</sup>

**Winter of 1773 / 1774 A.D.** In Selborne, *England*, there were four weeks of frost after the end of the first fortnight [14 days] in November 1773, then rain to the end of the year, and rain and frost alternating to the middle of March 1774.<sup>70</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1773 on December 19<sup>th</sup> – it snowed all last night and most of today. In 1774 on January 10<sup>th</sup> – the thermometer in the study was down to 0° F (-18° C), and in the wood house, -8° F (-22° C). January 11<sup>th</sup> – it was 6° F colder. January 22<sup>nd</sup> – the thermometer was down to the bottom of the plate. January 31<sup>st</sup> – more moderate. February 11<sup>th</sup> – moderate. February 14<sup>th</sup> – the snow is about a foot (0.3 meters) deep in the woods.<sup>78</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

In 1774, there was a snowstorm, which extended over most of Florida in the *United States*. The inhabitants long afterwards spoke of it as an extraordinary white rain.<sup>115</sup>

**1774 A.D.** In *England*, there were great floods at Battersea and Chelsea [both cities are now part of greater London] on March 9, 1774.<sup>40, 41, 43, 47</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Kiev, <i>Ukraine</i>	( 99.1° F, 37.3° C)	on 22 July
Marseille, <i>France</i>	( 97.9° F, 36.6° C)	
Edinburgh, <i>Scotland</i>	( 88.0° F, 31.1° C)	
Riga, <i>Latvia</i>	( 81.5° F, 27.5° C)	

On 20 March 1774, there were such heavy rains in *England*, that level or lowlands both at Chelsea and Battersea were overflowed.<sup>128</sup>

On 20 May 1774, there was great damage done in Saxony [now part of *Germany*] by storms of hail and rain; whole districts were laid waste.<sup>128</sup>

In May of 1774 in *Saxony*: "Accounts from different parts of the Electorate of Saxony are full of the damage done in that part of *Germany* by violent storms of hail and snow. Whole districts have been laid waste, and many cattle destroyed."<sup>93</sup>

On 26 July 1774 in *England*, there was a great hailstorm in Bedfordshire, in Buckinghamshire, and in various parts of Hertfordshire. "It cut off the corn as if with a sickle, and has done incredible damage to the fruit trees, and fruits of the earth, insomuch that many farmers will be ruined." This storm also struck Shropshire.<sup>93</sup>

On 3 August 1774 in northern *France*, a hailstorm at Alençon in Normandy began about noon. At 5 o'clock, the thunder became louder and the sky was on a sudden covered with thick black clouds, causing almost entire darkness: in the midst of which there occurred such a dreadful storm of hail that it was at first thought to be a shower of stones. "It broke down all before it, roofs, windows, etc., and wounded all those who were unhappily then in the streets. Hailstones have been found as large as a hat; others measured 18 inches in circumference. A countryman was killed by one of them, and many people were dangerously wounded—18 of whom had the Viaticum [part of the Last Rites] administered." This storm

lasted 45 minutes, and did enormous damage.<sup>93</sup>

On 3 August 1774, it was reported that there was a hailstorm at Alençon, *France*. The hailstones measured eighteen inches round.<sup>128</sup>

In Alençon, *France* on the 3<sup>rd</sup> of August, there was a hailstorm; stones measured 18 inches round.<sup>40, 41, 43, 56, 57</sup>

In 1774, Paris, *France* received 5.9 inches (149 millimeters) of annual rainfall above average and had sixteen more rainy days than normal. Denainvilliers, *France* received an extra 6.3 inches (160 millimeters) rainfall and eight more rainy days than normal. Montmorency, *France* received an extra 3.2 inches (81 millimeters) rainfall and nine more rainy days than normal.<sup>79</sup>

In *England*, there were great storms at London on September 30 and on December 5<sup>th</sup>-7<sup>th</sup>, which did great damage to the shipping.<sup>40, 41, 56</sup>

On 28 September 1774, it was reported that a great part of the Russian fleet was destroyed by a storm in the *Mediterranean Sea*.<sup>128</sup>

On 21 November 1774, a violent gale struck along the coast of New England in what was to become the *United States*. There were several wrecks on the coast of Massachusetts, between Cape Cod and Cape Ann. On the back of Cape Cod, a brig [a sailing vessel with two square-rigged masts] was wrecked and only one sailor survived. A brig and a schooner were seen bottoms up off Plymouth. At Marblehead, three or four vessels were driven ashore. In Salem harbor, a sloop was driven ashore and a schooner was driven with such violence against Blaney's wharf, that her quarterdeck was caved in and her side greatly damaged. Several vessels were driven ashore at Stage Point. At Beverly, a brig was driven onto a mussel bed. A sloop was upset and sank off Cape Ann. A brig and a sloop foundered on the back of Cape Ann, and all the people onboard perished.<sup>199</sup>

On 25 November 1774, in a storm more than forty ships were driven on shore between Yarmouth and Leith in *Great Britain*.<sup>128</sup> [Great Yarmouth is located in Norfolk in eastern *England*. Leith is located north of Edinburgh, *Scotland*.]

On 5-7 December 1774, there was a storm at London, *England*, which did considerable damage to the shipping in the River Thames.<sup>128</sup>

In 1774 during the period between 7 August and 5 September, a drought engulfed Hupeh (now Hubei province) in central *China* at Chung-hsiang, Ching-mên, Ying-ch'êng and Huang-an. During the period between 6 September and 4 October, a drought engulfed Kansu (now Gansu province) in northwest *China* at T'ien-shui and Min-ch'in; and Hopei (now Hebei province) in northern *China* at Ch'ing-yün, Pa and Nan-yüeh.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

March 31<sup>st</sup> – this month has been very moderate. The robins came and tuned up. April 8<sup>th</sup> – it has not frozen in the house since the beginning of February. April 13<sup>th</sup> – the spring is very forward; we began to dig our garden. April 21<sup>st</sup> – a surprising hot summer day. April 29<sup>th</sup> – rainstorm. May – a raw cold month; the spring backward. May 31<sup>st</sup> – a hot day. June 6<sup>th</sup> – cold. June 10<sup>th</sup> – summer breaks in upon us. June 17<sup>th</sup> – set out cabbage plants. July 10<sup>th</sup> – not a cherry or plum this year. July 12<sup>th</sup> – a memorable growing season. July 20<sup>th</sup> – we have had an abundance of peas. July 29<sup>th</sup> – very hot; a fine hay season. August 11<sup>th</sup> – a melancholy dry time. August 29<sup>th</sup> – the flies are vastly troublesome. September 1<sup>st</sup> – very hot and dry. September 16<sup>th</sup> – it is an exceeding dry time. September 29<sup>th</sup> – cold. September 30<sup>th</sup> – very hot. October 10<sup>th</sup> – everyday is unusually warm and constantly dry. October 14<sup>th</sup> – thundershower, with a deluge of rain. October 23<sup>rd</sup> – warm. November 3<sup>rd</sup> – it was almost as dry as before.

November 5<sup>th</sup> – it rained plentifully. November 11<sup>th</sup> – a calm and pleasant day. November 16<sup>th</sup> – a deluge of rain fell. November 20<sup>th</sup> – very cold. November 22<sup>nd</sup> – snowstorm. November 25<sup>th</sup> – rainstorm. November 28<sup>th</sup> – warm and pleasant. December 8<sup>th</sup> – there is no frost in the ground. December 14<sup>th</sup> – cold. December 19<sup>th</sup> – rain all day, and at night a prodigious tempest; the rest of the month, snow and cold.<sup>78</sup>

From 1772 to 1777, the northern part of St. Domingo experienced five years of extraordinary drought. The plains covered with sugar canes and the hills cultivated with coffee were afflicted with a desolating sterility.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

**Winter of 1774 / 1775 A.D.** The winter in 1774-75 started with a very intense cold. On 27 November 1774 in Paris, *France*, the Seine River was covered with ice, and the thermometer read 16.2° F (-8.8° C). In Franeker in *Friesland*, the cold was also very severe. The lowest temperature observed in Brussels, *Belgium* was on 25 January at 9° F (-12.8° C).<sup>62</sup>

In Selborne, *England*, there seemed to be no winter at all worth mentioning. From August 24 to the end of the third week in November, there was rain, with frequent intervals of sunny weather. Then to the end of December, dark dripping fogs. January, February and the first half of March 1775, there was rain almost every day; and to the end of the first week in April, cold wind, with showers of rain and snow.<sup>70</sup>

During the winter of 1774-75 in New England in what was to become the *United States*, no snow fell, the farmers plowed their land, flowers bloomed, and fruit grew and ripened. Spring came early and the grass waved in the wind in Massachusetts on the 19<sup>th</sup> of April.<sup>199</sup>

**1775 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: January 2<sup>nd</sup> – there is a great scarcity of corn in this part of the country. January 6<sup>th</sup> – very cold days. January 23<sup>rd</sup> – very moderate weather. January 27<sup>th</sup> – a summer's day. January 28<sup>th</sup> – wonderful, moderate. February 7<sup>th</sup> – there has been no snow, and but little rain since the 29<sup>th</sup> of December; wonderful weather; we saw two robins. February 11<sup>th</sup> – warm day. February 18<sup>th</sup> – cold. February 20<sup>th</sup> – snow, incomparable sledding. February 21<sup>st</sup> – a summer's day. February 23<sup>rd</sup> – a great snowstorm. March 7<sup>th</sup> – the frost seems out of the ground in the street. March 15<sup>th</sup> – we have wonderful moderate weather. March 28<sup>th</sup> – it has been a wonder of a winter, so moderate and unfreezing. April 4<sup>th</sup> – cold days. April 5<sup>th</sup> – a very stormy, snowy day. April 12<sup>th</sup> – cold northeast storm. May 6<sup>th</sup> – the spring has to this time been cold, wet and backward, except the grass. May 19<sup>th</sup> – hot summer's day. May 31<sup>st</sup> – the cherry and plum trees are out of, and the apples in the midst of blossoms. June 7<sup>th</sup> – a hot and dry season. June 16<sup>th</sup> – there was a small frost. June 22<sup>nd</sup> – cold for several days. June 29<sup>th</sup> – a great rainstorm. July 2<sup>nd</sup> – the face of the earth is renewed, but no grass on the Neck [peninsula]. July 11<sup>th</sup> – it rained plentifully. July 12<sup>th</sup> – an extreme hot day. July 21<sup>st</sup> – a fine shower. August 12<sup>th</sup> – we had plentiful rains. August 20<sup>th</sup> – a wonderful year for fruit of all sorts. August 29<sup>th</sup> – it rained abundantly.<sup>78</sup>

On 1 February 1775, there was a violent storm of wind and rain, which did much damage at Portsmouth, *England*; the water rose higher than was ever known.<sup>128</sup>

On 3 February 1775 there was incredible damage done by floods in *Germany* and *Hungary*.<sup>128</sup>

On 30 April 1775 in *England*, there was a hailstorm in the Midland Counties, and particularly at Northampton and Buckingham. The hailstorm was of considerable magnitude and did great damage to fruit trees and windows.<sup>93</sup>

On 13 May 1775 in southeastern *Spain*, there was a hailstorm in and about Murcia. The hailstorm only lasted 20 minutes. Many of the stones were of the size of oranges, weighing a pound and some 20 ounces, and the greatest part of them 8 ounces. The consequences of this storm were very serious due to the quantity of grain, silk, barilla, etc., destroyed.<sup>93</sup>

On 3 June 1775 in *England*, there was a great hailstorm in Buckinghamshire.<sup>93</sup>

The summer of 1775 was warm and dry in central *France*. The summer in Denainvilliers, *France* was characterized by:

Hot days	67 days
Very hot days	8 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The month of June was warm but the highest temperatures occurred in July and August. The high temperatures observed during the summer were:

Paris, <i>France</i>	( 96.1° F, 35.6° C)
Denainvilliers, <i>France</i>	( 96.1° F, 35.6° C) on 22 July
Stockholm, <i>Sweden</i>	( 93.9° F, 34.4° C)
Wroclaw, <i>Poland</i>	( 91.0° F, 32.8° C)
Berlin, <i>Germany</i>	( 90.5° F, 32.5° C) on 24 July
Mulhouse, <i>France</i>	( 90.1° F, 32.3° C) on 10 June
Brussels, <i>Belgium</i>	( 89.4° F, 31.9° C) on 6 June
Nancy, <i>France</i>	( 87.6° F, 30.9° C) on 19 August
London, <i>England</i>	( 86.0° F, 30.0° C) on 2 August
Moscow, <i>Russia</i>	( 83.8° F, 28.8° C) on 16 July
Riga, <i>Latvia</i>	( 81.5° F, 27.5° C)

In Burgundy, the grape harvest only began on 25 September. The grape harvest was common and the quality was good. In the area of Orleans, *France*, the harvest was less abundant, but of very good quality.<sup>62</sup>

In 1775, a real scarcity of corn [grain] prevailed in *France*.<sup>128</sup>

In July 1775 a famine at the *Cape de Verde Islands* carried off over 16,000 people.<sup>128</sup> [Cape de Verde Islands are located in the central Atlantic Ocean off the coast of Western Africa.]

At Cape de Verde [*Cape Verde Island*] in 1775, there was a great famine – 16,000 people perished.<sup>57, 90, 91</sup>

From 1772 to 1777, the northern part of St. Domingo experienced five years of extraordinary drought. The plains covered with sugar canes and the hills cultivated with coffee were afflicted with a desolating sterility.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

On 31 July 1775, a hurricane struck the *Caribbean Sea*. The English merchantman *Gill*, sailing from St. Eustatius to St. Vincent Island, sank during the hurricane.<sup>141</sup>

On 25 August 1775, at eight o'clock in the evening, a hurricane from the west, struck Montpellier, *France*. It levelled walls and uprooted trees. The gales lashed for an hour with frightening speeds. But only 0.1 inches (3 millimeters) of rain fell during this period. The barometer went down to 736 millimeters.<sup>79</sup>

On 2-6 September 1775, a hurricane struck North Carolina and Virginia in the *United States* causing more than 163 deaths.<sup>141</sup>

On 9-12 September 1775, a hurricane struck Newfoundland Banks, *Canada* causing 4,000 deaths. The storm struck the northwest coast of Newfoundland and on the coast of Labrador.<sup>141</sup>

The Newfoundland Hurricane of 1775, also called the Independence Hurricane. It struck the Outer Banks of North Carolina in the *United States* on 29 August 1775, then struck Virginia (Norfolk, Hampton and York), traveled up the East Coast of the *United States* and struck Newfoundland on 9 September 1775. In Newfoundland, *Canada*, 4,000 sailors, mostly from *England* and *Ireland*, were reported to have drowned. Localized storm surge at Newfoundland reached heights of between 20 and 30 feet.<sup>49</sup>

During the dreadful storm and tempest on the coast of Newfoundland, *Canada* on 11 September 1776 [Misprint: 1775], eleven ships, and several hundred smaller vessels with all their crews were lost.<sup>1</sup>

On 11 September 1775, at Newfoundland, *Canada*, there was a tempest. The sea rose thirty feet and over thirty fishing boats and nearly 700 men were lost.<sup>128</sup>

During 9-12 September 1775, a great Atlantic hurricane struck the Newfoundland Banks in *Canada* causing approximately 4,000 deaths.<sup>107</sup>

On 20 September 1775 in *England*, there was a hailstorm in Oxfordshire and Wiltshire, which caused much damage by hail and lightning.<sup>93</sup>

In *England*, during 1775-76 there was a wet autumn and winter. "The land-springs, which we call levants, break out much of the downs of Sussex, Hampshire, and Wiltshire. The country people say, when the levants rise, corn will always be dear; meaning that when the earth is so glutted with water as to send forth springs on the downs and uplands, that the corn vales must be drowned; and so it has proved for these last ten or eleven years past; for land-springs have never obtained more since the memory of man than during that period; nor has there been known a greater scarcity of all sorts of grains, considering the great improvements of modern husbandry."<sup>47</sup>

In *England* on the 29<sup>th</sup> of October, there was an awful storm in the north of *England*; many vessels destroyed; four Dublin packets lost.<sup>57,90</sup> (Other references gives the date as 19 October.<sup>40,41</sup>)

On 2 November 1775, a hurricane struck Caicos Islands in the *Caribbean*. During the hurricane at least eleven merchantmen and several English warships were lost in the Windward Passage near the Caicos Islands.<sup>141</sup>

In *England* on the South coast a storm struck in November 1775.<sup>40,41</sup>

In Rotterdam, Holland [now *the Netherlands*], the Meuse River overflowed, doing considerable damage.<sup>47,92</sup>

On 11 November 1775, there was a dreadful storm and inundation in Holland [now *the Netherlands*].<sup>128</sup>

Rainfall patterns were compared at Lyndon in Rutland in the east Midlands of *England*. During the 4 years 1740-1743 there was a total of 66.361 inches of rainfall. During the part four years 1772-1775, there was 124.957 inches of rainfall, which is almost twice as much.<sup>239</sup>

In 1775, there was an extreme drought on the island of Sumatra [in western *Indonesia*]. The dry monsoon set in about the middle of June and continued with very little intermission until March of 1776. So long and severe a drought had not been experienced there in the memory of the oldest man. The verdure of the ground was burnt up, the trees were stripped of their leaves, the springs of water failed, and the earth everywhere gaped in fissures. For some time a copious dew falling in the night supplied the deficiency of rain; but this did not last long; yet a thick fog, which rendered the neighboring hills invisible for months

together, and nearly obscured the sun, never ceased to hang over the land, and add a gloom to the prospect already but too melancholy. The Europeans on the coast suffered extremely by sickness. Around a quarter of them died by fevers and other bilious distempers. The natives also died in great numbers. In November 1775, the sea was observed to be covered, to a distance of a mile, and in some places a league from shore, with fish floating on the surface. These were various species of fish and most were dead or dying. Many of the rivers on the island dried up.<sup>232</sup>

In 1775 during the period between 5 February and 6 May, floods struck Hopei (now Hebei province) in northern *China*. During the period between 28 June and 26 July, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hangchow. During the period between 26 August and 24 September, floods struck Shansi (now Shanxi province) in northern *China* at Ho-ching. During the period between 25 September and 23 October, a drought engulfed Hupeh (now Hubei province) in central *China* at Fang; Kiangsu (now Jiangsu province) on the east coast of *China* at Li-shui, Wu-chin and Kao-yu; and Shantung (now Shandong province) on the east coast of *China* at Wên-têng and Jung-ch'êng.<sup>153</sup>

---

**Winter of 1775 / 1776 A.D.** In Selborne, *England* to the end of the year 1775 was rainy, with intervals of hoar frost and sunshine. During the first three weeks of January 1776, dark frosty weather prevailed with great snowfalls. Afterwards the weather turned foggy with hoar frost. The cold weather in January 1776 was remarkable.<sup>70</sup>

On 7 January 1776, there was a fall of snow, the greatest ever remembered in this country [*Great Britain*].<sup>128</sup>

During the winter of 1775-76 in London, *England*, there were 11 snowy days in January. There was a great frost on 7 January, which ushered in the first snow of the season. There was 1 frosty day in October; 2 in November; 8 in December; 25 in January; and 1 in February.<sup>239</sup>

During the winter of 1775-76 in Northampton, *England*, a severe frost struck during the last four days of January, the lowest state of the thermometer was 9° F [-12.8° C]. On 1 February, the temperature was 16° F [-8.9° C]. February 2<sup>nd</sup> brought in pleasant, spring-like day, ushered in a very mild and agreeable thaw and the temperature rose to 40° F [4.4° C].<sup>239</sup>

In England on 14 January 1776 after a week of frost, sleet and snow, which after the 12<sup>th</sup> of January overwhelmed all the works of men, drifting to the tops of gates, and filling in the hollow lanes. Gilbert White of Selborne believed he had never before or since encountered such rugged Siberian weather. "Many of the narrow roads were now filled above the tops of the hedges, through which the snow was driven into most romantic and grotesque shapes, so striking to the imagination as not to be seen without wonder and pleasure. The poultry dared not to stir out of their roosting places; for cocks and hens are so dazzled and confounded by the glare of snow that they would soon perish without assistance. The hares also lay sullenly in their seats, and would not move till compelled by hunger: being conscious, poor animals, that the drifts and heaps treacherously betray their footsteps and prove fatal to many of them." From the 14<sup>th</sup> the snow continued to increase, and began to stop the road-wagons and coaches, which could no longer keep their regular stages; and especially on the western roads. "The company at Bath that wanted to attend the Queen's birthday were strangely incommoded; many carriages of persons who got on their way to town from Bath, as far as Marlborough, after strange embarrassment, here met with a *ne plus ultra*. The ladies fretted and offered large rewards to labourers, if they would shovel them a road to London; but the relentless heaps of snow were too bulky to be removed; and so the 18<sup>th</sup> passed over, leaving the company in very uncomfortable circumstances, at the Castle and other inns."<sup>70</sup>

On the 21<sup>st</sup> of January, the thermometer measured 20° F (-6.7° C), and had it not been for the deep snows, the winter would not have been remarkable. On the 22<sup>nd</sup> of January, Gilbert White of Selborne traveled to London, *England* “through a sort of Laplandian scene, very wild and grotesque indeed.” But London exhibited an even stranger appearance than the country. “Being bedded deep in snow, the pavement of the streets could not be touched by the wheels or the horses’ feet, so that the carriages ran almost without the least noise.” Such an exemption from the din and clatter, says White, “was strange but not pleasant; it seemed to convey an uncomfortable idea of desolation.”<sup>70</sup>

The worst had not yet, however been reached. On the 27<sup>th</sup> much snow fell all day, and in the evening the frost became very intense. At South Lamberth, for the four following nights, the thermometer fell to 11° F, 7° F, 6° F, 6° F (-11.7° C, -13.9° C, -14.4° C, -14.4° C). At Selborne, the temperature fell to 7° F, 6° F, 10° F (-13.9° C, -14.4° C, -12.2° C) and then on the 31<sup>st</sup>, just before sunrise, with rime on the trees and on the tube of the glass, the quicksilver sank exactly to zero (0.0° F, -17.8° C) – a most unusual degree of cold for the south of *England*. During these four nights, the cold was so penetrating that ice formed under beds; and in the day the wind was so keen, that persons of robust constitutions could hardly endure to face it. “The Thames was at once frozen over, both above and below the bridge, that crowds ran about on the ice. The streets were now strangely encumbered with snow, which crumbled and trod dusty; and turning gray, resembled bay salt; what had fallen on the roofs was so perfectly dry that from first to last it lay twenty-six days on the houses in the city; a longer time than had been remembered by the oldest housekeepers living.”<sup>70</sup>

The snow in *England* was remarkably deep in 1776.<sup>40</sup>

The winter of 1776 was recorded as being intensely cold throughout *Europe*.<sup>1</sup>

In the year 1776, the Danube River was frozen in excess of five feet (1.5 meters) thick below Vienna, *Austria*.<sup>30</sup>

In 1776, the Seine River in *France* was entirely frozen over.<sup>38</sup>

In 1776 in Paris, *France*, there were 25 days of frost.<sup>58, 80</sup>

The winter of 1776 proceeded very unevenly. It was violence in northern *France*. It was among the harshest. It was generally less intense in the provinces of central and southern *France*. In Paris, the frost began on January 9 and lasted until February 2; that is to say for 24 consecutive days, the thermometer remained constantly below the freezing point. It was freezing constantly both night and day. The thaw occurred at 3 o’clock in the morning on February 2. The Seine River began to carry ice on January 19. The temperatures dropped to 8.6° and 6.8° F (-13° and -14° C) on the 20<sup>th</sup> and 21<sup>st</sup> of January. The river froze during night of the 24<sup>th</sup> and 25<sup>th</sup>. The Seine River froze across its entire width below the Bridge Tournelle and beyond the Pont Royal. The middle of the current was kept free of ice between Pont Neuf and the Pont-Royal. This inexplicable peculiarity was also observed during the winter of 1709. This frost was accompanied by overcast skies mixed with fog and northeast winds. The cold caused many people to die on the highways, in the countryside and in the streets.<sup>79</sup>

In Lyon, *France*, the cold of 1776 surpassed that of 1709. The frosts lasted 17 days. It began on January 16<sup>th</sup>. Between the 16<sup>th</sup> and the 27<sup>th</sup>, the thermometer varied between 16.3° and 18.5° F (-7.5° and -8.7° C). Then on the 31<sup>st</sup> the temperature rapidly dropped to -0.4° F (-18° C), and on 1 February it fell further down to -5.8° to -7.6° F (-21° to -22° C). A southerly wind brought a very cold thaw the next morning. The Rhône River carried an enormous amount of ice below the town. On the Saone River, the freezing process was complete, except between the two bridges.<sup>79</sup>

During the winter of 1776, the temperature of Bordeaux, at the other end of *France*, contrasted by producing gentle temperatures as compared to the rigorous winter experienced at Lyon. The temperature at Bordeaux only went below zero on the mornings of the 16<sup>th</sup>, 17<sup>th</sup>, 18<sup>th</sup>, 19<sup>th</sup> and 25<sup>th</sup> of January. The coldest temperature observed was 20.8° F (-6.2° C) on January 19<sup>th</sup>.<sup>79</sup>

In southern *France*, the cold was not very severe at Nimes, Viviers and in some parts of Provence. It brought intense cold for only a very short duration. At Nimes, there was a very violent north wind on 26 and 28 December 1775, that brought a severe frost that caused temperatures to drop down to 5° F (-15° C). The thaw came the day after by a northwest wind, accompanied by rain. The frost lasted only seven days at Viviers, but it reached 2.1° F (-16.6° C) on 31 January 1776. Elsewhere, the cold was moderate. In Montpellier, the frost occurred from January 14 to February 24. At its coldest on 31 January, the temperature only dropped down to 18.5° F (-7.5° C). In countryside around Marseille the temperature only fell to 23° F (-5° C). But the Étang de Berre was frozen enough so that the carriages could cross it. At Aix the temperature fell to 20.8° F (-6.2° C) on January 18<sup>th</sup>. At Perpignan the temperature fell to 30.9° F (-0.6° C) on January 18<sup>th</sup>. The brevity of the cold, its little intensity, or heat on the air in many regions of the south and central *France* offset the bitterness and persistence of this winter in most northern countries.<sup>79</sup>

In the winter of 1776, many bells in Paris, *France* cracked when they were rung rigorously [cold induced metal brittleness].<sup>58</sup>

In 1776, the vines and fruit trees in *France* were killed [by the extreme cold].<sup>58, 80</sup>

Since the water in tree sap acquires greater volume when it freezes, in extreme cold, trees burst apart [explode] with a loud noise. In Strasbourg, *France* more fruit trees burst when the cold reaches -16° Reaumur (-20° C, -4° F). A great number of trees in *France* burst in the winter of 1776.<sup>58, 80</sup>

On 19 January 1776, the Seine River in *France* experienced drift ice; on the 25<sup>th</sup> the river was frozen beyond the bridges (in Paris); on the 29<sup>th</sup> the river was frozen at its mouth at Havre, and in Paris they crossed the river on the ice, which was 17 centimeters (7 inches) thick, until the 31<sup>st</sup>. The thaw came on February 2<sup>nd</sup>, and the ice held on until the 6<sup>th</sup>. The Rhine River in *Germany* froze; the Rhône River and the Saône River were also almost completely frozen over. On the Medway River in *England*, individuals crossed the river on foot on the ice. In *Russia*, the cold was also extremely violent, and the Neva River on 10 April was traveled by wagon in all directions without danger.<sup>62</sup>

The winter in 1776 was severe throughout *Europe*. The cold was particularly violent during the month of January, and an extraordinary amount of snow fell. The very intense cold in Paris, *France* produced 25 frost days; and reached a low temperature on 29 January 1776 at -2.4° F (-19.1° C). In Denainvilliers, *France* there were 22 frost days in a row from 10 January to 2 February and the lowest temperature observed was on 29 January at 0.5° F (-17.5° C). The frost penetrated the ground 0.6 meters (2 feet) deep.<sup>62</sup>

The wine froze in Paris, *France* in 1776. The thermometer scored for 24 days from 9 January to 2 February, a temperature of -17.5° Reaumur (-7.4° F, -21.9° C).<sup>80</sup>

The lowest temperature observed during the winter in different cities is as follows: <sup>62</sup>

St. Petersburg, <i>Russia</i>	(-28.5° F, -33.6° C) on 18 January
Dresden, <i>Germany</i>	(-24.2° F, -31.2° C)
Leipzig, <i>Germany</i>	(-19.7° F, -28.7° C) on 27 January
Krakow, <i>Poland</i>	(-17.5° F, -27.5° C)
Warsaw, <i>Poland</i>	(-14.1° F, -25.6° C) on 27 January

Bienne (Biel), <i>Switzerland</i>	( -10.8° F, -23.8° C )	on 29 January
Stockholm, <i>Sweden</i>	( -8.5° F, -22.5° C )	on 15 January
Nancy, <i>France</i>	( -8.5° F, -22.5° C )	on 1 February
Montdidier, <i>France</i>	( -8.5° F, -22.5° C )	on 29 January
Lyon, <i>France</i>	( -7.4° F, -21.9° C )	on 1 February
Franeker, <i>the Netherlands</i>	( -7.4° F, -21.9° C )	
Grenoble, <i>France</i>	( -6.9° F, -21.6° C )	in February
Berlin, <i>Germany</i>	( -6.5° F, -21.4° C )	
Tournai, <i>Belgium</i>	( -6.3° F, -21.3° C )	on 28 January
Frankfurt, <i>Germany</i>	( -6.3° F, -21.3° C )	on 28 January

Perpignan, <i>France</i>	( 30.1° F, -0.6° C )	

The Rhine, the Seine, the Rhône, the Saône, the Medway, and many other rivers almost completely frozen over. At Nieuwport in *Flanders* [now *Belgium*] the brandy and rum froze. In Paris, *France*, the wine froze in the cellars and shattered the wine barrels. On 29 January, the ice was up to 2.4 meters (7.9 feet) thick on the seacoast at the mouth of the Seine River and the following days at a width of more than 8000 meters (5 miles). A portion of the sea between the Bay of Caen and the Cap de la Hève in *France* was all covered with ice. The Havre from the sea to the horizon seemed to be covered with ice. This ice was

broken by the ebb and flow of the tides, so that our sea was like the *Baltic Sea*. In *Italy*, the Tiber River near Perugia was blocked from one bank to the other by ice, which is a very rare occurrence, and the lagoons of Venice were covered with ice. The frost damaged the plants, the apricots and peaches, the alaternen, phillyräen, some pine species, ivy, the holly and the gorse. A large number of trees (elm, linden) were cracked from top to bottom near Paris. Many people were victim of the cold. A courier, who drove from Paris to Picardy, was found on his arrival at Clermont-en-Beauvaisis frozen to death in his carriage. Several other passengers were found dead in the snow. In Paris, Louis XVI. had large fires set in the streets. Many of the beggars who slept in the barns suffered frozen feet; others were killed on the roads, and some even found dead in the houses. Many old people were carried off by sudden death. One could hear oak trees burst apart with a crash. In *Provence*, the olive trees survived the cold.<sup>62</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1775 on September 30<sup>th</sup> – a great frost. October 11<sup>th</sup> – very hot. October 21<sup>st</sup> – a great storm after the burning of the town, that lasted three days. November – the whole of this month has been one continued spell of severely cold, windy, winter-like weather. December 24<sup>th</sup> – severely cold. In 1776 on January 29<sup>th</sup> – this month, like the two past months, had been constantly and severely cold. The wind has been westerly all winter. February – a dismal cold snap of weather. February 29<sup>th</sup> – the past winter has been the coldest, in the whole, that has been known. The ground has been constantly covered with snow. March 19<sup>th</sup> – it seems as if the summer was breaking upon us. April 22<sup>nd</sup> – it was a very cold, wet and backward spring. May 8<sup>th</sup> – the ground was frozen for the past three nights.<sup>78</sup>

---

**1776 A.D.** In *England* and *Wales*, the land was so inundated with continuous rains that scarcely an article of food was raised.<sup>1</sup>

In Kent, *England*, there were great floods.<sup>40, 41, 43, 47</sup>

On 25 March 1776 in Lorraine, *France*, there was a hailstorm. At 2 P.M. there fell such a prodigious quantity of hail and rain that in less than half an hour, 99 houses, composing the lower and principal street of the village of Tremont, were entirely laid under water and filled with mud and hail. Several of the inhabitants were drowned or buried under the ruins of their houses; and the rest to the number of 500 would have perished with hunger and cold had not their neighbors given assistance. All the poultry of the village, with 530 head of cattle, which formed the riches of the inhabitants, were destroyed, and the territory laid waste.<sup>93</sup>

On 6 April 1776, the village of Bois-le-Duc, France (now called 's-Hertogenbosch in southern *Netherlands*) was destroyed by rain.<sup>128</sup> [This account appears to identify the wrong city Bois-le-Duc instead of Bar le Duc and the wrong date of 6 April instead of 25 April.]

In northeastern *France* on the 25<sup>th</sup> of April, the village of Bar le Duc was destroyed by floods and other village's damaged.<sup>47, 92</sup>

The rains in Languedoc, *France*, destroyed the village of Bar le Duc on April 26, 1776.<sup>40, 41, 43, 56</sup>

In Holland [now *the Netherlands*] and Antwerp, *Belgium* on 11 June, there was a hailstorm; stones as large as hen's eggs, and weighed three-quarters of a pound; several horses killed, and the fruits of the earth destroyed.<sup>40, 41, 43, 56, 57</sup>

On 17 June 1776 in Flanders [now *Belgium*] in and about Antwerp, there was a violent hailstorm. The hailstones were as big as fowls' eggs. The hailstones together with pieces of ice, not only broke the windows to the south, but destroyed all the fruit. "The hail was so violent that men, horses, etc., were knocked down by it and very much hurt. This storm was also felt at Deschel, Rethy, Arendork, and Diest, on the frontiers of the principality of Liege."<sup>93</sup>

In June 1776 in southeastern *Ireland* in Clonegal (Carlow County), there was a great thundershower with lightning and amazing flakes of ice.<sup>93</sup>

The summer of 1776 was warm in central *France*. From 8 July to 5 August, with the exception of 2 interruptions, the temperature was above 77° F (25° C) at Denainvilliers. The summer in Denainvilliers, *France* was characterized by:

Hot days	45 days
Very hot days	4 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

In October [at Denainvilliers] the weather was so beautiful and warm, just like summer days. The high temperatures observed during the summer were:

Denainvilliers, <i>France</i>	( 98.4° F, 36.9° C) on 5 August
Montpellier, <i>France</i>	( 96.1° F, 35.6° C)
Perpignan, <i>France</i>	( 95.0° F, 35.0° C) on 26 June
Clermont-Ferrand, <i>France</i>	( 95.0° F, 35.0° C)
Mulhouse, <i>France</i>	( 92.3° F, 33.5° C) on 6 July
Paris, <i>France</i>	( 91.6° F, 33.1° C) on 2 and 3 August
Berlin, <i>Germany</i>	( 90.5° F, 32.5° C) on 17 July
Aix, <i>France</i>	( 89.4° F, 31.9° C)
Bordeaux, <i>France</i>	( 88.3° F, 31.3° C)
Brussels, <i>Belgium</i>	( 86.5° F, 30.3° C) on 16 July
Nancy, <i>France</i>	( 86.0° F, 30.0° C) on 3 August
London, <i>England</i>	( 86.0° F, 30.0° C) on 2 August
St. Petersburg, <i>Russia</i>	( 84.9° F, 29.4° C) on 22 July
Moscow, <i>Russia</i>	( 76.6° F, 24.8° C) on 17 July

In Burgundy, the harvest only began on 30 September. Despite the severity of the preceding winter, the grain harvest was good. The vine in the region around Orleans produced a good grape harvest. The fall was so mild that the fruit trees bloomed in some places a second time. Some apple trees, even for a second time wore fruit.<sup>62</sup>

During the two days of the maximum observed in Paris, *France*, the temperature level was measured for a direct exposure to the sun, in free air. On 2 August the reading was 133.0° F (56.1° C) and on 3 August the reading was 126.9° F (52.7° C). So the thermometer with direct exposure to the sun was 71.6° F (22.0° C) and 64.4° F (18° C) respectively higher than those measured in the shade.<sup>62</sup>

On 4 September 1776, a hurricane visited St. Christopher (now Saint Kitts), Antigua, Martinico (now Dominican Republic), Guadeloupe Island and other adjacent regions. On 6 September there was a storm in the *West Indies*, the severest ever known.<sup>128</sup> [

On 4 September 1776, a fire accidentally started at a bakery swept through Basseterre in St. Kitts in the *West Indies*. It was followed the next day by a hurricane. The island's council wrote the following message to King George III:<sup>144</sup>

The most considerable and most opulent part of Basseterre, the capital of our island, the seat of commerce and the magazine from whence the merchants supplied our plantations hath been destroyed with all the stores of provision in it by a dreadful and irresistible [irresistible] fire, so rapid and destructive in its progress that the security of life admitted of little attention to preservation of property. Scarcely had the afflicted inhabitants recovered from their consternation, when it pleased Divine providence to send an additional calamity, as violent in its operation and injurious in its consequence to the landed as the preceding one was to the commercial interest. A dreadful storm accompanied with astonishing torrents, unprecedented in the memory of the oldest

resident amongst us, has destroyed large tracts of our land and swept away almost all the provision in our ground. By this heavy visitation a large number of Your Majesty's commercial and other faithful subjects, before happy in the exercise of honest industry have lost their whole property and a town once the abode of content and affluence is ~~not~~ [now] become the residence of poverty, desolation and ruin.

At *St. Kitts* on 5 September 1776, a storm greatly damaged the island and the damage was immense.<sup>56</sup>

In the *West Indies*, the severest storm ever known struck on 6 September.<sup>40, 41, 56</sup>

On 6 September 1776, a hurricane struck Pointe-a-Pitre Bay in Guadeloupe in the *Leeward Islands*. The hurricane caused over 6,000 deaths.<sup>107, 141</sup>

In 1776 during the period between 15 July and 13 August, floods struck Hopei (now Hebei province) in northern *China* at Wan-p'ing. The city walls and houses were damaged by the floodwaters. Many people drowned. During the period between 8 August and 8 November, floods struck Shansi (now Shanxi province) in northern *China* at Tai. Houses and fields were damaged. During the same time, a drought engulfed Shansi province at P'ing-ting and Hsi-yang.<sup>153</sup>

The year 1776 was a year of abundance in the vicinity of Shanghai, *China*.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

May 10<sup>th</sup> – a hot day and night. May 12<sup>th</sup> – hot. May 17<sup>th</sup> – the heat continues. May 26<sup>th</sup> – cold weather all the week. May 31<sup>st</sup> – very cold still. June 12<sup>th</sup> – hot summer. June 19<sup>th</sup> – a drought seems to be coming on, with worms. June 22<sup>nd</sup> – a small shower. June 28<sup>th</sup> – hot for several days past. June 29<sup>th</sup> – showers. July – plentiful rain through this month and the next. September 20<sup>th</sup> – remarkable warm weather. September 30<sup>th</sup> – no frost yet to do any harm. A great prospect of Indian corn. November – this whole month has been remarkable for fine, moderate weather. December 6<sup>th</sup> – it was constantly moderate. December 18<sup>th</sup> – signs of snow, but none.<sup>78</sup>

From 1772 to 1777, the northern part of St. Domingo experienced five years of extraordinary drought. The plains covered with sugar canes and the hills cultivated with coffee were afflicted with a desolating sterility.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

---

**Winter of 1776 / 1777 A.D.** In Selborne, *England*, in November and December of 1776, the weather was dry and frosty, with some periods of hard rain. On 10 January 1777, a hard frost struck. That was followed by foggy weather with frequent showers to the 20<sup>th</sup>. That was followed by hard dry frost with snow until February 18. That was followed by heavy rains, with intervals of warm dry spring weather to the end of May.<sup>70</sup>

In *England* on 19 February 1777, it was noted that there was no rain, generally speaking, since the last harvest. Springs have not begun to rise, deep wells in general want water, and many ponds are not yet filled: even the surface of the earth is not satisfied.<sup>175</sup>

During the winter of 1776-77 covering the months from December to March, the coldest temperature observed in Montreal, *Canada* was -6° F [-21° C].<sup>239</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1776 on December 20<sup>th</sup> – very cold. December 27<sup>th</sup> – extreme cold. December 31<sup>st</sup> – cold; very poor sledding. In 1777 on January 18<sup>th</sup> – pretty good sledding. February 11<sup>th</sup> – it snowed all day. February 15<sup>th</sup> – very cold. February 21<sup>st</sup> – snowstorm. February 28<sup>th</sup> – continual snowstorms.<sup>78</sup>

December 1776 was a desperate time for George Washington and the American Revolution. During the night of December 25, Washington led his small Continental army of 2,400 troops from Pennsylvania (*United States*) across the Delaware River made dangerous and barely navigable by huge chunks of ice. Once across they launched a surprise attack on the Britain's Hessian mercenaries at Trenton, New Jersey, capturing 1,000 prisoners and seizing muskets, powder, and artillery.<sup>13, 14</sup>

Reverend Henry Muhlenberg who lived thirty-five miles from Trenton, New Jersey (*United States*) wrote that the snow was “a foot deep and it’s bitter cold” in his journal in December 1776. Thomas Jefferson mentioned the snow accumulation was 22 to 24 inches (0.6 meters) deep at his home in Monticello, Virginia. A large snowstorm struck Pennsylvania on 24 February 1777, where snow “perhaps as much as two feet (0.6 meters) fell.”<sup>27</sup>

**1777 A.D.** In Dublin, *Ireland*, there was a great flood; 6 feet of water in St. Patrick’s cathedral.<sup>47, 92</sup>

In *England*, there was a great flood of the River Tyne.<sup>47</sup>

In *England* [Southern counties] on 23 June 1777, it was reported that the springtime was moist, but not remarkably wet: the clouds reserved their bounty for May and June. The middle of May was very wet, and so was the middle of June. The last ten days were, except one, uniformly rainy. Last night it poured for eight or nine hours; perhaps never more rain fell in so short a time; the ground was never so wet since the [Great] Deluge. Then from the 23<sup>rd</sup> of June until the 8<sup>th</sup> of July, there was scarcely a fair day. The rain set in June 13 and lasted 26 days with scarcely one fair day intervening.<sup>175</sup>

The summer of 1777 in Denainvilliers, *France* was characterized by:

Hot days	47 days
Very hot days	8 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

Intense heat took place in July and especially August. The high temperatures observed during the summer were:

Luçon, <i>France</i>	(101.8° F, 38.8° C)
Saint Omer, <i>France</i>	( 99.5° F, 37.5° C)
Montargis, <i>France</i>	( 99.5° F, 37.5° C)
Udine, <i>Italy</i>	( 99.1° F, 37.3° C) on 17 August
Paris, <i>France</i>	( 97.0° F, 36.1° C)
Denainvilliers, <i>France</i>	( 95.0° F, 35.0° C) on 18 July
Montpellier, <i>France</i>	( 92.8° F, 33.8° C)
Tarascon, <i>France</i>	( 92.8° F, 33.8° C)
Bordeaux, <i>France</i>	( 92.8° F, 33.8° C)
Brussels, <i>Belgium</i>	( 92.1° F, 33.4° C) on 9 August
Mulhouse, <i>France</i>	( 89.4° F, 31.9° C) on 18 July
Nancy, <i>France</i>	( 87.6° F, 30.9° C) on 18 July
Moscow, <i>Russia</i>	( 87.1° F, 30.6° C) on 31 May
Berne, <i>Switzerland</i>	( 86.2° F, 30.1° C)
Berlin, <i>Germany</i>	( 86.0° F, 30.0° C) on 10 August
London, <i>England</i>	( 82.0° F, 27.8° C) on 8 August
St. Petersburg, <i>Russia</i>	( 80.8° F, 27.1° C) on 6 July

In the region around Orleans, *France*, the summer was cold and rainy. As a result, the grape harvest produced very little and there was almost no wine. In Burgundy, the grape harvest only began on 1 October. In the area of Toulouse food production was satisfactory. Little wine was produced in lower Languedoc. In the north [of *France*] the grain harvest was good.<sup>62</sup>

In June 1777, a hurricane struck off the coast of Florida in the *United States*. A Spanish man-of-war foundered in the hurricane and all hands were lost.<sup>141</sup>

On 10 September 1777, a hurricane struck the central *Atlantic Ocean*. The *Ariadne* from Dominica to London foundered at sea in a gale of wind on the 10<sup>th</sup>. The crew and passengers were saved. Five others [ships] of the Fleet were missing the next morning.<sup>141</sup>

On September 23, Petersburg, *Russia*, suffered damage to the amount of 1,000,000 rubles from an inundation and storm.<sup>41</sup>

On 17 September 1777, there was an inundation at Petersburg [St. Petersburg, *Russia*], which did considerable damage.<sup>128</sup>

On 15 October 1777 in Tuscany, *Italy*, there was a great hailstorm in the province of Muzello, accompanied by lightning and thunder. The hailstones were of extraordinary size. They did great damage to the buildings and fruit trees. The devastation was very extensive.<sup>93</sup>

A storm struck Florence, *Italy* and its neighborhood on October 16, doing immense damage.<sup>40, 41</sup>

In 1777 during the period between 6 May and 8 August, a drought engulfed Shensi (now Shaanxi province) in central *China* at Lo-ch'uan and Hupeh (now Hubei province) in central *China* at Tzū-kuei and Ku-ch'êng. During the period 2-30 September, a drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Wu-ch'uan; Kiangsi (now Jiangxi province) in southern *China* at Wu-ning; and Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p'ing.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

March 17<sup>th</sup> – it has been surprisingly warm weather for some time. April 6<sup>th</sup> – bad walking. April 12<sup>th</sup> – a wonderful week of warm weather. May 15<sup>th</sup> – it is agreed to be the coldest weather, and the most backward spring there ever was. May 20<sup>th</sup> – raw; cold. May 25<sup>th</sup> – a hot summer day. May 26<sup>th</sup> – raw, cold, with a deluge of rain. June 30<sup>th</sup> – cold, very cold; nothing ever like it through the whole spring, and yet everything is flourishing, perhaps never more so, except Indian corn. July 9<sup>th</sup> – a great cold storm, with much rain. July 13<sup>th</sup> – dismal cold. July 15<sup>th</sup> – a hot summer's day. July 17<sup>th</sup> – everything is flourishing. July 29<sup>th</sup> – a marvellous fruitful season as to everything. August 18<sup>th</sup> – never was there such gardens, never such fields, never such pastures, never such a year for everything. Hot weather to the end of the month. September 2<sup>nd</sup> – the earth produced an abundance of its fruits. September 8<sup>th</sup> – there was a frost in several of the back towns that killed the corn leaves. September 13<sup>th</sup> – another great frost. The corn not hurt. September 23<sup>rd</sup> – northeast storm. September 27<sup>th</sup> – fair. September 30<sup>th</sup> – comfortable. October 9<sup>th</sup> – hitherto, this month, very pleasant weather. October 10<sup>th</sup> – deluge of rain, and very high wind. October 11<sup>th</sup> – very cold. October 21<sup>st</sup> – it snowed all day. October 25<sup>th</sup> – the week past, raw, cold winter weather. November – a cold stormy month.<sup>78</sup>

From 1772 to 1777, the northern part of St. Domingo experienced five years of extraordinary drought. The plains covered with sugar canes and the hills cultivated with coffee were afflicted with a desolating sterility.<sup>143</sup> [Saint-Domingue (in French) or Santo Domingo (in Spanish) was a French colony on the Caribbean island of Hispaniola that in 1804 became the independent nation called *Haiti*.]

---

**Winter of 1777 / 1778 A.D.** In Selborne, *England*, the autumn weather to 12 October had been remarkably fine and warm. From then to the end of the year, gray mild weather prevailed, with but little rain and still less frost. During the first thirteen days of January, there was frost but a little snow; then rain to 24 January, followed by six days of hard frost. After this, harsh foggy weather with rain prevailed till 23 February; then five days of frost; a fortnight [14 days] of dark harsh weather; and spring weather to

the end of the first fortnight in April. The second fortnight of April, however, was cold with snow and frost.<sup>70</sup>

During the winter of 1777-78, the coldest temperature was measured at Nain and Okak in Labradore [Labrador, *Canada*]. At Nain, the coldest temperature in December was -26° F [-32.2° C]; in January -30° F [-34.4° C]; in February -27° F [-32.8° C]; in March -25° F [-31.7° C]; and in April -8° F [-22.2° C]. At Okak, the coldest temperature in December was -28° F [-33.3° C]; in January -27° F [-32.8° C]; in February -25° F [-31.7° C]; in March -18° F [-27.8° C]; and in April -10° F [-23.3° C].<sup>239</sup>

The winter of 1777-78 in Bradford County, Pennsylvania in the *United States* produced a heavy snowstorm on 12 & 13 February 1778. Snow fell to the depth of 2 feet [0.6 m].<sup>178</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: January and February 1778 – true winter, both as to cold and snow. March 31<sup>st</sup> – the whole month past has been a tedious spell of severely cold, stormy, snowy weather.<sup>78</sup>

**1778 A.D.** Storms, hurricanes, earthquakes, hail, rain and floods devastated *France* in 1778. On 21 January, near Pontorson in Normandy, lightning split and overturned at one stroke 99 apple, oak and elm trees. On 21 and 22 January in Paris, violent winds with waves of rain struck. Lightning and thunder were added to the storm on the evening of the 22<sup>nd</sup>. On 24 June, a storm followed by hail ravaged Toulouse, Biollet near Moulins, Condé-sur-Noireau. The same day, at Saint-Pierre-du-Regard, in Normandy, a terrible hurricane vomited lightning, hail and rain. The thunder fell at six locations, and it hailed furiously for three quarters of an hour. There were a few locations where the hailstones were 2 feet (610 millimeters) deep. Hailstones were of various shapes; some equalled the size of an egg. This mass of hailstones kept for six days, despite the heat. The next day, in Gland, envied for its thunder, a similar hurricane destroyed all the crops. On 20 July, the southwest winds furious upset Étampes and flooded the city with rain. On 31 July, a hurricane devastated St. Marcellin on the banks of the Isere River, Chatte, Saint Vincent and the Vinoy. Floods and earthquakes desolated Alsace, Franche-Comté, Champagne and Béarn.<sup>79</sup> [Gland is located in central *France*. Étampes is now in Paris. Marcellin and Chatte are located in southeastern *France*. Saint Vincent in in the French Alps. Vinoy, now Venoy is in central *France*. Alsace and Franche-Comté are in eastern *France*. Champagne is in southern *France*. Béarn is located in southwestern *France*.]

In 1778 in *Ireland*, there were great thunderstorms at Tralee, Abbeyfeale, and Clonmel. “The hailstones were as large as musket-balls.”<sup>93</sup> [Tralee and Abbeyfeale are located in southwestern *Ireland*. Clonmel is in southern *Ireland*.]

In 1778 in *France*, there was a great hailstorm in the vicinity of Paris.<sup>93</sup>

The summer of 1778 in Paris, *France* and the greater part of *Europe* was very warm and very dry. The summer in Paris was characterized by:

Hot days	27 days
Very hot days	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The summer in Denainvilliers, *France* was characterized by:

Hot days	54 days
Very hot days	15 days
Extremely hot day	3 days

The summer in Denainvilliers was unusual. In July, the thermometer was always over 77° F (25° C). The high temperatures observed during the summer were:<sup>62</sup>

Chennai (Madras), <i>India</i>	(104.0° F, 40.0° C) in May
--------------------------------	----------------------------

Montargis, <i>France</i>	( 99.5° F, 37.5° C)
Denainvilliers, <i>France</i>	( 98.4° F, 36.9° C) on 5 July
Bordeaux, <i>France</i>	( 97.9° F, 36.6° C)
Soissons, <i>France</i>	( 97.9° F, 36.6° C)
Paris, <i>France</i>	( 97.2° F, 36.2° C) on 5 July
Rouen, <i>France</i>	( 96.1° F, 35.6° C)
Vienne, <i>France</i>	( 95.5° F, 35.3° C)
Nantes, <i>France</i>	( 95.0° F, 35.0° C)
Brussels, <i>Belgium</i>	( 95.0° F, 35.0° C) on 20 July
Island of Oléron	( 93.9° F, 34.4° C) off the western coast of <i>France</i>
Mulhouse, <i>France</i>	( 93.4° F, 34.1° C) on 14 August
Franeker, <i>the Netherlands</i>	( 93.2° F, 34.0° C) on 20 July
Copenhagen, <i>Sweden</i>	( 92.8° F, 33.8° C) in July
Berne, <i>Switzerland</i>	( 92.8° F, 33.8° C)
Nancy, <i>France</i>	( 92.8° F, 33.8° C) on 7 and 14 August
Dijon, <i>France</i>	( 92.8° F, 33.8° C)
Toulon, <i>France</i>	( 92.8° F, 33.8° C)
Berlin, <i>Germany</i>	( 91.6° F, 33.1° C) on 14 August
Leyden (Leiden), <i>the Netherlands</i>	( 90.5° F, 32.5° C)
Marseille, <i>France</i>	( 90.5° F, 32.5° C)
Schaffhausen, <i>Switzerland</i>	( 88.7° F, 31.5° C) in July
Montauban, <i>France</i>	( 88.3° F, 31.3° C)
Moscow, <i>Russia</i>	( 86.9° F, 30.5° C) on 5 July
London, <i>England</i>	( 86.0° F, 30.0° C) on 13 and 14 July
Geneva, <i>Switzerland</i>	( 83.8° F, 28.8° C) in August
St. Petersburg, <i>Russia</i>	( 83.7° F, 28.7° C) on 20 July
Bristol, <i>England</i>	( 77.9° F, 25.5° C)

The great heat of 1778 was sustained, and accompanied by cloudless skies. The vegetable harvest was minimal and there was a lack of food generally. Around 5 August, the trees were already in a bad state. In the middle of the esplanade at Vincennes, *France* opposite the castle, the earth was dry and dusty to a depth of one meter (39 inches). The water level of the Seine River was very low for a long time. On 5 September, it was only 8 centimeters (3.2 inches) above the low water mark of the year 1719.<sup>62</sup>

The summer of 1778 produced high heat that was long and constant. Under this influence, many fruit trees blossom twice. At Malaquais in Paris, *France*, two grapevines against a wall of the former bodyguard of the wharf bloomed a second time on October 10<sup>th</sup> and later gave up large clusters of grapes. The same heat was observed in Montpellier and Salon in the south of *France*. This unusual heat ruled mainly during the months of July and August, which was dry and cloudless. The summer of 1778 was also noted for frequent floods, storms, hurricanes and earthquakes.<sup>79</sup>

In Paris, *France* in the garden of the arsenal, rasta trees bloomed a second time due to the high heat. This is a fairly common phenomenon in hot countries. This second blooming was also observed in other trees such as peach, plum and apple trees. Even more surprising were the grape vines that produced fruit twice in one season. After the first picking, the vineyards continued to flourish; and on 10 October they produced rather large grapes. The grapes were pressed tightly against each other and were in part black. It was observed that the majority would reach maturity, if the heat lasted for several more days.<sup>62</sup>

This heat of summer was felt in *France*. In several provinces, animal diseases were observed caused by the drought and the lack of water and green feed.<sup>62</sup>

The drought of 1778 was among the most severe and longest. The drought spread throughout *France* and much of Europe. The level of rainfall and the number of rainy days in many places were below the

average. In Paris, *France*, in particular, they only received 17.6 inches (446 millimeters) of rainfall and 113 rainy days. While on 7 October, the river marked 4 inches (10.2 centimeters) under the lowest water level [below the zero water mark of 1719].<sup>79</sup>

The weather [in *France*] also produced a number of storms, some reaching the level of hurricane strength and considerable floods.<sup>62</sup>

On 23 July 1778, much damage was done by lightning in the neighborhood of London, *England*.<sup>128</sup>

The warmth of 1778 covered a large part of *Europe*. In Genoa, *Italy*, the heat and dryness increased the price of food significantly. The same was the case in *France*. The hopes of a good harvest disappeared in Cologne, *Germany* due to lack of rain and the excessive and persistent "sun glow". The oldest people of the country had never seen anything like it. Instead of mature grapes; there were dried grapes in their place.<sup>62</sup>

In the area around Orleans, *France*, the grain was good; but vegetables and grapes were withered. Also the wine vintage quality was bad. In Burgundy, there was long and steady, intense heat, drought and a large number of storms. The grape harvest began on 22 September. In the Toulouse area, the year was in contrast to other regions, quite fertile.<sup>62</sup>

On 28-31 October 1778, a hurricane struck *Cuba*. This storm produced the greatest loss of human life by drowning.<sup>141</sup>

On 1 November 1778, a hurricane struck Cape Cod in Massachusetts in the *United States* causing between 50 and 70 deaths. [Loss of some crewmembers on *Somerset* in an "easterly storm (of) unusual fury." The Cape Cod storm may be related to a 28-31 October storm system over *Cuba*.]<sup>141</sup>

In 1778, droughts engulfed many regions of *China* including:<sup>153</sup>

— During the period between 28 January and 23 June, a drought engulfed Shansi (now Shanxi province) in northern *China* at Taiyuan.

— During the period between 6 May and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chia-hsing and Ch'ung-tê; and Shantung (now Shandong province) on the east coast of *China* at Tung-p'ing. The rivers dried up.

— During the period between 8 August and 8 November, a drought engulfed Hupeh (now Hubei province) in central *China* at Wuchang, Ao-ch'êng, Ch'ung-yang, Huang-p'o, Hanyang, Chung-hsiang, Ch'ien-chiang, Pao-k'ang and Chih-chiang.

— During the period between 8 November 1778 and 5 February 1779, a drought engulfed Kiangsi (now Jiangxi province) in southern *China* at Kiukiang and Wu-ning.

In 1778 during the 8<sup>th</sup> moon, there were three tides in one day at Nanhwai, *China*.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 25<sup>th</sup> - it has been almost constantly cold, and very windy. April 28<sup>th</sup> - we sowed our garden five weeks sooner than last spring. April 30<sup>th</sup> - the spring is forward, the ground is dry, but the weather cold. May 8<sup>th</sup> - rainy. May 15<sup>th</sup> - a summer's day. May 31<sup>st</sup> - there has been a great frost two nights past. June 14<sup>th</sup> - cold weather a few days. June 27<sup>th</sup> - fine weather for the Indian corn, which grows wonderfully, and there is as great a prospect of all the fruits of the earth as ever was. July 2<sup>nd</sup> - it is a dry time. July 18<sup>th</sup> - the drought awfully continues. July 27<sup>th</sup> - it is as grievous a drought as ever was known. July 31<sup>st</sup> - people fear a famine. The Indian corn curls, and is like to come to nothing; and there is no prospect of any potatoes, or turnips, or any sauce at all. August 6<sup>th</sup> - plentiful rains. August 9<sup>th</sup> - uncommonly hot. It has been, through the whole, a fine, seasonable, hot summer. August 16<sup>th</sup> - rain. August 20<sup>th</sup> - extremely hot. August 21<sup>st</sup> - a shower, short but plentiful. August 26<sup>th</sup> - a shower. September 17<sup>th</sup> -

no frost to do any damage. September 30<sup>th</sup> – potatoes have grown to the wonder of all. October 1<sup>st</sup> to 8<sup>th</sup> – wonderful fine weather. October 19<sup>th</sup> to 22<sup>nd</sup> – same, and hot. October 28<sup>th</sup> – wonderfully moderate.<sup>78</sup>

---

**Winter of 1778 / 1779 A.D.** In Selborne, *England*, from the end of September 1778 until the end of the year, the weather was wet, with considerable intervals of sunshine. January 1779 was characterized by alternating frost and showers. From February to April 21, the weather was warm and dry.<sup>70</sup>

A storm struck all over *England* in January 1779.<sup>40, 41</sup>

In *England* on 1 January 1779, there was a storm, one of the greatest ever known. There was scarcely a public building in the metropolis that did not receive damage. It extended several miles round London.<sup>128</sup>

In *England*, the frost in the winter of 1778-79 lasted eighty-four days.<sup>128</sup>

The winter of 1779 was very mild in [northern] *France* and the barometer was very high during this season.<sup>62</sup>

Snow and cold reigned extraordinary during the first three months of 1779 in regions of southern and central *France* only. Lakes and ponds in the South, experienced twenty-one days of frost and cold reaching down to 17.2° F (-8.2° C) on 16 January.<sup>79</sup>

On 19 January 1779, the temperature at Montreal, *Canada* fell to -22° F [-30° C]. On the same day 16 or 17 German soldiers were frozen to death in crossing the ice on Lake St. Pierre, a lake near Trois-Rivières; and about double that number were frost-bitten, many of whom lost their feet and hands.<sup>239</sup>

On 26 December 1778, the brig commanded by Captain James Magee was wrecked in a terrible snowstorm off Plymouth harbor in Massachusetts in the *United States*. More than half his crew perished in the cold. The dead, which amounted to 72, were carried ashore on the 29<sup>th</sup>. And interred at Plymouth. The survivors were at the same time brought off the wreck; some of whom, after living a few days in extreme pain, expired.<sup>174</sup>

The winter of 1779 was very mild in Philadelphia, Pennsylvania in the *United States* particularly in the month of February, when trees were in blossom.<sup>1</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

November and December 1778 – generally very cold and stormy. November 12<sup>th</sup> – there was a great southerly rainstorm. It blew down fences, Mr. Butler's house and other buildings. December 31<sup>st</sup> – Mr. Chase, minister of Kittery, was frozen to death. A team with four oxen and a horse, and the driver, were frozen to death on Boston Neck, all standing up, as were several other people. In 1779 on January 4<sup>th</sup> – it is wonderful how the people live here on the Neck [peninsula], for want of bread, there being little to be bought, and that so monstrous dear. January 8<sup>th</sup> – the people upon the Neck [peninsula], universally, have for some weeks past suffered extremely for want of wood, there having been no sledding, and the carting very bad, and wood thereupon raised to 20 dollars a cord. January 10<sup>th</sup> – it rained hard in the morning. January 21<sup>st</sup> – the harbor and whole bay froze over. January 23<sup>rd</sup> – good sledding; wood has fallen to eight dollars. January 26<sup>th</sup> – the harbor and the whole bay continues to remain frozen over. February 1<sup>st</sup> – pleasant. February 4<sup>th</sup> – hot, thawy [thawing of snow and ice] day. February 7<sup>th</sup> – fair and moderate. February 10<sup>th</sup> – thawy. February 13<sup>th</sup> – windy and cold. February 22<sup>nd</sup> – moderate. March 2<sup>nd</sup> to 3<sup>rd</sup> – delightful days. March 9<sup>th</sup> – snow. March 12<sup>th</sup> – snowstorm. March 19<sup>th</sup> – snow. March 22<sup>nd</sup> – southerly snowstorm. April 1<sup>st</sup> – a grievous cry for bread in all seaport towns, and there is but little meat and no fish yet. April 7<sup>th</sup> – Indian corn is sold at 30 dollars a bushel.<sup>78</sup>

---

**1779 A.D.** The summer of 1779 in *France* was remarkably hot. The summer in Paris was characterized by:

Hot days 33 days

Very hot days 1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The summer in Denainvilliers, *France* was characterized by:

Hot days 65 days

Very hot days 5 days

The most intense heat occurred in Paris in July and August. The high temperatures observed during the summer were:<sup>62</sup>

Cairo, <i>Egypt</i>	(105.6° F, 40.9° C) on 15 June
Bordeaux, <i>France</i>	( 97.5° F, 36.4° C)
Perpignan, <i>France</i>	( 95.0° F, 35.0° C)
Besançon, <i>France</i>	( 95.0° F, 35.0° C)
Paris, <i>France</i>	( 93.9° F, 34.4° C) on 18 July
Denainvilliers, <i>France</i>	( 91.4° F, 33.0° C) on 17 August
Berlin, <i>Germany</i>	( 91.0° F, 32.8° C) on 7 August
Salon, <i>France</i>	( 90.5° F, 32.5° C)
Montauban, <i>France</i>	( 88.3° F, 31.3° C)
Mulhouse, <i>France</i>	( 87.4° F, 30.8° C) on 19 July
Nancy, <i>France</i>	( 86.0° F, 30.0° C) on 19 July
Brussels, <i>Belgium</i>	( 85.5° F, 29.7° C) on 18 July
Amsterdam, <i>the Netherlands</i>	( 85.3° F, 29.6° C)
Dieppe, <i>France</i>	( 85.1° F, 29.5° C) on 20, 23 & 24 May
London, <i>England</i>	( 84.0° F, 28.9° C) on 13 July
Dieppe, <i>France</i>	( 72.5° F, 22.5° C) on 23 & 24 May

In Denainvilliers, *France*, the heat began towards the end of May. June was mild but the heat picked back up in July and lasted until September. This summer suffered from a severe drought. On 19 October, the Seine River was only 22 centimeters (8.7 inches) above the lowest water level measured in 1719.<sup>62</sup>

On 8 August 1779, a hurricane suddenly advanced on New Orleans, Louisiana in the *United States*. The naval squadron of Governor Galvez of Louisiana was destroyed.<sup>117</sup>

On 18 August 1779, a hurricane struck Louisiana in the *United States*. All but one of a Fleet of Spanish warships was sunk by the hurricane. Slaves were drowned in ditches.<sup>141</sup>

On 28 August 1779, a hurricane struck Martinique in the *Caribbean Sea*. Many lives were lost.<sup>141</sup>

In Burgundy, the grape harvest began on 21 September. The grain harvest was good. In the south of *France* fruit was in abundance. Heavy rain fell before the harvest, and a portion of the grapes were rotten as a result.<sup>62</sup>

In northern *France* in 1779, there was unnatural heat, unusual calm air. It was excessive dry during the beginning of the year and excessively wet at the end of the year. During the first four months the barometer produced a large pressure rise. But in August, the barometer produced a great depression the last two months. There were extremely persistence winds from the north and west, and a great scarcity of winds from the south and east.<sup>79</sup>

In 1779, the drought was everywhere in the southern *France*. It produced significantly less rain and rainy days than average. The drop in Marseille, Montpellier, Bordeaux and Viviers was between 3.2 and 13.6 inches (81 and 352 millimeters) less rainfall and between 6 and 29 fewer rainy days.<sup>79</sup>

In 1779 in Antigua in the *West Indies* experienced a severe drought. Every part of the surface of the ground became parched up, and all the ponds were dry. The importation of water was altogether insufficient to supply the demand. A malignant fever at the same time threatened total destruction to all.<sup>143</sup>

Before 8 October 1779, a hurricane struck the coast of the *United States*. The *Mary* traveling from St. Kitts to New York was overset [overturned] in a whirlwind, a few leagues from Sandy Hook, [New Jersey]. The vessel and cargo were entirely lost. Also at the same time a brig with rum for Antigua was lost in the storm.<sup>141</sup>

Before 3 December 1779, a hurricane struck the *Atlantic Ocean* causing 120 deaths. “The *Spitfire* Privateer, Captain White, foundered in a gale of wind, and all the crew, in number 120, perished.”<sup>141</sup>

In 1779 during the period between 13 July and 11 August, floods struck Shantung (now Shandong province) on the east coast of *China* at Lin-ch’ing; and Hupeh (now Hubei province) in central *China* at Ên-shih, Chung-hsiang, Chiang-ling, I-tu and Ao-ch’êng. At Chung-hsiang, houses were damaged and at Chiang-ling, crops were damaged by the floodwaters. Also during the period between 13 July and 11 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou; Shantung province at Wu-ch’êng, An-ch’iu and T’ai-an; and Anhwei (now Anhui province) in eastern *China* at Ch’ien-shan.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 10<sup>th</sup> – four days past pleasant and warm. April 19<sup>th</sup> – flounders plentiful. April 24<sup>th</sup> – pleasant. April 26<sup>th</sup> – began to dig our garden. April 27<sup>th</sup> – I hear wood is 52 dollars a cord in Boston, and flour at £50 per hundred, i.e. a barrel is more than my whole salary. May 18<sup>th</sup> – the cherries and plums begin to blow [blossom], but no grass yet. June 23<sup>rd</sup> – strawberries at their best. June 25<sup>th</sup> – several days of hot weather. Everything flourishes vastly. July 5<sup>th</sup> – the Indian corn was never so forward and flourishing. July 14<sup>th</sup> – a fine hot rain. July 25<sup>th</sup> – steady rain. A wonder of a season. August 31<sup>st</sup> – cut our corn stalks; never was the corn so forward; poor hay season, by reason of the almost daily rains. September 4<sup>th</sup> – a great tempest of rain. September 12<sup>th</sup> – rainy. September 18<sup>th</sup> – very hot. September 24<sup>th</sup> – a wonder of a potato year, so many, so large, and so good. October 1<sup>st</sup> – no frost yet, though very cold for three days past. October 4<sup>th</sup> – warm. October 10<sup>th</sup> – very hot. October 23<sup>rd</sup> – hot summer day. October 29<sup>th</sup> – wonderful fine weather; never such a fine season. November 30<sup>th</sup> – a moderate fall.<sup>78</sup>

---

**Winter of 1779 / 1780 A.D.** The whole winter near Philadelphia, Pennsylvania in the *United States* was intensely cold. The Delaware River was entirely closed or greatly obstructed by ice from the last week in November 1779 until the first week in March 1780. The ice was from two to three feet (0.6-0.9 meters) thick. During the month of January the mercury was several times from -10° to -15° F (-23° to -26° C) and only once during the month did it rise to 32° F (0° C). A great deal of snow fell as far south as the Carolinas and Georgia along with all the western, northern and eastern States. Long Island Sound and the Chesapeake were so completely ice-bound as to be passable with horses and sleights.<sup>1</sup>

The winter of 1779-80 was known as a “Hard Winter”. The Delaware River at Philadelphia, Pennsylvania in the *United States* froze around 1 December 1779, and remained a layer of ice two or three feet (0.6-0.9 meters) thick at times until 14 March 1780. Thomas Jefferson recalled “in 1780 the Chesapeake Bay was frozen solid from its head to the mouth of the Potomac.” Weather historian David M. Ludlum wrote, “The Hard Winter of 1780 is the only winter in American history when the waters surrounding New York City have frozen over and closed to all navigation for five consecutive weeks.” Three strong snowstorms struck the area. These occurred on 28 December, 2 & 3 January and 4 & 5 January. When the storms ended, snow was “over three feet (0.9 meters) deep” in Lancaster County, Pennsylvania. George Washington noted in his journal that the depth of the snow in Morristown, New Jersey was 18 inches (0.5 meters) after this last storm. His colonial troops crossed from New Jersey to Staten Island on foot over the frozen bay to do battle with the British. The extreme cold froze harbors and

inland bays as far south as the Virginia-North Carolina border. In some places, snowdrifts from ten to twelve feet (3.0-3.7 meters) deep were reported.<sup>27</sup>

The winter of 1779-80 was one of the most severe winters ever known in Bradford County, Pennsylvania in the *United States*.<sup>178</sup>

During the winter of 1779-80 New York Harbor in the *United States* froze solid for five weeks. Troops and people walked across the ice from New York to Jersey City and Staten Island with all sorts of goods including heavy cannons.<sup>33</sup>

During the winter of 1779-80, the Hudson River between New York and Powles' Hook [now called Paulus Hook, Jersey City, New Jersey] in the *United States* was frozen and was crossed on the ice. [Manhattan, New York is located 1 mile across the Hudson River from Powles' Hook. "Crossed on the ice" generally means the ice was sufficiently thick to allow foot and wagon traffic.] [This is only one of four winters when the Hudson River was completely frozen over during the century from 1740-1840. The other winters were 1740-41, 1764-65, and 1820-21.]<sup>202</sup>

In the *United States* in December 1779, a correspondent of the National Intelligencer, a resident of Virginia, said Colonel Baylor's regiment of horse crossed the Potomac River at Georgetown (Washington, D.C.), upon the ice, on their march to the Carolinas.<sup>38</sup>

In the *United States* on 14 January 1780, the cold was very intense that the mercury sunk into the bulb of the thermometer. The ice upon the James River in Virginia was 38 inches (1 meter) thick; and the Chesapeake Bay was so completely bridged with ice that many persons crossed over upon it from Annapolis to Kent Island in Maryland. Loaded wagons passed over the Chesapeake Bay.<sup>38</sup>

In the *United States* an old revolutionary officer stated that on 7 March 1780, he rode from Falmouth to Fredericksburg, Virginia upon the ice of the Rappahannock River, in company with his regiment, which was returning to Virginia, from the north. The cold weather continued without intermission from 10 December 1779 to March 1780.<sup>38</sup>

In the *United States* during the winter of 1779-80, the ice was driven out of the mouth of the Mississippi River into the Mexican gulf.<sup>42</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1779 on December 31<sup>st</sup> – the past month has been a true winter month, very cold and stormy, with repeated snows. January 1780 – a cold, stormy month. January 31<sup>st</sup> – severely cold, as perhaps ever was; the harbor down to the sea lies frozen up entirely. Thus January leaves as it found us, dismal, cold and windy, and snow very deep. February – some thaws and some cold weather until the 15<sup>th</sup>, then to the 24<sup>th</sup> moderate. February 1<sup>st</sup> – the country is blocked up with snow, and they suffer for want of wood and water. February 25<sup>th</sup> – very cold. February 29<sup>th</sup> – a most delightful day; a weather breeder. March 2<sup>nd</sup> – blustery day, lion-like March. March 7<sup>th</sup> – pleasant. March 12<sup>th</sup> – tempestuous. March 18<sup>th</sup> – moderate and pleasant since the 12<sup>th</sup>. March 26<sup>th</sup> – windy and cold. March 31<sup>st</sup> – the street to the meetinghouse remains full of snow.<sup>78</sup>

In 1779, the frost in *Britain* lasted 84 days.<sup>41, 43, 47, 93</sup>

During the winter of 1779-80, there was an extraordinary degree of cold at Glasgow, *Scotland*. On 11 January 1780, twelve inches of snow fell. The following low temperatures were observed in January: on the 12<sup>th</sup>, the temperature fell to 22° F [-5.6° C]; on the 13<sup>th</sup>, the temperature fell to -6° F [-21.1° C]; on the 14<sup>th</sup>, the temperature fell to -14° F [-25.6° C]; then there was a thaw and on the 22<sup>nd</sup>, the temperature fell to 5° F [-15° C].<sup>239</sup>

On 14 January 1780 the temperature at Newcastle, *England* fell to  $-3^{\circ}\text{F}$  [ $-19.4^{\circ}\text{C}$ ].<sup>249</sup>

In Selborne, *England*, during October and November, the weather was fine with intervals of rain. December was rainy with occasional days of frost and snow. January 1780 was frosty. During February dark harsh weather prevailed, with frequent intervals of frost. March was characterized by warm, showery, spring weather.<sup>70</sup>

---

#### **1780 A.D. – 1784 A.D. Bangladesh, Pakistan, and India. Drought and Famine**

From 1780-1784 in *India* and *Bangladesh*, “Great dearth has desolated the upper provinces of this beautiful country. Hardly any rain has fallen during four years. In consequence the crops have failed, and the poor starved. The scarcity was also in Bengal [*India* and *Bangladesh*]; but it being under better government, preserved it from monopolists and ruin. From my enquiries, I find half of the inhabitants of the Duab [Doab Region of *India*] and Rohileund have perished. Every ditch, road, brook, pond, and street, of these countries, were strewed with dead bodies of men, women, and children. As there is no police in this country, where the wretch expires, there he lies, till his flesh is stripped off by the dogs, which is generally done in two days. No one buries him; for who are friends to a starved wretch? Besides, the Hindoos do not bury their dead, but burn them if they have money to buy fuel. We have been often obliged to shift our camp on account of the stench, arising from the putrefaction of so many bodies. When you reflect, that the people of Hindostan are the most abstemious in the world; that their daily food is never stern; hardly anything else than about a seer (not quite two pounds weight) of wheat or barley made into cakes, and baked over a few lighted sticks: when you understand, that such is their food, and simple water their drink, you may form some judgment of the rage of this famine, which could deprive them of even this little. Men and women, with their children in their hands, flocked to camp, offering themselves for sale for a quart of corn. Mothers sold their children for four annas each, (or the fourth part of a rupee or half-crown.)”<sup>88</sup> [The Doab Region of *India* is a segment of the Indo-Gangetic Plain in western and southwestern Uttar Pradesh state, between the Ganges (Ganga) and Yamuna rivers in northeastern *India*.]

[In *India*, there was a famine largely due to the actions of man, rather than weather. In *India* from 1781-83, there was a famine in the Carnatic in southeast *India* and the Madras [Chennai] settlements. “The Carnatic had been devastated by Hyder Ali’s incursion in 1780-81, and the settlement of Madras [Chennai] was reduced to great straits for food, as the whole country in its vicinity was suffering from a general scarcity. Early in 1781 the government of Madras [Chennai] took steps to regulate the supply of grain; and the distress continuing, in January 1782, a public subscription was raised for the relief of the poor, to which the Government contributed. *This was the origin of the institution for the relief of the native poor, known as the Monegar Choultry*. Early in October the Government deemed it necessary to take the supply of rice and food-grain into their own hands. The scarcity seems to have come to an end in the early months of 1783.”<sup>57</sup>]

In *India* during the years 1782-83, there was no rainfall for two years in the Province of Sind [now Sindh in southeastern *Pakistan*].<sup>47</sup>

In *India* during 1782-84, there was a famine in Sind [now *Pakistan*], including Thar and Parkar. “When the Kulhora dynasty ceased in 1782, and that of the Talpors commenced, a very severe famine occurred, which lasted for two and a half years. During four months of this time not a grain of corn was procurable. This famine was caused by the burning of crops, and the suspension of cultivation during a period of hostilities. There was also no rainfall for two years.”<sup>57</sup>

In 1783, there was a great famine in the Northwest Provinces and Punjab region in *India*. The severest strain was felt in *Upper India*. The scarcity extended to Bengal. It also was believed to extended to Rajputana.<sup>156</sup>

— In *Northern India*, a drought had prevailed during the preceding year, which added, to the severity of the famine. As early as October emigration towards Oudh commenced, and “death left its mark freely along the road.” “Every man’s hand was against his neighbor, and the strong ruthlessly seized the portion of the weak, for the struggle to maintain life overcame all scruples.”

In *India* during 1783-84, there was no rainfall for two years in the northwest Provinces of the Punjaub [Punjab].<sup>47</sup>

In *India* during 1783-84, there was a famine in the northwest provinces of the Punjab. “The disturbance of the season of 1783 seems to have been general; but as the countries most affected were not then subject to British rule, very little information therein is obtainable. There are reasons for believing that the upper parts of Hindustan had been visited with extraordinary drought during the two previous years. In September and October 1783, there was an abnormal cessation of rain and extreme drought, and in the latter month a terrible famine was reported in all the countries from beyond Zahore to Karumna (the western boundary of Behar) . . . and the famine had been already felt in all the western districts towards Delhi. To the northward of Calcutta, the crops upon the ground had been scorched, and nearly destroyed.” By the middle of 1784, the famine had abated.<sup>57</sup> [Zahore, now is Lahore, the capital of the *Pakistani* province of Punjab. Karumna is a river in the northern part of *India*.]

In *India* in December 1784, some of the northwest provinces of the Punjaub [Punjab] suffered very severely from floods after a great drought.<sup>47</sup>

In 1781-82, there was a serious famine in Madras (now Chennai), *India*. The Carnatic region of southern India was devastated by Hyder Ali’s incursions in 1780-81 and the Madras was reduced to great straits for food. The whole country in this vicinity was suffering from a general scarcity. In 1782, the starvation became more acute with individuals dying in the streets. The scarcity came to an end during the early months of 1783.<sup>188</sup>

In 1782, there was a famine in the Madras territories [now Chennai] of *India*.<sup>182</sup>

French dispatches dated 19 November 1782 reported that “The famine which rages at Madras [the southeastern coastal region of *India* now referred to as Chennai] is dreadful indeed; but this calamity is not confined to the English settlements; it has reached the French army, and the dominions of Hyder Ally [the sultan and de facto ruler of the Kingdom of Mysore in southern *India*]. Its ravages were so great among our forces, the Mons. D.Offalis, who succeeded to the command on the death of Mons. Duchemin, found it impossible to maintain his post near Madras, and fell back three days march from his former station near that town. The supplies which used to be sent to our army from Hyder’s dominions, have fallen greatly short, and the prince is scarcely able to subsist his army. The Carnatic [southern coastal region of *India*] is so ravaged, that it can furnish him no subsistence, and he can draw very sparingly from home, for there the famine rages with infinitely more fury than at Madras. This has saved Madras, which, weakened by famine, must necessarily have fallen into our hands. Hyder Ally cannot recruit his army with the numbers he expected, as men begin to be as scarce as provisions. Whilst the Carnatic is thus famished, the utmost plenty reigns in Bengal [today *Bangladesh* and the Indian state of West Bengal]. But, what with the superiority of our fleet, and the storms that have raged of late, the unfortunate Carnatic derives little or no benefit from the plenty in Bengal. It was computed, when the dispatches came away, that upwards of 300,000 persons had perished by famine in the English territories and those of Hyder Ally; so that if this scourge should rage for any great length of time, as dreadful consequences may be

apprehended from it as were produced by the famine in Bengal some years ago, which carried off two millions of people.”<sup>253</sup>

In 1783, a severe famine struck Panjab, *India*.<sup>187</sup>

In a report from Goa, *India* of 4 October 1783 along with letters from officers at Onore and Carwar, describe the scarcity of grain and the sufferings on account in the upper provinces.<sup>249</sup>

A great famine in Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and Behar [now Bihar in northern *India*] occurred in 1783. But the countries most affected were not under British rule at the time. The upper parts of Hindustan had been visited with an extraordinary drought during the two previous years. At Madras [now Chennai] “the enemy was at their walls, and by his ravages in every part of the adjacent country, had destroyed the cattle, and reduced the inhabitants to the most pressing difficulty to obtain the most common necessaries of life.” By October 1783, the famine moved and affected all the countries from beyond Lahore to the Karumna (the western boundary of Behar). It affected Delhi and Calcutta. The long drought was succeeded by great floods in 1784, and on 1 December the provinces of Tipperah, Sylhet and Dacca suffered great distress from inundations.<sup>183</sup>

In 1783-84, there was a great famine in *India*. The famine was concentrated in central Duab [river region]. There was a complete failure of the autumn rains following two years of partial droughts. Mr. Girdlestone relates that the immigration of famine stricken to Oudh [now Awadh], where the scarcity was believed to be less severe, “death left its mark freely along the road. Such was the general apathy that the bodies were not removed from the place where they lay, even in towns and villages. No relief was held out to the sick and dying. Every man’s hand was against his neighbour, and the strong ruthlessly seized the portion of the weak, for the struggle to maintain life overcame all scruples.”<sup>181</sup>

In the spring of 1784, shocking accounts were received from *India* of the devastation along the coast caused by a great famine and by an epidemic disease. The region of Pondicherry in southern *India* sustained devastation. The disasters were compounded by war.<sup>247, 250</sup>

On 23 December 1784, a letter was received in England from the governor-general of Bengal. He described the scene upon his arrival at Lucknow in Uttar Pradesh, *India*. This great and opulent country is in a situation of misery and embarrassment, not to be described or conceived. The severity of the season had not only destroyed the accustomed crop, but also destroyed all vegetables by the roots. And one year more of so excessive a drought, would have the most dire consequences.<sup>247, 250</sup>

---

**1780 A.D.** On 24 February 1780, it was reported that a violent storm did great damage at Montega Bay [Montego Bay] in the island of *Jamaica*.<sup>270</sup>

On 11 May 1780, a storm of wind did much damage on the [River] Thames in *England*.<sup>270</sup>

On 16 May 1780, it was reported that a violent storm struck Plymouth [*England*] and did much damage.<sup>270</sup>

On 19 May 1780, complete darkness enveloped New England in the *United States*. Some people believed it was the end of the world. It was so dark that a person could not see his hand when he held it up, nor a sheet of white paper held within a few inches of the eyes, and the sky could not be distinguished from the earth. The darkness extended over the middle and southern portions of New England. It was observed as far west as Albany, New York, north as far as Portsmouth, New Hampshire and out on the ocean for a score of miles. From about the first of May, great tracts of forest along Lake Champlain, extending down to the vicinity of Ticonderoga, were on fire. New settlements were being made in northern New

Hampshire and in Canada and the settlers were burning the forests in preparation of cultivation. This caused a soot to fall, which in some places were 6 inches [15 centimeters] thick. The unusual weather pattern combined with the smoke from the massive forest fires is believed to be the cause of “The Dark Day”.<sup>199</sup>

On 1 June 1780 in *England*, there was a hailstorm at Warminster (Wilts). The stones measured from 3 to 9 inches in circumference. The same storm was also felt in Oxfordshire with most destructive effect: geese, ducks, and poultry generally were killed, and the utmost destruction to glass ensued.<sup>93</sup>

On 13 June 1780, a hurricane struck *Puerto Rico* causing deaths and losses.<sup>141</sup>

The summer of 1780 was warm over a large area of *France*. The summer in Paris was characterized by:

Hot days	33 days
Very hot days	1 day
Extremely hot days	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The summer in Denainvilliers, *France* was characterized by:

Hot days	59 days
Very hot days	15 days
Extremely hot days	3 days

At Denainvilliers, the month of July was dry and quite hot and the month of August was very hot. The high temperatures observed during the summer were:<sup>62</sup>

Turin, <i>Italy</i>	(99.7° F, 37.6° C)	on 28 July
Bordeaux, <i>France</i>	(97.5° F, 36.4° C)	
Montpellier, <i>France</i>	(97.3° F, 36.3° C)	
Gray, <i>France</i>	(97.3° F, 36.3° C)	
Orleans, <i>France</i>	(96.4° F, 35.8° C)	
Denainvilliers, <i>France</i>	(95.0° F, 35.0° C)	on 1 June, 31 July and 1 August
Paris, <i>France</i>	(95.0° F, 35.0° C)	on 2 June
Mulhouse, <i>France</i>	(93.7° F, 34.3° C)	on 31 July
Verviers, <i>Belgium</i>	(92.8° F, 33.8° C)	
Vire, <i>France</i>	(91.6° F, 33.1° C)	
Nancy, <i>France</i>	(90.5° F, 32.5° C)	on 2 June
Rodez, <i>France</i>	(88.7° F, 31.5° C)	
Breda, <i>the Netherlands</i>	(87.8° F, 31.0° C)	
Bourbonne-les-Bains, <i>France</i>	(87.6° F, 30.9° C)	
Nain, <i>Labrador</i>	(84.4° F, 29.1° C)	
Okak, <i>Labrador</i>	(84.2° F, 29.0° C)	
London, <i>England</i>	(84.0° F, 28.9° C)	on 29 May
Amsterdam, <i>the Netherlands</i>	(83.3° F, 28.5° C)	
Agde, <i>France</i>	(81.5° F, 27.5° C)	

In Paris, *France*, it was very dry until August. On 9 August, the water level on the Seine River was 16 centimeters (6.3 inches) above the lowest water level measured in 1719. In Provence, the summer produced great heat. In Burgundy, the year was variable and wet. The grape harvest began on 18 September, and many grapes suffered from decay. In the area around Orleans, the grain harvest was plentiful and of good quality. In the south and the north of *France*, the harvest was average.<sup>62</sup>

During the summer of 1780, the temperature peaked at 89.6° F (32° C) at Marseille and 96.8° F (36° C) at Montpellier, *France*.<sup>79</sup>

The year 1780 in *France* was variable and wet.<sup>79</sup>

On 24 August 1780, a hurricane more furious than that of the 1779 hurricane struck the Gulf coast of the *United States*.<sup>117</sup>

On 25 August 1780, it was reported that a violent storm struck *St. Kitt's* island in the West Indies and did much damage.<sup>270</sup>

On 15 September 1780, it was reported that a violent storm on the coast of *France* did great damage to the shipping.<sup>270</sup>

On 3 October 1780, a hurricane struck *Jamaica*.<sup>124</sup>

On 2-5 October 1780, a hurricane struck *Jamaica* and *Cuba* causing approximately 1,115 deaths but accounts vary significantly. [Seon has upwards of 1000 deaths in Jamaica, while Evans (1848) and Millas (1968) indicate 300 deaths there. Ludlum (1963) account has 200 in Savanna-La-Mar (Sav), Jamaica and "several white people and some hundreds of negroes killed...in the whole parish."] <sup>141</sup>

The hurricane in *Jamaica* was different in many respects from the others: it was a week earlier (3 October 1780) than the hurricane that struck *Barbados* (on 10 October 1780), and was more complex, being accompanied by an earthquake, and a most extraordinary swell of the sea [tsunami]. Its effects were also more confined: it seems to have been only its eastern wing, which swept the western point of that island; the parishes of Westmoreland and Hanover suffered most.<sup>143</sup>

Upon the 3<sup>rd</sup> of October 1780, the inhabitants of Savannah-la-Mar, *Jamaica* were gazing with astonishment at the sea swelling as it never had before: on a sudden, bursting through all bounds, and surmounting all obstacles, it overwhelmed the town, and swept every thing away so completely upon its retreat, as not to leave the smallest vestige of man, beast, or habitation behind. About 300 persons perished in this dreadful irruption. The sea flowed half a mile beyond its usual limits; and so sudden and unavoidable was the destruction, although it took place at noon, that of the inhabitants of one gentleman's house, consisting of ten Whites and forty Negroes, not a soul escaped. Where the sea did not reach, the destruction was nearly as effectual by the succeeding earthquake and hurricane: between both, scarcely a house or building of any sort was left standing in the parishes we have named. In the parish of Westmoreland only, the damage was estimated at near £ 700,000 sterling.

The gale began from the S.E. at one p.m.; at four p.m. it veered to the south, and became a perfect tempest, which lasted in full force till near eight p.m. It then abated. Forty of the inhabitants, who had sought shelter in the courthouse, were killed by the house falling upon them. At ten p.m., there was a smart shock of an earthquake, and the waters subsided. All the vessels in the bay were dashed to pieces, or driven on shore. The earthquake lifted the *Princess Royal* from her beam-ends, and fixed her upright in a firm bed, where she afterwards served as a house for the inhabitants.

[The timeline indicates a massive wave swept the island at noon. At 1 p.m. the gale began. From 4-8 p.m. the full force of the hurricane struck the island. And then at 10 p.m., a powerful earthquake struck. If the massive wave was caused by a tsunami, I believe the earthquake should strike first followed by the tsunami. I have noticed that in several account of hurricanes *on the island*, that earthquakes occur during the hurricane. In other words, hurricanes trigger earthquake or earthquake like events. This series of events in my mind still pose a mystery.]

On 4 October, His Majesty's ship *Phoenix*, commanded by Captain Sir Hyde Parker, was wrecked on *Cuba*, three leagues to the eastward of Cape Cruz, in a hurricane: twenty of the crew were washed overboard with the masts.

*Jamaica* was struck by a hurricane on 3 October 1870, *Barbados* and the neighboring islands a week later. In *Jamaica* the southwestern part of the island suffered most, Savanna-la-Mar being completely destroyed. Rivers changed their courses, lakes were formed, roads blocked for miles and crops utterly destroyed, including all the slaves' provision grounds. Famine followed and epidemics soon broke out. But *Jamaica* was not the only sufferer. In *Barbados* more than 4,300 people died in the hurricane there, in *Martinique* fully 7,000, and on almost every *West Indian* beach bits of wrecked vessels – British, French and Spanish sprawled on the soft sands.<sup>152</sup>

A hurricane struck *Jamaica* in 1780. At Westmoreland parish, there was not a tree of any kind, shrub or fence left standing. The storm raged with such fury, that there was not a leaf to be seen the next day, nor a bird of any sort for many weeks after. The appearance of the mountains the next morning resembled the broken teeth of a comb. The trunks of the trees, here and there, standing without a branch or limb so that the whole face of the country, having been totally stripped of its verdure, wore the appearance of the dreary mountains of *Wales* in the winter season.<sup>241</sup>

On 10-11 October 1780, one of the most dreadful storms that ever happened in the *West Indies* spread desolation over Barbados, Jamaica, etc. and the adjoining islands of the French, particularly Martinico [Martinique].<sup>270</sup>

During a major hurricane in the *West Indies*, on 10 October 1780, the whole town of Bridgetown [capital of Barbados] was destroyed, and many thousand persons perished. St. Lucien [now St. Lucia], Grenada, and St. Vincent, were also laid to waste and many thousands perished. At Fort Royal (Martinique), fourteen hundred houses were blown down, and an incredible number of persons killed. Every house at St. Pierre on the island of Martinique was also blown down, and many thousands perished. At St. Eustatius [now called Statia], at least five thousand persons lost their lives. Many vessels with their crews were dashed to pieces in the above ports.<sup>1</sup>

On 10-16 October 1780, a Great Hurricane struck *Barbados*, *Saint Vincent*, *Granada*, *Saint Lucia*, *Martinique*, *Hispaniola*, *Dominica*, *Guadeloupe*, *Antigua*, *Saint Kitts*, *Sint Eustatius* [now called Statia], *Puerto Rico* and *Bermuda* killing over 27,500 people. The hurricane produced wind speeds (gusts) in excess of 200 miles per hour (320 kilometers per hour). In *Barbados*, “The winds stripped the bark off trees before the hurricane downed every tree on the island.” In *Barbados*, the winds and seas moved heavy cannons about 100 feet (30 meters). The hurricane destroyed 19 Dutch ships at *Grenada*; the British fleet of Admiral Rodney at *Saint Lucia*; a fleet of 40 French ships off *Martinique*; many ships washed ashore at *Saint Kitts*; and grounded 50 ships near *Bermuda*.<sup>48</sup>

A great storm struck all of the *West India* islands, particularly at Savannah-la-Mar (Sav-la-Mar), in *Jamaica*, and at *Barbados* in October, 1780.<sup>40, 41, 56</sup>

In 1780, a powerful cyclone struck *Lesser Antilles Islands* causing 22,000 deaths.<sup>98</sup>

During 10-16 October 1780, a great Atlantic hurricane struck the Caribbean islands of *Martinique*, *Barbados* and *St. Eustatius* causing approximately 22,000 deaths.<sup>107</sup>

On 31 October 1780, reports were received of a hurricane at *Barbados* that did great damage.<sup>128</sup> [The hurricane struck the Caribbean between 10-16 October.]

On 10-16 October 1780, a hurricane struck the *Caribbean* islands of Martinique, St. Eustatius [Statia] and offshore Barbados. The hurricane killed approximately 22,000 people. It is the deadliest known Atlantic hurricane.<sup>141</sup>

On 10-12 October 1780, a hurricane struck the islands of *St. Lucia*, *Granada*, *Jamaica*, Hispaniola [now the island of the *Dominican Republic* and *Haiti*], *Barbados*, *St. Kitts*, *Dominica*, *Martinique*, *St. Vincent* and *St. Eustatius* [*Statia*].<sup>143</sup>

— During the evening of the 10<sup>th</sup>, there arose a hurricane at *St. Lucia*. The *Ajax*, *Montagu*, *Egmont*, *Amazon*, *Deal Castle* and *Camelion* were all driven to sea by the hurricane. The winds blew with irresistible fury attended by an incessant flood of rain. A little after midnight, the *Vengeance* parted her cable and tailed upon the rocks. The sailors cut away her mast and moved a number of guns forward. The winds shifted and increased in intensity and the ship cleared the rocks. The *San Vincente* snow, with many of the transports, victuallers and traders were dismasted, and mostly all on shore. [A snow is a sailing vessel primarily used as a merchant ship but also used in war. A victualler is a supply ship.] The storm continued with incredible vehemence during the whole day of the 11<sup>th</sup>. On the 13<sup>th</sup>, the *Montagu* anchored before the harbor, without a mast or bowsprit standing, eight feet of water in her hold. The *Ajax* returned to anchorage on the 21<sup>st</sup> with the loss of her main-yard, maintop mast and mizzenmast. The *Beaver's* prize, being on her passage to Barbados was unfortunately wrecked on the back of *St. Lucia*, near Vieux Fort and all her officers and crew, except 17 men perished. [A prize ship was a captured enemy vessel with an associated monetary reward attached.]

— The ship *Amazon* was off *St. Lucia* during the hurricane when a gust of wind overturned the ship. The wheel on the quarterdeck was underwater. The water was up to the after-part of the sides of the carronades on the weather side. The ship righted herself as far as to bring the lee-gunwale even with the water's edge. The officers and men soon got the lee quarterdeck guns and carronades overboard [to lighten the load], and soon after one of the forecastle guns and sheet anchor cut away. This act raised the ship enough to allow the crew to reach the pumps and lee guns on the main deck. These were thrown overboard after great difficulty. The water was above the cables on the orlop deck, with a vast quantity between decks and the stump of the main mast. Due to the valiant efforts of the officers and crew the ship was saved.

— In the island of *Granada*, a type of African ant was accidentally brought to the island [probably from the slave trade ships]. The ant was extremely destructive to the vegetation on the island. These ants were of slender make of a middling size of a dark-red color, remarkable for the acidity of their taste when applied to the tongue. On the island their numbers became so immense that they covered the roads for many miles together; so that the impressions made by the feet of horses that travelled over them could be seen distinctly. When rubbed together, these ants emitted a strong sulphurous smell. They first appeared on a sugar plantation about five miles from *St. George*. In the space of a few years they covered a track twelve miles in length, blasting vegetation, and reducing the country to a state of the most deplorable desolation. After the hurricane of 10 October that struck the island, this curse was gone, destroyed.

— Admiral Rowley, who sailed with the *Jamaica* convoy for England, returned to that island with five of his squadron, mostly dismasted, and all disabled. The *Berwick* parted company with the fleet, was dismasted, and thought it less dangerous to proceed alone to England than to return. The *Stirling Castle*, of sixty-four guns, was totally lost on the coast of Española [Hispaniola now the island of the *Dominican Republic* and *Haiti*], and only a few of the crew saved. The part of the wreck from which these unfortunate people were taken, was driven to sea, with near twenty men upon it, without a drop of water or any provisions, excepting a few pieces of pork, which were washed overboard soon after they were adrift. In this situation they were driven about for several days, many of them dying raving mad, and those who survived were kept alive by sucking the blood of their dead companions. They were saved by a small vessel, and carried into Cape Francois [now Cap-Haïtien, *Haiti*].

— The *Thunderer*, seventy-four [guns], commanded by Commodore Boyle Walsingham, was supposed to have foundered in the gale: no particulars of her fate were ever known.

— The *Barbadoes* and *Victor* sloops of war, with the *Cameleon*, *Scarborough*, and *La Blanche* frigates, became likewise, upon different services, and with a partial or total loss of men, victims to the rage of the elements.

— The *Laurel* and *Andromeda* were wrecked. The *Marquis de Bouille* sent thirty-one sailors, all that were saved of their crews, with a flag of truce, to Commodore Holham at *St. Lucia*; he declared that he could not consider in the light of enemies men who, in common with his own people, had been partakers of the same danger, and were in like manner entitled to every comfort and relief which could be given in a season of such universal calamity and distress. He only lamented, he said, that their numbers were so small, and particularly that none of the officers were saved.

— The hurricane began at *Barbados* on the morning of the 10<sup>th</sup> of October, and continued, with little intermission, about forty-eight hours. In the afternoon of the first day, all the ships were driven from their anchors to sea. In the course of the night, Bridgetown was nearly laid level with the earth. Daylight presented a scene of desolation seldom equaled: not one house or building in the island, however strong or sheltered, was exempt from damage. Most of the livestock and 4,326 persons perished. The loss, which the colony sustained, was estimated at £ 1,320,564 sterling.

— The hurricane nearly ruined the Spanish fleet, under the command of Don Bernardo de Galvez. Four capital ships, besides others of different denominations, were totally lost, and all on board, above 2000 persons, perished. The remainder of the shattered fleet got to the Havana, *Cuba*.

— At *St. Lucia*, only two houses were left standing in the town. His Majesty's sloop *Badger* was dismasted and driven ashore in that harbor. All the barracks, huts, and other buildings, were blown down, and all the ships were driven to sea.

— At St. Christopher's island [*St. Kitts*], several vessels were driven on shore.

— Considerable damage was done at *Dominica*.

— Every building in *St. Vincent's* was blown down. The *Experiment*, of fifty [guns], and the *Juno*, a French forty-gun frigate, were entirely destroyed.

— At *Grenada*, nineteen sail [sailing ships] of loaded Dutch ships were stranded, and beat to pieces.

— At Martinico [*Martinique*], on the 12<sup>th</sup>, four ships foundered in Fort Royal Bay, and every soul perished. Every house in St. Pierre's was blown down, and more than 1000 persons perished. At Fort Royal town, the cathedral, seven churches, the governor's house, the senate-house, the prisons, the hospitals, the barracks, and upwards of 1,400 houses, were blown down. In the hospital of Notre Dame, 1,600 patients, with the nurses and attendants, were almost all of them buried in the ruins. In the shipwrights' sick house, 100 perished. Upwards of 9,000 persons were computed to have perished in the island, and the damage was estimated at 700,000 louis-d'ors.

— At St. Eustatius [*Statia*], on the 10<sup>th</sup>, at eleven a.m., the sky suddenly blackened all round: it rained violently, and thundered and lightened. In the afternoon the gale increased: seven homeward bound ships were dashed to pieces, and every soul on board perished; nineteen others were driven to sea. In the night, every house to the northward and southward was blown down, or washed away, with the inhabitants, into the sea. Some few who had hid themselves in large holes in the mountain were saved. In the afternoon of the 11<sup>th</sup>, the wind shifted suddenly to the eastward, and swept away every house to the east and west. Between four and five thousand persons perished; and the damage was estimated at £ 150,000 sterling. The cathedral and four churches, and the barrack and hospital, were left standing.

The following account by Major-General Cunninghame, Governor of Barbados in the *Lesser Antilles*, describes the hurricane that struck Barbados in the *Lesser Antilles* from 9-16 October 1780:<sup>143</sup>

"The evening preceding the hurricane, the 9<sup>th</sup> of October, was remarkably calm, but the sky surprisingly red and fiery; during the night much rain fell. On the morning of the 10<sup>th</sup>, much rain and wind from N.W. By ten o'clock it increased very much; by one, the ships in the bay drove; by four o'clock, the *Albemarle* frigate (the only man-of-war here) parted her anchors and went to sea, as did all the other vessels, about twenty-five in number. Soon after, by six o'clock, the wind had torn up and blown many trees, and foreboded a most violent tempest. At the government-house, every precaution was taken to guard against what might happen: the doors and windows were barricaded up, but it availed little. By ten o'clock, the wind forced itself a passage through the house from the N.N.W., and the tempest increasing every minute, the family took to the centre of the building, imagining, from the prodigious strength of the walls, they being three feet thick, and from its circular form, it would have withstood the wind's utmost rage: however, by half after eleven o'clock they were obliged to retreat to the cellar, the wind having forced its way into every part, and torn off most of the roof. From this asylum they were soon driven out, the water being stopped in its passage, and having found itself a course into the cellar, they knew not where to go; the water rose four feet, and the ruins were falling from all quarters. To continue in the cellar was impossible; to return to the house equally so; the only chance left was making for the fields, which at that time appeared equally dangerous; it was, however, attempted, and the family were so fortunate as to get to the ruins of the foundation of the flag-staff, which soon after giving way, every one endeavoured to find a retreat for himself. The governor and the few who remained were thrown down, and it was with great difficulty they gained a cannon, under the carriage of which they took shelter; their situation here was highly deplorable — many of the cannon were moved, and they had reason to fear that under which they sat might be dismounted, and crush them by its fall, or that some of the ruins that were flying about would put an end to their existence; and to render the scene still more dreadful, they had much to fear from the powder magazine, near which they were. The armoury was level with the ground, and the arms, &c. scattered about.

"Anxiously did they wait the break of day, flattering themselves that with the light they should see a cessation of the storm; yet when it appeared, little was the tempest abated, and the day served but to exhibit the most melancholy prospect imaginable. Nothing can compare with the terrible devastation that presented itself on all sides: not a building standing; the trees, if not torn up by the roots, deprived of their leaves and branches; and the most luxuriant spring changed, in this one night, to the dreariest winter. In vain was it to look round for shelter: houses that, from their situation, it was to have been imagined would have been in a degree protected, were all flat with the earth; and

the miserable owners, if they were so fortunate as to escape with their lives, were left without a covering for themselves and family. General Vaughan was early obliged to evacuate his house; in escaping he was much bruised; his secretary was so unfortunate as to break his thigh.

"Nothing has ever happened that has caused such universal desolation. No one house in the island is exempt from danger. Very few buildings are left standing on the estates. The depopulation of the Negroes and cattle, particularly of the horned kind, is very great, which must, more especially in these times, be a cause of great distress to the planters. It is as yet impossible to make any accurate calculation of the number of souls who have perished in this dreadful calamity. Whites and Blacks together, it is imagined to exceed some thousands, but fortunately few people of consequence are among the number. Many are buried in the ruins of the houses and buildings — many fell victims to the violence of the storm and inclemency of the weather; and great numbers were driven into the sea, and there perished. The troops have suffered inconsiderably, though both the barracks and hospital were early blown down. Alarming consequences were dreaded from the number of dead bodies that lay uninterred, and from the quantity the sea threw up, which, however, are happily subsided. What few public buildings there were, are fallen in the general wreck. The fortifications have suffered very considerably. The buildings were all demolished; for so violent was the storm here, when assisted by the sea, that a twelve-pounder gun was carried from the south to the north battery, a distance of 140 yards. The loss to this country is immense — many years will be required to retrieve it."

Letters from Admiral Hood, dated at sea [in the *Atlantic Ocean* on 4 January 1781], advise, that he, with the squadron under his command, and his convoy, went on very well till the 10<sup>th</sup> of December [1780], when it blew a violent storm, which, however, was but of short continuance. At daylight, the fleet and convoy were much shattered, and one of the men of war, which proved the *Minorca*, was seen far to leeward dismasted. She has since arrived at Plymouth; and the fleet and convoy have proceeded with a fair wind.<sup>270</sup>

During 17-21 October 1780, a great hurricane struck eastern *Gulf of Mexico* causing approximately 2,000 deaths.<sup>107, 141</sup>

On 10 October 1780, a violent storm did much damage near London, *England*.<sup>270</sup>

On 15 October 1780, there was great damage done to Hammersmith church in a borough of London, *England* by a kind of whirlwind, or tornado, accompanied by thunder and lightening.<sup>128</sup>

A storm struck Roehampton (Wandsworth) near London, *England* on October 17.<sup>40, 41</sup>

In 1780, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 5 April and 3 May, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ing-yüan.

— During the period between 3 June and 1 July, floods struck Kiangsi (now Jiangxi province) in southern *China* at I-ch'un; Hupeh (now Hubei province) in central *China* at Chiang-ling, Chung-hsiang, Mien-yang, and Ch'ien-chiang; and Chekiang province at I-wu.

— During the period 2-30 July, floods struck Shantung (now Shandong province) on the east coast of *China* at T'êng; Hopei (now Hebei province) in northern *China* at Fang-shan and Wu-ch'ing; and Chekiang province at Ch'ang-shan. At Ch'ang-shan, many houses were damaged by the floodwaters.

— During the period between 28 September and 27 October, floods struck Chekiang province at Chin-hua and Ch'ing-yüan.

In 1780 during the period between 3 June and 1 July, a drought engulfed Hupeh (now Hubei province) in central *China* at Ying-ch'êng.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 15<sup>th</sup> – moderate spring-like weather. May 1<sup>st</sup> – no warm weather yet. May 10<sup>th</sup> – morning summer-like weather, quite reviving. May 11<sup>th</sup> – cold and windy. May 18<sup>th</sup> – a cold, backward spring. May 24<sup>th</sup> – a little taste of summer. May 27<sup>th</sup> – thundershowers, quite needful, it being a dry time. May 30<sup>th</sup> – no grass yet. June 30<sup>th</sup> – a wonder of a winter the past, and a spring, and a summer thus far, so cold and till now dry. July 1<sup>st</sup> – the grass grows to the admiration of all. July 4<sup>th</sup> – very hot. July 18<sup>th</sup> – plenty of rain. July 28<sup>th</sup> – extremely hot. August 2<sup>nd</sup> – a blessed rain. August 7<sup>th</sup> to 16<sup>th</sup> – sultry hot. August 18<sup>th</sup> – a wonderful change from very hot to very cold. August 22<sup>nd</sup> – a fine season for vegetation. August 24<sup>th</sup> – a memorable hot night. August 27<sup>th</sup> – extremely hot. August 29<sup>th</sup> – intensely hot day and night. August 31<sup>st</sup> – a great rain; very cold. September 1<sup>st</sup> – cold still. September 3<sup>rd</sup> – heavy showers. September 21<sup>st</sup> – calm hot summer's day.<sup>78</sup>

*Also refer to the section 1780 A.D. – 1784 A.D. for information on the drought and famine in Bangladesh, Pakistan, and India during that timeframe.*

---

**Winter of 1780 / 1781 A.D.** In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1780 on November 1<sup>st</sup> – a great snowstorm. November 30<sup>th</sup> – the whole month generally cold and stormy. December 1<sup>st</sup> and 2<sup>nd</sup> – severely cold. December 9<sup>th</sup> – moderate all the week. December 18<sup>th</sup> – no snow on the ground. December 23<sup>rd</sup> – snowed about five-inches (13 centimeters). December 26<sup>th</sup> – snow knee deep. December 28<sup>th</sup> – the roads all blocked up [impassable]. In 1781 on January 6 – fine sledding. January 9<sup>th</sup> – extreme cold. January 23<sup>rd</sup> – a great snowstorm. January 28<sup>th</sup> – rain and a thaw. February 1<sup>st</sup> – snow again, but turned to rain. February 5<sup>th</sup> – severely cold snowstorm. February 9<sup>th</sup> – extreme cold. February 17<sup>th</sup> – great snowstorm. February 20<sup>th</sup> – blustering and very cold. February 22<sup>nd</sup> and 24<sup>th</sup> – the street is brim full of snow; we are buried. March 10<sup>th</sup> – cold month thus far; fine sledding. March 15<sup>th</sup> – a beautiful spring. March 18<sup>th</sup> – rain and snow. March 23<sup>rd</sup> – it snowed all day. March 28<sup>th</sup> – very cold and windy. April 3<sup>rd</sup> – a great snowstorm. April 11<sup>th</sup> – a heavy rain. April 19<sup>th</sup> – snow again.<sup>78</sup>

---

**1781 A.D.** Lewes in Sussex, *England* reported that it appears more shipping was wrecked on the coast on 26 January 1781, than was ever before known in the memory of man. At Bears-Hide a vessel, supposed to be a victualling sloop, was dashed to pieces, and every person on board perished. Opposite New Haven Mill a salt vessel shared the same fate, and every person on board perished. At Cuckmere the *Syren* frigate and *Race Horse* schooner both went to pieces, but the crew were saved. A vessel at Crow Link and another at Berling were wrecked, the crews mostly perished. The *Syren* was a fine frigate, built about a year and a half ago at Newcastle upon Tyne, and was sheathed with copper; she carried 170 men, mounted 32 guns, and sailed with the schooner as convoy to a small fleet from Spithead to the Downs; but most of the merchantmen perceiving their danger before the Commodore, they racked and stretched off. The frigate struck about two o'clock, and immediately fired several guns as signals of distress to the *Race Horse*; but the wind blowing a hurricane, they struck themselves between three and four in the afternoon. The *Sprightly* cutter and a Dutch prize that were in company are missing.<sup>270</sup>

Aldborough in Sussex, *England* reported on 12 February 1781, that a violent storm of wind which for three days raged with greater fury than ever were remembered. “Our coasts, says the letter writer, is covered with pieces of wrecks of ships, and every tide throws up dead bodies. Guns from ships of distress are continually discharging, but the wind blows so hard, that we cannot venture to their assistance.”<sup>270</sup>

A Spanish fleet left Havana, *Cuba* on 23 February 1781. During the night of the 25<sup>th</sup>, it blew a hurricane. On the 26<sup>th</sup>, it blew much harder, with thunder, lightning and heavy rain. The following ships were either foundered or missing and all their men supposed lost: *El S. Fr. De Assissa* (70 guns), *El San Augustino* (70 guns), *El Francisco De Pablo* (70 guns), and *El Astuto* (64 guns). The following ships lost their masts: *El San Louis* flagship (80 guns, lost mainmast), *El San Nicolas* (80 guns, lost all three masts), *El San Guerero* (70 guns, lost foremast) and *St. Maria* frigate (26 guns, lost all three masts). The surviving remnant of this fleet returned back to Havana. As a result of the hurricane, they lost 4 captains, 26 lieutenants, 110 inferior officers, 1600 seamen and 440 soldiers, totaling 2,180 individuals.<sup>270</sup>

In 1781, a great Atlantic hurricane struck off the coast of Florida causing approximately 2,000 deaths.<sup>107, 141</sup>

On 27 February 1781, a most violent storm of wind broke from west-northwest and did considerable damage to the shipping. It was severely felt at Spithead, *England*, where the *Portland* of 50 guns lost her mizenmast; the *Prothée* of 64 guns, and *Latham* outward-bound Indiamen, drove ashore, but got off. Several other ships received considerable damage, and some were lost along the coast. At Blundworth, in Hampshire, the violence of the storm was dreadful. In less than three hours scarce a house but what was stript [stripped] of its [roof] tiles and thatch; three houses were blown down, and not a tree of any size left standing in the neighborhood. For ten miles [16 kilometers] round scarce a house escaped without damage, more or less. By this storm the *French* suffered considerably in their shipping; The *Mentor* of 64 guns was lost 6 or 7 leagues [18-21 miles] south-southwest of the Dauvette.<sup>270</sup>

On 3 March 1781, reports were received by Flanders mail that great devastation was caused by hurricanes and inundations in *France*, Flanders [now *Belgium*], and Holland [now *the Netherlands*]; particularly in the latter country, where several dykes [dikes or levees] were borne down, houses washed away, numbers of cattle perished and many people drowned.<sup>270</sup>

On 20 June 1781, a most violent storm of thunder and lightning struck Salisbury, *England* than has been known there for many years. A ball of fire fell upon a barn at Shrowton [Shrewton], set it on fire, and consumed it along with another barn, with their contents, to ashes. A large oak tree in Longleat Park, the seat of Lord Weymouth, was shivered in pieces by the lightning, and scattered in every direction to the distance of 130 yards [119 meters], one splinter weighed 150 pounds [68 kilograms].<sup>270</sup>

On 20 June 1781, the *Pheasant* cutter, Lieutenant Matthews, commander, in his passage from Jersey to Portsmouth, *England*, was unfortunately crossed by a whirlwind [waterspout?], which in a moment split every sail, the vessel broached too, filled and sunk, and every soul, except the pilot, the master, and two boys perished.<sup>270</sup>

The summer of 1781 was very warm in northern and southern *France*. The summer in Paris was characterized by:

Hot days	54 days
Very hot days	5 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The months of June and July were very hot. The high temperatures observed during the summer were:<sup>62</sup>

Metz, <i>France</i>	(100.6° F, 38.1° C)
Liège, <i>Belgium</i>	( 99.5° F, 37.5° C) on 26 July and 2 September
Montpellier, <i>France</i>	( 97.3° F, 36.3° C)
Troyes, <i>France</i>	( 97.3° F, 36.3° C)
Poitiers, <i>France</i>	( 96.8° F, 36.0° C)
Paris, <i>France</i>	( 93.9° F, 34.4° C) on 31 July
Denainvilliers, <i>France</i>	( 93.9° F, 34.4° C) on 31 July
Bordeaux, <i>France</i>	( 93.2° F, 34.0° C)
Dax, <i>France</i>	( 92.8° F, 33.8° C)
Mulhouse, <i>France</i>	( 92.1° F, 33.4° C) on 3 September
Stockholm, <i>Sweden</i>	( 90.5° F, 32.5° C)
Amsterdam, <i>the Netherlands</i>	( 84.9° F, 29.4° C)
London, <i>England</i>	( 84.0° F, 28.9° C) on 31 July

The summer of 1781 in northern *France* was very hot.<sup>79</sup>

The drought of 1781 in northern *France* prevailed especially in spring and summer. The drought lasted longer than six months. The drought began after a furious storm, which occurred on February 27. The drought persisted, except for some short rains until mid-September. The drought, accompanied by heat, made the harvest very early and very fertile. The year produced only 14.5 inches (367 millimeters) of rainfall compared to a typical yearly average of 20.9 inches (530 millimeters). The annual number of rainy days in Paris and northern *France* raised only to 91 instead of [the typical level of] 150.<sup>79</sup>

During the summer of 1781, the temperature peaked at 89.6° F (32° C) at Marseille and 96.8° F (36° C) at Montpellier, *France*.<sup>79</sup>

The drought in northern *France* was great. In Paris the rainfall for the entire year was only 362 millimeters (14.3 inches). In the south, downpours of rain in June caused the harvest to be very mediocre. In Burgundy, the grape harvest began on 10 September. The grain harvest was sufficient in central and northern *France*.<sup>62</sup>

A letter from Beaumaris, *Wales* of 1 July 1781, describes the tempestuous weather that lately struck their coast, which had been such that no man living remembers the like, by which the shipping suffered much.<sup>270</sup>

On 1 August 1781, a hurricane struck *Jamaica*.<sup>124</sup>

In August, a hurricane struck *Jamaica*.<sup>40, 41, 42</sup>

In August 1871 another hurricane, scarcely less violent than the 1870 hurricane struck *Jamaica*. Over a hundred ships were driven ashore, including a number of men-o-war, and again all the newly-planted provision grounds were destroyed.<sup>152</sup>

On 1 August 1781, a powerful hurricane struck *Jamaica*. The hurricane drove over 120 vessels ashore destroying a great number of them. Amongst the 120 ships were 30 British men-of-war. Many lives were lost on these ships. More than twenty bodies were recovered. There were more losses on shore.<sup>141</sup>

On 1 August 1781, *Jamaica* was desolated by a hurricane. Seventy-three light vessels were driven on shore, two loaded ships sunk, twenty-four ran on shore, between the Salt Ponds and Mosquito Point. His Majesty's Ship *Ulysses* was dismasted. His Majesty's ship *Southampton* was dismasted and driven to Wreck Reef, to leeward of Port Royal. Many houses and piazzas were blown down. His Majesty's ship *Thunderer*, seventy-four guns, was lost with all her crew. The *Stirling Castle*, sixty-four guns, was lost on the *Silver Keys*, and only fifty of her crew was saved. The *Deal Castle*, twenty-four guns, was lost in *Puerto Rico*. The *Endeavour* brig, fourteen guns, was lost on *Jamaica*. On 2 August 1781, His Majesty's ship *Pelican*, commanded by Captain Collingwood, was wrecked upon the Morant Quays [*Morant Cays*], in a violent gale of wind. All the crew except 4 were saved.<sup>143</sup> [*Morant Cays* is an offshore island group 51 kilometers SSE of Morant Point, *Jamaica*.]

On 20 August 1781, the *Sophia Albertina*, a Swedish man of war of 72 guns, Johan Gustaaf Schiold, commander, convoy to a fleet of 7 merchantmen bound to Cadiz, was wrecked on the Haaks on the coast of Holland [*the Netherlands*], and of 554 men, of whom the crew consisted, only 26 were saved on pieces of the wreck. The violence of the storm in which this ship perished was irresistible, and several Portuguese ships, as well as those of Holland [now *the Netherlands*] and other nations, which happened to be on the coast at the same time, shared the same fate.<sup>270</sup>

On 23 August 1781, a hurricane desolated Louisiana in the *United States*; Mississippi Delta entirely inundated.<sup>117</sup>

On 29 October 1781, a hurricane struck the *Atlantic Ocean*. The ship *Peach and Plenty* from Cork traveling to the West Indies was overset [overturned] by a hard gale of wind and all the crew perished except one.<sup>141</sup>

A letter from Bade in *Hungary* dated 1 September 1781 reported that the grapes are already ripe in their vineyards, and the vintage so superabundant that a ton full of wine it offered for two casks of equal measure.<sup>270</sup>

On 4 September 1781 at Carlisle, *England* and its neighborhood, “there fell the heaviest rain that has been known in the memory of man, by which many fields of corn [grain] were overflowed, the rivulets rose to an alarming height, and great damage has been sustained by many individuals.”<sup>270</sup>

In 1781 during the period between 24 April and 22 May, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p’ing. During the period between 21 July and 18 August, a drought engulfed Chekiang province at Chin-hua and Hsin-têng.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: April 22<sup>nd</sup> – cold and windy. April 29<sup>th</sup> – moderate. May 1<sup>st</sup> – pleasant day, quite reviving. May 9<sup>th</sup> – cold and windy. May 15<sup>th</sup> – warm. May 20<sup>th</sup> and 21<sup>st</sup> – summer days. May 30<sup>th</sup> – hot summer weather. June 11<sup>th</sup> – a fine growing season. June 19<sup>th</sup> – heavy shower, with thunder and lightning, and great hail. June 27<sup>th</sup> – a deluge of rain. June 30<sup>th</sup> – no summer except for three days. July 5<sup>th</sup> – a hot day and night. July 8<sup>th</sup> – extremely hot. July 15<sup>th</sup> – very hot. July 24<sup>th</sup> – small showers; a very dry time. July 30<sup>th</sup> – a merciful shower. August 6<sup>th</sup> – a grievous drought. August 13<sup>th</sup> – a plentiful rain. August 20<sup>th</sup> – a deluge of rain. September 12<sup>th</sup> – hot weather. September 20<sup>th</sup> – fine weather. September 24<sup>th</sup> – a summer’s day. October 8<sup>th</sup> – horrid cold. October 10<sup>th</sup> – a very hot summer’s day. October 11<sup>th</sup> – hotter (like this day 59 years.) October 22<sup>nd</sup> – it froze last night. October 31<sup>st</sup> – a moderate fall, thus far. November 2<sup>nd</sup> – a great storm, and a deluge of rain. November 11<sup>th</sup> – a moderate day. November 18<sup>th</sup> – rainy.<sup>78</sup>

*Also refer to the section 1780 A.D. – 1784 A.D. for information on the drought and famine in Bangladesh, Pakistan, and India during that timeframe.*

---

**Winter of 1781 / 1782 A.D.** In Plymouth [*United Kingdom*] on 16 February 1782, “The most intense frost almost ever known. . . . The grass, which on Friday was as green and flourishing as if it had been midsummer, on Sunday morning seemed to be entirely killed. This is mentioned by our correspondent as very unusual in that part of the country; and the snow lay on the ground in many places.”<sup>47, 93</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: In 1781 on November 23<sup>rd</sup> – blustering and cold. November 25<sup>th</sup> – snowstorm. November 30<sup>th</sup> – a tedious, cold, stormy month. December 7<sup>th</sup> – snow. December 11<sup>th</sup> – good sledding. December 28<sup>th</sup> – storm of fine snow. December 31<sup>st</sup> – another great snowstorm. In 1782 on January 1<sup>st</sup> to 7<sup>th</sup> – thaws. January 11<sup>th</sup> – snow. January 13<sup>th</sup> – a great snowstorm. January 16<sup>th</sup> and 17<sup>th</sup> – severe cold. January 28<sup>th</sup> – colder. January 29<sup>th</sup> – very blustery and cold dismal winter. January 30<sup>th</sup> – the harbor has been frozen up a fortnight [for 14 days]. January 31<sup>st</sup> – cold still. February 3<sup>rd</sup> – still cold and snowy. February 12<sup>th</sup> – colder than any day yet. February 26<sup>th</sup> – the harbor down to the islands remains shut up. February 28<sup>th</sup> – a long, close [overcast], stormy and severe winter as perhaps ever was known.<sup>78</sup>

The winter of 1781 in Philadelphia, Pennsylvania in the *United States* was very mild but spring was cold and backwards.<sup>1</sup>

In Selborne, *England*, in November and December 1781, the weather was warm and rainy and this weather prevailed until 4 February 1782. Then followed eighteen days of hard frost, after which to the end of March, the weather was cold and windy, with frost, snow, and rain.<sup>70</sup>

On 3 January 1782, *France* reported the winter weather was unhealthy. The weather was as warm as spring; and sickness so prevalent that all the physicians and apothecaries were making fortunes. Accounts from the southern provinces say the rains have been incessant for 15 days.<sup>269</sup>

On 10 February 1782, “a dreadful hurricane arose at Corunna [A Coruña] in *Spain*, by which more than 30 vessels perished. The sea swelled to a tremendous height, and many houses, warehouses, &c. were washed away.”<sup>269</sup>

On 16 February 1782 at Plymouth, *England*, there “was the most intense frost almost ever known; some water in a bedroom (wherein was kept a constant fire) just poured out was, whilst the family went to break fast [breakfast], covered with ice; and the grass, which on Friday was as green and flourishing as if it had been midsummer, on Saturday morning seemed to be entirely killed. This is mentioned by our correspondent as a thing very uncommon in that part of the country; and the snow lay on the ground in many places.”<sup>269</sup>

On 11 March 1782, “the river Clyde rose higher than has ever been known in the memory of man. In Glasgow [*Scotland*] the waters reached half way up the Salt Market.”<sup>269</sup>

On 1 May 1782, “the weather was uncommonly severe, not in *England* only, but almost all over *Europe*. At Vienna [*Austria*] the frost continued so rigorous that the vines were thought to be materially hurt. In *Italy* such a fall of snow as has never been remembered. In *Russia* many thousands have perished of a sickness owing to the rigour of the season. In *Sweden* men and cattle have perished for want of food. In the Highlands of *Scotland* cattle die, or are killed for want of fodder. In short, the severity of the weather has been generally felt.”<sup>269</sup>

On 1 May 1782, the severity of winter continued longer that year in all parts of *Europe* than was ever known.<sup>128</sup>

**1782 A.D.** In *England*, there were great floods in Northumberland; Hexham and other bridges thrown down.<sup>47</sup>

Inundations in the north of *England* in March 1782, caused the Hexham Bridge and Ridley-Hall Bridge and others to be thrown down.<sup>40, 41, 43</sup>

On 18 March 1782, lightning struck an ammunition storage magazine at Fort Marlborough, Sumatra [in western *Indonesia*], which contained 400 barrels of powder and blew it up. It destroyed [the munitions] stores and killed several men.<sup>226</sup>

On 3 April 1782, reports were received of an inundation in the north of *England*. The bridges of Hexham and Ridley Hall were destroyed.<sup>128</sup>

On 22 April 1782, a storm at Surat in western *India* destroyed 7,000 of the inhabitants.<sup>128</sup>

In *India* on the 22<sup>nd</sup> of April, there was a great storm at Surat; about 7,000 inhabitants destroyed.<sup>41, 43, 57, 90</sup>

In *India*, “At Surat, a Dutch settlement lately taken by the English, a most dreadful hurricane arose, which carried all before it; neither man, horses, nor sheep could be saved. The storm began from the southeast

and ended northwest with the same fury. The whirlwind swept into the sea more than 3,000 inhabitants, who in the first moments had taken refuge between Surat and Domus.”<sup>57, 253</sup>

A storm struck Dieupole, Moravia (*Czech Republic*) on May 30, 1782; which totally destroyed the place.<sup>41</sup>

From January to May 1782, the amount of rain that fell in Suffolk, *England* was 13.45 inches [34.16 centimeters].<sup>269</sup>

In *France* on the 17<sup>th</sup> of June, hailstorm; stones weighed 8 ounces.<sup>41, 43, 56, 57, 93</sup>

On 18 June 1782, a most severe storm of thunder and lightning struck London, *England* and a waterspout struck near Clapham Common. A thunderstorm also struck Thornbury in Gloucestershire and its neighborhood. A ball of fire fell upon the church, broke down one of the pinnacles, and covered the pavement within with mortar and shattered stones. At Pilton near Wells, the same storm very much damaged the church, killed a poor man that was tolling the bell, and two oxen that were grazing in an adjacent field.<sup>269</sup>

On 23 June 1782, a tornado struck New England in the *United States*. It first appeared at Dalton, Massachusetts (also known as Ashuelot-Equivalent). It leveled two large houses and uprooted trees. Then it swept through Manchester, Vermont, doing great damage to the crops and buildings. The storm then passed onward to Royalton, Vermont. The storm caused hailstones of extreme size to fall. Some of the individual hailstones were 6-inches [15 centimeters] in diameter and weighed a pound. It also caused flash flooding. The water was knee deep in many houses and buildings. The tornado, which cut a half-mile [0.8 kilometers] wide path of destruction, passed through Weathersfield, and then crossed the Connecticut River into New Hampshire, where it proceeded through Claremont and Croydon. The tornado left a scene of desolation along its entire path.<sup>199</sup>

On 28 June 1782, at the village of Venisy and its neighborhood in the district of Senonois [*France*], after some severe claps of thunder and a rumbling noise like the flourish of a thousand drums, there fell a storm of hail, the stones of which were as large as an ordinary apple, with a hard substance in the middle crystallized by which several persons were dangerously wounded, and all the game and fruits of the earth destroyed. This was succeeded by so dreadful a fall of rain, that in less than two hours the inhabitants were obliged to take refuge on the tops of their houses, while the torrent below carried everything before it. Most of the cattle perished, and the country laid waste.<sup>269</sup>

On 16 July 1782, “one of the most terrible storms that has been known in the memory of man alarmed the whole neighbourhood of Padstow [*England*]. The thunder and lightning began about one in the morning, and continued till nine, when the wind rose in squalls, and the rain fell in torrents. Several vessels were cast away on the western coast. In the neighbourhood of London the storm was no less severe; and, what is uncommon, after the thunder and lightning had ceased, it rained incessantly for more than 12 hours. The heavy corn suffered much; and it is feared the farina, which had just begun to shew [show] itself on the wheat, was not a little hurt.”<sup>269</sup>

On 17 July 1782, a storm of hail in *France*; some of the hailstones weighed eight ounces.<sup>128</sup>

On 22 July 1782, a hailstorm at Madrid, *Spain* destroyed glass to the value of 6,000*l*.<sup>128</sup>

In Madrid, *Spain*, a violent hailstorm struck on July 26. “Some of the stones weighed a pound.” £6,000 damage to glass windows.<sup>40, 41, 43, 56, 57, 93</sup>

In northern *France* following two months of very mild temperatures, cold weather suddenly materialized in the middle of February 1782. This occurred after several days of strong winds and extraordinary changes in the barometer. The following months, especially May and August, were still very cold and very wet. Intense short burst of heat were felt in July. There was no fall. A cold winter suddenly took hold beginning in the middle of October.<sup>79</sup>

The summer of 1782 produced many rainfalls in northern *France*. Nevertheless, very high temperatures were observed in various places.<sup>62</sup>

Haguenau, <i>France</i>	(102.9° F, 39.4° C)
Manosque, <i>France</i>	(101.8° F, 38.8° C)
Paris, <i>France</i>	(101.7° F, 38.7° C) on 16 July
Nancy, <i>France</i>	( 99.7° F, 37.6° C) on 26 July
Mulhouse, <i>France</i>	( 97.9° F, 36.6° C) on 26 July

Saint-Gotthard, <i>Switzerland</i>	( 66.9° F, 19.4° C)

In Burgundy, *France*, the grape harvest began on 30 September. In the south [of *France*], a drought struck without interruption from June until October. This caused the loss of maize and vegetables. In the north, the harvest was poor.<sup>62</sup>

On 16 August 1782, “about two in the morning the most dreadful fall of rain began at Dublin [*Ireland*] and its neighbourhood, that was ever remembered in that country. It continued for fourteen hours, with a violence that was truly alarming. The distress of the inhabitants in different parts of Dublin are beyond description. Rings-end bridge was borne down by the flood.”<sup>269</sup>

Letters from Holland [now *the Netherlands*] dated 18 August 1782 brought a melancholy account of the effects of the cold and wet weather, which destroyed the hopes of a plentiful harvest all along the coasts of the Rhine.<sup>269</sup>

On 24 August 1782, “the heaviest rain fell in the neighbourhood of Elgin [*Scotland*], about 20 miles [32 kilometers] to the north of Aberdeen, that ever had been known in the memory of man. The floods swelled the river Lossie to such a degree, that it bore down the mills and every thing before it. The road going into Elgin from the east was so torn by the river as to be impassible. The river Findhern rose and overflowed its banks, laying the fine, fertile, and most beautiful vale between its usual bed and the burn [creek] that runs by Fenre into one continued sheet of water. The ferryman’s house was carried away, and the river now runs where the road was that led to the ferry. The Burn of Delvey carried away the bridge of that name and the adjoining houses along with it. At Nairn the fine new bridge at the east end of the town was born down by the flood, as was also the Highland bridge, a few miles above the town, by the same river. In the flat road between Nairn and Inverness the water lay so high as to float the chaises [carriages] that were passing that way. At Sligo in *Ireland* the inundation was still greater. The water rose ten feet [3 meters] above high water mark; and the Mardyke being broken down, the flood reached as far as Ballyade, and carried all before it.”<sup>269</sup>

In August-September 1782, a hurricane struck the *Atlantic Ocean*. The corsair, *St. Juan Nepomuzeno*, sailed from St. Andero [Spain] bound for Havana, Cuba on 15 August, and foundered in a violent storm the same day in sight of the port. The crew and passengers all drowned.<sup>141</sup>

On 16-17 September 1782, a great Atlantic hurricane struck the *central Atlantic* causing approximately 3,000 deaths.<sup>107</sup>

On 16-17 September 1782, a hurricane struck the central *Atlantic Ocean* causing more than 3,000 deaths. [Ellms (1860) locates the disaster at 48° 33' N 43° 20' W, placing in doubt the tropical character of the storm. *Lloyd's List* (Oct 1782), however, has accounts of storm from the Jamaica Fleet at 43° N 48° W, and at 43° N 44° W. At the latter location, in a gale of wind from east-southeast on the 16<sup>th</sup> in the evening, when on the morning of the 17<sup>th</sup> the wind came out in an instant to northwest. The storm lasted for two hours. A very similar account from an officer on the *Ramilies* at 42.3° N and 48.9° W is reprinted in Redfield (1836).]<sup>141</sup>

On 16 September 1782, a hurricane destroyed many English ships, belonging to the fleet of ninety sails [sailing vessels] that were heading in the *Atlantic Ocean* from the banks of Newfoundland, Canada to Jamaica. The *Ramillies*, the *Centaur*, *L'Hector*, the *Ville de Paris*, and many other ships, the spoils of Rodney's victory [Battle of the Saintes] in the West Indies, all perished.<sup>204</sup>

A fleet of 150 merchantman sailing ships under convoy with 7 men-of-war set out from Jamaica on 26 July for different ports. On 16 ult. [16 September 1782] at latitude 45° N., longitude 48° W. [off the Grand Banks near Newfoundland, *Canada*] ran into a severe gale. Several ships were damaged in the storm. The *Ramillies* commanded by Admiral Graves lost its main and mizzenmasts. The *Centaur* lost all her masts along with her bowsprit, head, and rudder. The *Canada* lost her mizzen and main topmasts. The *Glorieux* lost her bowsprit and foremasts. The *Ville de Paris* lost her main sail. The *Alexander* of Glasgow lost her mizzenmast and rudder. The *Salt River* lost her mizzenmast and her sails were ripped to pieces. The *Minerva* lost her bowsprit and foretopmast. The *Good Hope* and the *Druid* lost their main sails. Many other ships lost their masts and bowsprits. The morning after the storm, the ocean was littered with puncheons [barrels], bags of cotton, logs of mahogany, masts, spars, etc.<sup>269</sup>

On 23 September 1782 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 23 September 1782, a hailstorm struck London, *England*. The hailstones were unusually large and broke many windows.<sup>269</sup>

On 5 October 1782, reports were received of the fleet from Jamaica which suffered much by a gale of wind off the banks of Newfoundland, *Canada*. The *Ville de Paris* of 110 guns, one of the Admiral Rodney's prizes; and the *Glorieux*, *Centaur*, and *Ramilies* were all lost.<sup>128</sup>

The convoy ran into a violent Atlantic storm, which sent the *Ville de Paris* and another vessel *Le Glorieux*, to the bottom with the loss of 1,200 men.<sup>152</sup>

On 5 October 1782, the first news of the tremendous gale, which the Jamaica fleet with their convoy met with off *Newfoundland*, was received at the Admiralty office.<sup>269</sup>  
— “Capt. Cornwallis of the *Canada* man of war of 74 guns, who arrived at Portsmouth [England] the day before, brought the account of the return of the *Ardent* of 64 guns, one of the convoy, to Port Royal in Jamaica, having sprung a leak in Blue Fields; that the *Glorieux*, with five merchantmen, joined the convoy off the Grand Carnarias [Gran Canaria]; and that off the Havanah [Havana, Cuba] they fell in with Adm. Pigo, who was cruising in order to intercept Don Solano's fleet from Cape Francois; and who had

taken a nest of American privateers waiting for the fleet, and had destroyed a fort in Matansa-bay [Matanzas Bay, Florida], that harboured them.”

— “Capt. Moulton, of the *Truelove* Jamaica man, who arrived at Portsmouth [England] about the same time, gave a still more deplorable account of the effects of the above gale, which continued three days, and in which the *Rodney* was seen to perish; the *Truelove* had seven feet [2 meters] water in her hold, and was saved only by the lightness of her cargo, chiefly spirits. The gale came on the 16<sup>th</sup> of September. On the 17<sup>th</sup>, 35 sail [sailing ships] were seen most of them dismasted or water-logged. On the 24<sup>th</sup> the *Parnassas*, Capt. Carr, was seen captured by an American privateer, but has since been retaken. *Ville de Paris*, 104 guns, her mainsail carried away. *Glorieux*, 74 [guns], lost her foremasts, bowsprit, and misen [mizzen] top-mast. *Centaur*, 74 [gun], lost all her masts. *Ramelies*, 74 [guns], after losing her mizzen-mast, main-mast, and fore top-mast, went to the bottom; most of the crew saved. *Canada*, 74 [guns], lost her mizzen-mast. *Caton*, 64 [guns], went to America in distress before the gale, and the *Palas* to attend her. *Ardent*, 64 [guns], so leaky that she was obligated to put back to Port Royal, from Bluefields. *Jason*, 64 [guns], left watering at Bluefields, when the fleet sailed, and was seen some time after near the Canaries.”

On 17 October 1782, it was reported that Admiral Graves was on board the *Ramelies* when she foundered in the gale off *Newfoundland* [of 16 September] but was taken up by the *Belle* and landed safely at Waterford in Ireland.<sup>269</sup>

On 8 October 1782, a hurricane struck Surat in state of Gujarat, *India* killing 3,000 inhabitants and destroying much shipping.<sup>242</sup>

On 15 October 1782, there was a most violent storm that struck Madras [Madras now Chennai, *India*] and immense damage was done to the shipping. One hundred coasting vessels were lost.<sup>241, 242</sup>

A letter was received from Madras [the southeastern coastal region of *India* now referred to as Chennai] dated 17 October 1782. “This coast has been visited by as severe a gale of wind as ever was known by the oldest inhabitant of Madras. About noon, on the 15<sup>th</sup>, it began to blow, and before night it was a perfect hurricane. The surf was so high, that it was impossible for any boat could either got off or come on shore. Very fortunately Sir Edward Hughes had anchored in 15 fathom water, and finding the gale increase he put to sea in the afternoon. He had an entertainment on board the *Superbe*, and was obligated to take his company to sea with him. In the night, *the Hertford*, *the Free Trade*, *the Shannon*, *the Nancy*, *the Essex*, and a Moorman’s ship, were all drove on shore. *The Free Mason* foundered at her anchors, and near 100 snows [merchant sailing ships] and donies were entirely lost. The beach for some miles were strewed with wrecks and dead bodies. *The Neckar* lost her main-mast, and the *True Briton* was entirely dismasted.”<sup>253</sup>

On 28 October 1782, a letter was received from Glasgow, *Scotland*, “that they have had for many days a continual fall of snow, rain, and hail, such as have not been remembered by the oldest man living, which has laid every thing under water, and the corn [grain] which was left upon the ground is much damaged, so that every necessary of life is grown so dear [scarce] that the poor in that part of *Scotland* are in the greatest distress.”<sup>269</sup>

On 30 October 1782, a strong gale from the northwest (mistral) broke out in Provence, *France*. Acting on a surface of 33 square centimeters, a weight of nearly seven kilograms. Nothing could resist this extraordinary violence, if it had only been sustained a few minutes. During the hurricane, the barometer sank 8 millimeters below the average height. It was then and still is now the strongest Mistral known.<sup>79</sup>

In October-November 1782, a hurricane struck the *Atlantic Ocean*. A ship foundered in its passage from Haiti to Europe.<sup>141</sup>

The proportion of rainfall in 1782 was greater at high latitudes in *France*. In Metz and Montmorency, the annual rainfall surpassed the average by about 2.1 inches (54 millimeters). Metz had twelve more rainy days than normal. Montmorency had thirty-two more rainy days than normal.<sup>79</sup>

Letters received from Lisbon, *Portugal* give a lamentable account of the [grape] vintage in that country; and the state of the harvest, which has almost failed throughout Portugal, owing to the uncommon wetness of the season. At the beginning of December [1782], fruit was hanging on the trees as green as four months before.<sup>253</sup>

On 4 December 1782, it was reported that “The inhabitants of Birmingham and Hinckley [in *England*] have shewn [shown] a laudable spirit on this occasional dearth, and have raised a subscription to buy bread at the present advanced [high] price, and to resell it to the poor at a reduced price.”<sup>269</sup>

On 21 December 1782, Derbyshire, *England* reported that some of the northern counties are full of distress of the poor [due to scarcity/famine] and the southern counties seem to have suffered less.<sup>269</sup>

A great famine appears to have occurred in *Hungary* in 1782 from the following account. “There have been already put to death in *Hungary* 45 cannibals; 150 more are still in prison, among whom, we are assured, are fathers who have had the barbarity to cut the throats of their wives when pregnant, and devour children in the womb; and sons who have massacred, roasted, and eaten their fathers and mothers. The Emperor, who cannot be persuaded that there are such ferocious characters in the world, has just written to the judges of *Hungary* to suspend all further execution of these horrid wretches, till his Imperial Majesty can send to the spot a commission to examine the proceedings against them.”<sup>253</sup>

[Towards the end of 1782] accounts from Philadelphia [Pennsylvania in the *United States*] indicate that the harvest was remarkably plentiful in the middle provinces. And as a result, wheat sold at New York from 15 to 13 shillings per quarter [quarter ton].<sup>253</sup>

In Yarle in Denbighshire County in northeast *Wales*, the distresses of the poor, from the badness of last year’s harvest [harvest of 1782] is truly pitiable. Great part of the corn rotted on the ground, and what was got in was fit only for the hogs.<sup>253</sup>

In 1782, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 14 January and 11 February, floods struck Hupeh (now Hubei province) in central *China* at I-ch’êng and Chiang-ling; and Shantung (now Shandong province) on the east coast of *China* at Shou-kuang and Po-hsing.

— During the period between 10 July and 8 August, floods struck Hupeh province at Wuchang, An-lu, Ao-ch’êng, Huang-p’o and Hanyang; Kiangsi (now Jiangxi province) in southern *China* at Tê-an; Chekiang (now Zhejiang province) on the east coast of *China* at Shui-an; and Szechwan (now Sichuan province) in southwest *China* at San-t’ai, Shih-hung, Sui-ning [possible misprint, “Sui-an”], P’êng-ch’i, Chung-chiang, and Yen-t’ing. In Szechwan province within the areas named, almost all the houses and fields were destroyed by the floodwaters.

In 1782 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Wên-têng. During the period between 11 June and 9 July, a drought engulfed Shantung province at Huang. During the period between 10 July and 8 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Lo-t’ien. During the period between 8 August and 8 November, a drought engulfed Shensi (now Shaanxi province) in central *China* at Sui-tê.<sup>153</sup>

In 1782 during the 6<sup>th</sup> moon on the 18<sup>th</sup> day, there was a storm in the vicinity of Shanghai, *China*. The

storm produced great wind and rain. It tore up trees, capsized boats and threw down houses. Seawater was carried into the canals, making them briny for two weeks.<sup>166</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

March 1<sup>st</sup> – moderate. March 6<sup>th</sup> – rainy. March 14<sup>th</sup> – a fine day. March 18<sup>th</sup> – a deluge of rain. March 23<sup>rd</sup> – lion-like March. March 26<sup>th</sup> – high winds and cold. April 2<sup>nd</sup> – a delightful day. April 7<sup>th</sup> – a heavy rain. April 14<sup>th</sup> – a pleasant day. April 16<sup>th</sup> – the spring is moderate and forward. April 28<sup>th</sup> and 29<sup>th</sup> – pleasant. April 30<sup>th</sup> – the spring is thought to be remarkably forward. May – a cloudy, wet month containing a few fair days, but not any hot ones. June 30<sup>th</sup> – a wonder of a season; the Indian corn, that was backward, revived and flourishes. August 31<sup>st</sup> – a memorable summer, with but few hot days. September 4<sup>th</sup> – a horrid cold day. September 16<sup>th</sup> – very cold. September 17<sup>th</sup> – pleasant summer’s day; a wonder! September 24<sup>th</sup> – plentiful rain. September 30<sup>th</sup> – a delightful day. October 5<sup>th</sup> – a week of pleasant weather. October 14<sup>th</sup> – a dry time. October 17<sup>th</sup> – a grand rain. October 23<sup>rd</sup> – a delightfully warm day. October 25<sup>th</sup> – another. October 31<sup>st</sup> – it snowed most of the day. November 2<sup>nd</sup> – very cold. November 9<sup>th</sup> – moderate. November 28<sup>th</sup> – horrid cold and windy. December – a cold month.<sup>78</sup>

*Also refer to the section 1780 A.D. – 1784 A.D. for information on the drought and famine in Bangladesh, Pakistan, and India during that timeframe.*

+++++

### **Taiwan Mega-Tsunami**

In a letter published in the Chinese State Paper from the Governor of the province of Fourkein to the Emperor. “Theheu, Governor General of the province of Fourkein, and Tehe-Kiung-ya, Viceroy of Fourkien [Fourkein], and other officers, make known to your Majesty the disaster which has lately befallen the island of Tay-Ocan (by us called Formosa [now *Taiwan*]) Mou-ha-lan, and the other officers of that island, informed us by letter, that on the 22nd day of the 4th moon (22nd of May, 1782) [This date conversion is wrong. It should read 2 June 1782 in the Gregorian calendar.<sup>219</sup>] a most furious whirlwind, accompanied with a very heavy rain, &c. an higher tide than was ever observed in the memory of man, struck the inhabitants with an apprehension of being swallowed up by the sea, or buried alive in the earth. From the hour *yn* (Chinese hours are double to our own; *yn* begins at three and ends at five in the morning) to the hour *oeici* (begins at three, and ends at five, P.M.) the dreadful storm seemed to break out from the four corners of the earth, and lasted all that space of time with unabated fury. The buildings, where usually sit the courts judicature, public granaries, barracks, warehouses, and folines, were levelled to the ground, and nothing could be saved out of them; the shops of the tradesmen and artists, as well as the dwelling houses of the inhabitants, are nothing now but a heap of rubbish and ruin. Of seventeen men of war, then in the harbour, two have been sunk, two more dashed to pieces, and ten are so completely battered as to be entirely unfit for future service. The same fate has attended smaller ships, above an hundred in number; eighty of the latter have been swallowed up; five of them, which had just taken in their laden of rice, amounting to 100,000 bushels, are totally lost as to the rest of the shipping, which had not yet reached their mooring, ten or twelve of the larger sort were sunk; the lighter vessels, and a great number of small craft have disappeared, and left no traces behind them: as the whole island was under water, the produce of its soil is either carried off, or so far spoiled, as to endanger the lives of those who might dare to make use of them; and as for the crop, it is entirely ruined. This, however, is only an [a] hasty sketch of the dreadful calamity. When we are better informed, we shall make it our business to transmit to your Majesty a more circumstantial account.”<sup>248, 252</sup> [This account was published in the September 1783 edition of *The Political Magazine and Parliamentary, Naval, Military and Literary Journal* and the September 1783 edition of *The Scot Magazine*.]

In December 1782, a great part of the isle of Formosa in China [now *Taiwan*] was destroyed by an inundation of the sea, occasioned by an earthquake, wherein 40,000 souls were lost.<sup>241, 242</sup> [This account was published in the February 1784 edition of *The Hibernian Magazine, or, Compendium of Entertaining*

*Knowledge* and the January 1784 edition of *The European Magazine and London Review*. In both editions, the original account according to the entry was received {in Great Britain?} on 12 August 1783.]

[Suspecting these two accounts might refer to the same event, I asked Robert Juhl in the Far East to see what he might dig up. This is what he uncovered:]

— One secondary Chinese source quotes an entry in what looks like a local gazette: "22<sup>nd</sup> day of the 4<sup>th</sup> lunar month (2 June 1782), Taiwan was suddenly struck by a typhoon. The sea tides rose suddenly, and official buildings, fields, and the local inhabitants suffered great damage. The emperor instructed [local officials to] sympathize with and give relief to the disaster victims."

— "Between the 4<sup>th</sup> and 5<sup>th</sup> months (24 April - 21 June 1781), at a time when the weather was fair and clear, the sea suddenly roared like thunder and welled up into the sky, with water rising several zhang [A "zhang" is a traditional Chinese unit of length equal to 9.8-12.1 feet, 3.0-3.7 meters] (at then Jiateng harbor in Fengshan county at latitude 22.62°N, longitude 120.34°E, on the southwest coast of Taiwan). The people in nearby villages were submerged and climbed into trees, thinking they were certain to die. After some time (45 min to an hour or more), the water retreated in a violent rush."

— A separate report of what may be the same event quoted in a secondary source [Seismological Bureau of Shantou] gives the date as 22 May 1781, saying: "An area about 120 km. long on Taiwan's SW [southwest] coast was first hit by a destructive earthquake, followed by a tsunami. The destruction lasted 8 hours. Nothing but debris was left of [today's] Tainan City, 3 towns, and 20 villages. 40,000 people died. Innumerable boats were damaged or sunk. Promontories and coastlines were washed away, replaced by coves and cliffs."

[Now things are getting interesting! If these accounts describe the same event, then we are looking at a strange mega-tsunami. Immediately before the event, "the weather was fair and clear". There was an earthquake. Then the sea "suddenly roared like thunder". There was a "most furious whirlwind". The sea "welled up in the sky". A mega-tsunami struck and the inhabitants had "the apprehension of being swallowed up by the sea". The "whole island was under water." The mega-tsunami caused great devastation along 120 kilometers [75 miles] of the southwest coast of Taiwan. Then the area was struck by heavy rains and a dreadful storm that broke out from "the four corners of the earth", and lasted several hours "with unabated fury". As a result, there was almost total devastation and 40,000 casualties. "Promontories and coastlines were washed away, replaced by coves and cliffs."

An asteroid/comet impact off the coast of Taiwan would produce effects very similar to those described above. The impact event would generate a ground shock wave that might be described as an earthquake. It would create an atmospheric blast wave that might be described as a sudden roar and a most furious whirlwind. It would generate a devastating water compression wave, a mega-tsunami if the impact was near the coastline. An ocean impact would eject massive amounts of ocean water into the atmosphere. This might look like the sea "welled {rose} up in the sky". This debris, primarily ocean water, would fall back to the Earth and the effects might appear as an extremely heavy rainstorm.]

A little more research turned up the following article published in *The Gentleman's Magazine: and Historical Chronicle* of August 1783 describing the dreadful catastrophe which happened to the island of Formosa [now *Taiwan*] in the Chinese seas: "About the beginning of December last new volcanos appeared, with dreadful craters upon the mountains which divide the isle of Formosa, East and West, situated in the Chinese ocean, in the middle of the province of Fokein [Fourkein], north of Japan, south of the peninsula of Corea [Korea], and east of the Philippines. The explosion of these volcanos was accompanied with a hurricane, attended with a subterraneous motion of the isle, which being moved from East to West, and having its bounds overflowed by waves of the sea, sunk and disappeared under a deluge of water, so that nothing but the tops of the mountains were to be seen. This convulsion of nature lasted more than eight hours with the same motion. The three principal towns Tai-Ovan-Fou, Jong-Khan-Hien, and Tehu-Lo-Hien, with 20 boroughs, or little towns, were entirely buried, and the ruins of them washed

away by the agitation of the waters. Upwards of 40,000 inhabitants have been drowned, and all the parts of the earth which projected into the sea have been broken off and sunk. The islands of Pongzhou and several others, the forts of Zelande, of Ngan, and Pingt-Chingi have disappeared, as well as the little hills upon which they stood. History nowhere records a disaster more terrible. *Later advices speak only of a few towns being overflowed.*"<sup>253</sup> [Tai-Ouan-Fou, Fong-Chan-Hien and Tchu-Lo-Hein were at the time inhabited by the Chinese and were the 3 Governmental Capitals dividing up Taiwan. The capital city called Tai-Ouan-Fou was very populous, a place of great commerce and equal to the greatest cities of China at that time. The islands of Pongzhou might refer to the islands of Pong-Hou, the chief island of the Pescadores. Fort Zeelandia was built by the Dutch and was a fort in the town of Anping (Tainan), Taiwan. The Fort Ngan-Ping-Tching was located at the Foot of the Castle of Zeland.]

---

**Winter of 1782 / 1783 A.D.** In *France*, "On the night of the 11<sup>th</sup> November 1882, it froze so hard at St. Pons, a district in [southern] *France*, during a heavy shower of rain [freezing rain], so as to form a glazing as clear as crystal, and at the same time of the density of the most compact ice, and so thick that the tenderest twigs were in many places an inch thick. Hardly any trees were able to support the weight. Beech, ash, chestnuts, and oaks fell under it. Large branches were torn off, and some broke close to the roots. The most dismal prospect of desolation presented itself in the woods; and the most lamentable apprehensions of famine spread consternation throughout the province. The potatoes were frozen in the ground, and the vines blasted in the vineyards. The hills in the diocese of St. Pons, Castres, and Lavour, have been most exposed to its rigour. The valleys and plains have suffered little, being covered with a very deep snow."<sup>47, 93, 253</sup>

The rigid winter in Venice, *Italy* in 1782, harassed the city. It is said that the North travelled to the South bring forth the piercing cold of that season.<sup>81</sup>

In Selborne, *England*, in November 1782, there was a hard frost; which continued throughout with alternating periods of frost and thaw. During the first part of December it was frosty. But during the later half of December and the first 16 days of January, the weather was mild, with much rain and wind. Then came a week of hard frost, followed by stormy dripping weather to the end of February. Then until 9 May, cold harsh winds prevailed. On 5 May, there was thick ice.<sup>70</sup>

The winter of 1782 was very cold in the *United States*. The Delaware River in Philadelphia, Pennsylvania froze over in one night.<sup>1</sup>

In January 1783, Colonel Willet, with about 600 men, and a great number of sleighs, loaded with ammunition, provisions, forage, etc. set out from Albany, New York in the *United States* on an expedition up the Mohawk River, with the intent of surprising and attacking the British post at Fort Oswego in New York. After enduring incredible fatigue and hardships, they arrived within a mile of that place, and sent an Indian, who was their guide, as a spy into the fort. The garrison received and liberally entertained him and then permitted him to return to his employers, whom he conducted into a swamp, six miles [10 kilometers] beyond the fort. They remained there during the night and eight of the party froze to death and the greatest part of the survivors were miserably frost bitten. The next morning, finding themselves deceived by their Indian guide, they began their retreat to Albany retracing their original paths. Many of those fortunate enough to reach Albany died in consequence of the severity of the weather. Others had lost their legs or hands, and a great number became real objects of compassion.<sup>253</sup>

Rome, *Italy* reported that on the 14<sup>th</sup> past [14 February 1783] a very heavy rain began to fall, which continued 24 hours; when it abated, a gentle wind melted all the snow upon the mountains; and the waters having swelled those of the Tiber [River], its banks were overflowed on Sunday morning, laying all the lower parts of this capital under water, from which the inhabitants sustained great damage: Those

especially in the country, where the waters extended, suffered very considerably; a great number of cattle, effects, etc. were swept away, and many persons lost their lives by this accident.<sup>253</sup>

Lincoln, *England* reported on the 5<sup>th</sup> instant [5 March 1783], that they have lately had so much rain and snow in that neighborhood, that the fens are covered with water for many miles round; that the lower part of the houses are overflowed with water, that the inhabitants live up one pair of stairs, and that they are forced to have boats fastened to their windows, in order to preserve the communications. On the same date, Yorkshire, *England* reported that they have had such falls of snow in many parts, that the roads are absolutely unpassable.<sup>253</sup>

## 1783 Fractured Comet Impact Hypothesis

### Introduction

A number of strange disasters and anomalies occurred in 1783-1785. These anomalies accounted for the death of over 13 million people worldwide. After reviewing various accounts, I feel that these anomalies are interconnected and can be explained by a single core event.

***Hypothesis: Shortly before noon (Italian time) on 5 February 1783, a small comet broke up in Earth's atmosphere. One comet fragment impacted Earth in the deep ocean. The impact triggered the Calabria earthquakes in Italy and the rare deep magma Lakagigar volcanic eruption in Iceland.***

### Calabria Earthquake

An ocean impact is similar to an underwater nuclear explosion. The earth's crust is thinnest in the deep ocean. In an ocean impact, most of the impact energy will be expended as a focused ground shock wave that will travel through the molten lava and pass to the opposite side of the globe. If the asteroid or comet is sufficiently large, this shock wave will produce earthquakes and trigger volcanic activity on the opposite side of the earth. The impact ground shock wave will travel through the earth at speeds similar to a primary earthquake ground shock wave – between 13,500 mph and 29,000 mph. So in less than a half a minute from the time of impact, the damage could be felt on the other side of the globe as a major earthquake. It can also create rupture in the earth's crust that allows very deep magma to penetrate slowly to the earth's surface (relatively rare: flood basalt eruption). Generally, these ruptures take place at the seam of the continental crust and the ocean crust.<sup>223</sup>

An example of this process can be seen on the planet Mercury. A massive (comet/meteor) impact formed the Caloris Basin. The shock wave from this impact traveled through the planet and produced a jumbled terrain on the opposite side of the planet Mercury called the Chaotic Terrain.

Sir William Hamilton reported to the Royal Society at Naples, *Italy* on 23 May 1783 and provided a very detailed description of the earthquake of 5 February 1783 at Calabria in *Italy*. Because of its length, I have moved this detailed account to the end of the hypothesis. Some of the important findings detailed in the account are:<sup>248</sup>

- The first earthquake, which occurred at noon on 5 February 1783, the one that caused the greatest damage, consisted of a strong vertical thrust.
- Many rivers in the region went dry during this initial earthquake and then later the water returned and overflowed. This water was salty.
- Generally large earthquakes are preceded by a very low frequency growl several seconds before the ground motion begins. The initial earthquake of 5 February struck without this warning.
- As a result of the primary earthquake of 5 February and its subsequent aftershocks, immense tracts of land moved vast distances. These tracts were numerous. Some of these dislodged tracts of land were a mile long and a half-mile wide. Some of these tracts moved a distance of 4 miles. Contributing factors included: geological strata, proximity to deep ravines, previous rainfall and elevation.
- These dislodged tracts of land sealed off rivers and as a result caused new lakes to form.
- At Scilla, a mountain slid into the sea and generated a tsunami that killed 2,473 inhabitants.

### Lakagigar Volcano

The Laki or Lakagígur [Grímsvötn] volcanic eruption in *Iceland* took place over an 8-month period during 1783-1784 beginning in 8 June 1783. The eruption produced 14.7 cubic kilometers (3.5 cubic miles) of basalt. Flood volcanic events are different from typical volcanic events in two important areas. First, they generally do not include extreme explosions and as a result do not score high on the Volcanic Explosivity Index (VEI) scale. The Earth's crust cracks and a large fissure forms, magma oozes out of the ground rather than released through massive explosions. (The Laki eruption scored only a 4+ on the VEI scale.) Secondly, the magma comes from very deep inside the Earth and generally releases a richer mixture of gases at the Earth's surface. It is believed that the release of basalt lava and clouds of poisonous hydrofluoric acid/sulfur-dioxide compounds killed over 50% of Iceland's livestock population, leading to famine which killed approximately 25% of the population of *Iceland*.

The initial signs of volcanic activity began around the time of the Calabria earthquakes. According to an article in the *Morning Herald and Daily Advertiser* of 18 July 1783, a letter from Copenhagen reports, "A Dane bound to *Iceland*, at about seven leagues [21 miles, 34 kilometers] distance from the place of his destination observed an unknown land which sent forth smoke in abundance, he was then in ten fathom [60 feet, 18 meters] water and found sticking to the lead a quantity of pumice-stone and charcoal; having sailed round the island in search of anchorage, he found it scarce a mile in circumference; he was informed on his arrival in port, that this smoking island had issued from the sea about the time of the late earthquakes, which had so cruelly ravaged Messina and Calabria." His Danish Majesty has since taken possession of it as a fief of the Crown of Denmark.<sup>255</sup>

In August 1783, a published account of the discovery of an island just risen out of the ocean near Iceland in the North Seas reports, "This uncommon phenomenon was first observed by a Norway trader on his return from *Iceland* to Drentheim [Trondheim, *Norway*], whose crew were so terrified that they stood away from it with the utmost precipitation. Soon after a Dane from the Sound fell in with it, and at first mistook it for the continent of *Iceland*. The master, however, did not approach nearer than a league [3 miles, 5 kilometers], but stood on for Skalholt, the capital of *Iceland*, where he made a report of his discovery to the Danish Governor. It was at first supposed that he had fallen in with a monstrous body of ice; but, on his persevering in his account, some officers of the garrison, with several of the most skilful seamen of Iceland, went in quest of it; and in about three hours after their departure from Skalholt, came so near it that a boat was hoisted out, and the island taken possession of in his Danish Majesty's name. It is said there is not the least appearance of soil, but that the surface is of a marly [gnarly?] nature, with crannies running through it filled with pumice stone, which are supposed to be thrown out by the different volcanoes in the island, of which it is thought there are three. The volumes of smoke that have been seen rise from one of the craters are very considerable, but no flame has yet issued from any of them. Its position is said to be at eight miles [13 kilometers] distance from the rocks des Viseaux, and its soundings about 44 fathoms [264 feet, 80 meters]. This singular production, which is supposed to have been formed in the spring of the present year, will no doubt induce such of the learned as are curious to visit it. It is conjectured by many to have taken its rise at the time of Sicily [*Italy*] suffered so much by the late eruptions of Mount *Ætna* [in *Italy*]; but those who consider its neighbourhood with Hecla [Mount Hekla, *Iceland*], the second volcano in the world, will rather attribute it to some intestine commotions of that mountain."<sup>254</sup>

"Several vessels lately returned to Copenhagen from *Iceland*, bring the most deplorable accounts of the melancholy situation to which the inhabitants are reduced. The disaster that country has undergone, are such, that all hopes of an [a] harvest are entirely at an end. The extremities of famine and distress are equally felt by the men and cattle, and a great number of both have fallen victims to their complicated miseries. The fires which broke out in several places, rage as violently as ever; and the new island which had lately emerged from the sea has totally disappeared. The following is the substance of the several

accounts received from that island: ‘The subterraneous fire which broke out on June 7<sup>th</sup> last year [1783] in the western part of Skaptfield’s Syssel, (the district of Skaptfield) on the mountain Skaptan Gluver, spread so wide, that marks of its devastation are visible at the distance of 20 leagues [60 miles, 97 kilometers] to the south-southwest. The conflagration extended to four leagues [12 miles, 19 kilometers] in breadth, and continued till the month of May this year [1784]. The fourth part of the burnt soil consisted of a very old lava and marshes. The burnt earth resembles a heap of calcined stones of the colour of vitriol. The great river of Skaptage which was from seven to eight fathoms [42–48 feet, 13–15 meters] deep, is entirely dried up. On the east side, the fire broke out much about the same time in the channel of the Huervissiodt nearly of the same depth with the Skaptage, but here its breadth was not above a league [3 miles, 5 kilometers]. The whole extent of ground from which the flames issued, is about ten leagues [30 miles, 48 kilometers]. At first the flames darted perpendicularly upwards, and seemed to issue from a great depth, but afterwards they rolled along the surface in waves resembling those of the sea; and when they approached the frozen mountains, whose bowels are impregnated with sulphur and nitre, they raged with such fury as to sweep away in a moment cattle, houses, and every thing in their way, even the soil. Seventeen districts have been entirely ruined. The hay harvest failed, and the inhabitants were obligated to kill great part of their young store about the end of autumn, for want of provender [food for livestock]. What little they got in was of so bad a quality, that it produced an epidemical distemper among the cattle, by which, and the severity of the winter, five sixths of the cattle and three fourths of the sheep have perished. The inhabitants were obligated to house them in the beginning of September, and from Oct. 15. [1783] to April 27 [1784] there was a continued frost, and the ground covered with snow. Many of the peasants having lost their whole [live] stock, have been obliged to give up house and land. To add to their calamities, the fishery has been very unsuccessful. In short, nothing can equal the distress of the inhabitants, especially those of the interior parts, who, even if they have wherewithal to purchase the necessaries of life from the trading towns on the coast, cannot carry them home for want of horses.’ ”<sup>249</sup>

On 17 July 1784, Copenhagen reported news from *Iceland*. The mortality caused by want of provision has caused the death of a number of persons and many cattle. Provision sent to the relief of the island has hit a snag. Horses were difficult to obtain in order to transport these supplies from the coast into the interior of the island. Instead of 4 rxdollars [rigsdaler?], the usual price of a horse, they are now paying 50. The subterraneous fire continues burning. The inflamed island, which lately arose from the bottom of the sea, has disappeared again.<sup>247, 250</sup>

It is my opinion that massive flood volcanic events are associated with (are caused by) massive impact events.<sup>218</sup> This was observed in the Emeishan & Siberian Traps in the end Permian extinction event and the Deccan Traps in the K-T (Cretaceous-Tertiary) extinction event. Therefore, it is reasoned that smaller flood basalt eruptions could be triggered by smaller impact events. As a consequence, flood basalt eruptions might represent a unique signature for impact events. The Laki eruption was the largest basaltic lava flow in recorded historical times. The Laki eruption produced a 25-kilometer (16-mile) long fissure that generated 14.7 cubic kilometers (3.5 cubic miles) of lava, filling two deep river valleys and covering an area greater than 500 square kilometers (190 square miles).

### **Tsunami**

It was originally feared that an ocean impact would generate a far-reaching mega-tsunami but later research indicates that the tsunami impact threat is exaggerated. The waves generated from an impact are highly dissipative (decays rapidly) and very turbulent. An early Office of Naval Research Report studying the tsunami hazard from nuclear explosions showed the wave structure had shorter wavelengths (with a periods of 20 to 100 seconds) than earthquake or landslide generated tsunami (with a period of 100 seconds to 1 hour). Due to the “Van Dorn effect”, these shorter wavelength impact waves are

expected to break on the outer continental shelf minimizing damage onshore.<sup>223</sup>

A mega-tsunami would only form very near the original site of the impact.

According to the World Tsunami Database, a tsunami struck Kashima, *Japan* and another struck the *Fuji Islands* on 5 February 1783.<sup>213</sup> If that was the case, then these may have been impact generated tsunamis. But I have not been able to confirm the accuracy of these accounts. So therefore, I have currently excluded them from this hypothesis. But should these accounts become substantiated, they might provide important clues as to the location of the impact site.

And whether this event is related to the unusual Taiwan mega-tsunami, I cannot say at this time. The various accounts do not adequately define the date of this event. It is currently detailed in the main chronology in the year 1782 in December. There is enough overlap in the various accounts to interpret this tsunami as a single event rather than multiple events. Generally when the information from the various accounts is combined, they describe an impact event very near the site of the impact. [The impact event would generate a ground shock wave that might be described as a “destructive earthquake”. It would create an atmospheric blast wave that might be described as a “sudden roar” and a “most furious whirlwind”. It would generate a devastating water compression wave, a mega-tsunami if the impact was near the coastline. The “whole island was under water.” An ocean impact would eject massive amounts of ocean water into the atmosphere. This might look like the sea “welled {rose} up in the sky”. This debris, primarily ocean water, would fall back to the Earth and the effects might appear as an extremely heavy rainstorm from “the four corners of the earth”. And it would cause massive destruction to the island and its inhabitants.] Well it does beg the following question: Is it too great a stretch of the imagination that a mega-tsunami of this magnitude could have occurred on 5 February 1783 in the Gregorian calendar [4 January 1783 in the Lunisolar calendar] and the initial reports first reached England over land or sea approximately 6 months later?

### **Other Earthquakes and Volcanoes**

A large ocean impact event can generate a ground shock that will pass through the earth and reach the other side of the globe. This ground shock would ring the planet for several weeks. This shock wave can trigger major earthquakes.<sup>223</sup> In the days and months following 5 February 1783, numerous earthquakes were observed at Calabria, *Italy*, other regions of *Italy*, *Spain*, *England*, *France*, *Germany*, *Iceland*, *Sweden*, *Denmark*, *Austria*, *Hungary*, *Romania*, *Greece*, *Turkey*, *Russia*, *Syria*, *Lebanon*, *Indonesia*, *Japan*, *Haiti*, *the Dominican Republic*, *Guatemala*, *China* and the *United States*.

It also can trigger volcanic eruptions. Several volcanic eruptions took place during 1783. Three of *Italy*'s volcanoes erupted in 1783. Mount Etna erupted on 17 February 1783 and Stromboli [a small island in the Tyrrhenian Sea off the coast of Sicily, *Italy*] a few days later.<sup>238</sup> Mount Vesuvius erupted on 18 August.<sup>214</sup> The Mount Iwaki volcano in Japan erupted on 13 April 1783 Gregorian calendar (March 12 in the Lunisolar calendar). The Mount Asama volcano erupted on 3 August 1783 (6 July in the Lunisolar calendar).<sup>256</sup>

***The impact ground shock wave may have been a contributing factor on the increase in earthquake activity [secondary effects] especially in the region near Calabria [the European theater] until the Earth returned to an equilibrium state.***

The year 1783 produced several earthquakes. This included the 5 strong earthquakes at Calabria in Southern *Italy* on 5, 6, 7 February and 1 & 28 March 1783 in which more than 100,000 people perished and many cities were left in ruins. On 13 February 1783, an earthquake struck Neustadt in *Hungary*.

During the middle of February, an earthquake struck the Island of Amboyna [Ambon Island in *Indonesia*] and shook the whole island. On 18, 25 February, 25 March and 12 April, earthquakes struck Selb in Upper Saxony [in central *Germany*]. On 28 February, an earthquake struck Palermo in Sicily, *Italy*. On 5 March, an earthquake struck Paris, *France*. On 6 March, an earthquake struck in the Angoumois, *France*. On 6 March, there was an earthquake at Irkutsk, *Russia* and along the Altai chain from Lake Baikal to the Altai Kolywan. On 9 March, a mountain fell at Ardes in Auvergne, *France*. On 18 March, an earthquake struck Padua in northern *Italy*. On 25 & 26 March, an earthquake was felt at Malemort [Mallemort] in Province, *France*. On 26 March, an earthquake was felt at Venice and Padua [in *Italy*] and at St. Maura, Zante, and Cephalonia [Ionian Islands of *Greece*]. On 5 April, an earthquake struck Mannheim, *Germany*. On 8 April, an earthquake struck Vienna, *Austria* and Comorn [Komárom], *Hungary* along with other towns of *Hungary*. On 13 April, an earthquake struck Lisbon and St. Jago in Galicia, *Spain*. On 22 April, there was a very violent earthquake at Comorn [Komárom], along the Danube River at Pesth [Pest], Buda [Budapest], Odimburg, and Estherhaz [Esterhazy] in *Hungary* and Vienna, *Austria*. Comorn was almost completely destroyed. Between 12 and 31 May, nineteen more shocks struck Comorn, *Hungary*. The last shock was more violent than the earthquake that struck on 22 April. On 23 April, an earthquake struck Colebrook Dale [Coalbrookdale] in *England*. On 5 May, an earthquake struck Grenoble in *France*. On 1 June, an earthquake struck Constantinople [now Istanbul, *Turkey*]. From 1-10 June, there were numerous and violent earthquakes at Skaptarfiall, *Iceland*. [These are likely associated with the Lakagigar volcanic eruption]. On 15 June, an earthquake struck Godgard in Ost Gothland, *Sweden*. On 20 & 22 June, there were earthquakes at Florence, *Italy*. On 6 July, an earthquake struck Dijon, Verdun, Seurre, St. Jean-de-Leone [Saint-Jean-de-Losne], *France* and a line passing through Langres, Châtillon, Aignay-le-Duc & Montbard; extending into the Rhône [region] and felt at Besançon. On 20 July, an earthquake struck Tripolis in *Syria* [Tripoli, *Lebanon*?] and part of the mountains of *Lebanon*. During the end of July, earthquakes struck the main island of Nippon [now Honshū], *Japan*. It was felt over a region of 20-30 leagues [60-90 miles, 97-145 kilometers] and lasted for 4 or 5 days. Great clefts opened in the earth, rivers became dry, and many villages with their inhabitants were destroyed. On 9 August, there was an earthquake at Launceston in Cornwall, *England*. On 30 August, an earthquake struck Messina in Sicily, *Italy*. On 7 September, an earthquake struck La Rochelle, *France*. On 26 October, an earthquake struck Kapnik, *Transylvania* [now Cavnic, *Romania*]. On 17 November, an earthquake struck Bolsena, *Italy*. On 29 and 30 November, earthquakes struck New York [New Jersey] in the *United States*. [The earthquake was felt from New Hampshire to Pennsylvania. This is the largest earthquake ever recorded for New Jersey.] On the end of November, a violent earthquake struck Thessalonica [Thessaloniki, *Greece*]. On 8 December, an earthquake struck Pistoia, *Italy*. On 14 December, an earthquake struck Aleppo, *Syria*. During the night between December 17 & 18, an earthquake struck the *Danish Island* of Christian near Bornholm. Towards the end of 1783 and the beginning of 1784, a major earthquake struck *Guatemala*.<sup>214</sup>

Other accounts document additional earthquakes that occurred during this timeframe. On 11 and 12 February 1783, earthquakes struck Santiago de los Caballeros, *Dominican Republic*. There was serious damage to churches and houses made of brick. It also struck Port-au-Prince, *Haiti*. There were 3 quakes of which 2 were quite strong.<sup>215</sup> Several earthquakes struck China in 1783. One earthquake struck in Yunnan Province of *China* near the coordinates of 25.6 North and 103.8 East.<sup>217</sup> In another account, this earthquake struck Zhanyizhou in Yunnan [now Xuanwei, Qujing, Yunnan in China. There was great damage to the city wall and people's dwellings. A second earthquake struck in Xunyang, Shaanxi [now Ankang, Shaanxi]. Another struck in the 5<sup>th</sup> month [31 May-29 June 1783] at Zhenhai, Ningbo, Zhejiang. Another earthquake struck on 19 November 1783 at Kunshan, Suzhou, Jiangsu. Another struck during the autumn of 1783 at Jishan, Yuncheng, Shanxi. There was also a possible earthquake during the summer of 1783 at Guanghua, Hubei [now Laohekou]. The text said "The earth at Guanghua spread apart."<sup>219</sup> On 8 May 1783, an earthquake in the Adriatic Sea, destroyed the Island of St. Maria [Santa Maria della Grazia? An island in the Venice lagoon, *Italy*].<sup>241, 242</sup> On the 13<sup>th</sup> and 16<sup>th</sup> of November 1783, several shocks of an earthquake were felt in the Pouille [Apulia, *Italy*], which did great damage, and so

terrified the inhabitants, that they left their habitations, and passed both the nights in the fields.<sup>242, 247, 250</sup>

The Asama volcano in *Japan* began to erupt on 1 August 1783 [in the Gregorian calendar (4 July in the Lunisolar calendar)]. It began with a rumbling like very loud thunder, which gradually increased in violence during the next 4 days. On 2 August, it rained down sand and ash. On 3 August, immense quantities of stones fell. Some of these stones were so large that two men could not move them. Twenty-seven villages were swallowed up. On 4 August, the volcano exploded with torrents of flames and balls of fire; the earth shook in a frightful manner; and the whole country was enveloped in darkness. The inhabitants at the base of the mountain fled, but large chasms opened in the ground and prevented their escape and great numbers died. The eruptions were visible for a distance of 20-30 [French] leagues [between 40-87 miles, 65-140 kilometers]. The water of the rivers Yoko-gawa [Yokogawa] and Karousawa [Karuizawagawa] appeared to boil. On 5 August, large trees and the timber of houses were seen floating on the River Yedo [Edogawa], which were soon afterwards completely covered with the mangled carcasses of men and beast. In the countryside of Zinzou [possibly a subdistrict called Shinmachi], the devastation extended over a tract of thirty [French] leagues [around 75 miles, 120 kilometers]. It was impossible to determine the number of dead and the devastation was incalculable.<sup>216</sup>

### Atmospheric Effects

In 1783, an extraordinary dry fog extended intermittently over the whole of *Europe* and part of *Asia*. The remarkable thing about this fog was that it was phosphorescent and at nighttime, the light it yielded was sufficient to read by. The fog in some places permitted only less than one mile visibility. It also allowed people to look directly at the sun without being dazzled. It was first observed on 9 May at Copenhagen, *Sweden*; on 6 June at La Rochelle, *France*; on 14 June at Dijon, *France*; on 16 June at Manheim [now Mannheim], *Germany* and at Rome, *Italy*; on 19 June in *the Netherlands*; on 22 June in *Norway*; on 23 June on Saint Gothard [St. Gotthard, *Switzerland*] and in *Hungary*; towards the end of June in *Syria*; and by 1 July on the tops of the Altai Mountains [a mountain range located where *Russia*, *China*, *Mongolia* and *Kazakhstan* come together]. [Several hypotheses were put forward to explain this dry fog. It might be related to the Laki volcanic eruption in *Iceland* that began on 8 June 1783. Or it might be related to the earthquakes at Calabria in Southern *Italy*. The problem with these two hypotheses is that the strange fog first appeared a month before the Laki volcano erupted and that earthquakes are not known to eject debris into the upper atmosphere. Another hypothesis put forward by Benjamin Franklin, and really the most interesting one, is that this phenomenon was the result of an asteroid/comet impact.]<sup>205</sup>

Benjamin Franklin recorded his observations of the extraordinary dry fog in a lecture on 22 December 1784: “During several of the summer months of the year 1783, when the effect of the sun's rays to heat the earth in these northern regions should have been greater, there existed a constant fog over all *Europe*, and a great part of *North America*. This fog was of a permanent nature; it was dry, and the rays of the sun seemed to have little effect towards dissipating it, as they easily do a moist fog, arising from water. They were indeed rendered so faint in passing through it, that when collected in the focus of a burning glass they would scarce kindle brown paper. Of course, their summer effect in heating the Earth was exceedingly diminished. Hence the surface was early frozen. Hence the first snows remained on it unmelted, and received continual additions. Hence the air was more chilled, and the winds more severely cold. Hence perhaps the winter of 1783-84, was more severe, than any that had happened for many years.” He then went on to suggest that the cause of the dry fog was an asteroid/comet impact on Earth. “The cause of this universal fog is not yet ascertained. Whether it was adventitious to this earth, and merely a smoke, proceeding from the consumption by fire of some of those great burning balls or globes which we happen to meet with in our rapid course round the sun, and which are sometimes seen to kindle and be destroyed in passing our atmosphere, and whose smoke might be attracted and retained by our earth...”<sup>211</sup>

Over a hundred years later in 1908, a similar “phosphorescent fog” phenomenon was observed. On 30 June 1908 near the Podkamennaya Tunguska River in what is now Krasnoyarsk Krai, Siberia, *Russia*, there was a massive explosion caused by the impact of a small asteroid or comet. The impact was believed to be a bolide air burst rather than a surface impact since no crater was found. In 1930, the British astronomer, F.J.W. Whipple suggested the Tunguska body was a small comet. The comet hypothesis was further supported by the glowing skies (or “skyglows” or “bright nights”) observed across Europe for several evenings after the impact, possibly explained by dust and ice that had been dispersed from the comet’s tail across the upper atmosphere.<sup>265</sup> In London, England, people could read newspapers and play cricket outdoors at midnight. Today we might refer to this effect as associated with the formation of “noctilucent clouds”. These clouds are the highest clouds in Earth’s atmosphere around the altitudes of 47-53 miles [76-85 kilometers] above the Earth’s surface. They are visible in deep twilight. They are composed of microscopic ice crystals of water ice, up to 100 nm [.0000001 meters] across.<sup>266</sup> These ice crystals are commonly referred to as “diamond dust”.

According to Tom Slemen: “The first reports of a strange glow in the sky [from the Tunguska event] came from across Europe. Shortly after midnight on 1 July 1908, Londoners were intrigued to see a pink phosphorescent night sky over the capital. People who had retired awoke confused as the strange pink glow shone into their bedrooms. The same ruddy luminescence was reported over Belgium. The skies over Germany were curiously said to be bright green, while the heavens over Scotland were of an incredible intense whiteness which tricked the wildlife into believing it was dawn. Birdsong started and cocks crowed - at two o'clock in the morning. The skies over Moscow were so bright; photographs were taken of the streets without using a magnesium flash. A captain on a ship on the River Volga said he could see vessels on the river two miles away by the uncanny astral light. One golf game in England almost went on until four in the morning under the nocturnal glow, and in the following week The Times of London was inundated with letters from readers from all over the United Kingdom to report the curious 'false dawn'. A woman in Huntingdon wrote that she had been able to read a book in her bedroom solely by the peculiar rosy light.”<sup>267</sup>

There are 3 components of water vapor released in a comet ocean impact event. These are the water ice of the comet, the ocean saltwater ejected from the impact event, and the water contained in flood basalt volcanic eruptions triggered by the ground shock of the impact event.

The nucleus of a comet has been described as a dirty snowball. The nucleus is primarily composed of water ice. But the nucleus also contains other frozen substances including methane, ammonia and carbon dioxide and small amounts of solids such as dust grains and hydrocarbons. Comets that pass into Earth’s outer atmosphere travel at speed of 20 to 50 kilometers/second (45,000 to 10,000 miles per hour). The frictional heating as a comet encounters Earth’s outer atmosphere can melt the water ice and aerosolize the resulting liquid. This effect is amplified for comets that break up and disintegrate in Earth’s upper atmosphere. In the cold outer atmosphere this water will refreeze into microscopic ice particles.

An ocean impact will eject vast amounts of salt water into Earth’s upper atmosphere where they can freeze into microscopic ice crystals.

A flood basalt volcanic eruption, which brings up deep magma, releases a rich mixture of several gases including water vapor, carbon dioxide, sulfur dioxide, hydrogen sulfide, hydrogen, hydrogen chloride, carbon monoxide, hydrogen fluoride and helium. Of these gases, the water vapor component is approximately 37%.<sup>218</sup> Some of this water vapor will rise into the Earth’s outer atmosphere where it will freeze into microscopic ice crystals.

There are three main forms of diamond dust ice crystals. These are microscopic *hexagon plates*, *hexagon*

*columns* and *long prisms*. Thin *hexagon plates* can act like miniature mirrors that can reflect sunlight. They can produce atmospheric optical effects like light pillars. These crystals can be observed in a clear sky when they produce brief flashes of light as they tumble through the air. This glittering effect gave the ice crystals their name “diamond dust” because they appear to be diamonds flashing in the sky. *Hexagon columns* can refract sunlight like a prism and can produce atmospheric optical phenomena including (22° and 46°) halos, sundogs, moondogs, and parhelion. The third form of diamond dust is *long prisms*, which are sometimes referred to as Shimizu crystals. These Shimizu crystals can be very long. Some were observed that were 1,000 μm long by only 10 μm in width. Diamond dust ice crystals can produce the “phosphorescent fog” effect through refraction and reflection of sunlight. Dense falls of diamond dust can be very dangerous because it can cause serious lung damage to individuals that breath it resulting in their death. [Refer to the account in this chronology in the year “Winter of 1897/1898” about a diamond dust fall called by the American Indian name “pogonip” which translate to “white death”.]

Diamond dusts ice crystals are approximately the width of a human hair. Thick clouds of diamond dust diffuse sunlight, which would allow individuals to look directly at the sun without being dazzled. Clouds of diamond dust at the edges of space can reflect and refract sunlight, giving the cloud phosphorescent qualities at nighttime and provide a level of light sufficient for those on the planet’s surface to read a newspaper at midnight without the aid of any artificial light.

The 1783 comet impact event ejected significant amounts of water into Earth’s upper atmosphere where it was reformulated into “diamond dust” ice crystals. This limited visibility for several years thereafter. The Koreans officially reported sightings of the planet Venus in daylight on 8, 12, 18, 25 and 26 January 1783 and then there was a 2-year gap in reported sightings. The next official sighting was observed on 24 April 1785.<sup>219</sup> So the transparency of the atmosphere appears to have been diminished for approximately two years.

***The impact event produced a strange dry fog that reduced the intensity of sunlight so individuals could gaze directly at the sun and not be blinded and at night this high altitude fog provided reflected sunlight that allowed individuals to see in what would normally be the dark of night. These observed effects were caused by the creation of “diamond dust” ice crystals in the upper atmosphere resulting from a deep ocean comet impact event.***

### Dust Falls

During this time the impact debris would slowly begin falling back to Earth from the upper atmosphere. The Chinese reported an unusual cluster of falls of dirt within a three-year time span [1783-1786], led by one on 15 April 1783 at Ningshan, *China*. Given the time of year, this initial fall could have been the usual dust from the Gobi, but in that case it would not have been so localized nor would the histories have paid any attention to it.<sup>219</sup>

### Subsequent Impact Events: Moon & Earth

If a fragment of a comet impacted the Earth’s surface, it may have been part of a stream of fragments or a ruptured comet, which were captured by Earth’s gravitational field, which then subsequently impacted the moon and Earth. The German astronomer Johann Elert Bode reported that an unnamed observer with a 5-foot [1.5 meter] telescope on 16 March 1873 saw "sparks outside of the moon around the middle of the east edge of the moon. They moved in a semicircle and fell back on the moon, and were about [the magnitude of] a 6<sup>th</sup> and 7<sup>th</sup> size stars. Some were bigger but didn't rise so high. The phenomenon lasted 10-11:40 pm." <sup>219</sup> [Sir Frederick William] Herschel observed bright volcanoes [bright lights] on the [dark

part of the] moon on 4 May 1783.<sup>219</sup> He compared it to the brightness of a star of the 4<sup>th</sup> magnitude.<sup>240</sup>

According to a letter by J.H. DeMagellan, “It was on the 13<sup>th</sup> following of the same month [13 May 1783], the Mr. Herschel discovered two small conical mountains [impact craters] in the very same spot where he had observed, on the 4<sup>th</sup> of the same month, that volcanos [asteroid/comet impact events] these are situated in the Mons Porphyrites of Hevelius, just by a third mountain, much larger, which Mr. Herschel had often observed before; but these two small ones were never before perceived in that place, nor were they represented in the drawing which he had made of that spot of the Moon before that observation. This particularity I have received in a letter with which I was favoured from Mr. Herschel himself, dated May 8, 1784.”<sup>249</sup>

On 18 August 1783, a great meteor was observed traveling 1,000 miles through Earth’s upper atmosphere from beyond *Scotland* to beyond *France*. This great meteor entered the Earth’s atmosphere over the North Sea, before passing over the east coast of *Scotland* and *England* and the *English Channel*; it finally broke up, after a passage within the atmosphere of around a thousand miles (1610 km), over southwestern *France* or northern *Italy*. The meteor passed over Shetland and the northern parts of *Scotland*; Essex [in *England*]; the *Straits of Dover*; Ostend and Brussels [in *Belgium*]; and Dunkirk, Calais, Paris, and [Côte de] Nuits in Burgundy [in *France*]. During its course, it gave off a prodigious light, which illuminated all objects. Over Brussels, from several observations, the elevation of the meteor was estimated at 50 miles [80 kilometers] above the surface of the Earth [0.0002 LD]. The size of the meteor was estimated at ½ mile across. The tail of the meteor was 10 or 12 times longer than the body. It was traveling at speeds greater than 20 miles per second [32 kilometers per second] and passed over the whole island of *Great Britain* in less than a half a minute. As it traveled, it exploded into a number of balls [fragments] each carrying a tail. The meteor [explosions] gave off a sound similar to the discharge of one or more cannons at a distance. The sound was loudest at Lincolnshire and the adjacent counties, and also in the eastern part of Kent.<sup>191</sup> Another account reports that this meteor was observed over Rome, Italy.<sup>220</sup> Figure B depicts the meteor’s oblong shape before it acquired a tail. Figure D depicts the meteor after it separated into several bodies each with a tail.

The 18 August 1783 Meteor before and after it broke up – drawing by T. Cavallo.<sup>221</sup>

There were an unusually high number of fireballs observed over Great Britain in the weeks following the Great Meteor of 18 August 1783. They occurred on 26 September and 4, 19 and 29 October.<sup>222</sup> On 4 October, there were two separate meteors observed. One occurred at 6:43 p.m. and the other about 3 a.m.<sup>220</sup>

Another curious event occurred on 10 September 1783 in the evening. There was a total eclipse of the moon. In *England*, this eclipse began at 9:38 p.m. The period of total lunar darkness began at 10:38 and ended at 12:22. This eclipse was visible not only in Europe and Africa, but also to a great part of Asia and America. During the eclipse, a body of light, equal and similar to what is called Saturn’s Rings, was seen round the moon, at first only with glasses, but afterwards with the naked eye; a phenomenon equally curious and uncommon.<sup>254</sup>

This comet may have fractured as it passed through Earth's atmosphere with part of the comet driving into the deep ocean and another large part escaped back into space but was captured by Earth's gravity and reappeared almost 6 months later on 18 August 1783. Other smaller fragments of this comet may have struck the moon on 16 March and 4 May of 1783. Most of the comet fragments disintegrated in Earth's upper atmosphere over a period of a couple years. It would also follow that the observed ring around the moon may be lunar impact debris.

### Effect on Weather

***The impact event affected the climate. It caused the Earth to cool dramatically in 1783 and resulted in an extremely cold and snowy winter in Europe in 1783-84. When the snow melted, it resulted in massive spring floods. It also altered the jet stream, which caused drought conditions across the globe that led to great famines. These climatic conditions from the impact carried on into the years 1784 and 1785.***

Refer to the main chronology for details on the cold summer of 1783, the severe winter of 1783-84, the massive spring floods caused by the thaw, and the great droughts and famines caused by the altered jet stream.

The impact event produced adverse weather effects due to a lowering of temperatures (global cooling) and the deflection of the jet stream winds. These effects produced devastating droughts and/or great famines across the globe. The regions affected included: *Iceland, Finland, Sweden, Scotland, Ireland, England, France, Italy, Spain, Tunisia, Libya, Egypt, Syria, Bangladesh, Pakistan, India, Turkestan, Korea, China, Japan* and *Mexico*.

— In 1783, a famine in *Iceland* killed 1/5<sup>th</sup> the population.<sup>258</sup>

— There were major crop failures in *Finland* between the years 1783-1785.<sup>264</sup>

— In 1783, Scania, the southmost part of *Sweden* and also known as “the granary of Sweden”, experience a famine.<sup>263</sup>

— In 1784-1785, there was a severe drought in *England, France, Italy* and *Spain*. Accounts are detailed in the main chronology.

— In 1784 or 1785, the entire potato crop of the Lothians [region of the *Scottish Lowlands*] was devastated. In 1784 the intense frost injured the potato crop in *Ireland*.<sup>260</sup>

— In 1784-1785, a famine in *Tunisia*, in North Africa killed up to 1/5<sup>th</sup> of its population.<sup>258</sup> Tripoli, *Libya* in North Africa experienced famine in 1784.<sup>259</sup>

— In 1784-1785, there was a severe drought (insufficient Nile River inundation) and great famine in *Egypt*. Accounts are detailed in the main chronology. Egypt lost 1/6<sup>th</sup> of its population.<sup>259</sup> The population of Egypt at that time was around 2.5 million; therefore the famine claimed around 420,000 lives.

— In 1784, a famine struck *Syria*.<sup>261</sup>

— A severe drought and great famine took place in *Bangladesh, Pakistan* and *India* in the years 1780-1784. Accounts are detailed in the main chronology. The famine in *North India* called the Chalisa famine of 1783-84 and the one a year earlier in *South India* killed approximately 11 million people.<sup>268</sup>

— In 1785 in the region of the Duab Mountains in *Turkestan*, there was a great famine. “Whole bodies have been eaten by dogs and vultures.”<sup>246</sup>

— A famine also struck *Korea*. In 1784, around 500,000 people died in *Korea* from famine.<sup>257</sup> In reviewing the Korean annuals there were 13 reports concerning famine or famine relief or court comments about famine in 1782; 18 reports in 1783; and 16 in 1784.<sup>219</sup>

— In 1784-1785, there were severe droughts in *China*. It is detailed in the main chronology by year.

— The Great Tenmei famine took place in *Japan* from 1782-1788. It was the deadliest famine in the early modern period of *Japan*. The population decreased by 920,000 people across Japan due to the

famine and the plague epidemic that accompanied it between the years 1780 & 1786. The population of *Japan* was 26.01 million in 1780, 25.09 million in 1786 and 24.89 million in 1792. The damage was particularly severe in Mutsu Province.<sup>256</sup>

— In 1785-1786, there was a severe drought and famine in *Mexico*. This famine was caused by 2 years of drought combined with severe frosts in the summer of 1785. The famine killed nearly 15% of the Bajío's population.<sup>262</sup> [The Bajío is the lowland region of Central Mexico.]

Even though some of these famines began before 5 February 1783, many appeared to intensify during the years 1783-1785.

Diamond dust can reflect and refract sunlight. One type of diamond dust, the "hexagonal plates" can reflect sunlight like miniature mirrors. When this type falls through the atmosphere, it travels like a Frisbee and can stay aloft on the winds for an extended time. Diamond dust injected into the upper atmosphere could stay aloft for many months before it returns to the surface. These ice crystals can reflect sunlight back into deep space. Water in the form of diamond dust ice crystals is very efficient per unit weight as a planetary cooling mechanism. In Polar Regions where they are generally encountered, falls of diamond dust (commonly referred to as clear sky precipitation) are associated with significant falls of temperature.

The area beneath these clouds of diamond dust ice crystals are significantly cooled. The molecules of air are constricted and become more dense. In meteorological terms, high-pressure areas are formed. If these cold dense regions become large enough they can deflect or block jet stream winds.

The clouds of high altitude diamond dust formed by the water injected into the upper atmosphere robbed the Northern Hemisphere of heat and altered the jet stream. This affected the rain patterns (annual Nile River floods, India monsoons, rainfall in China). And anomalies in rainfall then contributed to the severity of these famines.

### **Comet Parent**

Comets are very fragile, with little internal strength and a very low mass density. Comets have been described as similar to huge dirty snowballs. Comets are composed of various ices, including water ice, clay and organic matter, including hydrocarbons in the form of an oil-like tar. When a comet comes within 400 million kilometers of the Sun (a little bit beyond the orbit of Mars); the sunlight is strong enough to start evaporating the ice in large quantities. Ammonia, methane, nitrogen, carbon monoxide and carbon dioxide ice change from a solid to vapors. Since the ice and rock are intimately mixed, the warming and evaporating ice produces great thermal and physical stresses on the surface of the comet nucleus. Vapor and tiny dust grains fly off the surface of the nucleus and form a comet tail. The comet travels on a long elliptical orbit around the sun. The dust tail generated in the comet tail also follows this same orbit. Over many orbits, this elliptical orbit becomes saturated with these dust grains. Sometimes the circular orbit of Earth will cross the elliptical orbit of the comet. When this happens, the Earth will be bombarded by some of these grains of dust, which will produce shooting stars in the night's sky. Generally, these meteorite showers are an annual event that occurs on approximately the same day each year. But also imbedded in this stream of meteorites is the parent comet. Therefore the date of a meteorite storm can provide clues about the parent comet. The hypothetical impact event occurred on or about 5 February 1783. If the impactor was of comet origin, it should line up with a meteorite shower. The February Eta Draconids meteor shower occurred on 4 February. It is a faint shower and was first detected in the year 2011. The parent comet of the February Eta Draconids may have had an extremely close encounter with earth in February 1783. The fact that it is faint shower might indicate that the parent comet was relatively small (by comet standards) and/or the number of orbits this comet made

around the sun was very limited in quantity. The parent comet associated with the February Eta Draconids has yet to be discovered. If this parent comet was the comet associated with this impact event, it might help to explain why this annual meteorite shower is faint and why the parent comet is currently “unknown”.

#### Detailed Account of the Calabria Earthquake

The following is the account by Sir William Hamilton [the English Minister at the Court of Naples] to the Royal Society at Naples, *Italy* on 23 May 1783 describing the earthquake of 5 February 1783 at Calabria in *Italy*.<sup>248</sup>

— “The earthquakes (which began the 5<sup>th</sup> of February last, and continue to be sensibly, though less violently, felt to this day) in the two Calabrias, at Messina, and in the parts of Sicily nearest to the continent. From the most authentic reports and accounts received at the office of his Sicilian Majesty’s secretary of state, we gathered in general, that the part of Calabria which has been the most affected by this heavy calamity is that which is comprehended between the 38<sup>th</sup> and 39<sup>th</sup> degrees; that the greatest force of the earthquakes seemed to have exerted itself from the foot of those mountains the Appennines [Apennine Mountains] called the Monte Dejo, Mount Sacro, and Monte Caulone, extending westward to the Tyrrhene [Tyrrhenian] Sea; that the towns, villages, and farm-houses, nearest these mountains, situated either on the hills, or on the plain, were totally ruined by the first shock of the 5<sup>th</sup> of February about noon, and that the greatest mortality was there; that in proportion as the towns and villages were at a greater distance from this centre [center], the damage they received was less considerable; but that even those more distant towns had been greatly damaged by the subsequent shocks of the earthquake, and especially by those of the 7<sup>th</sup>, the 16<sup>th</sup>, and the 28<sup>th</sup> of February, and that of the 1<sup>st</sup> of March: that from the first shock, on the 5<sup>th</sup> of February, the earth continued to be in a continual tremor, more or less; and that the shocks were more sensibly felt at times in some parts of the afflicted provinces than in others; that the motion of the earth had been various, and, according to the Italian denomination, *vorticoso*, *orizoniale*, and *oscillatorio*, either whirling like a vortex horizontal, or by pulsations, or beating from the bottom upwards; that this variety of motion had increased the apprehensions of the unfortunate inhabitants of those parts, who expected every moment that the earth would open under their feet, and swallow them up; that the rains had been continual and violent, often accompanied with lightning, and irregular and furious gusts of wind: that from all these causes the face of the earth of that part of Calabria, comprehended, as above-mentioned, between the 38<sup>th</sup> and 39<sup>th</sup> degrees [latitude], was entirely altered, particularly on the westward side of the mountains above-named; that many openings and cracks had been made in those parts; that some hills had been lowered, and others quite leveled; that in the plains deep chasms had been made, by which many roads were rendered impassible; that huge mountains had been split asunder, and parts of them driven to a considerable distance; that deep vallies [valleys] had been filled up, by the mountains which formed those vallies [valleys] having been detached by the violence of the earthquakes, and joined together; that the course of some rivers had been altered; that many springs of water had appeared in places that were perfectly dry before; and that, in other parts, springs that had been constant had totally disappeared; that near Laureana, in Calabria Ultra, a singular phenomenon had been produced, that the surface of two whole tenements, with large olive and mulberry trees thereon, situated in a valley perfectly level, had been detached by the earthquake, and transplanted, the trees still remaining in their places, to the distance of about a mile from their first situation; and that from the spot on which they formerly stood, hot water had sprung up to a considerable height, mixed with sand of a ferruginous nature [ferruginous - resembling iron rust in appearance and color, brownish red, or yellow red]; that near this place also some countrymen and shepherds had been swallowed up, with their teams of oxen, and flocks of goats and sheep: in short, that beginning from the city of Amantea, situated on the coast of the Tyrrhene [Tyrrhenian] Sea, in Calabria Citra, and going along the westward coast to Cape Spartivento, in Calabria Ultra, and then up the eastern coast as far as the Cape d’Alice, (a part of Calabria Citra on the

Ionian Sea) there is not a town or village, either on the coast or land, but what is either totally destroyed, or has suffered more or less, amounting in all to near four hundred what are called here *paeses*. (A village containing less than an hundred inhabitants is not counted as a *paese*. [In other words, a *paese* is a village containing more than 100 inhabitants.]”

— “The greatest mortality fell upon those towns and countries situated in the plain, on the western side of the mountains Dejo, Sacro, and Caulone. At Casal Nuovo [Casalnuovo], the Princess Grace, and upwards of 4000 of the inhabitants, lost their lives; at Bagnara, the number of dead amounts to 3017; Radicina and Palma count their loss at about 3000 each; Terra Nuova [now Gela] about 1400; and Seminari still more. The sum total of the mortality in both Calabrias, and in Sicily, by the earthquakes alone, according to the returns in the Secretary of State’s office, at Naples, is 33,367; but I have good reason to believe, that, including strangers, the number of lives lost must have been considerably greater; 40,000 at least may be allowed, and, I believe, without exaggeration.”

— “From the same office intelligence we likewise heard, that the inhabitants of Scilla, on the first shock of the earthquake, on the 5<sup>th</sup> of February, had escaped from their houses on the rock, and following the example of their prince, taken shelter on the sea-shore; but that in the night-time the same shock which had raised and agitated the sea so violently, and done so much damage on the point of the Faro of Messina, had acted with still greater violence there, for that the wave (which was represented to have been boiling hot, and that many people had been scalded by its rising to a great height) went furiously three miles inland, and swept off in its return 2473 of the inhabitants of Scilla, with the prince at their head, who were at that time either on the Scilla strand, or in boats near the shore.”

— “All accounts agreed, that of the number of shocks which have been felt since the beginning of this formidable earthquake, amounting to some hundreds, the most violent, and of the longest duration, were those of the 5<sup>th</sup> of February, at 19½ (according to the Italian way of counting the hours); of the 6<sup>th</sup> of February, at seven hours in the night; of the 27<sup>th</sup> of February, at 11¼ in the morning; of the 1<sup>st</sup> of March, at 8½ in the night; and that of the 28<sup>th</sup> of March, at 11½ in the night. It was this last shock that affected most the upper part of Calabria Ultra, and the lower part of the Citra, an authentic description of which you will see hereafter, in a letter which I received from the Marquis Ippolito, an accurate observer, residing at Catanzaro, in the Upper Calabria. The first and the last shocks must have been tremendous indeed, and only these two were sensibly felt in this capital.”

— “The accounts which this government has received from the province of Cosenza, are less melancholy than those from the provinces of Calabria Ultra. From Cape Suvero to the Cape of Cetraro, on the western coast, the inland countries, as well as those on the coast, are said to have suffered more or less, in proportion to their proximity to the supposed centre [center] of the earthquake; and it has been constantly observed, that its greatest violence has been exerted, and still continues to be so, on the western side of the Apennines, precisely the celebrated Sila [La Sila] of the ancient Brutii [Bruttii], and that all those countries situated to the eastward of the Sila had felt the shocks of the earthquake, but without having received any damage from them. In the province of Cosenza, there does not appear to be above 100 lives lost. In the last accounts from the most afflicted part of Calabria Ultra, two singular phænomena, are mentioned: at about the distance of three miles from the ruined city of Oppido, there was a hill (the soil of which is a sandy clay) about 500 palmos high, and 1300 in circumference [the length of a palm in Naples, Italy at this time was approximately 8 7/12 inches. Therefore the hill was approximately 358 feet high and 930 feet in circumference.] at its basis; it was said that this hill, by the shock of the 5<sup>th</sup> of February, jumped to the distance of about four miles from the spot where it stood, into a plain called the Campo di Baffano [Bassano?]. At the same time the hill on which the town of Oppido stood, which extended about three miles, divided into two, and as its situation was between two rivers, its ruins filled up the valley and stopped the course of those rivers; two great lakes are already formed, and are daily encreasing [increasing], which lakes, if means are not found to drain them, and give the rivers their due course, in a short time must infect the air greatly.”

— “From Sicily the accounts of the most serious nature were those of the destruction of the greatest part of the noble city of Messina, by the shock of the 5<sup>th</sup> of February, and of the remaining parts by the subsequent ones; that the quay in the port had sunk considerably, and was in some places a palm and a

half underwater; that the superb building, called the Palazzata [La Palazzata di Simone Gulli], which gave the port a more magnificent appearance than any port in Europe can boast of, had been entirely ruined; that the lazaret [hospital] had been greatly damaged, but that the citadel had suffered little; that the mother-church had fallen: in short, that Messina was no more; that the tower at the point of the entrance of Faro was half destroyed; and that the same hot wave that had done such mischief at Scilla, had passed over the point of land at the Faro, and carried off about 24 people. The Viceroy of Sicily likewise gave an account of some damage done by the earthquakes, but nothing considerable, at Melazzo [Milazzo], Patti, Terra di Santa, Lucia, Castro Reale [Castroreale], and in the island of Lipari.”

— “This, Sir, was the intelligence I was possessed of at the end of the month: but as I am particularly curious, as you know, on the subject of volcanoes, and was persuaded in my own mind (from the present earthquakes being confined to one spot) that some great chemical operation of nature of the volcanic sort was the real cause of them; in order to clear up many points, and to come at truths, which you also well know, Sir, is exceedingly difficult, I took the sudden resolve on to employ about twenty days (which was as much as I could allow, and have time to be out of Italy, in my way home, before the heats [hot weather] set in) in making the tour of such parts of Calabria Ultra and Sicily as had been, and were still, most affected by the earthquakes, and examining with my own eyes the phænomena above mentioned. I accordingly hired for that purpose a Maltese speronara [a type of small Mediterranean sailing boat] for myself, and a Neapolitan felucca [small sailing vessel] for my servants, and left Naples on the 2<sup>nd</sup> of May. I was furnished, by command of his Sicilian Majesty, with ample passports, and orders to the commanding officers of the different provinces to give me every assistance and protection in the pursuit of my object. I had a pleasant voyage in my Maltese speronara (which are excellent boats, and the boatmen very skilful [skillful]) along the coast of the Principato Citra and Calabria Citra, after having passed the Gulph [Gulf] of Policastro. At Cedraro, I found the first symptoms of the earthquake, some of the principal inhabitants of that city having quitted their houses, and living in new-erected barracks, though not a house in the whole town, as I could see, had suffered. At St. Lucido, I perceived that the baron’s palace, and the church-steeple had suffered, and the most of the inhabitants were in barracks. The barracks are just such sort of buildings, as the booths of our country fairs, though indeed many I have seen are more like our pig-styes [pigsties]. As my object was to get as fast as possible to the centre [center] of the mischief [damage], having little time, and much to see, I contented myself with a distant view of Maida, Nicastro, and Santo Eusemia, and pushed on to the town of Pizzo [Pizzo Calabro], in Calabria Ultra, where I landed on the evening of the 6<sup>th</sup> of May. This town, situated on the sea, and on a volcanic cussa [former volcanic activity] had been greatly damaged by the earthquake of the 5<sup>th</sup> of February, but was completely ruined by that of the 28<sup>th</sup> of March. As the inhabitants of this town (amounting to about 5000) had sufficient warning, and had left their houses, and taken to barracks on the first shock, the 5<sup>th</sup> of February, the mortality on the 28<sup>th</sup> of March was inconsiderable; but, from the barracks having been ill constructed, and many situated in a very confined unwholesome spot, an epidemical disorder had taken place, and carried off many, and was still in fatal force whilst I was there, in spite of the wise endeavours [endeavors] of government to stop its progress. I fear, as the heats [hot weather] increase, the same misfortune will attend many parts of the unfortunate Calabria, as also the city of Messina. The inhabitants of Pizzo seem to me to have habituated themselves already to their present inconvenient manner of living, and shops of every kind were opened in the streets of the barracks, which, except some few, are but poorly constructed. I was assured here, that the volcano of Stromboli, which is opposite, and in full view of this town, and at the distance of about fifty miles, had smoked less, and thrown up a less quantity of inflamed matter during the earthquake than it had done for some years past; that slight shocks continued to be felt daily; and the night I slept here, on board the speronara drawn on shore, I was awakened with a smart one, which seemed to lift up the bottom of the boat, but it was not attended with any subterraneous noise. My servants in the other boat, felt the same. The next day, I ordered my boats to proceed to Reggio, and I went on horseback to Monteleone [now Vibo Valentia], about six miles from Pizzo, up hill, on a road of loose stones and clay scarcely passable in this season, but through the most beautiful and fertile country I ever beheld; a perfect garden of olive-trees, mulberry-trees, fruit-trees, and vines; and under these trees the richest crops of corn or lupins, beans, or other

vegetables, which seemed to thrive perfectly, though under a thick shade. This is the stile [style] of the whole plain of Monteleone [now Vibo Valentia], except that here and there are vast woods of oak and olive trees mixed, and there olive trees are of such a size as I could never have conceived, being half as big as the oaks themselves, which are fine timber-trees, and more than treble the size of the olive trees of the Charapagna Felice. The olive woods, in some parts of the plain, are regularly planted in lines, and in others grow irregularly. Though the object of my present journey was merely to take a hasty view of the spots which had suffered so much by the calamity, my attention was continually called away, and I was lost in the admiration of the fertility and beauty of this rich province, exceeding by many degrees (as to the first point) every country I have yet seen. Besides the two rich products of silk and oil, in which this province surpasses every other, perhaps in the whole world, it abounds with corn, wine, cotton, liquorice; fruit and vegetables of every kind; and if its population and industry kept pace with its fertility, the revenue of Calabria Ultra might surely be more than doubled in a short time. I saw whole groves of mulberry-trees, the owners of which told me did not let for more than five shillings an acre, when every acre would be worth at least five pounds, had they hands to gather the leaves and attend the silk worms. The town of Monteleone, anciently Vibo Valentia, is beautifully situated on a hill, overlooking the sea, and the rich plains above-mentioned, bounded by the Appenines [Apennine Mountains], and crowned by Aspromonte, the highest of them all, interspersed with towns and villages, which alas! are no more than heaps of ruins. The town of Monteleone [now Vibo Valentia] suffered little by the first shocks of the earthquake; but was greatly damaged by that of the 28<sup>th</sup> of March, (though only twelve lives were lost) and all the inhabitants are reduced to live in barracks, many of which are well constructed with either planks or reeds, covered with plaster on the outside. As this country has ever been subject to earthquakes, the baron had [constructed] a barrack near their palace, to retire to on the least alarm of an earthquake. I inhabited here a magnificent one, consisting of many rooms well furnished, which was built by the present Duke of Monteleone's grandfather. I owe the safety and expedition of the very interesting journey which I have taken through this province, to this duke's goodness as he was pleased, at Naples, to furnish me with a letter to his agent; in consequence of which, I was not only most hospitably and elegantly treated in his barrack, and supplied with excellent surefooted horses for myself and servant, but also with two of his horse guards, well acquainted with the cross-roads of the country, without which it would have been impossible, with any degree of safety, to have visited every curious spot between Monteleone [now Vibo Valentia] and Reggio, as I did, in four days. No one, that has not had the experience, can conceive the horrid state of the roads in Calabria, even in this season, nor the superior excellence of the horses of the country. All agreed here, that every shock of the earthquake seemed to come with a rumbling noise from the westward, beginning usually with the horizontal motion, and ending with the vorticose [swirling], which is the motion that has ruined most of the buildings in this province. The same observation I found to be a general one throughout this province. I found it a general observation also, that before a shock of an earthquake, the clouds seemed to be fixed and motionless; and that, immediately after a heavy shower of rain, a shock quickly followed. I spoke with many here, and elsewhere, who were thrown down by the violence of some of the shocks; and several peasants in the country told me, that the motion of the earth was so violent that the heads of the largest trees almost touched the ground from side to side; that, during a shock, oxen and horses extended their legs wide asunder, not to be thrown down; and that they gave evident signs of being sensible of the approach of each shock. I myself observed that in the parts that have suffered most by the earthquakes, the braying of an ass, the neighing of a horse, or the cackling of a goose, always drove people out of their barracks, and was the occasion of many Paternosters and Ave-Marias being repeated in expectation of a shock. From Monteleone [now Vibo Valentia]: I descended into the plain, having passed through many towns and villages which had been more or less ruined, according to their vicinity to the plain. The town of Mileto, situated in the bottom, I saw was totally destroyed, and not a house standing. At some distance I saw Soranio and the noble Dominican Convent a heap of ruins: but, as my object was not to visit ruins, but, the greater phænomena produced by earthquakes, I went on to Rosarno. I must, however, first mention the most remarkable instance I met with of animals being able to live long without food, of which there have been many examples during these present earthquakes. At Soriano two fattened hogs, that had

remained buried under a heap of ruins, were taken out alive the forty-second day; they were lean and weak, but soon recovered. One of his Sicilian Majesty's engineers, who was present at the taking them out, gave me this information. It was evident to me, in this day's journey that all habitations situated on high grounds, the soil of which is a gritty sand-stone, somewhat like a granite, but without the consistence, had suffered less than those situated on the plain, which are universally levelled to the ground. The soil of the plain is a sandy clay, white, red, or brown; but the white prevails most, and is full of marine shells, particularly scollop [scallop] shells. This valley of clay is intersected in many places by rivers and torrents coming from the mountains, which have produced wide and deep ravines all over the country. Soon after we had passed through the ruined town of St. Pietro, we had a distant view of Sicily, and the summit of Mount Ætna, which smoked considerably. Just before we arrived at Rosarno, near a ford of the River Mamella, we passed over a swampy plain, in many parts of which I was shewn [shown] some hollows in the earth, of the shape of an inverted cone; they were covered with sand, as was the soil near them. I was told that, during the earthquake of the 5<sup>th</sup> of February, from each of these spots a fountain of water mixed with sand had been driven up to considerable height [sand/water geyser]. I spoke to a peasant here, who was present, and was covered with the water and sand; but he assured me it was not hot, as had been represented. Before this appearance, he said, the river was dry, but soon after returned and overflowed its banks. I afterwards found, that the same phænomenon had been constant with respect to all the other rivers in the plain during the formidable shock of the 5<sup>th</sup> of February. I think this phænomenon is easily explained, by supposing the first impulse of the earthquake to have come from the bottom upwards, which all the inhabitants of the plain attest to be fact; the surface of the plain suddenly arising, the rivers, which are not deep, would naturally disappear, and the plain, returning with violence to its former level, the rivers must naturally have returned, and overflowed at the same time that the sudden depression of the boggy grounds would as naturally force out the water that lay hid under their surface. I observed in the other parts where this phænomenon had been exhibited, that the ground was always low and rushy. Between this place and Rosarno we passed the river Messano, or Metauro, (which is near the town above mentioned) on a strong timber bridge, 700 palms long, which had been lately built by the Duke of Monteleone. From the cracks made on the banks and in the bed of the rivers by the earthquake, it was quite [?] in one part, and the level on which the piers were placed having been variously altered, the bridge has taken an undulated form, and the rail on each side is curiously scolloped; but the parts that were separated having been joined again, it is now passable: the duke's bridgeman told me also, that at the moment of the earthquake this great river was perfectly dry for some seconds, and then returned with violence and overflowed, and that the bridge undulated in a most extraordinary manner. When I mention the earthquake in the plain, it must be always understood the first shock on the 5<sup>th</sup> of February, which was by far the most terrible, and was the one that did the whole mischief [damage] in the plain, without having given any previous notice [warning]. The town of Rosarno, with the Duke of Monteleone's palace there, was entirely ruined; but the walls remained about six feet high, and are now sitting up as barracks. The mortality here did not much exceed 200 out of near 3000. It had been remarked at Rosarno, (and the same remark has been constantly repeated to me in every ruined town that I have visited) that the male dead were generally found under the ruins in the attitude of struggling against the danger; but that the female attitude was usually with hands clasped over their heads, as giving themselves up to despair, unless they had children near them, in which case they always were found clasping the children in their arms, or in some attitude which indicated their anxious care to protect them— a strong instance of the maternal tenderness of the sex! The only building that remained unhurt at Rosarno was a strong built town goal [jail], in which were three notorious villains, who would probably have lost their lives had they been at liberty. After having dined in a barrack, the owner of which had lost five of his family by the earthquake, I proceeded to Laureana, often crossing the wide extended bed of the river Metauro."

— "The environs [neighborhood] of Laureana, which stands on an elevation, is the Garden of Eden itself; nothing I ever saw can be compared to it. The town is considerable; but as the earthquake did not come on suddenly, as in the plain, not a life was lost there; but from a sickness occasioned by hardships and fright, 52 have since died. I lodged in the barracks of a sensible gentleman of Mileto, Don Domenico

Acquanetta, who is a principal proprietor of this town. He attended me the next day to the two tenements, called the Macini and Vaticano, mentioned in the former part of this letter, and which were said to have changed their situation by the earthquake. The fact is true, and easily accounted for. These tenements were situated in a valley surrounded by high grounds; and the surface of the earth, which has been removed, had been probably long undermined by little rivulets [a very small stream] which came from the mountains, and now are in full view on the bare spot the tenements had deserted. These rivulets have a sufficiently rapid course down the valley, to prove it's not being a perfect level, as was represented. I suppose the earthquake to have opened some depositories of rain water in the clay hills which surround the valley, which water, mixed with the loose soil, taking it's course suddenly through the undermined surface lifting it up with the large olive and mulberry trees, and a thatched cottage, floated the entire piece of ground, with all it's vegetation, about a mile down the valley, where it now stands, with most of the trees erect. These two tenements may be about a mile long, and half a mile broad. I was shewn [shown] several deep cracks in this neighborhood, not one above a foot in breadth; but which, I was credibly assured, had opened wide during the earthquake, and swallowed up an ox, and near an [a] hundred goats, but no countrymen, as was reported. In the valley above mentioned I saw the same sort of hollows in the form of inverted cones, out of which, I was assured, that hot-water and sand had been emitted with violence during the earthquakes, as at Rosarno; but I could not find any one who could positively affirm that the water had been really hot, although the reports which government received affirm it. Some of the sand thrown out here with the water has a ferrugineous [ferruginous] appearance and seems to have been acted upon by fire. I was told that it had also, when fresh, a strong smell of sulphur [sulfur], but, I could not perceive it."

— "From hence I went through the same delightful country to the town of Polistene. To pass through so rich a country, and not see a single house standing on it, is most melancholy indeed! Wherever a house stood, there you see a heap of ruins, and a poor barrack, with two or three miserable mourning figures sitting at the door, and here and there a maimed man, woman, or child, crawling upon crutches. Instead of a town, you see a confused heap of ruins, and round about them numbers of poor huts or barracks, and a larger one to serve as a church with the church-bells hanging upon a sort of low gibbet; every inhabitant with a doleful countenance, and wearing some token of having lost a parent."

— "I travelled four days in the plain, in the midst of such misery as cannot be described. The force of the earthquake was so great there, that all the inhabitants of the towns were buried either alive or dead under the ruins of their houses in an instant. The town of Polistene was large, but ill situated between two rivers, subject to overflow. 2100 out of about 6000 [people] lost their lives here the fatal 5<sup>th</sup> of February. The Marquis St. Giorgio, the baron of this country, whom I found here, was well employed in assisting his tenants. He had caused the streets of his ruined town to be cleared of rubbish, and had erected barracks on a healthy spot near it, for the remainder of his subjects, and on a good plan. He had also constructed barracks of a larger size for the silk worms, which I found already at work in them. This prince's activity and generosity is most praise-worthy; and, as far as I have seen hitherto, he is without a rival. I observed, that the town of St. Giorgio, on a hill about two miles from Polistene, though rendered uninhabitable, was by no means levelled like the towns on the plain. There was a nunnery at Polistene: being curious to see the nuns that had escaped, I asked the Marquis to shew [show] me their barracks; but, it seems only one out of twenty-three had been dug out of her cell alive, and she was four score [80] years of age. After having dined with the Marquis in his humble barrack, near the ruins of his very magnificent palace, I went through a fine wood of olive, and another of chestnut-trees, to Casal Nuovo [Casalnuovo], and was shewn [shown] the spot on which stood the house of my unfortunate friend the Princess Grace Grimaldi; who, with more than four thousand of her subjects, lost her life by the sudden explosion of the 5<sup>th</sup> of February, (for so it appears to have been) that reduced this town to atoms. I was told by some here, who had been dug out of the ruins, that they felt their houses fairly lifted up, without having had the least previous notice [warning]. In other towns some walls and parts of houses are standing: but here you neither distinguish street nor houses; all lie in one confused heap of ruins. An inhabitant of Casal Nuovo [Casalnuovo] told me he was on a hill at the moment of the earthquake, overlooking the plain; when, feeling the shock, and turning towards the plain, instead of the town, he saw in the place of it a thick

cloud of white dust like smoke, the natural effect of the crushing of the buildings, and the mortar flying off.”

— “From hence I went through the towns of Castellace and Milicufoo (both in the same condition as Casal Nuovo [Casalnuovo]) to Terra Nuova [now Gela], situated in the same lovely plain, between two rivers, which with the torrents from the mountains, have, in the course of ages, cut deep and wide chasms in the soft sandy clay soil, of which the whole plain is composed. At Terra Nuova [now Gela] the ravine or chasm is not less than 500 feet deep, and three quarters of a mile broad. What causes a confusion in all the accounts of the phænomena produced by this earthquake in the plain, is the not having sufficiently explained the nature of the soil and situation. They tell you, that a town has been thrown a mile from the place where it stood, without mentioning a word of a ravine; that woods and corn-fields have been removed in the same manner: when, in truth, it is but upon a large scale, what we see every day upon a smaller, when pieces of the sides of hallow ways [ravines], having been undermined by rain-waters, are detached into the bottom by their own weight. Here, from the great depth of the ravine, and the violent motion of the earth, two huge portions of the earth, on which a great part of the town stood, consisting of some hundreds of houses, were detached into the ravine, and nearly across it, about half a mile from the place where they [once] stood; and, what is most extraordinary, several of the inhabitants of these houses, who had taken this singular leap in them, were nevertheless dug out alive, and some unhurt. I spoke to one myself who had taken this extraordinary journey in his house, with his wife and a maid-servant: neither he nor his maid-servant were hurt; but he told me his wife had been a little hurt, but was now nearly recovered. I happened to ask him, what hurt his wife had received: his answer, though of a very serious nature, will nevertheless I am sure, make you smile, Sir, as it did me. He said, she had both her legs and one arm broken; and that she had a fracture on her skull, so that the brain was visible. It appears to me, that the Calibrosi have more firmness [toughness] than the Neapolitans; and they really seem to bear their present excessive misfortune with a true philosophic patience. Of 1600 inhabitants at Terra Nuova [now Gela], only 400 escaped alive. My guide there, who was a priest and physician, had been shut up in the ruins of his house by the first shock of the earthquake, and was blown out of it, and delivered by the succeeding shock, which followed the first immediately. There are many well-attested instances of the same having happened elsewhere in Calabria. In other parts of the plain, situated near the ravine, and near the town of Terra Nuova [now Gela], I saw many acres of land with trees and cornfields that had been detached into the ravine, and often without having been overturned, so that the trees and crops were growing as well as if they had been planted there. Other such pieces were lying in the bottom, in an inclined situation, and others again that had been quite overturned. In one place, two as these immense pieces of land having been detached opposite to one another, had filled the valley, and stopped the course of the river, the waters of which were forming a great lake; and this is the true state of what the accounts mention of mountains that had walked, and joined together, stopped the course of the river, and formed a lake. At the moment of the earthquake the river disappeared here as at Rosarno; and, returning soon after, overflowed the bottom of the ravine about three feet in depth, so that the poor people who had been thrown with their houses into the ravine from the top of it, and had escaped with broken bones, were now in danger of being drowned. I was assured that the water was salt, like that of the sea, but this circumstance seems to want confirmation. The same reason I have given for the sudden disappearing of the River Metauro at Rosarno, will account for the like phænomenon here, and in every part of the country where the rivers dried up at the moment of the earthquake. The whole town of Mollochi di Sotto, near Terra Nuova [now Gela], was likewise detached into the ravine, and a vineyard of many acres near it lies in the bottom of the ravine, as I saw, in perfect order, but in an inclined situation: there is a foot-path through this vineyard, which has a singular effect, considering it's present impracticable situation. Some watermills, that were on the river, having been jammed between two such detached pieces as above described, were lifted up by them, and are now seen on an elevated situation, many feet above the level of the river. Without the proper explanations, it is no wonder that such facts should appear miraculous. I observed in several parts of the plain, that the soil, with timber trees and crops of corn, consisting of many acres, had sunk eight and ten feet below the level of the plain; and in others again I perceived it had risen as many. It is necessary to remember, that the soil of the plain is a clay mixed with sand, which is easily

moulded [molded] into any shape. In the plain, near the spots from whence the above-mentioned pieces had been detached into the ravines, there were several parallel cracks; so that had the violence of the shocks of the earthquake continued, these pieces also would probably have followed. I remarked constantly, in all my journey, that near every ravine, or hollow-way, the parts of the plain adjoining were full of large parallel cracks. The earth rocking with violence from side to side, and having a support on one side only, accounts well for this circumstance.”

— “From Terra Nuova [now Gela] I went to Oppido. This city is situated on a mountain of a ferruginous [ferruginous – containing iron] sort of gritty stone, unlike the clay soil of its neighbourhood [neighborhood], and is surrounded by two rivers in a ravine deeper and broader than that of Terra Nuova [now Gela]. Instead of the mountain on which Oppido was situated having split in two, and by its fall on the rivers stopped their course, and formed great lakes, as we are told, it was (as at Terra Nuova [now Gela]) huge pieces of the plain on the edge of the ravine, that had been detached into it, nearly filled it up, and stopped the course of the rivers, the waters of which are now forming two great lakes. It is true, that part of the rock on which Oppido stood, was detached with several houses into the ravine, but that is a trifling circumstance, in comparison of the very great tracts of land, with large plantations of vines and olive trees, which have been detached from one side of the ravine clear over to the other, though the distance is more than half a mile. It is well attested, that a countryman, who was ploughing his field in this neighborhood with a pair of oxen was transported with his field and team, clear from one side of the ravine to the other, and that neither he nor his oxen were hurt. After what I have seen, I verily believe this may have happened. A large volume might be composed of the curious facts and accidents of this kind, produced by the earthquake in the valley; and, I suppose, many will be recorded in the account of the late formidable earthquakes, which the Academy of Naples intends to publish, the president having already sent into Calabria fifteen members, with draftsmen in preparation, to collect the facts, and make drawings for the sole purpose of giving a satisfactory and ample account of the late calamity to the public: but, unless they attend, as I did, to the peculiar nature of the soil where those accidents happened, their reports will generally meet with little credit, except from those who are professed dilettanti [a dabbler in the art] of miracles, and many such do certainly exist in this country. I met with a remarkable instance here of the degree of immediate distress to which the unfortunate inhabitants of the destroyed towns were reduced. Don Mascillo Grillo, a gentleman of fortune, and of great landed property, having escaped from his house at Oppido, which was destroyed by the earthquake, and his money (no less than twelve thousand pieces of gold) having been buried under the ruins of it, remained several days without food or shelter during heavy rains, and was obliged to a hermit in the neighborhood for the loan of a clean shirt. Having walked over the ruins of Oppido, I descended into the ravine, and examined carefully the whole of it. Here I saw, indeed, the wonderful force of the earthquake, which has produced exactly the same effects as I have described in the ravine of Terra Nuova [now Gela], but on a scale infinitely greater. The enormous masses of the plain, detached from each side of the ravine, lie sometimes in confused heaps, forming real mountains, and having stopped the course of two rivers, (one of which is very considerable) great lakes are already formed, and, if not afforded by nature or art, so as to give the rivers their due course, must insatiably be the cause of a general infection in the neighbourhood [neighborhood]. Sometimes I met with a detached piece of the surface of the plain, (of many acres in extent) with the large oaks and olive trees, with [lupins?] or corn under them, growing as well, and in as good order, at the bottom of the ravine, as their companions from whom, they were separated, do on their native soil in the plain, at least 500 feet higher, and at the distance of about three quarters of a mile. I met with whole vineyards in the same order in the bottom, that had likewise taken the same journey. As the banks of the ravine, from whence these pieces came, are now bare and perpendicular, I perceived that the upper soil was a reddish earth, and the under one a sandy white clay, very compact, and like a soft stone; the impulse these huge masses received, either from the violent motion of the earth alone, or that assisted with the additional one of the volcanic exhalations let at liberty, seems to have acted with greater force on the lower and more compact stratum, than on the upper cultivated crust: for I constantly observed, where these cultivated islands lay, (for so they appeared on the barren bottom of the ravine) the under stratum of compact clay had been driven some hundred yards farther, and lay in confused blocks; and, as I observed, many of

those blocks were of a cubical form. The under soil having had a greater impulse, and leaving the upper in its flight, naturally accounts for the order in which the trees, vineyards, and vegetation, fell, and remain at present in the bottom of the ravine. This curious fact, I thought, deserved to be recorded, but is not easily described by words. When the drawings and plans of the Academy are published, this account (imperfect as it is) may, perhaps, have its utility; had my time permitted, I would certainly have taken a draftsman with me into Calabria. In another part of the bottom of the ravine there is a mountain composed of the same clay soil, and which was probably a piece of the plain detached by an earthquake at some former period; it is about 250 feet high, and about 400 feet diameter at its base: this mountain, as is well attested, has travelled down the ravine near four miles, having been put in motion by the earthquake of the 5<sup>th</sup> of February. The abundance of rain which fell at that time, the great weight of the fresh detached pieces of the plain, which I saw heaped up at the back of it, the nature of the soil of which it is composed, and particularly its situation on a declivity [a downward slope], accounts well for this phænomenon; whereas the reports which came to Naples, of a mountain, in a perfect plain, having leaped four miles, had rather the appearance of a miracle. I found some single timber trees also, with a lump of their native soil at the roots, standing upright in the bottom of the ravine, and which had been detached from the plain above-mentioned. I observed also, that many confused heaps of the loose soil, detached by the earthquake from the plains on each side of the ravine, had actually run like a volcanic lava, (having probably been assisted by the heavy rain) and produced many effects greatly resembling those of lava during their course down a great part of the ravine. At Santa Christina, in the neighbourhood [neighborhood] of Oppido, the like phænomena have been exhibited, and the great force of the earthquake of the 5<sup>th</sup> of February seems to have been exerted on these parts, and at Casal Nuovo [Casalnuovo] and Terra Nuova [now Gela]. The phænomena exhibited by the earthquakes in other parts of the plains of Calabria Ultra, are of the same nature; but trifling in comparison of those I have been describing. The barracks erected for the remaining inhabitants of the ancient city of Oppido, now in ruins, are on a healthy spot, at about the distance of a mile from the old town, where I found the baron of this country, the Prince of Cariati, usefully employed in the assistance of his unfortunate subjects. He shewed [showed] me two girls, one about sixteen years of age, who had remained eleven days without food under the ruins of a house at Oppido: she had a child of five or six months old in her arms, which died the fourth day. The girl gave me a clear account of her sufferings: having light through a small opening, she had kept an exact account of the number of days she had been buried. She did not seem to be in bad health, drinks, freely, but has yet a difficulty in swallowing anything solid. The other girl was about eleven years of age: she remained under the ruins six days only; but in so very confined and distressful a posture, that one of her hands pressing against her cheek, had nearly worn a hole through it.”

— “From Oppido I proceeded through the same beautiful country and ruined towns and villages to Seminara and Palmi. The houses of the former were not quite in such a ruined condition as those of the latter, whose situation is lower, and nearer the sea. One thousand four hundred lives were lost at Palmi, and all the dead bodies have not been removed and burnt, as in most other parts I visited; for I myself saw two taken up whilst I was there; and I shall ever remember a melancholy figure of a woman in mourning, sitting upon the ruins of her house, her head reclined upon her hand and knee, and following with an anxious eager eye every stroke of the pickaxe of the labourers [laborers] employed to clear away the rubbish, in hopes of recovering the corpse of a favourite [favorite] child. This town was a great market for oil, of which there were upwards of 4000 barrels in the town at the time of its destruction; so that the barrels and jars being broken, a river of oil ran into the sea from it for many hours. The spilt oil mixed with the corn of the granaries; and the corrupted bodies have had a sensible effect on the air. This, I fear, as the heats [hot weather] increase, may prove fatal to the unfortunate remainder of the inhabitants of Palmi, who live in barracks near the ruined town. My guide told me, that he had been buried in the ruins of his house here by the first shock; and that, after the second, which followed immediately, he found himself sitting astride a beam at least sixteen feet in the air. I heard of many such extraordinary escapes in all parts of the plain, where the earthquake had exerted its greatest force.”

— “From Palmi I proceeded through the beautiful woody mountains of Bagnara and Solano; noble timber oak-trees on high rocks, narrow vallies [valleys] with torrents in their bottoms, the road dangerous

both on account of robbers and precipices. My two guards instead of leading the way, as they had hitherto done, now separated, and formed an advanced and a rear guard. The narrow road was often interrupted by the fallen rocks and trees during the earthquakes, and obliged us to seek a new and still more dangerous road; but the Calabrese horses are really as sure footed as goats. In the midst of one of these passes we felt a very smart shock of an earthquake, accompanied by a loud explosion, like that of springing a mine; fortunately for us, it did not, as I expected, detach any rocks or trees from the high mountains that hung over our heads. After having passed the woods of Bagnara, Sinopoli, and Solano, I went through rich corn fields and lawns, beautifully bounded with woods and scattered trees, like our finest parks, and which continue varying for some miles, till you come upon the top of an open plain on a hill, commanding the whole Faro of Messina, the coast of Sicily as far as Catania, with Mount Ætna rising proudly behind it, which altogether composed the finest view imaginable. From thence I descended a horrid rocky road to the Torre del Pezzolo, where there is a country seat and a village belonging to the Princess of Bagnara. There I found that an epidemical disorder had already manifested itself, as it probably will in many other parts of this glorious but unhappy country, in proportion as the heats [hot weather] increase, owing to the hardships suffered, and the air having been spoiled by new formed lakes. Several fishermen assured me, that, during the earthquake of the 5<sup>th</sup> of February at night, the sand near the sea was hot, and that they saw fire issue from the earth in many parts. This circumstance has been often repeated to me in the plain; and my idea is, that the exhalations which issued during the violent commotions of the earth, were full of electrical fire, just as the smoke of volcanoes is constantly observed to be during violent eruptions: for I saw no mark in any part of my journey of any volcanic matter having issued from the fissures of the earth; and I am convinced that the whole damage has been done by exhalations and vapours [vapors] only. The first shock felt at this place, as I was assured, was lateral, and then vorticose, and exceedingly violent; but what they call violent here must have been nothing in comparison of what was felt in the plain of Casal Nuovo [Casalnuovo], Polistene Palmi, Terra Nuova [now Gela], Oppido, etc. etc. where all agreed in assuring me, that the violence of the fatal shock of the 5<sup>th</sup> of February was instantaneous, without warning, and from the bottom upwards; and, indeed, in those places where the mortality has been so great, and where nothing is to be seen but a confused heap of ruins, without distinction of either streets or houses, the violence of that shock is sufficiently confirmed. From this place to Reggio the road on each side is covered with villas and orange-groves. I saw not one house levelled to the ground; but perceived that all had been damaged, and were abandoned; and that the inhabitants were universally retired to barracks in these beautiful groves of orange, mulberry, and fig-trees, of which there are many in the environs of Reggio. One that I visited, and which is reckoned the richer in all this part of Magna Graecia, is about 2 mile and a half from the town of Reggio; and, what is remarkable, belongs to a gentleman whose christian name is Agamemnon. The beauty of the argrume [agrume - citrus] (the general name of all kind of orange, lemon, codsate, and bergamot trees) is not to be described; the soil being sandy, the exposition warm, and great command of water, a clear rivulet being introduced at pleasure in little channels to the foot of each tree, are the reasons of the wonderful luxuriance of those trees. Don Agamemnon assured me it was a bad year when he did not gather from his garden (which is of no great extent) 170,000 lemons, 200,000 oranges, (which I found as excellent at those of Malta) and bergamots enough to produce 200 quarts of the essence from their rinds. There is another singularity in these gardens, as I was assured, every fig-tree affords two crops of fruit annually; the first in June, the second in August.”

— “But to return to my subject, from which my attention was frequently called away by the extraordinary and uncommon beauty and fertility of this rich province; I arrived about sunset at Reggio, which I found less damaged than I expected, though not a house in it is habitable or inhabited, and all the people live in barracks or tents: but, after having been several days in the plain, where every building is leveled to the ground, a house with a roof, and a church with a steeple, was to me a new and refreshing object. The inhabitants of the whole country that has been so severely afflicted with earthquakes, seem, however, to have so great a dread of going into a house, that when the earthquakes shall have ceased, I am persuaded the greater part of them will still continue to live in barracks. The barracks here (except some few that are even elegant) are ill constructed, as are in general throughout the country all barracks of

towns that have been so little damaged as to allow the inhabitants to flatter themselves with a hope of being able to return to, and occupy, their houses again, when the present calamity is at an end. Reggio has been roughly handled by the earthquakes, but is by no mean destroyed. The archbishop, a sensible, active, and humane prelate, has distinguished himself from the beginning of the earthquakes to this day, having immediately disposed of all the superfluous ornaments of the churches, and of his own horses and furniture, for the sole relief of his distressed flock, with whom he cheerfully bears an equal share of every inconvenience and distress which such a calamity has naturally occasioned. Except in this instance, and very few others, indeed, I observed throughout my whole journey a prevailing indolence, inactivity, and want of spirit, which is unfortunate, as such a heavy and general calamity can only be repaired by a disposition directly contrary to that which prevails: but as this government is indefatigable in its endeavours [endeavors] at remedying every present evil, and preventing such as may naturally be expected, it is to be hoped that the generous and wise dispositions lately made, will restore the energy that is wanting; and without which one of the richest provinces in Europe is in danger of utter ruin. Silk and essence of bergamot [bergamot oil], oranges and lemons, are the great articles of trade at Reggio. I am assured, that no less than 100,000 quarts of this essence are annually exported. The fruit, after the rind is taken off, is given to the cows and oxen; and the inhabitants of this town assure me that the beef, at that season, has a strong and disagreeable flavour [flavor] of bergamot. The worthy archbishop gave me an account of the earthquakes here in 1770 and 1780, which obliged the inhabitants (in number 16,400) to encamp or remain in barracks several months, without, however, having done any considerable damage to the town. I was assured here, (where they have had such a long experience of earthquakes) that all animals and birds are in a greater or less degree much more sensible of an approaching shock of an earthquake than any human being; but that geese, above all, seem to be the soonest and most alarmed at the approach of a shock; if in the water, they quit it immediately, and there are no means of driving them into the water for some time after.”

— “The mortality here, by the late earthquake of the 5<sup>th</sup> of February, corresponds with the apparent degree of damage done to the town, and does not exceed 126 [people]. As it happened about noon, and came on gently, the people of Reggio had time to escape: whereas, as I have often remarked, the shock in the unhappy plain was as instantaneous as it was violent and destructive. Every building was levelled to the ground, and the mortality was general, and in proportion to the apparent destruction of the buildings. Reggio was destroyed by an earthquake before the Marsian war, and having been rebuilt by Julius Cæsar, was called Reggio Julio. Part of the wall still remains, and is called the Julian Tower; it is built of huge masses of stone without cement. Near St. Peruto, between Reggio and Cape Spartivento, there are the remains of a foundry [foundry]; his present Catholic Majesty, when King of Naples, having worked silver mines in that neighbourhood [neighborhood], which were soon abandoned, the profit not having answered the expence [expense]. There are some towns in the neighbourhood [neighborhood] of Reggio that still retain the Greek language. About fifteen years ago, when I made the tour of Sicily, I landed at Spartivento in Calabria Ultra, and went to Bova, where I found that Greek was the only language in use in that district. On the 14<sup>th</sup> of May I left Reggio, and was obliged (the wind being contrary) to have my boats towed by oxen to the Punta del Pezzolo, opposite Messina, from whence the current wafted us with great expedition indeed into the port of Messina. The port and the town; in its half ruined state, by moonlight, was strikingly picturesque. Certain it is, that the force of the earthquake (though very violent) was nothing at Messina and Reggio to what it was in the plain. I visited the town of Messina the next morning, and found that all the beautiful front of what is called the Palazzata, which extended in very lofty uniform buildings, in the shape of a crescent, had been in some parts totally ruined, in others less; and that there were cracks in the earth of the quay, a part of which had sunk above a foot below the level of the sea. These cracks were probably occasioned by the horizontal motion of the earth, in the same manner as the pieces of the plain were detached into the ravines at Oppido and Terra Nuova [now Gela]; for the sea at the edge of the quay is so very deep, that the largest ships can lie along side; consequently the earth, in its violent commotion, wanting support on the side next the sea, began to crack and separate; and as where there is one crack there are generally others less considerable in parallel lines to the first, I suppose the great damage done to the houses nearest the quay has been owing to such cracks under their

foundations. Many houses are still standing, and some little damaged, even in the lower part of Messina; but in the upper and more elevated situations, the earthquakes seem to have had scarcely any effect, as I particularly remarked. A strong instance of the force of the earthquake having been many degrees less here than in the plain of Calabria, is, that the convent of Sante Barbara, and that called the Noviziato de Gesuiti, both on an elevated situation, have not a crack in them, and that the clock of the latter has not been deranged in the least, by the earthquakes that have afflicted this country for four months past, and which still continue in some degree. Besides, the mortality at Messina does not exceed 700 out of upwards of 30,000, the supposed population of this city at the time of the first earthquake, which circumstance is conclusive. I found that some houses, nay a street or two, at Messina were inhabited, and some shops open in them; but the generality of the inhabitants are in tents and barracks, which, having been placed in three or four different quarters, in fields and open spots near the town, but at a great distance one from the other, must be very inconvenient for a mercantile town; and unless great care is taken to keep the streets of the barracks, and the barracks themselves, clean, I fear that the unfortunate Messina will be doomed to suffer a fresh calamity from epidemical disorders during the heat of summer. Indeed, many parts of the plain of Calabria seem to be in the same alarming situation, particularly owing to the lakes which are forming from the course of rivers having been stopped, some of which, as I saw myself, were already green, and tended to putrefaction. I could not help remarking here, that the nuns, who likewise live in barracks, were constantly walking about, under the tuition of their confessor, and seemed gay, and to enjoy the liberty the earthquake had afforded them, and I made the same observation with respect to school-boys at Reggio; so that in my journal, which I wrote in haste, and from whence I have as hastily transcribed the imperfect account I send you, the remark stands thus: 'Earthquakes particularly pleasing to nuns and school-boys.' Out of the cracks of the quay, it is said, that during the earthquakes, fire had been seen to issue, (as many I spoke with attested;) but there are no visible signs of it, and I am persuaded it was no more than, as in Calabria, a vapour [vapor] charged with electrical fire, or a kind of inflammable air. A curious circumstance happened here also to prove that animals can remain long alive without food: two mules belonging to the Duke of Belviso remained under a heap of ruins, one of them twenty-two, and the other twenty-three days: they would not eat for some days, but drank water plentifully, and are now quite recovered. There are numberless instances of dogs remaining many days in the same situation; and a hen belonging to the British vice-consul at Messina, that had been closely shut up under the ruins of his house, was taken out the twenty-second day, and is now recovered; she did not eat for some days, but drank freely; she was emaciated, and shewed [showed] little signs of life at first. From these instances, from those related before of the girls at Oppido, and the hogs at Soriano, and from several others of the same kind that have been related to me, but which, being less remarkable, I omit, one may conclude that long fasting is always attended with great thirst, and total loss of appetite. From every enquiry I found that the great shock of the 5<sup>th</sup> of February was from the bottom upwards, and not like the subsequent ones which in general have been horizontal and vorticose. A circumstance worth remarking (and which was the same on the whole coast of that part of Calabria that had been most affected by the earthquake) is, that a small fish called cicirelli, resembling what we call in England white-bait, but of a greater size and which usually lie at the bottom of the sea, buried in the sand, have been ever since the commencement of the earthquakes, and continue still to be, and in such abundance as to be the common food of the poorest sort of people; whereas, before the earthquakes, this fish was rare, and reckoned amongst the greatest delicacies. All fish in general have been taken in greater abundance, and with much greater facility, in those parts, since they have been afflicted by earthquakes than before. I constantly asked every fisherman I met with on the coast of Sicily and Calabria, if this circumstance was true, and was constantly answered in the affirmative; but with such emphasis, that it must have been very extraordinary. I suppose, that either the sand at the bottom of the sea may have been heated by the volcanic fire under it, or that the continual tremor of the earth has driven the fish out of their strong holds, just as an angler, when he wants a bait, obliges the worms to come out of the turf on a riverside by trampling on it with his feet, which motion never fails in its effect, as I have experienced very often myself. I found the citadel here had not received any material damage, but was in the same state, as I had left it fifteen years ago. The lazaret has some cracks in it like those on the quay, and from a like

cause. The port has not received any damage from the earthquakes. The officer who commanded in the citadel, and who was there during the earthquake, assured me, that on the fatal 5<sup>th</sup> of February, and the three following days, the sea, about a quarter of a mile from that fortress, rose and boiled in a most extraordinary manner, and with a most horrid and alarming noise, the water in the other parts of the Faro being perfectly calm. This seems to point out exhalations of eruptions from cracks at the bottom of the sea, which may very probably have happened during the violence of the earthquakes; all of which, I am convinced, have been a volcanic origin.”

— “On the 17<sup>th</sup> of May I left Messina, where I had been kindly and hospitably treated, and proceeded in my speronara along the Sicilian coast to the point of the entrance of the Faro, where I went ashore, and found a priest who had been there the night between the 5<sup>th</sup> and 6<sup>th</sup> of February, when the great wave passed over that point, carried off boats and above twenty-four unhappy people, tearing up trees, and leaving some hundred weight of fish it had brought with it on the dry land. He told me he had been himself covered with the wave, and with difficulty saved his life. He at first said the water was hot; but, as I was curious to come at the truth of this fact, which would have concluded much, I asked him if he was sure of it: and, being pressed, it came to be no more than the water having been as warm as it usually is in summer. He said the wave rose to a great height, and came on with noise, and such rapidity, that it was impossible to escape. The tower on the point was half destroyed, and a poor priest that was in it lost his life. From, hence I crossed over to Scilla. Having met with my friend the Padre Minasi, a Dominican friar, a worthy man, and an able naturalist, who is a native of Scilla, and is actually employed by the Academy of Naples to give a description of the phænomena that have attended the earthquake in these parts, with his assistance on the spot I perfectly understood the nature of the formidable wave that was said to have been boiling-hot, and had certainly proved fatal to the baron of the country, the Prince of Scilla, who was swept off the shore into the sea by this wave, with 2473 of his unfortunate subjects. The following is the fact: the Prince of Scilla having remarked, that during the first horrid shock, (which happened about noon the 5<sup>th</sup> of February) part of a rock near Scilla had been detached into the sea, and fearing that the rock of Scilla, on which his castle and town is situated, might also be detached, thought it safer to prepare boats, and retire to a little port or beach surrounded by rocks at the foot of the rock. The second shock of the earthquake, after midnight, detached a whole mountain, (much higher than that of Scilla, and partly calcareous, and partly cretaceous) situated between the Torre del Cavallo, and the rock of Scilla. This having fallen with violence into the sea, (at that time perfectly calm) raised the fatal wave, which I have above described to have broken upon the neck of land, called the Punta del Faro, and in the island of Scilla, with such fury, which returning with great noise and celerity [swiftness] directly upon the beach, where the prince and the unfortunate inhabitants of Scilla had taken refuge, either dashed them with their boats and richest effects against the rocks, or whirled them into the sea; those who had escaped the first and greatest wave were carried off by a second and third, which were less considerable, and immediately followed the first. I spoke to several men, women, and children, here, who had been cruelly maimed, and some of whom had been carried into the sea by this unforeseen accident. ‘Here,’ said one, ‘my head was forced through the door of the cellar,’ which he shewed [showed] me was broken. ‘There,’ said another, ‘was I drove into a barrel.’ Then a woman would shew [show] me her child, all over deep wounds from the stones and timber, etc. that were mixed with the water, and dashing about in this narrow port; but all assured me they had not perceived the least symptom of heat in the water, though I dare say, Sir, you will read many well-attested accounts of this water having been hot; of many dead bodies thrown up, which appeared to have been parboiled by it; and of many living persons who had evidently been scalded by this hot wave; so difficult it is to arrive at truth. Had I been satisfied with the first answer of the priest at the Punta del Faro, and set it down in my Journal, who could have doubted but that this wave had been of hot water? Now that we are well acquainted with the cause of this fatal wave, we know it could not have been hot; but the testimony of so many unfortunate sufferers from it is decisive. A fact which I was told, and which was attested by many here, is very extraordinary indeed: a woman of Scilla, four months gone with child, was swept into the sea by the wave, and was taken up alive, floating on her back at some distance, nine hours after. She did not even miscarry, and is now perfectly well; and, had she not been gone up into the country, they would have shewn her to me. They told me she had been used

to swim, as do most of the women in this part of Calabria. Her anxiety and sufferings, however, had arrived at so great a pitch, that, just at the time that the boat which took her up appeared, she was trying to force her head under water, to put a period [end] to her miserable existence. The Padre Minasi told me another curious circumstance that happened in this neighbourhood [neighborhood], which to his knowledge was strictly true: a girl about 18 years of age was buried under the ruins of a house six days, having had her foot, at the ancle [ankle], almost cut off by the edge of a barrel that fell upon it; the dust and mortar stopped the blood; she never had the assistance of a surgeon; but the foot of itself dropped off, and the wound is perfectly healed without any other assistance but that of nature. If of such extraordinary circumstances, and of hair-breadth escapes, an account was to be taken in all the destroyed towns of Calabria Ultra and Sicily, they would, as I said before, compose a large volume. I have only recorded a few of the most extraordinary, and such as I had from the most undoubted authority. In my way back to Naples, (where I arrived the 23<sup>rd</sup> of May) along the coast of the two Calabrias and the Principato Citra, I only went on shore at Tropea, Paula, and in the Bay of Palinurus. I found Tropea (beautifully situated on a rock overhanging [overhanging] the sea) but little damaged; however, all the inhabitants were in barracks. At Paula the same. The fishermen here told me they continued to take a great abundance of fish, as they had done ever since the commencement of the present calamity. At Tropea, the 15<sup>th</sup> of May, there was a severe shock of an earthquake, but of a very short duration. There were five shocks during my stay in Calabria and Sicily; three of them rather alarming; and at Messina, in the night-time, I constantly felt a little tremor of the earth, which has been observed by many of the Messinese. I am really ashamed, Sir, of sending such an unconnected, hasty extract of my journal; but when I reflect, that unless I send it off directly, the Royal Society will be broken up for the summer season, and the subject will become stale before its next meeting: of two evils I prefer to chose the least. Such rough drafts, however, (though ever so imperfect and incorrect) have, as in paintings, the merit of a first sketch, and a kind of spirit that is often lost when the picture is correctly finished. If you consider the fatigue and hurry of the journey I have just been taking; and that, in the midst of the preparations for my other journey to England, which I propose to begin to-morrow, I have been writing this account, I shall hope then to be entitled to your indulgence for all it's imperfections. But, before I take my leave, I will just sum up the result of my observations in Calabria and Sicily, and give you my reasons for believing that the present earthquakes are occasioned by the operation of a volcano, the seat of which seems to lie deep, either under the bottom of the sea, between the island of Stromboli and the coast of Calabria, or under the parts of the plain towards Oppido and Terra Nuova [now Gela]. If on a map of *Italy*, and with your compass on the scale of Italian miles, you were to measure off 22, and then fixing your central point in the city of Oppido, (which appeared to me to be the spot on which the earthquake had exerted it's greatest force) form a circle, (the radii of which will be, as I just said, 22 miles) you will then include all the towns and villages that have been utterly ruined, and the spots where the greatest mortality has happened, and where there have been the most visible alterations on the face of the earth. Then extend your compass on the same scale to 72 miles, preserving the same centre [center], and form another circle, you will include the whole of the country that has any mark of having been affected by the earthquake. I plainly observed a gradation in the damage done to the buildings, as also in the degree of mortality, in proportion as the countries were more or less distant from this supposed centre [center] of the evil. One circumstance I particularly remarked; if two towns were situated at an equal distance from the centre [center], the one on a hill, the other on a plain, or in a bottom, the latter had always suffered greatly more by the shocks of the earthquake than the former; a sufficient proof to me of the cause coming from beneath, as this must naturally have been productive of such an effect. And I have reason to believe, that the bottom of the sea, being still nearer the volcanic cause, would be found (could it be seen) to have suffered even more than the plain itself; but, as you will find in most of the accounts of the earthquake that are in the press, and which are numerous, the philosophers, who do not easily abandon their ancient systems, make the present earthquakes to proceed from the high mountains of the Appennines [Apennine Mountains] that divide Calabria Ultra, such as Monte Dejo, Monte Caulone, and Aspromonte. I would ask them this simple question, did the Æolian or Lipari islands (all which rose undoubtedly from the bottom of the sea by volcanic explosions at different and perhaps very distant periods) owe their birth to the Appennines

[Apennine Mountains] in Calabria, or to veins of minerals in the bowels of the earth, and under the bottom of the sea? Stromboli, an active volcano, and probably the youngest of those islands, it not above 50 miles from the parts of Calabria that have been most affected by the late earthquake. The verticle [vertical] shocks, or, in other words, those whole impulse was from the bottom upwards, have been the most destructive to the unhappy towns in the plain; did they proceed from Monte Dejo, Monte Caulone, or Aspromonte? In short, the idea I have of the present local earthquakes, is, that they have been caused by the same kind of matter that gave birth to the Æolian or Lipari islands; that, perhaps, an opening may have been made at the bottom of the sea, and most probably between Stromboli and Calabria Ultra, (for from that quartar [quarter] all agree that the subterraneous noises seem to have proceeded) and that the foundation of a new island or volcano may have been laid, though it may be ages, which to nature are but moments, before it is completed [completed], and appears above the surface of the sea. Nature is ever active; but her action are, in general, carried on so very slowly, as scarcely to be perceived by mortal eye, or recorded in the very short space of what we call history, let it be ever so ancient. Perhaps, too, the whole destruction I have been describing, may have proceeded simply from the exhalations of confined vapours [vapors], generated by the fermentation of such minerals as produce volcanoes, which have escaped where they met with the least resistance, and must naturally in a greater degree have affected the plain than the high and more solid grounds around it. When the account of the Royal Academy of Naples is published, with maps, plans, and drawings, of the curious spot I have described, this rude and imperfect account will, I flatter myself, be of use; without the plans and drawings, you well know, Sir, the great difficulty there is in making one's self intelligible on such a subject."

The following was one of the earliest accounts published in England of the Calabria earthquake in *Italy*.<sup>253</sup>

— "Messina, one of the principal cities in the kingdom of Sicily Ulteriorie, situated on the border of the sea, upon the meridian of the island, forty years since was struck with a most horrible affliction of the plague, which broke out about the end of Feb. 1743, by which that city was almost desolated of inhabitants, having lost about 50,000 souls; and now, forty years after, has suffered a second more horrible punishment, of which the following is a relation:"

— "On the 5<sup>th</sup> of Feb. last there was observed, almost throughout the whole island, an horizon full of black intense fog, which indicated some unhappy event, or a presage of some sorrowful woe, and in reality, about the 19<sup>th</sup> hour (which corresponds with our noon) a shock of an earthquake was felt, which threw down several houses, and in particular that part of the cross street called the Plains of the Hospital; several persons were killed, and many much hurt and maimed by the ruins; which increased the fears of the inhabitants that some still greater misfortune might happen; and, in reality, their fears were not without reason, for on the following night, about a quarter after seven (answering to our quarter past one in the morning) a most furious shock finished, in swallowing up or throwing down the remainder of the city, and besides the shock, a whirlpool of fire issued from the earth, which finished to consume and level to the ground those noble and great edifices which were not before destroyed."

— "The morning of the 6<sup>th</sup>, the master of a barque, which brought this news to Naples, relates, that on the next day, nothing more was to be seen of Messina; the place being covered with an intense thick vapour, mixed with a thick dust, prevented the sight of that fatal catastrophe of misery and horror."

— "The day advancing, and the wind dispersing the thick vapour, Citadella (the fortification so called) was observed to be half thrown into the sea by the earthquake, and the other half destroyed by a whirlpool of fire, which was supposed to be a volcano. A King's frigate, which lay at anchor in the road, astonished at the sight of the fire, began to fire shot upon the castle, supposing it to have been maliciously set on fire; but when they perceived the fire issuing from the earth, ceased firing, not willing to add greater distress to those who had saved themselves from the dreadful chastisement."

— "The same master of the barque also relates, he saw only one priest, who was running bare-footed to the sea side, seeking a boat to take him off."

— "From further accounts and letters received, the above is confirmed; and that at the time which the earthquake happened in Messina, the same disaster happened to other cities in that island, viz. Cataneo

[Catania], Sicily, Lipari, and places adjacent in Messina; no edifice remained, except the Capuchin Convent, situated a little distance from that city.”

— "Multitudes of people must have been buried under the ruins. At the same time also the earthquake was felt in the interior and ulterior Calabria. Besides the many buildings thrown down, the cities of Reggio, in Calabria and Bagnera, suffered greatly. And respecting the number of dead, we have certain advice that the whole family of the Prince of Geraci was buried in the ruins: and calculating Messina to have contained 30,000 souls, the greater part are lost. This melancholy accident has been followed with the wisest precautions by government. A stop has been put to all public spectacles; the theatres are shut up in this kingdom, as well as in Sicily; and public prayers are offered up to appease the Supreme Disposer of the Universe, who has in his power those just chastisements which mankind merit for their sins."

— To these particulars, translated from the account published by authority at Naples, the London Gazette adds, that "it appears from the most authentic relations, the calamity has been general, and most distressful on the whole coast of Calabria Ultra, extending upwards of 150 miles. From Tropea to Squillace most of the towns and villages appear to have been either totally or in part overthrown, and many of the inhabitants buried in the ruins; but as the first shock happened in the day-time, about noon, the mortality will, it is hoped, prove much less than is generally represented. The sea rose very considerably on the Sicilian coast, and retired from that of Calabria; and it is remarkable that the houses in Sicily fell in a direction from the sea, and those in Calabria towards it.

— "At Scilla, however, no less than 2000 people, who, with the Prince of Scilla, were on the shore, having just escaped from their ruined houses, were swept off at once, and drowned by the sudden rise of the sea; but from the fright and confusion this heavy calamity occasioned on the spots where it fell, no distinct accounts have as yet been received; and the persons who have been sent from Naples with such succour as that government thought necessary, have not yet had time to make their reports. The first notice of the misfortune did not reach Naples till the 14<sup>th</sup> inst. [14 February] owing to the distance and badness of the roads; and as it must be some days before the succours could reach Calabria, it is greatly to be apprehended that many more lives will be lost from these unfortunate circumstances. It appears from several accounts, that the earth opened in many parts; that a mountain has been split in two; and that the course of a great river was stopped for some time."

---

**1783 A.D.** [Around January 1783], the Oeder [Oder] River in Prussia broke through many dykes [dikes] and overflowed a vast tract of the country.<sup>253</sup> [The Oder River originates in the *Czech Republic* and flows through *Poland* and *Germany*.]

[Around 15 January 1783], the fine city of Comorra [Komárom], at the border between *Hungary* and *Slovakia* was almost destroyed by an earthquake.<sup>253</sup>

Several storms struck Great Britain from the end of January to the middle of March 1783. Ramsgate in Kent, *England* reported that on 26 January, a hard gale caused many vessels in the Downs to part anchors. A brig struck a rock off the Colborn, between the North pier-head and Broad-stairs and overset. Plymouth, *England* reported that on 29 January, a Danish East Indiaman, lying at Cat-water, went onshore at Dead Man's Bay, but was got off the next day with little damage. Greenock, near Glasgow, *Scotland* reported that on 31 January, several vessels went onshore in the Frith [Firth], owing to a heavy fall of snow, but most got off without damage. Also on 31 January, the ship *Friendship* from Jamaica after sailing through the Gulph [gulf] encountered a most tremendous gale, which continued without intermission until the 8<sup>th</sup> of February, during which many of the fleet were seen in great distress. The *Friendship* had her upper counter stove in, her lockers blown up, and was very near being lost. A frigate, the *Ardent* that also sailed in a fleet of 50 sails from Jamaica after getting through the Gulph, had 5 feet [1.5 meters] of water in her hold with 3 pumps going and it is not known what became of her. Milford Haven in Pembrokeshire, *Wales* reported that on 5 February, a large ship, thought to be a French privateer, foundered off the harbor in a violent gale and all the crew perished. Only 4 men were onboard and were in the greatest distress as the ship was sinking. It was reported that the *Graston* man-of-war was dismasted [in a storm] a hundred leagues [300 miles, 483 kilometers] southwest of Cape Finisterre on the west coast of Galicia, *Spain* sometime prior to 13 February. The *Isle of Scilly* reported that on 7 February 1783, the hull of a large ship, Dutch built, was seen on shore. The *Isle of Scilly* reported on 23 February, that the most boisterous weather had prevailed there for some days past, and then continued. That several ships had passed by that island dismasted, and that very morning a large Swedish ship the *Fredericus*, was discovered on shore. But no boats could put to sea to her relief; at length the crew hoisted out their long boat, and as many as she could stove got safe on shore. Those left behind soon perished, as the ship sunk soon afterwards. Aberdeen, *Scotland* reported that on 5 March 1783, there was a violent gale of wind, which increased to a hurricane. Three vessels came into the bay from the southward, one of which, the Ostend packet was laid on her beams ends. The other two ships *Euphane* and *Lady Grant*, ran on shore. Another ship, the *Fortune* foundered and came on shore keel uppermost. All the crew drowned. Several other vessels were cast away on the eastern coast and a great part of the pier at Peterhead demolished. Hull [Kingston upon Hull, *England*] reported that on 9 March, a large Hamburg ship was lost off the River Humber and all the crew perished. Weymouth, *England* reported that the Dutch ship, the *Young Kendrick* went ashore in a gale of wind and was totally lost. Liverpool, *England* reported that on 13 March 1783 the loss of the *Count Belgioso* East Indiaman. It was feared that all 127 persons on board perished.<sup>253</sup>

On 5 February 1783, a horrible earthquake struck Calabria and Sicily, *Italy*. This was followed by repeated hurricanes and thunderstorms.<sup>79</sup> [Calabria is located at the "toe" of the Italian peninsula.]

On 5 February 1783, a terrible earthquake destroyed Messina, and a great part of Calabria in the Kingdom of Naples [*Italy*].<sup>241, 242</sup>

On 8 March 1783, a Belgioso [Belgioioso?] Indiaman [A large merchant ship formerly used on trade routes to India] was cast away on the coast of *Ireland*, and 147 men perished in her.<sup>242</sup>

On 8 March 1783, a violent storm struck the coast of *Scotland*, much shipping lost.<sup>242</sup>

“On March 17 [1783], between the hours of three and four in the afternoon, it blew the severest squall from the N.W. ever remembered in Calcutta [*India*]. It came on so suddenly, that the people on board the ships in the river had not time to take measures for the safety of their vessels, and almost every one of them parted from their anchors. The following vessels were irrecoverably lost: The *Eagle* snow, a Bombay cruiser [cruiser], sunk abreast of the New Fort; one of her anchors gave way, and, in swinging round, she tript [tripped] upon the other, and was overset. The first lieutenant and forty-five men, many of them Europeans, were unfortunately drowned. The *Reformation*, a snow (late a privateer), was overset. She had been sold to the Portuguese the day before. The Company’s ketch, *Fly*, Capt. Tho. Forrest, drove from her anchors, and was lost abreast of the Old Fort. Many budgerows, butts, and a great number of country boats, several of them full of people, were lost. When the wind had blown about half an hour from the N.W. it suddenly shifted to the Eastward, and blew from that quarter with great violence. The damage done by this storm on land is also very considerable. The cavalry encampment at Cowgetchy was almost entirely levelled to the ground, and the cantonments at Barrackpore sustained some damage. Many large trees, in the neighbourhood of Calcutta, were torn up, and an incredible number of small straw-houses destroyed.”<sup>254</sup>

On 18 March 1783 at half past two in the morning at Bencoolen [now Bengkulu City, *Sumatra*], it being extremely stormy the evening before, the magazine and laboratory were set afire from lightning. They contained 500 barrels of [gun] powder, and every implement of artillery was totally destroyed.<sup>253</sup>

On 28 March 1783, another earthquake in Sicily destroyed the remains of Messina, *Italy* and 290 inhabitants.<sup>241, 242</sup>

On 5 April 1783 at Edinburgh, *Scotland*, for the past several days the weather was very warm, and the thermometer higher than they ever remembered at that season.<sup>253</sup>

On 6 April 1783, it was reported that the crops on the island of Barbadoes [*Barbados*] was totally destroyed by the dry season.<sup>241, 242</sup>

On 11 April 1783, the sea overflowed in Venice, *Italy* and did much damage to the city.<sup>55</sup>

On 11 April 1783, a violent hurricane struck Venice, *Italy*. The sea overflowed the city and did immense damage.<sup>128</sup>

On 12 April 1783, a fire and storm happened at Presburg, Germany [now Bratislava, *Slovakia*], which did much damage.<sup>241, 242</sup>

On 13 May 1783, Kremnitz in Hungary [now Kremnica, *Slovakia*] nearly destroyed by fire and inundation.<sup>241, 242</sup>

In *Hungary*, a most violent storm happened there on the 13<sup>th</sup> [13 May 1783], which has done very great damage to the upper part of that Kingdom. The city of Kremnitz [now Kremnica, *Slovakia*] is entirely ruined; the lightning fell in nine different parts of it, and the whole city was in flames at once, and all but seven houses burnt down; 50 persons have lost their lives, either by the fire or by the torrents of water which came from the mountains with such violence as to carry all before it.<sup>254</sup>

On 30 May 1783, it was reported in *England* that, “the thaw of the Dwina [Dvina or Daugava River] had done [sown] a great deal of damage this year in the environs [neighborhood] of Riga [in *Latvia*]. The river quitted its bed, and rose to a height which exceeded that of 1771. This inundation was the cause of great losses in cattle, and timber for building, with the latter of which the little islands on the banks of the river were covered, particularly a large quantity of masts which were collected at Boldera. Even people

were carried away by the impetuosity of the currents. The vessels which were ready laden there also suffered greatly, and several of them made so much water that they were obligated to unload.”<sup>253</sup>

On 31 May 1783, Warsaw, *Poland* reported that a few days earlier, a large part of the forest, which extends around Landhut [Landshut, now Łańcut], in Lesser Poland, suddenly disappeared.<sup>254</sup>

In June 1783 a letter from Flint in *North Wales*, said that the weather has been as severe as it was in the middle of winter. They had a great deal of snow and the frost so hard that the ice was an inch thick, which had destroyed all their early fruits and plants, and has done a great deal of damage to their corn. Another report said that from 1 June to the middle of June, the frosts were more or less every night in many parts of *England*.<sup>253</sup>

In June 1783, “Late accounts from the North of *Ireland* say, the people there are almost starving. At Carrickfergus, rotten meal is sold at 30s [shillings] the hundred weight [a unit of weight in the British Imperial System equal to 112 pounds or 50.80 kilograms].”<sup>253</sup>

[In June 1783] a most violent hurricane arose in the province of Bourbonnais in *France*. Hail of an extraordinary size, driven by an impetuous wind, and followed by incessant rain for three hours, laid all the country waste. The country seat of Count Viri was unroofed, and all the windows broke; many trees were torn up by the roots, and the harvest of ten domains entirely ruined. Ten or twelve parishes have shared the same fate.<sup>254</sup>

[In June 1783] lightning struck several ships at various locations. At Bourdeaux [Bordeaux, *France*] lightning struck a fine new ship just fitted up for the East-India trade and burnt the ship down to the water’s edge. At Cadiz, *Spain*, thunder and lightning did much damage to the shipping as well as the houses. At Flushing, *England* on June 20 in a heavy storm, a brig making into the harbor was upset and lost, by lightning striking her main mast.<sup>254</sup>

Naples, *Italy* reports, “Since the shocks of the earthquake ceased in the two Calabrias, the sea from that time has been in violent agitation, and on the 20<sup>th</sup> of June [1783] the atmosphere being loaded with thick fog, it was observed that the sea retired six palms [~62 inches] more than usual.”<sup>254</sup>

On 20 June 1783, a sudden heavy rain did much damage in London and Westminster, *England*.<sup>242</sup>

On 22 June 1783, the county of Glatz in Germany [now Klodzko, *Poland*] was visited with a dreadful storm.<sup>241, 242</sup>

On 22 June 1783, a very violent thunderstorm struck in the county of Glatz in lower *Silesia*, which was followed by so great a fall of rain that the whole country has been overflowed, and much damage occasioned. The town of Neisse in *Silesia* [now Nysa, *Poland*] has likewise suffered much from the same inundation, and great injury is done to the fortifications and [military] magazines there.<sup>254</sup>

On 23 June 1783, there was a remarkable frost at Barton [Barton-upon-Irwell in Greater Manchester, *England*]. In a shallow tub, the ice was the thickness of a crown piece. A frost on 26 May preceded this frost and the combination of these two frosts ruined the walnut crop.<sup>232</sup>

On 24 June 1783, the island of *Iceland* received great damage from eruption from Mount Ecla.<sup>241, 242</sup>

In 1783, a foggy mist covered nearly all of *Europe* for about a month.<sup>205</sup>

The summer in *Northern Europe* and in the interior of *France* was remarkable. The summer in Paris was characterized by:

Hot days	30 days
Very hot days	5 days
Extremely hot days	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The month of June was very hot. The high temperatures observed during the summer were: <sup>62</sup>

Seurre, <i>France</i>	(102.2° F, 39.0° C)
Chinon, <i>France</i>	(100.6° F, 38.1° C)
Constantinople (Istanbul), <i>Turkey</i>	(100.6° F, 38.1° C)
Cambrai, <i>France</i>	( 99.5° F, 37.5° C)
Liège, <i>Belgium</i>	( 98.6° F, 37.0° C)
Caussade, <i>France</i>	( 98.4° F, 36.9° C) on 11 July
Bordeaux, <i>France</i>	( 97.7° F, 36.5° C)
Paris, <i>France</i>	( 97.3° F, 36.3° C) on 11 July

Düsseldorf, <i>Germany</i>	( 86.0° F, 30.0° C)
St. Petersburg, <i>Russia</i>	( 84.7° F, 29.3° C) on 17 June

On 1 July 1783, a new island made its appearance near *Iceland*.<sup>241, 242</sup>

A letter dated 4 July 1783 described the extraordinary state of the atmosphere at Paris, *France*. “For a considerable time past the weather has been very remarkable here; a kind of hot fog obscures the atmosphere and gives the sun much of that dull red appearance which the wintry fogs sometimes produce. The fog is not peculiar to Paris; those who came lately from Rome say that it is as thick and hot in *Italy*, and that even the top of the Alps is covered with it, and travelers and letters from *Spain* affirm the same of that kingdom.”<sup>248</sup>

On 6 July 1783 in Cracow [Kraków], *Poland*, there was a storm of thunder and lightning that was the most awful ever known in that country. Some people counted 200 claps of thunder with almost incessant flashes of lightning, by which 12 houses were set on fire, and several churches, with the Starost’s [mayor’s] palace, much damaged. The next day some people were found dead in the streets.<sup>254</sup>

The thunder has been more alarming and the lightning more fatal, during the course of the present month [July 1783], than has been known for many years in *England*.<sup>254</sup>

— On 2 July at Fen-Stanton in Cambridgeshire, a fireball struck a barn setting it on fire.

— A violent flood of rain overflowed the town of Stilton [in Cambridgeshire].

- A woman in Huntingdonshire and another young woman at Hilton and a lad at Needingworth were struck dead by lightning.
- At Whitney in Oxfordshire, a man and a woman were struck dead from lightning in a field at a distance from each other.
- At Cockfield in Suffolk, a house was set on fire and entirely consumed, and most of the family were severely hurt. Several cows and horses that were in the fields were struck dead by lightning.
- At Sherrington in Wiltshire, near Warminster, 18 sheep were struck dead from lightning.
- At Walsford [Wansford] in Huntingdonshire, a ball of fire fell on a schoolhouse killing 3 children.
- At Wetherington [Witherington in Wiltshire], a cow standing under an oak was killed.
- At Ledbury [in Herefordshire], a team of 5 horses were struck by lightning; 4 fatally. In the same neighborhood 2 oxen and 10 sheep that had taken shelter under oak trees were killed.
- Two horses grazing on the Downs near Lincoln heath were struck dead.
- On 10 [July] at Leicester in the east Midlands experienced an extremely black cloud with vivid lightning. Two cows were struck dead and a hayrick set on fire at Knighton. At Blaby, the hail broke the windows on the southwest throughout the entire town. At Hinckley, the storm raged dreadfully tearing off the roof of a house.
- At Iddelsleigh [Iddesleigh in Devonshire], the mills on the river Okemouth near Exeter, were nearly burnt to the ground by lightning.
- In Portsmouth harbor, lightning struck the foretopmast and a part of the foremast of a Belisarius storeship.
- Near Lynn in Norfolk, lightning struck dead several horses and over 40 sheep, grazing in the fields.
- Near Monymeal [Monimail], *Scotland*, a shepherd lost a son and a daughter in one flash.
- On 10 [July], an extremely violent storm struck Lincoln. Several days before the storm, a thick hot vapor filled the valley between the hills on which the upper town stands. The sun and the moon appeared through the fog like heated brickbats. When the storm struck the lightning assumed various shapes, sometimes in sheets and at other times like the mouth of a cannon.
- On 20 July, a storm struck near Hatfield and set the stables on fire and at Wavley [Waverley?] Common it struck a house.
- The roof of an old house in Shoreditch [in Middlesex] was beat in by the lightning, by which a poor man, his wife, and one child perished.
- On 20 July, a vessel off Languard Fort [Landguard Fort] was struck by lightning and all onboard perished except two.
- On Hounslow-Heath outside London, seven sheep were found dead by lightning.

On 14 July 1783, a violent storm struck *England* near Birmingham, Leeds, etc. which did much mischief [damage]. On the same date a storm struck *France*.<sup>242</sup>

On 18 July 1783, a ball of fire, or meteor, was seen in the greatest part of *England*, and at Ostend, [*Belgium*] at the same time.<sup>241, 242</sup>

On 22 July 1783, Dover, *England* reported that the oldest man living can scarce remember any fog of so long continuance as the present, not being able to descry [catch sight of] the opposite shore for almost three weeks.<sup>254</sup>

Lausanne, *Switzerland* reported in a letter dated 23 July 1783 that, “The harvest was very promising, but a furious hurricane, attended with hail, has, with these few days, destroyed all our hopes, especially in the district of 15 villages, among which are St. Saphorin [Saint-Saphorin], Cossonais [Cossonay], Chavrenais [Chavornay], le Creuz [le Creux], Bavoy [Bavois], Pentaras, and the town of Yverdum [Yverdon]. The storms are continual in these parts. At Geneva the lightning had killed 15 persons in a church.”<sup>254</sup>

On 24 July 1783, a violent storm struck in different parts of *England* as well as *Switzerland*.<sup>242</sup>

On 29 July 1783, in Tripoli, Syria [now Tripoli, *Lebanon*] was visited by a dreadful earthquake.<sup>241, 242</sup>

On 30 July 1783, New York in the *United States* reported, “The late excessive hot weather has occasioned much sickness in the neighbouring State of New Jersey.”<sup>254</sup>

On 30 July 1783, Tripoli in Syria [*Lebanon*] reported that, “On the 20<sup>th</sup> of this month two shocks of earthquakes were felt here, both of which together only lasted eight or ten seconds, and were preceded by a rumbling noise: On the evening before, a very violent rain had fallen, which is very extraordinary at this season. For this month past, both land and sea have been covered with a thick fog, and the winds have been as violent as during winter; the sun appears but rarely, and when it does looks very red. These phænomena were unheard of before in Syria. The same earthquake was felt at Libanus, and a whole village near Napoulousia was buried under a rock which fell upon it. These events, together with the recollection of what has happened at Messina, alarm the Turks very much.”<sup>254</sup>

On 2 August 1783, there was a violent hailstorm in Yorkshire, *England*, where the hailstones measured 5 inches in circumference.<sup>242</sup>

On 2 August 1783, a violent storm struck throughout Orleans, *France*.<sup>242</sup>

Around August 1783, *Turkey* reported, “The plague still continues to rage in Constantinople [now Istanbul, *Turkey*] and its neighbourhood. Pera [now Beyoğlu] and Galata [now Karaköy], the residence of the Franks, have suffered severely, and in the new barracks for the gunners at Topana, 20 or 30 are buried in a day. The raw foggy weather that has prevailed here serves to increase the disorder, which has now reached Smyrna [now Izmir].”<sup>254</sup>

Paris reported that the storms that struck *France* on 3 August 1783 were mostly general. “But no part of the kingdom seems to have suffered so much as the countries adjacent to Orleans. On the above day a storm arose, which taking its direction from S.W. to N.E. over-ran, in less than half an hour, a space of 20 leagues [60 miles] in length and one [3 miles] in breadth. By its dreadful and rapid effects 20 parishes have lost every hope of a crop, which was the most promising ever known. The hamlet of St. Bohaire [Saint-Bohaire] suffered most; all the trees were torn up by the roots, the chimneys beat down, and every house, mill, and barn unroofed. The timber work of the church, 56 feet [17 meters] in length, 14 [4 meters] in breadth, and 19 [6 meters] in height, which, though built in the year 1455, was as good as new, gave way during the evening service. Luckily only one life was lost, and about 40 were wounded; the rest owed their lives to the strong ceiling that supported the timber frame.”<sup>254</sup>

On 9 August 1783, Dublin, *Ireland* reported, “We have every reason to hope that the calamities, under which the lower classes of people in this kingdom have so long pined, will be speedily terminated. There is every prospect that our harvest will be early and uncommonly plentiful; and of course bread, and indeed provisions of every sort, will be once more reduced to a reasonable rate.”<sup>254</sup>

In August 1783, *England* reported, “There is no year upon record when the lightning was so fatal in this island as the present; our limits will not admit of half the damage done by it.”<sup>254</sup>

On 7 August 1783, an earthquake was felt in different parts of Cornwall, *England*.<sup>242</sup>

On 16 August 1783, Copenhagen reported that various accounts have been received here of an island having lately arisen in the sea, in the neighborhood of *Iceland*. Although the fact itself is authentic, yet the time of the first appearance of this island, its dimensions, and situation, are not well ascertained. The

information brought by the last ship from thence is, that it was still increasing, and that great quantities of fire issued from two of its eminences.<sup>248</sup>

On 18 August 1783, an extraordinary meteor, or ball of fire was seen in London, *England*.<sup>242</sup>

On 28 August 1783, there was a storm near London, *England*, which damaged the King's Bench.<sup>242</sup> [The King's Bench Prison was located in Southwark, south London. The Court of the King's Bench was a court of law in England.]

On 30 August 1783, a severe storm struck *England*. Two vessels from the coast of France were thrown ashore near Yarmouth and totally lost. A sloop that was coming into the harbor at Folkstone [Folkestone] was no more heard of. Two vessels from the coast of Scotland were driven ashore at Yarmouth. One of these vessels was entirely lost and the crew drowned.<sup>254</sup>

On 30 August 1783, a most tremendous storm of wind, thunder, and lightning struck Cardigan, *Wales*. Several houses were unroofed, some persons killed, and many cattle found dead in the field.<sup>254</sup>

On 31 August 1783, [London, *England*] reported, "A little before twelve at night came on in this metropolis a most violent storm of thunder, lightning and rain, which continued near four hours. Vast damage was sustained in the cellars and warehouses at the waterside, and in almost all the low parts of the metropolis and its adjacencies. Among the slaughter-houses between Saffron-hill and Turnmill-street above 1000 lambs, sheep, hogs, and calves were afloat; and it was with great difficulty they were saved from drowning. The flood was so excessive, that great numbers of sheep and oxen intended for sale could not be brought to market. During the thunder-storm, the house of Messrs. Mount and Page, stationers, on Tower-hill, was almost unroofed by the lightning, and by the fall of rain a great quantity of paper was damaged. Several chimneys were thrown down in different parts of the city. The water rose so amazingly by the stoppage of the shores in the neighborhood of Pimlico, that part of Buckingham-house was overflowed; it rose as high as from 12 to 16 inches before the grates were cleared to let the shores have their proper current."<sup>254</sup>

On 31 August 1783, there was a violent storm of rain in the environs [the area surrounding] of London, *England* and the adjacent counties.<sup>242</sup>

The rains that fell in *Jamaica* during the autumn of 1783 were excessive and have done irreparable damage in many parts of the country. In the vicinity of Spanish Town, the Rio Cobre rose to a greater height than in the great storm of August 1722. The new bridge was overflowed and the level grounds were underwater for several miles distance. At the Bag-Walk tavern, the waters rose as high as the eaves of the houses and people were obligated to take refuge on the sides of a hill, where they were exposed all night to the inclement weather.<sup>244</sup>

In 1783, a violent storm struck the leeward part of the island of Barbadoes [*Barbados*]. It injured several of the principal estates.<sup>241, 247, 250</sup>

Limerick, *Ireland* remarked on 1 September 1783 that "Last night and this morning we had some of the loudest claps of thunder and flashes of lightning ever known, which were attended with very heavy showers of hail and rain: several houses were struck, and some small ships have received considerable damage. There is hardly an instance of a thunder storm extending so far [so late in the season] as that of the 30<sup>th</sup> past [30 August]. It did infinite damage along the *Dutch coast*, where the shore was covered with pieces of wrecks; and in the inland country, houses were unroofed, people killed, and cattle struck dead by the lightning."<sup>254</sup>

Whitehaven, *England* reported that on 3 September 1783 that, “about nine in the forenoon, one of the most violent storms of thunder and lightning, wind, and rain, that has ever been known: and on Saturday, the 6<sup>th</sup>, a gale of wind arose, which, at high tide, increased to a hurricane, by which many houses were unslated [lost their slate roofs], and a great deal of damage done amongst the shipping.”<sup>254</sup>

On 4 September 1783, Brough in Westmoreland, *England* reports that, “about two o’clock in the afternoon, the river Swindale, which runs through Market Brough, was suddenly swoln [swollen] to an unusual height, and in a few minutes it increased to such a flood as had never been seen there before. This uncommon rise is supposed to have been occasioned by a heavy rain, which fell among the mountains above Brough, and which, soon collecting, forced a passage through some mosses into the river. On receiving the inundation, the river became quite black, had a most nauseous and offensive smell, and, rolling down a vast body of water, tore up by the roots vast numbers of large trees. All the stone walls and fences adjoining the river were carried away by the torrent, and two corn-mills rendered useless. Great apprehensions were formed for the safety of the houses which stood near it.”<sup>254</sup>

On 6 September 1783, two smart shocks of an earthquake were felt at Salonica [now Thessaloniki, *Greece*]. On the 8<sup>th</sup>, at half past eight in the morning, there was a very violent earthquake; and in the space of a 15 minutes, three others; and 11 more within 24 hours. Part of the city walls, a bagnio [prison] and some other buildings were thrown down.<sup>248</sup>

[There were other accounts of the earthquakes at Thessaloniki causing great destruction, but these accounts appear to be wildly exaggerated.] As reported on 21 December 1783, the city of Thessalonica, capital of Macedonia [now Thessaloniki, *Greece*], a great magazine for the Levant [eastern Mediterranean] trade, has been totally overthrown by an earthquake; in the lower parts many French, English and Italians, are buried in the ruins. This disaster is more destructive than that of Messina. Warehouses of all kinds of commodities, belonging to the merchants of Marseilles and London are swallowed up.<sup>241, 247</sup> [And then from:] Papers from Vienna Austria on 3 January 1784 reported “The public papers have amused themselves with an account that the ancient city of Salonica [Thessaloniki] was entirely destroyed by an earthquake. This falsehood is contradicted by several letters, from the Levant, and from Salonica, of a more recent date.”<sup>242</sup>

On 9 September 1783, Copenhagen reported that accounts are received from *Iceland*, of a violent eruption having taken place near that island, on 8 June. Several villages have been destroyed, and a considerable tract of country is buried under immense depths of lava. The new island also continues to emit great quantities of fire, and was still increasing, when the last ships came from thence. Letters from Iceland on 24 July contain the most dismal detail of the devastations occasioned by the course of the lava, and affirm that the eruptions continued even at that date.<sup>248</sup>

On 10 September 1783, a violent storm struck Liverpool, *England*.<sup>242</sup>

In Burgundy, *France*, the grape harvest began on 16 September. Heavy rainfalls in the south damaged the corn harvest. There was a grape shortage throughout Languedoc.<sup>62</sup>

Copious rains fell in the southern *France* in 1783. In Montpellier, the winter was very wet. This was followed by an extremely wet summer. This year was also obscured by vapors [fogs]. In Montpellier, the annual rainfall exceeded 3.8 inches (97 millimeters) above the average. The total number of rainy days was 24 more days than average. Provence and Languedoc swam in moisture. Finally, on January 15, a flood of the Saône River at Lyon carried the pavement of the stone bridge in the Perrache quarter.<sup>79</sup>

In the fall of 1783, a hurricane struck the east coast of the *United States*. The *John and Nelly* from New York to Charleston, South Carolina. The ship left New York on the 22 September and was believed to

have foundered in the several gales of wind that struck the coast the beginning of October, as she was not heard from since.<sup>141</sup>

In 1783, a hurricane struck Charleston, South Carolina in the *United States* (much less violent than the hurricane of 1752).<sup>124</sup>

On 19 September 1783, a hurricane struck the east coast of the *United States*. The *Mercury* from Dunkirk to Philadelphia was lost in a furious gale of wind the night of 19 September on Cape May, New Jersey. The captain, mate, and all the crew, except seven men drowned.<sup>141</sup>

In 1783, a great hurricane struck Charleston, South Carolina in the *United States*.<sup>204</sup>

In the fall of 1783, a hurricane struck Delaware in the *United States*. During a gale in the fall, nine large ships were wrecked at Cape Henlopen and many lives were lost.<sup>141</sup>

On 29 September 1783, reports received from *Africa* indicated that the fogs in summer were thicker and most suffocating all along their coasts than was observed in England, and in the Archipelago, and along the Mediterranean too, they were so thick as to render the communications [?].<sup>254</sup>

In *England* on the 25<sup>th</sup> of November, there were great storm of thunder and lightning in Hants and Wilts [Hants and Wilts is an abbreviation for Hampshire and Wiltshire]; also about this period, great storms of wind and rain of “remarkable violence.”<sup>57</sup>

As reported on 6 December 1783, the master of a Dutch ship, a native of Iceland, and named Johan Eagemundson deposed, that passing under *Greenland*, he discovered a new island, from which a thick smoke issued out by day, which by night became a flame, and enlightened the surface of the sea in a great way; he added, that part of his sails were burnt by the sparks which issued from that island, and which were driven to a great distance.<sup>241, 247, 250</sup>

On 9 December 1783 about four o’clock in the morning, the inhabitants of the city of Cambray [Cambrai], in French Flanders [now *France*], were greatly alarmed at a noise, like the report of several pieces of cannon going off as quick as possible: but whether occasioned by a violent explosion, or by the shock of an earthquake, not yet certain. Some chimnies [chimneys] were thrown down by it, and large pieces of stone fell from many of the public buildings; the same noise was heard in several neighbouring villages.<sup>254</sup> [Possible comet fragment bolide air burst]

On 10 December 1783, Constantinople [now Istanbul, *Turkey*] reported, “We have several accounts of the plague since last post; notwithstanding which the mortality is almost entirely ceased. We now flatter ourselves that the cold weather may put a total stop to the contagion, which has cost this city at least 80,000 inhabitants since last June.” Then on 10 January 1784, they reported, “The plague still continues; but it is hoped that the present remarkable cold weather will destroy the infection.”<sup>249, 250</sup>

On 14 December 1783 at Amsterdam in *the Netherlands*, from 10 in the morning until one in the afternoon, the city was wrapped up in so thick a fog, that no one remembers seeing its equal. Everything was in confusion. Not one person could distinguish the way he intended to go. This phenomenon caused several fatal accidents. Many people and some coaches fell into the canals. This fog seems to have struck all of *the Netherlands*. The harbor is entirely frozen over and put a stop to all nautical communications.<sup>244, 249</sup>

As reported on 16 December 1783, the new island which is formed near *Iceland* increases daily; there reigns a continual fermentation in the sea in those parts, which frequently throws up quantities both of

land and rock, which makes it imagined that this island may in a few years become large enough to make some settlement upon, as soon as the fires which exhale from it cease.<sup>244, 249</sup>

On 22 December 1783, there were extraordinary inundations in *Hungary* and the Low Countries [*Belgium, the Netherlands*].<sup>249</sup>

On 23 December 1783, the coast of *Spain* was visited with the most dreadful storms, accompanied by rain. The rainfall was so excessive as to create impassable inundations, so that many villages and part of the flat countries have been reduced to the greatest distress. Seville and the surrounding region were almost entirely overflowed. The large trees and piles, which served for anchoring ships, have been torn up. The bridge of boats has been carried away. A whole village with all its inhabitants was swallowed up in the deluge. Several barks and other ships were dashed on shore, and some even struck houses. The merchant ships, under the command of Captain Zylemaker and J.G. de Vries, were lying on the shore.<sup>244</sup>

In *Spain* on the 23<sup>rd</sup> of December and seven days following, there were dreadful storms, accompanied by rains, "so excessive as to create impassable inundations, so that many villages and part of the flat countries have been reduced to the greatest distress." Floods particularly severe at Seville, *Spain*. Great number of shipwrecks on coast.<sup>57</sup>

In 1783 during the period between 3 March and 1 April, a drought engulfed Shensi (now Shaanxi province) in central *China* at Sui-tê and Shantung (now Shandong province) on the east coast of *China* at Jung-ch'êng and Wên-têng. During the period between 31 May and 29 June, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p'ing. Crops were damaged by the floodwaters. During the period between 30 June and 28 July, floods struck Hupeh (now Hubei province) in central *China* at Wuchang, Huang-mei, Ao-ch'êng, Huang-kang and Kuang-chi. During the period between 8 August and 8 November, a drought engulfed Shantung province at Ho-tsê.<sup>153</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April - generally a pleasant month. May 9<sup>th</sup> - after an unusual dry spring up to this time, a deluge of water fell last night. May 10<sup>th</sup> - another great rain. May 20<sup>th</sup> - very cold. May 21<sup>st</sup> - very warm. May 22<sup>nd</sup> - a deluge of rain. May 29<sup>th</sup> - a hot day. May 30<sup>th</sup> - very hot. June - the first part of the month, cold, cloudy and wet; the latter part, very hot. July 6<sup>th</sup> - it rained plentifully. July 11<sup>th</sup> - a grand rain. July 19<sup>th</sup> - hardly any hot weather this month. July 25<sup>th</sup> and 26<sup>th</sup> - very hot; our gardens are surprisingly flourishing. July 30<sup>th</sup> - a deluge of rain. August 7<sup>th</sup> - extremely hot. August 8<sup>th</sup> and 9<sup>th</sup> - very cold, raw and windy. August 12<sup>th</sup> - cold. August 16<sup>th</sup> - extremely hot. August 19<sup>th</sup> - a surprising growing season. August 21<sup>st</sup> - a very hot day. August 24<sup>th</sup> - extremely hot. August 28<sup>th</sup> - more rain. August 31<sup>st</sup> - a remarkable uneven summer; some few days extremely hot; but the most of it heavy raw weather, with sea winds and cold. September has been like the summer, and particularly like the last month of it. October - the same; never the like; a most memorable year. November 12<sup>th</sup> - a strange warm day.<sup>78</sup>

*Also refer to the section 1780 A.D. - 1784 A.D. for information on the drought and famine in Bangladesh, Pakistan, and India during that timeframe.*

---

**Winter of 1783 / 1784 A.D.** In 1783, the Seine River in *France* was entirely frozen over.<sup>38</sup>

The winter of 1783-84 was confined primarily to *northern France*. Le Gentil of the Royal Observatory of Paris mentioned this winter as one of the toughest. This rigorous winter broke in December 1783. On the 29<sup>th</sup>, the thermometer at the Paris Observatory, about seven o'clock in the morning read 11.8° F (-11.2° C) and at six o'clock at night 8.6° F (-13° C). The greatest cold came on the 30<sup>th</sup> at a quarter to midnight and was measured at -1.8° F (-18.8° C). Abundant snow strewed the ground. The frosts lasted sixty-nine consecutive days.<sup>79</sup>

The frost in Laon in northern *France* began on 14 December 1783 and ended on 21 February 1784; producing 69 days of frost. This cold was only interrupted on December 25 & 26 and on January 1, 2, 3, 16 and 17. On 31 December the low temperature was  $-1.5^{\circ}\text{F}$  ( $-18.6^{\circ}\text{C}$ ). There was abundant and persistent snowfall between 28 December and 17 February; a period of 27 days with snow, and the amount of snow was measured as 2 feet (0.65 meters). Several people were killed in the snow, the deers die of hunger and the hungry wolves invaded the villages and ripped several people apart. In the countryside and the cities the roads and streets were blocked by snow. The distress was extraordinary, especially in the countryside, because everyone lacked bread, wood and money.<sup>62</sup>

In Paris, *France* and the surrounding area, the wine froze in the cellars and the ground was frozen to 0.65 meters (2.1 feet) deep. Louis XVI ordered in the various districts of the capital, that public fire be set, so that the poor could warm up. At the barrier of the Sergent, a statue representing the king of snow was erected. The Seine River froze, not completely, but created a lot of ice. This ice began on 21 February and proceeded slowly and without any accidents. It was different with the Loire, Oise, Marne, Aisne, rivers, which caused the great damage by sweeping away bridges, and coming close to destroying whole villages, and people with their household furniture. The melting of the vast amount of fallen snow and the resulting floods lasted until the end of February. March and April were cold; the snow was followed by hail; and only on 12 May did the weather clear and warm into springtime.<sup>62</sup>

During the winter of 1783-84, the Loire, Oise, Marne and Aisne rivers in *France* were frozen.<sup>62</sup>

In the extreme cold of 1783 to 1784, Louis XVI of *France* had made light of public fires in different districts of Paris and the distribution of public assistance to the poor. A mob erected a statue made of snow representing His Majesty, and wrote on the pedestal the following lines:

Louis, the poor protected by your kindness,

Can only erect a monument of snow;

But let it appeal far more to your generous heart,

Than a statue made of marble, wet with tears from the eyes of the unfortunate.<sup>58</sup>

[Perhaps because he failed to understand the devastating effect of the extreme cold on the poor and starving, Louis XVI, king of *France*, was executed by guillotine in 1793.]

During the winter of 1783-84, the cold was excessive in Paris, *France* from the night of 29 December to the 31<sup>st</sup> at noon. This excessive cold was preceded by an abundant fall of snow, which has tended to preserve the fruits of the earth [snow acts as an insulator].<sup>241, 247, 250</sup>

On 2 January 1784, Paris, *France* reported, "The oldest inhabitant does not remember so heavy a fall of snow as we have lately experienced. It is now near four feet deep in the streets; and these prodigious showers having been succeeded by a most intense frost, it is impossible to go about, but in traineaux [dog sled], such as are made use of in Russia. The King came in one of these vehicles, followed by sixty more. From Versailles to Paris, on the last day of the year."<sup>249</sup>

On 17 and 18 January 1784, a strong storm struck Rochelle [La Rochelle, *France*]. "The end of the world could hardly afford a more terrifying spectacle. On the 17<sup>th</sup>, towards evening, a strong wind arose, and at nine o'clock we felt a shock of an earthquake, attended with thunder, lightning, and hail. The largest trees were torn up by the roots, the [roof] tiles and windows flew about the streets. Two hundred chimnies [chimneys] were thrown down, the upper stories were demolished, and even some houses have been totally destroyed. In this general destruction we were threatened with a fire, the progress of which we could not possibly have stopped. The fall of chimnies in the places where the fire was beginning to catch, prevented the conflagration; the roofs of several churches, and among the rest the cathedral, were stripped off: the wind even carried away the lead. The postillion [driver of a horse drawn coach or post chaise] from Nantz [Nantes] says, that he saw many trees lying on the road; torn up by the roots; that from

Bourdeaux [Bordeaux] assures, that the country between Rochfort [Rochefort] and Saintes has suffered much; the lightning fell within 20 paces of the said postillion, who was thrown from his horse ten different times. The disaster at sea was still more melancholy. Many ships have foundered, both on our coast, and that of the Isle of Rhé [Île de Ré off the west coast of *France*]. Twenty four dead bodies have been taken out of the water here, and a much greater number were taken up at the Isle of Rhé.”<sup>241, 242, 247, 249, 250</sup>

On 17 January 1784, a violent storm struck Rochelle [La Rochelle, *France*] at 6 o'clock in the evening. The storm was accompanied by an earthquake, thunder, lightning and hail and lasted until 9 o'clock in the evening. The storm blew down many of the largest trees in the neighborhood of the city. Two hundred chimneys were thrown down in Rochelle, together with several houses, and some churches, and amongst the rest the cathedral was much damaged. At Nantes and Rochefort much damage was done. On the coast 27 ships were lost, 80 bodies were washed on shore at Rochelle, and many more on the Isle of Rhé.<sup>244</sup>

In western *France* on the 17<sup>th</sup> of January, there was a violent storm at Rochelle [now La Rochelle], accompanied by an earthquake, thunder, lightning and hail; great damage done to houses and trees. The towns of Nantes and Rochefort much injured; and many ships lost on the coast.<sup>57</sup>

On the night of the January 17<sup>th</sup> to the 18<sup>th</sup> 1784, Rochelle [La Rochelle, *France*] experienced a disaster from excessive high winds and the shock of an earthquake. The city has suffered greatly, and 17 ships are reckoned to be entirely lost on the coast.<sup>242</sup>

In 1783 in Paris, *France*, there were 69 days of frost.<sup>58, 80</sup>

On 26 January 1784, Paris, *France* reported that it was remarkable that while at Paris, in Flanders [now *Belgium*], and in all the *North of Europe*, they experienced the most rigorous cold. At Geneva, *Switzerland* and Lyons, *France* and everywhere on this side, and beyond the Alps, along the rivers Po and the Rhône, they have not felt the least cold, but the temperature of the air there has been extremely mild during the whole of the month of December to the beginning of February.<sup>242, 244, 247, 250</sup>

On 30 January 1784, Paris, *France* reported the streets of the city by the late bad weather was deluged with water and mud, after the first thaw.<sup>244</sup>

The *French* historians cite great mortality of animals due to cold during the winter of 1783-84.<sup>58, 80</sup>

The winter of 1783-84 was remarkable because of its long duration and severity that reigned across *Europe*. In Paris, *France* there were 69 consecutive days of frost. The lowest observed temperature in various European cities were:<sup>62</sup>

Stockholm, <i>Sweden</i>	( -28.7° F, -33.7° C) in January
<i>Ibid.</i>	( -22.0° F, -30.0° C) on 15 February
Siebenbürgen, <i>Romania</i>	( -20.9° F, -29.4° C)
Prague, <i>Czech Republic</i>	( -18.9° F, -28.3° C) on 7 January
Frankfurt, <i>Germany</i>	( -15.2° F, -26.2° C) on 30 December
St. Petersburg, <i>Russia</i>	( -13.2° F, -25.1° C)
Mannheim, <i>Germany</i>	( -9.6° F, -23.1° C) on 30 December
Regensburg (Ratisbon), <i>Germany</i>	( -9.4° F, -23.0° C) on 31 December
Delft, <i>the Netherlands</i>	( -8.5° F, -22.5° C) on 31 December
Vienna, <i>Austria</i>	( -6.2° F, -21.2° C) on 7 January
Munich, <i>Germany</i>	( -6.2° F, -21.2° C) on 15 January
Amsterdam, <i>the Netherlands</i>	( -4.0° F, -20.0° C) on 30 December
Hamburg, <i>Germany</i>	( -4.0° F, -20.0° C) on 8 January

Troyes, <i>France</i>	( -3.3° F, -19.6° C) on 31 January
Paris, <i>France</i>	( -2.4° F, -19.1° C) on 30 December
Strasbourg, <i>France</i>	( -1.7° F, -18.7° C) on 30 December
Chartres, <i>France</i>	( -1.7° F, -18.7° C) on 30 December
Pontarlier, <i>France</i>	( 0.5° F, -17.5° C) on 31 January
Brussels, <i>Belgium</i>	( 2.7° F, -16.3° C) on 31 December
Tournai, <i>Belgium</i>	( 2.8° F, -16.2° C)
Lons-le-Saunier, <i>France</i>	( 7.3° F, -13.7° C) on 31 January
Montluçon, <i>France</i>	( 7.3° F, -13.7° C) on 30 December
Grenoble, <i>France</i>	( 10.8° F, -11.8° C) on 26 January
Montpellier, <i>France</i>	( 25.2° F, -3.8° C) in January
Perpignan, <i>France</i>	( 32.0° F, 0.0° C) on 31 January

In [March 1784], the accounts from *France* are equally deplorable. The weather has driven the wolves in many places even into the farmyards, where they have done much mischief [damage]. It should seem likewise, that the weather has been still more severe on the *American Continent*, as whole flocks of aquatic birds have been seen in the marsh of Champigny this winter, which were never before seen in *France*. They are said to come from Louisiana. They weigh five or six pounds, have black beaks armed with four ranges of teeth set like saws, and from the circumstance take the name of Saw birds [might be merganser, which were often called “sawbills” because of its serrated bill].<sup>244</sup>

In France there was a flood. On 4 March 1784, the Seine River in Paris, *France*, at the bridge “Pont de la Tournelle” reached a height of 6.66 meters (21.9 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

As reported on 25 January 1784 at Hague, *the Netherlands*, many diverse towns on the Meuse River have chunks of ice heaped up to prodigious heights, which have even changed the course of the river and have overflowed a great number of villages. The city of Maestricht [Maastricht] is inundated to such a degree, that it can be entered only by the gates of Tongress and Brussels.<sup>242, 244, 247, 250</sup>

On 23 January 1784, the Visa, near Liege [Liège, *Belgium*] reported, “The whole extent of land from Maestricht [*the Netherlands*] to this place is under water. The inhabitants of the parts inundated, after having abandoned their dwellings, come in crowds here, and in neighbouring parts, to seek an asylum. The [warning] cannon is fired continually on the ice at the bridge of Witch, at Maestricht; but it is thought that it would be better to demolish it at once, to put an end to the misfortunes it occasions by the swell of the waters and the ice. The height of the latter overtops the houses of the neighbouring villages. In the memory of man the Meuse [River] was never seen so swelled. The bodies of ice are so heaped up, from distance to distance, that they look like rocks of an enormous size. Five times the river has been frozen and thawed; it has been seen to rise three feet in half an hour. Yesterday we were witnesses of a melancholy spectacle; it was a coach coming down on the flake of ice, with two gentlemen in it; but it was impossible to afford them any assistance; there were no horses to it, and it was thought they had already perished.”<sup>249</sup>

On 3 February 1784 at Flushing [Vlissingen, *the Netherlands*] reported the Admiral, Peter Hein, of 60 guns, and the Valck Sloop, of 16 guns, arrived in the outer harbor from the West Indies, where they must remain until the severe weather breaks up, as they cannot come in because of the ice. The two Scheids, the Maese, Rhine, Moselle, and indeed all the rivers in these parts, are frozen up. The island of Zealand is surrounded by hills of ice, a circumstance never known before in our memory, and the more extraordinary, as it is almost everywhere surrounded by the sea.<sup>244</sup>

As reported on 4 February 1784, there was intense frost in Holland [*the Netherlands*]. As a result, water was sold at Amsterdam at seven stivers per pail. At Rotterdam, there was the largest fair on the ice ever known, with playhouses and other places of diversion.<sup>241, 244</sup>

Last Saturday [28 February 1784], the ice in the River Waal [in *the Netherlands*] broke, by which a vast length of country is inundated. In the neighborhood of Gorinchen [Gorinchem], there were 72 villages under water; in another district there were 34 villages overflowed, insomuch that the tops of the houses only are to be seen. Many persons and vast quantities of cattle are drowned. In short, the distress is not to be imagined: thousands will be ruined, and vast tracts of land spoiled.<sup>244</sup>

On 3 March 1784, Nimeguen [Nijmegen, *the Netherlands*] reported, “Last Saturday [28 February] evening the ice broke near this city, in the Waal [River]. Since that, a most terrible scene! The dikes broke in many places; so that, from the Panderse Gat to Gorinchem, (a district of seventy-two villages), all are under water; near the Maaswall dike two breaches, whereby thirty-four villages are under water; in the Betuwe, the houses are in water to the tops; people and cattle are drowned in numbers; near Thiel and Kraanburg are large dams of ice.”<sup>249</sup>

In [March 1784], the great lake of Harlem [Haarlem] in Holland [*the Netherlands*] has overflowed its banks. The inundations are inconceivably great. The village of Harlmostadt is entirely destroyed by the floods.<sup>244</sup>

As reported on 1 January 1784 from Copenhagen, the accounts from *Iceland* are not very favorable. The volcano has thrown out such large quantities of sulfurous matter, that the country around to a vast distance is burnt up, which has reduced many families to misery; whole flocks have died for want of food. The sound is at present frozen over, so that the passage is entirely stopped.<sup>242, 247, 250</sup>

On 6 January 1784 at Frankfort, *Germany*, the cold has been excessive since the end of December. According to the observations made at Manheim and Nuremberg, the weather has not been so cold since the beginning of the present century.<sup>244, 247, 250</sup>

At Munich, *Germany*, it was uncommonly cold during the winter of 1783-84. The severe cold began on 28 December. During 6-8 January 1784, the temperature on the Reaumur's thermometer was  $-16^{\circ}$  Re [ $-4^{\circ}$  F,  $-20^{\circ}$  C].<sup>242</sup>

On 19 January 1784, Munich, *Germany* reported, “The cold has been uncommonly severe here since the 28<sup>th</sup> of last month; on the 6<sup>th</sup>, 7<sup>th</sup>, and 8<sup>th</sup> of the present month Reaumur's thermometer was at  $16 \frac{3}{4}$  degrees below the point of congelation, which was three quarters of a degree lower than it fell in the year 1709.”<sup>249</sup>

On 19 January 1784, all the country between Heidelberg and Manheim [Mannheim] in southwest *Germany* was underwater. On the night of the 17<sup>th</sup>, all the lower part of Heidelberg was inundated, and the inhabitants obligated to quite their houses. This inundation was occasioned by the vast quantities of ice, which clogged up the bridge, and stopped the free current of the river. Several houses have been much damaged, and in the country, both mills and houses have been carried away, and it is feared some lives were lost.<sup>247, 249, 250</sup>

Frankfort [Frankfurt], *Germany* reported on 7 February 1784 that accounts from different parts [of the surrounding area], this winter appears to be universally very severe, and the snow lay very deep in most places, the falling of which was preceded by the same kind of gloom which was so general during the last summer. At Heidelburgh [Heidelberg], *Germany*, the present cold is almost insupportable; but the apprehensions of the damage which is expected to follow the breaking up of the frost, by the vast

quantities of ice with which the rivers are now covered, and will then be let loose, is truly shocking to think of. Most of the inhabitants of the streets next to the river have packed up all their effects that they may move off the instant the ice breaks in the river. Cannons have been placed at distances to give notice. These will be fired as soon as the ice loosens. Although some accounts seem to represent that a fourth of Europe is free from the severity of the weather, yet we find by letters from Venice, *Italy* dated the 21<sup>st</sup> of January, that they have very severe frost there, and a great deal of snow. We have the same accounts from other parts of *Italy*, and particularly from Genoa, where the port is so blocked up with ice, that no ship can go in or out.<sup>242, 247, 250</sup>

At Heidesburgh [Heidelberg, *Germany*], in the Palatinate [in southwest *Germany*], the cold is almost insupportable, and the dread of the inundations on the snow's melting so alarming, the inhabitants near the rivers Rhone and Main have packed up their effects, to be in readiness to remove on the first signal [of the ice breaking].<sup>244</sup>

In the morning of 27 February 1784 at Heidelberg [in *Germany*], the beautiful bridge of the city was carried away by the ice. Half of the town is underwater and the destruction and misery both within and without the walls is beyond description. The inhabitants of Nauenheim [Nauheim] have all taken refuge in other places. Opposite to the village, the ice has accumulated in heaps as high as a house.<sup>241, 247, 249, 250</sup>

On 3 March 1784, Cologne, *Germany* reported that the Rhine River is at last tolerably clear of ice. Deutz [an inner city of Cologne] was protected by the ice having been thrown up by the tide and wind in such heaps as to resist the force of the water. Nobody perished there, but some houses were thrown down. Mulheim [Mülheim] was very much damaged. The Catholic Church has almost tumbled down, and upwards of 156 houses had fallen. The Lutheran Church except for the new steeple was also down. Upwards of 200 persons are either drowned or crushed to death. As fast as the waters leave a street, new devastations are discovered. Houses and walls were down, and cellars were blown up. Very few of the merchants who lived on the banks of the river had time to empty their warehouses so the loss in merchandise is immense. Accounts from Bonn indicate large quantities of ice floating down the river have thrown down part of the walls of the town. A vast number of houses on the border of the river had many swept away with all they contained.<sup>244, 247</sup>

On 4 March 1784, the city of Emmerick in the Dutchy of Cleves [now Emmerich am Rhein, *Germany*] reports they have no more dikes. The Rhine River threatens the city with ruin. The fields have disappeared under the water. The desolation that reigns is beyond all description. Great numbers of people have been swallowed up. The cattle perished by the hundreds. Hunger and cold join their ravages to those of the water. "If God does not help us, our ruin must be inevitable."<sup>244, 249</sup>

On 5 March 1784, at Bamberg, *Germany*, the river Reidnitz, which runs through the city, overflowed its banks and caused considerable damage. It carried away a bridge built in 1732, and which cost 140,000 florins. Many houses and mills have been thrown down, and 40 persons have lost their lives.<sup>241, 247, 250</sup>

On 7 March 1784 it was reported at Frankfort on the Main [Frankfurt], *Germany* that the rivers Rhine, the Main, and the Neckar thawed and overflowed. Many houses and mills at Sachsenhausen have been swept away; 13 houses were thrown down at Miltemberg [Miltenberg], and a number of persons buried in their ruins. Many edifices have been washed away by the torrents at Kittingen [Kitzingen]. One half of the town of Bonn was underwater, as well as the villages of Limperic [Limperich], Beul [Bühl], and Schevartz-Shandorffe [Schwarz-Schwandorf], the Lutheran Church and 130 houses have been destroyed at Mulheim [Mülheim].<sup>242, 247, 250</sup>

In [March 1784], one half of the town of Bonn, *Germany* is underwater. The Lutheran Church and 130 houses in Mulheim have been destroyed in the inundation. These inundations have traversed the

provinces of *Spain*, and have occasioned dreadful devastations. The Gadaluviar [Guadalaviar River] especially has swept away an infinite number of houses in its progress.<sup>244</sup>

As reported at Petersburg [a city in the Palatinate region of *Germany*?] on 16 March 1784, the damage done by the overflowing of the rivers Rhine and Necker are distressing beyond conception. The city itself would have been destroyed except for its fortifications, which fortunately withstood the impetuosity of the inundation. The waters on the side next to the Necker rose as high as the roofs of houses, and with such alarming rapidity, that the inhabitants had hardly time to save their lives. The city of Heidelberg has also greatly suffered; not only its magnificent bridge on the Necker, but also about fifty houses have been entirely swept away. The village of Necker Hausen, one of the most beautiful spots in the Palatinate, is so entirely destroyed, that not above [no more than] six houses are left standing. Many of the inhabitants were carried away on stupendous mountains of ice. Some perished and others found means to escape at the distance of several leagues down the river. Of the latter we saw an instance here, a woman, who had remained over 36 hours [on a sheet of ice] in the above uncomfortable situation, was landed here safe, after having seen her father and mother, brothers and sisters, perish by her side. The cold has set in again with double severity. Fuel is scarcely to be had. The provisions we had amassed are exhausted. The roads are impassible.<sup>244</sup>

The following is an extract of a letter to the admiralty of Amsterdam, the Netherlands from Vice-Admiral Reynst, commander of our fleet in the Mediterranean, dated, on board the *Liberty*, in Toulon harbor on 18 February 1784: "Having set sail for Malaga on the 22<sup>nd</sup> ult. [22 January 1784] accompanied by the whole squadron, and aided by a favourable wind, we the next morning got into the latitude of Gates's Capes, where we were first becalmed, and then met with contrary winds; so that, on the 3<sup>rd</sup> [3 February 1784], we had got no farther than the coast of Catalonia [in northeastern *Spain*], in the latitude of the island of Minorca. Here we were assailed some hours before day-break by so violent a tempest, that neither I, in the whole course of my service, nor any of the seamen who were with me, ever remember to have seen it equalled. It lasted eight and forty hours without intermission; and although at its commencement we were at the distance of twenty leagues from the island of Minorca, we found ourselves so close to it on the second day before noon, that it was with the greatest difficulty that we could, by crowding all our sails, keep clear of the breakers which surround the island. We remained in this dangerous situation a considerable time; and when we cleared the last of the breakers, we were so near, that the surge washed our deck. We owed our escape principally to our mizen-mast, which had fresh guards put to it, the first being carried away entirely, as indeed were almost all our sails. When this dreadful storm was in some measure abated, we, on the 7<sup>th</sup> instant [7 February], came up with the *North Holland*, which, during the tempest, besides other considerable damage, had lost all her masts, and floated like a lighter at the pleasure of the winds. A short time after we saw *La Medée* frigate, which had sustained no other loss than that of five of her fore-castle guns, which she was obligated to throw into the sea. I left this frigate to succour [succor] Capt. Ryniveld of the *North Holland*, giving him orders to conduct himself as wind and weather should direct. We have, since Feb. 6. kept cruising in the latitude of Toulou, and the isles of Heires, with very bad weather, having met with three storms, two from the Levant [Eastern Mediterranean], and the third from the northwest quarter. The day before yesterday I was joined by Rear-Adm. Van Braam, and we this morning entered the harbour together. We here found the *Prince William*, one of our fleet. I have not hitherto received any intelligence whatever of the *Hercules*, and am therefore under great apprehensions respecting its fate; nevertheless, I wish I was in the same uncertainty concerning the *Drenthe*, Captain Smissaert, and did not find myself under the necessity of informing your Noble and Mighty Lordships what Captain Valliant told me, namely, that on the first day of the storm he saw one of our ships sink, which he took to be that unfortunate vessel. Capt. Van Ryniveld has confirmed this melancholy piece of information; and as the *Drenthe* was a very remarkable ship, I dare not flatter myself that the two above-named captains are mistaken." <sup>249</sup>

On 30 January 1784 at Leghorn [Livorno, *Italy*], the seas were very stormy for some days past, and many vessels were lost.<sup>244</sup>

On 3 February 1784, the storm that struck during the night at Genoa, *Italy* has done immense damage. The hail was of an immense size. The tops of several houses were blown off. Many trees were torn up by the roots. The olive trees have particularly suffered. The damage done has been valued at a million, and no doubt we shall have accounts of great damage being done at sea.<sup>247, 250</sup>

It was reported in Naples, *Italy* on 3 February 1784, that vast quantities of snow had fallen and detained the courier expected from Calabria a whole week. But he finally arrived and brought some melancholy news from those parts. The earthquake has returned again. Near Palermo, the sea inundated upwards of 6 miles of country. Several warehouses, full of merchandise, were ruined. It was reported that after a violent shock of an earthquake, Catania was covered by the sea.<sup>247, 249, 250</sup>

On 6 February 1784, Rome, *Italy* reported that such a vast quantity of snow has fallen during the last week, that the post could not get over the mountains, although 600 workmen were employed in clearing the road.<sup>244</sup>

In *Italy*, there was severe frost in Venice, Genoa, and Rome.<sup>47, 93</sup>

On 5 March 1784, Madrid, *Spain* reported that the overflowing of the rivers, which traverse their provinces, have occasioned frightful devastation. The Guadalavir [Guadalquivir River] especially had thrown down an infinite number of houses, and occasioned the greatest desolation in all places which it has inundated.<sup>247, 250</sup>

On 7 February 1784, Lisbon, *Portugal* reported that for the last 5 weeks, there have been great storms on their coasts that the oldest man living does not remember anything that compares with this season. No vessel comes into this port without having suffered damage, and many have been lost. Upwards of 100 persons have perished in the Tagus River.<sup>244, 247, 250</sup>

In *Hungary* after deep snows and severe cold, a sudden thaw took place during 27-29 December 1783. The Danube and the river of Maros [Mureş] have exceeded their bounds, and occasioned the greatest destruction in their course. The greatest damage was at Newzaz and Arrad [now Arad, *Romania*]; the latter city is entirely underwater, and the inhabitants of the greater part of the houses were obligated to go to the tops of them for refuge. On 30 December, the misfortune was heightened by a frost, which covered the streets and houses with ice. The frost increased till 5 January, when the Reaumur's thermometer stood at -23.5° [-21° F, -29° C].<sup>244, 249</sup>

During 7-9 March 1784, the cities of Pest and Buda [now combined into the city of Budapest] in *Hungary* were immersed in water, occasioned by the overflowing of the Danube River. The greatest part of these cities was underwater and Pest resembles an island. The damage sustained in goods, merchandize, houses, churches, and cattle, is not to be estimated.<sup>244, 247, 250</sup>

During the beginning of January 1784, Austrian Dalmatia [now generally the region of *Croatia*] experienced a severe storm that lasted 3 days. Much damage was done to the coasts. The winds blew so hard that the inhabitants did not think themselves safe in their houses, fearing they would be blown down every moment.<sup>244</sup>

On 6 March 1784, Vienna, Austria reported, "From all the provinces of this monarchy, we received the most afflicting accounts of the shocking devastation occasioned by the sudden thaw of the rivers. Part of the city of Prague [now in *Czech Republic*] is under water: the loss occasioned by the floods is

considerable; the great bridge is so much damaged, that it cannot be passed over without danger; the guardhouse there has been thrown down, and four men killed, the cities of Lints [Linz, *Austria?*] and Presbourg [now Bratislava, *Slovakia*] have shared the same fate. At Tischamont the waters have risen to a prodigious height; at Schisnau [now Chişinău, *Moldova*], in the same neighbourhood, forty houses have been submerged by the waters; so that it was impossible to give any assistance to the unfortunate inhabitants, victims of this terrible disaster.”<sup>249</sup>

On 15 January 1784, excessive cold struck the city of Smyrna [an ancient city now located at Izmir, *Turkey*]. The cold drove away the plague and putrid fevers which have raged so much of late in these parts.<sup>247, 250</sup>

On 18 February 1784, it was reported that at Cherson [in the southern *Crimea*] that nearly half of the inhabitants of that city have died of the plague. But the severe winter cold of the winter has checked the contagion.<sup>247, 250</sup>

In Selborne, *England* from 23 September until 12 November, the weather was dry and mild. Then till 18 December there was grey soft weather with a few showers. From 18 December 1783 to 19 February 1784, there were hard frosts. During this period it thawed during 2 days (14 January and 5 February). From 19 to 28 February there was mild wet fogs. To 10 March, there was sleet and snow. To 2 April, there was snow with hard frost.<sup>70</sup>

At Leeds in Yorkshire, *England*, the temperature on New Year's Day [1 January] 1784 fell to 8° F [-13° C]. During the winter of 1783-84, there was 89 days of frost.<sup>272</sup>

In *England* during the winter of 1783-84 the frost lasted 89 days. The weather in November was unusually mild. In Montrose in northeastern *Scotland* on the 4<sup>th</sup> of November “the cattle seek shade at noon from the heat.” On the 17<sup>th</sup> of November the thermometer stood at 56° F (13° C) indoors and out. On the 23<sup>rd</sup> and 24<sup>th</sup> there was frost and ice. On 30<sup>th</sup> November, “very hard frost.” On 6<sup>th</sup> January, “Thames not frozen quite over, but navigation stopped by ice.” The frost continued through January and February, and even into March there was snow and cold cutting winds. “From different parts of the country we have accounts of more persons having been found dead in the roads, and others dug out of the snow, than ever was known in any one year in the memory of man.” The cold weather was especially severe in London, Canterbury, Salisbury, Worcester, Northampton, and Barnard Castle in *England*, Edinburgh in *Scotland*, Amsterdam in *the Netherlands*, Mannheim in southwestern *Germany*, Rome in *Italy*, and *Hungary*. The frost was especially severe from the 10<sup>th</sup> to the 20<sup>th</sup> of February. In the last days of February, the spring flowers were out, and the birds were singing. In March, frost, snow, and thick ice all through. Deep snow in Hampshire continued till 3<sup>rd</sup> April. Thames frozen and traffic crossed at many places.<sup>47, 93</sup> [Barnard Castle is in Durham in northeastern *England*.]

On Wednesday last [24 December 1783], a snowstorm struck Aberdeen, *Scotland*. In the evening, it blew a perfect hurricane.<sup>244</sup>

On Monday, 29 December 1783, Aberdeen, *Scotland* reported, “On Wednesday last [24 December] it began to snow, with the wind at north. In the evening, the wind changed to about east, and it blew a perfect hurricane. During the gale, the *Industry*, [commanded by] Macleod, from Newcastle for this place, went ashore a little to the northward of Don mouth. The master and mate were washed overboard a little before she struck; the rest of the crew got safe ashore, and got part of the goods saved, although much damaged. The *Rodney*, [Captain] Taylor, and the *Venus*, [Captain ?], both bound for this port from Sunderland with coals, were wrecked, the one near Sketraw, and the other at Cowie, and all the crews, to the number of 13, perished. The snow has continued ever since Tuesday to fall, with little interval; and a greater quantity is seldom remembered to have fallen in so short a time. All communication with the

country is in a manner stopped. The post was nine hours between Old Meldrum and Aberdeen, and it was only by going over the eminencies [hills] on the road side that they were able to go on. The Edinburgh Saturday's post did not arrive here till Sunday afternoon, and yesterday's post at eight this morning." <sup>249</sup>

In December 1783 and January 1784, there was remarkably cold weather, and prodigious falls of snow in *England and Scotland*.<sup>249</sup>

In December 1783 and January 1784, there were greater falls of snow than has happened for a great many years past. It began at Edinburgh, *Scotland* on 24 December 1783, and continued with very little intermission until the end of the month. The roads were rendered almost impassable, which in a great measure stopped all intercourse with the country. The diligences [public stagecoaches] and slys [sleighs?] which set out from Edinburgh on the 29<sup>th</sup>, after going but a short way from town, were obliged to return, it being impossible for them to proceed. They were subjected to the same inconvenience once or twice during the month of January, by fresh falls. The showers of snow were frequently attended by high winds, which did a great deal of damage on the coast, particularly at Aberdeen, where several vessels were driven ashore and wrecked. In the end of December the cold was excessive. On Sunday the 28<sup>th</sup>, at half past 11 p.m. the thermometer, exposed to the open air at the observatory at Glasgow was 4° F [-16° C]; the next night about the same time, it was 11° F [-12° C]; and on the 30<sup>th</sup>, it was -4° F [-20° C]. The post-boy with the mail from Dumfries to Thornhill, was frozen to death upon his horse. At Edinburgh, on Wednesday the 31<sup>st</sup>, at eight o'clock in the morning, Fahrenheit's thermometer, on the outside of a window, stood at -3° F [-19° C]. This is perhaps the greatest degree of cold known in this country since thermometer registers were kept. The instrument, laid on the surface of the snow in a garden just at sunrise fell to 48° below the freezing point [-16° F, -27° C].<sup>249</sup>

"The frost was so intense on Sunday night [28 December 1783] at Kilkenny, *Ireland* that the [River] Nore was froze over before morning. Multitudes of people assembled on, and walked over it on Monday and Tuesday." <sup>249</sup>

On 31 December 1783, the temperature at Montrose, *Scotland* fell to 8° F [-13° C].<sup>249</sup>

On 2 January 1784, London, *England* reported "Very large quantities of ice are coming down the River Thames, which have occasioned the ships to haul up their cables and moor with chains, to prevent accidents. At Maidenhead the river is so choked up with ice, that no craft whatever can pass up or down the Thames. From all parts of the country we have an account of a great fall of snow last week, attended by an immense frost, by which the arrival of the post, has been a great many hours out of the common course. There was no work done in the Poole yesterday, on account of the ice in the river. The fall of snow between Canterbury and Dover has been so unusually large, that men are employed on the road to clear a channel for travelers to pass with safety. In consequence of the great fall of snow, many other of the roads in the country are impassable, and several of the stage-coaches and other vehicles, which were expected in town early this morning, had not reached their respective inns at three in the afternoon." The temperature on Wednesday [31 December 1783] was 17° F [-8° C] at Highgate.<sup>249</sup>

On 2 January 1784, Tadcaster, *England* reported "You will no doubt be sorry to hear, that on the 1<sup>st</sup> instant we had a most terrible flood; the water rose nearly four feet high in the space of about thirty-three hours, several boats were sunk, and two fishermen were drowned; but what adds still more to this melancholy scene, is to see five of the arches of the bridge torn away, on one of which was a post-chaise, going over at the time this fatal accident happened, whereby the postboy, one horse, and one passenger, by getting on the roof of the chaise, was driven on shore and saved." <sup>249</sup>

On 3 January 1784, Canterbury, *England* reported "The frost on Tuesday [30 December 1783] night was so uncommonly severe, that the River Stour, which runs very rapidly through the city, was frozen in

many places hard enough to walk over; a circumstance which the oldest inhabitant never before remembered.”<sup>249</sup>

On 3 January 1784, Newcastle, *England* reported, “Since Christmas day the frost has set in remarkably keen, attended with much snow, so that the river [Tyne] was frozen up on Tuesday [30 December 1783]. Many keels that morning stuck fast among the large bodies of ice carried by the tide, and one in particular close to the bridge, in a very dangerous situation; the men, however, were drawn up by ropes on the bridge. People were skating on the river on Wednesday, and a passage made very easy to Gateshead.” On Wednesday [31 December 1783] a thermometer exposed to the open air in Newcastle stood at 2.5° F [-16.4° C]. It was the coldest day at Newcastle since 14 January 1780 when the temperature dropped to -3° F [-19.4° C].<sup>249</sup>

On 3 January 1784, Dublin, *Ireland* reported, “The Puddle-hole, near the lower Castle-yard, being deluged over with water, from the melting of the late snow and the intenseness of yesterday’s rain, burst out about ten last night, and in a short time flooded for several feet deep, so much so, that it is said a boy was drowned near the Castle-gate. All the kitchens of the houses of the new buildings, and those opposite Daly’s, Mr. Wilson’s, etc. were filled with water even with the street. Through Crampton-court, Crane-lane, and Cycamore-alley, a wide and rapid river made its course, taking its way down Essex street, filling numerous cellars, and emptying itself into the [River] Liffey at the upper slip. The consternation of the inhabitants of the neighbourhood was great, and the damage done to many articles in cellars, kitchens, etc. that could not be removed in time, it is supposed is very considerable. Patrick street, and the neighbouring avenues were also under water, occasioned by the mountain flood.”<sup>249</sup>

On 3 January 1784, Haddington, *Scotland* reported, “Last night and this forenoon, we had an exceeding great fall of snow, which has rendered our roads almost impassable, insomuch that the post-boy who left Edinburgh last night with the London mail, got to Tranent with great difficulty; and, after stopping there until the violence of the storm abated, only reached this place about five o’clock this afternoon.”<sup>249</sup>

During the winter of 1783-84, in Dublin, *Ireland*, there was a flood. On [Saturday in the Gregorian calendar] 3 January, the very sudden thaw, after the late fall of snow, together with heavy and incessant rain on Friday, occasioned such floods in and about the city, as were attended with considerable injury to the inhabitants situated within. The rivers Liffey and Dodder overflowed all the low grounds and the River Poodle covered Patrick Street to unprecedented height, having risen at the church to near 6 feet. Ship Street as far as Sycamore Alley, was laid underwater, which takes an impetuous course through Crampton Court, Crane Lane, etc. filled all the cellars and kitchens. The suddenness of this inundation threw the inhabitants into the greatest terror, and prevented the removal of many articles, such as sugar, etc. by which many have sustained considerable damage. A young apprentice was killed when a small arch failed.<sup>241</sup>

On 5 January 1784, Salisbury, *England* reported, “The frost was never known in the memory of man so severe in Worcestershire as on Tuesday and Wednesday last week [30 & 31 December 1783]. The [River] Severn was frozen over for miles together, and various are the accounts of people and cattle that perished.”<sup>249</sup>

On 5 January 1784, Aberdeen, *Scotland* reported, “The *Hope*, [Captain] Cravie, was wrecked in Lunan bay, but all the hands saved. The *Newcastle*, of and for this place, was put ashore in the frith, crew and cargo saved. The *Betty*, [Captain] Will, on her voyage from London, lost one of the men, who was washed overboard during the gale. On Monday and Tuesday [29 & 30 December 1783] the frost was exceedingly intense, and the thermometer was at one time 27 degrees below the freezing point [5° F, -15° C]. On Thursday [1 January 1784] the wind came to S.E. and continued to blow strong all that day and Friday; but in the night between Friday and Saturday, it increased to a degree seldom remembered. A

good part of the lead on the roof of the New Inn was tore off; several chimney-tops hurt [destroyed], and some stacks of bear blown down and scattered about the fields: And from about three on Saturday morning was a continued drift of snow, sleet, and now and then hail. In the evening, the wind abated.”<sup>249</sup>

In January 1784, there were extraordinary floods in *England and Ireland*.<sup>249</sup>

Great snowstorms pounded *England* in January and February of 1784, especially in northern York, and in parts of the midland counties. Barnard Castle and Northampton suffered severely. These storms were accompanied with intense frost.<sup>47, 57</sup>

On 6 January 1784, Dumfries, *Scotland* reported, “Last Friday [2 January] afternoon we had here a very heavy fall of snow, attended with a severe easterly wind, which continued till Saturday at mid-day. We do not remember to have seen such a quantity of snow lying on the ground at one time these many years; the great road to England, as well as the Edinburgh road, being almost impassable even to a foot-traveller, which occasioned the Edinburgh post due on Saturday night not to arrive till this morning; and the English post has been full twenty-four hours later than usual. The frost continues at present with great severity, and without the smallest appearance of a change of weather.”<sup>249</sup>

On 7 January 1784, a Prussian vessel called the *Friendship* came ashore in London, *England*. As a result of a strong storm, the ship was in a dreadful situation. It was waterlogged for several days. Its sails were torn to pieces. The storm had produced a very mountainous sea, which broke over the stern half-mast high; her rudder came ashore, and the hatchways blew up. The seven people onboard were quite worn out with the severity of the storm. Only the captain and one member of the crew survived.<sup>241, 242</sup>

On 9 January 1784, Dublin, *Ireland* reported, “We hear from Arklow, that the late floods have marked their progress with distress and desolation along the banks of every stream in the neighbourhood; nor has the storm from the sea been less destructive; two square-rigged vessels have been driven high and dry on shore; one vessel is entirely wrecked, and a great number of small craft beat to pieces, to the utter ruin of many poor families.”<sup>249</sup>

On 18 January 1784, the schooner *St. Barbaras* was working its way up the channel at Dublin, *Ireland* but encountered a violent storm that almost beat the ship to pieces.<sup>241</sup>

On 22 January 1784 the River Tweed at Kelson [Kelso, *Scotland*] was almost covered in ice, which rose above the town in two hours to a height of eight feet perpendicular. The course of the river changed and the ice was thrown up to an amazing height.<sup>244</sup>

Reports out of Bernard Castle in Durham, *England* on 25 January 1784 state: the distress from the snow, and the intensity of the frost (which was there more severe than had been remembered since the year 1740) was so great as to confine the poor within doors, and to put a total stagnation to all sorts of business without. The birds were so tame they might be taken with the hands almost starved to death.<sup>244</sup>

On 30 January 1784, a man walked across the River Thames in London, *England* on the ice at low water from Rotherhithe to Wapping new stairs.<sup>244</sup>

On 9 February 1784, a letter from *Scotland* stated: “At a small village in this country, the snow lying so deep as to be above the houses, the inhabitants have scooped out a way under the snow [a tunnel], the length of the village, leaving a solid arch at least six feet thick overhead. The storm continues with unabated severity, and in the course of the last week, a great quantity of snow has fallen. On Saturday morning it drifted so violently, that several carriages that left town were obligated to turn back, after proceeding about three miles.”<sup>244</sup>

On 10 February 1784 at Northampton, *England*, the snow is so deep in this country, that in many parts, the cottages are so covered as to be no longer visible. There is great apprehension for the poor inhabitants who are feared starved to death.<sup>244</sup>

An extract from a letter from Kilkenny, *Ireland* dated 11 February 1784 related the following story. “The following very singular circumstance occurred in this city one night last week during the very intense frost: A cat having discovered a rat with five or six young one in the corner of a room, made a set at them; the old rat, regardless of her own safety, kept her situation for the protection of her young, and the cat not to be outdone in vigilance remained centinel [sentinel] all night, and in the morning they were all found frozen to death, in the most watchful attitude.”<sup>241</sup>

On 12 February 1784, a heavy snowfall began at Salisbury in Wiltshire, *England* in the morning and continued without interruption for 28 hours. This is longer and deeper than had been known there since the year 1740 when the fall lasted 36 hours. The Heytesbury post boy was frozen coming from thence on the 13<sup>th</sup>. The Weymouth mail, which set out on the evening of the 12<sup>th</sup>, and should have been at Salisbury about the same time on the 13<sup>th</sup>, did not arrive until 11 o'clock in the evening of the 14<sup>th</sup>. The Blandford post boy was lost some hours on Handley Down, where he wandered all night, and in the morning was forced to wade through the trackless snow, with the mail upon his back, leaving his horse behind him. When he reached a house, he was almost speechless, and it was with difficulty he was recovered. A post Chaise, horses and driver, were lost in Cornwall; and both horses and boy perished in the snow.<sup>244</sup>

From 10 December 1783 to 22 February 1784, there has been 63 days of frost in [London, *England*]. Of these it snowed 19 days, thawed 12 days, and rained 9 days. Had the frost continued at 13° F [-11° C], as on 31 December during the night, it would have frozen over the Thames in 24 hours. The snow having fallen soon after the frost in December did not penetrate the ground very deep [because snow acts as an insulator]. But the first snow having partly dissolved was succeeded by a very keen frost, and formed the dissolution into a hard cake, which was afterwards covered with other falls of snow.<sup>244</sup>

The winter of 1739-40 was compared to the winter of 1783-84 at Edinburgh, *Scotland*. During the present winter, the snows began Christmas day in 1783 and continued to 20 February. There were snow showers almost every day accompanied by frost, sometimes very intense as in *England*. The frost of 1740 was more intense and was severe enough to freeze malt liquor and even spirits; but this did not happen in the present frost.<sup>244</sup>

During the winter, the River Thames in London, *England* was frozen below Gravesend. The winter was recorded as being intensely cold throughout *Europe*.<sup>1</sup>

In *England*, the frost during the winter of 1783-84 lasted eighty-nine days.<sup>128</sup>

The frost in *Britain* lasted 89 days.<sup>41, 43</sup>

In *England*, on the fifth bell of the Tadcaster peal it is recorded: “*It is remarkable that these bells were moulded in the great frost, 1783. C. and R. Dalton, Fownders, York.*”<sup>47, 93</sup>

In *Scotland*, daily heavy snowfalls extended over nearly a month.<sup>47, 57</sup>

In *Europe* in 1784, storms and excessive cold were reported from Smyrna, Vienna, Nimeguen, Cologne, Naples (great flood), Leghorn, Rome, Lisbon and Amsterdam.<sup>47, 57</sup> [Smyrna is now İzmir, *Turkey*. Vienna is in eastern *Austria*. Nimeguen is in eastern *Netherlands*. Cologne is in western *Germany*. Naples is in southern *Italy*. Leghorn or Livorno is in northwestern *Italy*. Rome is located in west-central

region of the *Italian Peninsula*. Lisbon lies in *Portugal* in the western Iberian Peninsula on the Atlantic Ocean and the Tagus River. Amsterdam is on the western side of *the Netherlands*.]

On 20 March 1784, Vienna, *Austria* reported that the most melancholy details of the inundations occasioned by the thaw arrived at Vienna from almost all parts of *Germany*, the Low Countries [*Belgium, the Netherlands*], *France, Italy*, etc. so that these misfortunes seem to have been the lot of almost all the countries of *Europe*.<sup>247, 250</sup>

In *Sweden, Denmark, Germany, Holland [now the Netherlands], Poland, England, and Ireland* and even in the *United States*, the winter produced very severe cold, large amount of snow, and great flood disasters caused by the melting of the snow. The Danube River remained frozen almost the whole month of February. For 30 years, this river was rarely closed for shipping. The cold weather in *Portugal*, and especially Lisbon was quite extraordinary.<sup>62</sup>

The winter of 1783-84 was unusually severe and long continued in both *Europe* and *America*. [At Calabria, *Italy*], a thaw of alarming suddenness took place in the middle of March, but afterwards severe cold set in again.<sup>214</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1783 occurred on 21 November. It snowed 6 inches deep.<sup>116</sup>

In the *United States*, the winter of 1783 was long and severe. The Delaware River closed as early as the 28<sup>th</sup> of November, and continued ice-bound until the 18<sup>th</sup> of March. The mercury was several times below zero (0.0° F, -17.8° C).<sup>1</sup>

The winter of 1783-84 was known as the Long Winter in New England in the *United States*. The first snowfall of the season blanketed the eastern seaboard from New Jersey to Maine on 12-13 November 1783. Morristown, New Jersey (twenty-five miles from New York City) records showed 7 additional snowstorms struck in November and December and then followed by a major snowstorm on 30-31 December. About 20 inches (51 centimeters) of snow accumulated in this late December storm. Three more snowstorms struck in January and then a strong one occurred on 26-27 January piling up 18 inches (46 centimeters) of snow in 24 hours. The total snow accumulation at Morristown during those 3 months was 83.5 inches (212 centimeters) of snow. Snowstorms continued into March and April. Philadelphia, Pennsylvania recorded a temperature -11° F (-24° C) on 9 February. Hartford, Connecticut recorded a temperature of -20° F (-29° C) on 14 February.<sup>27</sup>

In the year 1784, Joseph Clark, the architect who built the dome of the state house in Annapolis, Maryland in the *United States*, skated to that city from Baltimore.<sup>38</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:  
In 1783 on November 13<sup>th</sup> – a deep snow. November 28<sup>th</sup> – a great storm. December – the first half of the month moderate, the latter cold and stormy. In 1784 on January 31<sup>st</sup> – the first week of this month was moderate, but the rest horrid cold, stormy, snowy weather. February – a cold month, and indeed a cold winter through the whole; the longest and coldest ever known. March has been moderate, and not so very windy as usual. April 6<sup>th</sup> – it snowed yesterday and went away today. April 17<sup>th</sup> – this is the third day of cold, rainy, snowy weather.<sup>78</sup>

The winter of 1783-84 was cold and severe in Bradford County, Pennsylvania in the *United States*. On 15 March 1784, a Great Ice Flood took place. The damage was particularly severe in the Wyoming Valley. The breaking up of the Susquehanna River greatly distressed the inhabitants who had built their houses on the low lands near the banks of the river. The uncommon rain and large quantities of snow on the mountains together with the amazing quantity of ice in the river; swelled the streams to an unusual

height of ten feet [3 m] and in many places twenty feet [6 m] higher than it had ever been known since the settlement of the country. Horses, cattle and other effects of the settlers were swept down in the torrent of floodwater and forever lost.<sup>178</sup>

On 10 January 1784, Bombay Castle in India reported that Brigadier General Macleod onboard the *Ranger* that on 28 & 29 December 1783, there was snow off Mangalore, in southern *India*.<sup>249</sup>

On 27 February 1784, a hurricane or waterspout struck Havannah [Havana], *Cuba* and it caused the loss of 17 or 18 sail of vessels [sailing ships]. The hurricane only lasted a few hours and was not felt at any other islands. These tornadoes are frequent in the isle of *Cuba*, and principally upon the seacoast. They are of short duration, but excessively severe and dreadful. One of these stationary storms, or airquakes as the Spanish language terms them, happened in the year 1705, when four men-of-war, with most of their crews, were lost in the harbor of the Havannah, though the period of its lasting was not more than twenty-four hours.<sup>244</sup>

---

**1784 A.D.** On 14 April 1784, Lucca in central *Italy* reported, “The inhabitants of the villages of St. Casciano de Controne, belonging to this republic, and situated at the foot of the Apennines [Mountains], lately experienced a most terrible disaster. After a violent rain, accompanied with high winds, on the 29<sup>th</sup> of last month, about noon, an extraordinary motion of the earth was felt in the village of Celle; which occasioned the inhabitants to leave their falling houses, with what effects they could collect amidst their horror and amazement, and retreat to a large plain, driving their cattle thither for safety. In the evening of the same day, they had reason to congratulate themselves for the prudent precaution they had adopted; for a dreadful chasm opening, not less than fifty houses, which had been inhabited by about 300 people, were in an instant swallowed by the earth. The effects of this phenomenon were felt in a circumference of about three miles, which now exhibits a shocking scene of desolation. The loss sustained is estimated at 35,000 crowns.”<sup>249</sup>

On 6 May 1784, a waterspout was observed at Aberdeen, *Scotland*.<sup>249</sup>

On 10 May 1784, Aberdeen, *Scotland* reported, “Upon Thursday last week [6 May], in the forenoon, there appeared at Ellon, something very uncommon, at least in this country. About eleven o’clock, there was observed, to the eastward, something like the smoke that arises from a whin-bush or wet straw when set on fire, and seemed to issue from a black thick cloud; one side of which, a column of seeming smoke, appeared as if it ascended, and the other side of it, as if it descended, and sometimes the whole column seemed to move round. Soon after, there was seen, a little below the town of Ellon, upon the river and some of the grounds adjacent, a grayish-coloured vapour [waterspout], which moved up the river, the water of which, at the surface, was whirled about, and is said to have been raised sometimes to a considerable height; at which time there was heard an uncommon noise, which, at first, was thought to be thunder, but it seems plain it was not; for the sound was quite different from the sound of thunder; and it did not intermit, but continued equally the same, till it ceased altogether, which happened about two or three minutes after it was first heard. Whether this noise was occasioned by the vapour, or by the approach of a very heavy shower of uncommonly large hail, seems to be uncertain. The grayish-coloured vapour moved up the river, whirling, or at least ruffling, the surface of the water. When it came a little below the place where the ferry-boat passes, it appeared, on the south bank, in the form of a cone, and was seen to move round rapidly, for a little; and about the same time, one of the ferry-boats, it is said, was whirling about again and again; and in a little after, it disappeared, and was not seen any more by the people about Ellon. No hurt was done to trees, nor any thing else, as has been reported. Some say, that, while the vapour was moving up the river and its banks, they felt the smell of sulphur; but others, who were equally near, say, that they felt no such smell.”<sup>249</sup>

On 26 May 1784, a most alarming thunderstorm did considerable damage in the neighborhood of London, *England*. A ball of fire entered a gentleman's house in Hounslow, threw down a stack of chimneys, and struck a manservant and a footboy senseless, who notwithstanding, soon recovered. The lightning blasted many trees; and, what is remarkable, the leaves fall from the trees, in several places, as if in autumn, without any apparent cause.<sup>244</sup>

On 31 May 1784, a strong hailstorm struck Welch Pool [Welshpool], *Wales* and the surrounding neighborhood. The storm produced the most violent and heavy rain and hail, attended with the most tremendous thunder and lightning, ever remembered in those parts. The torrents of water pouring from the long mountain, brought down a most amazing quantity of earth and large stones, carrying away every mound and railing in its course, and entirely choking up the little bridges across the roads, so as to overflow them in several places.<sup>249</sup>

On 4 June 1784 it was reported that the principal square of a fortified town Ronda in the Kingdom of Grenada, *Spain* sunk, with all the houses that surrounded it. Approximately 3,000 people lost their lives. The disaster is attributed to the continual rains, which undermined the foundation of rock on which the town was built.<sup>247, 250</sup>

On 5 June 1784, there was an extraordinary storm of rain and hail in *England*.<sup>249</sup>

On 5 June 1784, a strong hailstorm struck Sherborne in Hants, *England*. "A very extraordinary storm or hail happened on the 5<sup>th</sup>, which was preceded by drops of rain as broad as a half crown. These drops of rain were soon followed by round hail, and then by pieces of ice, some of which measured more than three inches in girth; these stones coming from the N.W. [northwest] broke all the windows and garden glasses which were open to that quarter, but the principal damage was done in several farms at the N.W. of this village, where it has made great havoc indeed. The beans, pease [peas], and clover, are in appearance half ruined; but the wheat not being in the ear we hope has escaped pretty well. All the hop gardens in that part of the parish are much injured, and yet all the while there was no hail at several of the neighbouring villages, neither did it extend to the top of this; the storm appeared to have been not more than a mile in breadth. In the spot where the centre of the storm passed, there arose a vast and sudden flood, which seems to have done as much mischief [damage] as the hail; the soil is swept out of the corn-fields into the lanes, and the meadows filled with mud and gravel; such a torrent came down the hollow lanes as tore up the very rocks. It is impossible at present to estimate the damage. The great pieces of hail were, I thought, somewhat of the shape of crockles [clams], with a white nucleus in each; it lay three feet deep in some places, and continued all day yesterday."<sup>249</sup>

On 19 June 1784, a new island near *Iceland* totally disappears. There was great devastation from subterraneous fires.<sup>249</sup>

On 13 July 1784, Sclavonia [now *Croatia*] reported that although the season has been remarkably temperate, the Save [Sava] River has not completely returned to its original channel, and many of the low grounds still are flooded. This is due to the vast amounts of snow that fell upon the mountains during the winter.<sup>247, 250</sup>

On last Wednesday se'night [14 July 1784] in the island of Jersey [a British Crown dependency just off the coast of Normandy, *France*], a tremendous storm of thunder and lightning passed over the island without doing any damage. But a vessel arrived from St. Maloes [Saint-Malo, *France*] indicating a great deal of damage was done to that city by the storm. Tops of chimneys were thrown down, houses unroofed, several persons killed, and a great many cattle were found dead on the ground adjoining that city. The vessels in the harbor took fire and were totally consumed.<sup>247</sup>

On 18 July 1784 in *France*, there was a hailstorm in the Pyrenees. Some of the hailstones weighed 18 ounces.<sup>93</sup>

In the Pyrenees Mountains, on the borders of *France* and *Spain*, on 18 July, there was a hailstorm; stones as large as hen's eggs, some weighing 23 ounces.<sup>41, 43, 57</sup>

On 19 July 1784, a violent storm struck Lago Maggiore [Lake Maggiore] in *Austria/Switzerland*. This storm destroyed almost 32 villages on the border of the lake. The part, which suffered the most was the coast opposite that belonged to the house of Austria. The hailstones were so large and fell in such quantities, that all the trees were stripped of their leaves. For some days after this, the weather was very cold.<sup>241, 247, 250</sup>

A hurricane struck *Jamaica* on 30 July 1784.<sup>41, 42, 124</sup>

Port-Royal in *Jamaica* destroyed by a terrible storm on July 30, 1784.<sup>41, 43, 56</sup>

On 20 July 1784, a storm did great damage at Port Royal, *Jamaica*.<sup>128</sup>

On 30-31 July 1784, a hurricane struck *Jamaica*. Many lives were lost. Two drowned from the ship *Hanover Planter*. Half the crew was lost from the ship *Industry*. On two other ships, most of the people perished.<sup>141</sup>

On 30 July 1784, *Jamaica* suffered from a hurricane. Upon the night of July the 30<sup>th</sup>, every vessel in the harbor, except four, was either sunk, dismasted, or driven on shore, and numerous lives lost; the barracks at Up Park Camp were blown down, and five soldiers killed; the workhouse was destroyed, and ten of its inmates killed or wounded. The storm began at half-past eight p.m., and continued till past eleven p.m. Two severe shocks of an earthquake were felt. [These appear to be hurricane-induced earthquakes.] On the first 3 days of August, the island [*Dominican Republic, Haiti?*] suffered severely from a storm.<sup>146</sup>

On 30 July 1784, a hurricane struck *Jamaica*. "After a close and warm day, the sun appearing more red than usual, and the hills being clear of those cloudy caps which usually cover them, about five in the evening the sky all of a sudden began to look extremely angry; the sea in the harbour of Kingston, rose in swells, without any apparent cause, as there was little wind stirring; the sun set in blood; and when the moon, which was near full, arose soon after, there was a duskiness across her disk, all which foreboded what we afterwards experienced. At seven o'clock the wind shifted, and began to blow fresh; on which occasion the ships in Kingston and Port-Royal harbour, many of which were preparing to get away, remoored. Captains and other officers, who were on shore regaling, made haste to get on board their ships. By ten o'clock the gale increased to such a degree, that there was no such thing as a boat living; the small craft were all drawn up on shore. At midnight the hurricane had increased to an alarming height; the clouds exceeding low and black, and a violent torrent of rain issuing from them. At two in the morning a smart shock of an earthquake was felt, which caused the people to get out of their beds, and many ran naked into the fields; within a few minutes after another shock was also felt, but less severe, though accompanied with a hollow noise as of thunder, which went gradually off in about four minutes. By four o'clock, which was before day-light, a prodigious devastation was done in Kingston. At six the gale began to moderate; and by nine it was so near over, that boats ventured off. The morning discovered an awful sight, the wrecks of vessels, some of the ships still at anchor, but dismasted, and mere wrecks; among which were the *Flora* frigate of 36 guns, Capt. Montague, who flung most of her guns over, and were obliged to cut away all her masts. The *Janus*, of 44 guns, where the Commodore's pendant was, luckily lay in a kind of eddy, sheltered from the wind's greatest force. To our great surprise, neither the ships at Port Royal, nor this place, suffered so much as was to be expected. Some houses were blown down at New Greenwich, and a few at Spanish Town. In St George's parish, at Crawford Town, they had

a great deal of mischief [damage] done, and seven people killed. In the harbour of Port Morant, four vessels were lost. In Manchineel [Manchioneal], two are lost, and a number of craft. To the parish of St. Thomas in the East, which is at the S.E. [southeast] point of the island, the most damage has been done. There has been much mischief [damage] at St. Ann's, but the accounts are various. The number of people killed is about 170 in all the island, chiefly slaves.”<sup>249</sup>

On 31 July 1784, a hurricane struck *Jamaica*. The effect of this hurricane last night was fatal beyond imagination. Every vessel in the harbors, except three or four, among which is numbered his Majesty's packet-boat *Thynne*, were either sunk, dismantled, or driven on shore, and great numbers of lives were lost. The *Martha* was one of the ships destroyed, and every soul perished, except for the carpenter. The barracks at Up-Park Camp were leveled with the ground, and five soldiers killed. The inner barracks on the parade was in ruins, and several soldiers terribly maimed. The workhouse was also destroyed, and about 10 persons killed or wounded. In the upper part of town, and to the eastward, the scene is fearful beyond example. The whole town has suffered immense damage. The storm began about 8:30 p.m., with a deluge of rain, and continued with increasing violence till past 11:00 p.m., when it moderated. To add to the horror of this dreadful night, two severe shocks of an earthquake were felt between 9 and 10 o'clock at night, which completed the destruction of several houses. His Majesty's ship *Janus* rode out the storm. The ship *Brothers* was totally dismantled, and six of her hands were washed overboard and perished. The ships *Simon Taylor* and *Ester* were both [washed] ashore on the Palisadoes. The former it is believed was lost, the latter got off, though not without considerable damage. The vessels sunk and otherwise damaged at *Jamaica* included: the *Thompson*, his Majesty's brigs *Antelope* and *Duke of Rutland*, and the *Friendship*, *James*, *Industry*, *Adventure*, and *Regulator* (a brig belonging to Captain Everet, and every soul perished), and the Spanish brig *Souverain*. Several schooners were lost including: *Eliza*, *La Bische*, *Marianne*, *Endeavour*, *Kingston*, *Union*, *Bell*, *Daphne*, and a watering schooner. Several sloops were lost including: the *Fly*, *Patty*, *Dolphin*, *Viper*, and *Surprize*. The vessels onshore include: *Three Sisters*, *Tartar*, *Esther*, *Jett*, *Two Brothers*, *Sally*, *Sophia*, *Fox*, *Providence*, *Three Friends*, *Grand Folie*, *Success*, *Two Friends*, *St. Croix Packet*, *Ann*, *Kingston* and *Juno*. The vessels dismantled included the *Flora* man-of-war, *Thynne* packet, *Maria*, *Martha*, *Garnet*, *Two Brothers*, *Nancy*, *Dragon*, *Fort Augusta*, *Betsey*, and *Durald*. Two unknown vessels were dashed to pieces on the rocks near Fort Small, and most of the people perished. The ship *Portland Planter* was dashed to pieces at the mouth of Plantain Garden River. A new fort to the east of Port Royal stood up fairly well to the force of the hurricane. But the barracks at Fort Augusta was mostly in ruins. It fell to the earth so suddenly that four soldiers were killed instantly and thirty others wounded and some of these wounds are so grievous that they may perish. The barracks in Spanish Town was blown down by the fury of the storm, crushing one soldier to death and wounding three others very dangerously. The parishes of St. George and St. David suffered enormous damage and most of the estates and plantations in those districts have lost their buildings and provisions. The storm struck with ten times more fury in the parish of St. Thomas, which now is a scene of complete desolation. Many people have perished there. The villages of Morant Bay and Port Morant were destroyed. At the harbor of Port Morant, the ship *Eliza* was utterly lost and the ship *Fame* was driven on the rocks. Every vessel in this harbor was either ashore, sunk or entirely destroyed. The parishes of Clarendon and Vere suffered great destruction. Several vessels fled the port before the hurricane struck and afterward returned in distress. The *Rosehill* lost her main and mizzenmast. The *Philippa* was totally dismantled and one of the crew killed. At Annotto Bay, the ship *Spencer* was totally destroyed and two brigs were driven ashore. At New Charles Town, the two wings of the barracks on the palisade were blown by the hurricane. The main body of the building was moved from the pillars on which it stood a distance of at least 15 feet. At Old Harbor, the ship *London* is totally lost and the ships *Benson* and the brig *Sally* are completely dismantled. Also great quantities of sugar, rum, coffee and cotton in the stores were destroyed or damaged beyond use. Great numbers of dead bodies, of all colors, have been found on the beach at Hunt's Bay, and other parts of the harbor. The damage done at Kingston and Port Royal and to the shipping is computed at a moderate estimate as

500,000 *l.* [In present currency, that would be equivalent to £685 million in damages based on the retail price inflation index.]<sup>241, 247, 250</sup>

On 1-3 August 1784, a hurricane struck the island of San Domingo [*Haiti*]. It lasted 3 whole days, attended with very heavy rain, which has done incredible damage to the plantations, particularly the cotton grounds; but the most heavy loss is in the cattle, which taking shelter in the valleys from the violence of the storm, were found drowned, the water having come down from the hills in torrents. The northwest parts, where the plantations lie, have received very great damage; the Spaniards have not suffered near so much, except in their shipping, of which it is already known they have lost thirteen sail of vessels [sailing ships]. The king's ship *L'Amphibieux*, of 36 guns, was in the harbor on the 2<sup>nd</sup>, but drove to sea, and is feared to be lost. The Spaniards, as we learned, felt it [the hurricane] severely at Havana, Cuba.<sup>250</sup>

In 1784, a hurricane struck the *Caribbean* island of Curacao. During a hurricane, several large ships were wrecked in the main harbor and others forced to sea, where they were lost without a trace.<sup>141</sup>

In *England*, there were great floods in Yorkshire; Tadcaster bridge thrown down and several lives lost.<sup>47</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Nîmes, <i>France</i>	(101.1° F, 38.4° C)
Angers, <i>France</i>	(100.4° F, 38.0° C) on 17 July
Perpignan, <i>France</i>	( 97.3° F, 36.3° C)
Montdidier, <i>France</i>	( 95.0° F, 35.0° C) on 20 May
Tonneins, <i>France</i>	( 91.6° F, 33.1° C)
Étampes, <i>France</i>	( 91.6° F, 33.1° C)
Beaune, <i>France</i>	( 90.5° F, 32.5° C) on 6 July
L'Aigle, <i>France</i>	( 89.4° F, 31.9° C)
Brest, <i>France</i>	( 86.0° F, 30.0° C)
Montluçon, <i>France</i>	( 86.0° F, 30.0° C)
Mont-Dauphin, <i>France</i>	( 80.6° F, 27.0° C) on 7 July
Castel-Sarrazin, <i>France</i>	( 75.2° F, 24.0° C) on 18 July

The year 1784 was irregular in *France*. Excessive cold and heavy snows characterized the winter. There was a stubborn drought in the spring that destroyed the forage. The summer was characterized by alternately periods of excess heat and cold, humidity and drought. Premature chills invaded the autumn.<sup>79</sup>

During the summer of 1784, the heat at Mesulapatam [Machilipatnam, *India*], in the East Indies was very uncommon and extraordinary. The thermometer was up at 109 [° F, 42.8° C], and at Ellone rose to the astonishing height of 120 [° F, 48.9° C] out of the sun [in the shade].<sup>272</sup>

On 27 August 1784, a most violent hurricane [tornado] attended with dreadful thunder and lightning struck Newhaven [New Haven, Connecticut in the *United States*]. Its course was from northwest to southwest and its greatest force about 300 yards [900 feet, 274 meters] wide. In one parish ten dwelling houses, five barns, two great mills, and a sawmill were leveled to the ground. The parsonage demolished, and the Rev. John Minor Jehu buried in the ruins [ruins]. The planks of a new bridge, formally spiked down, were torn off and carried a considerable distance; the largest trees rooted up on the forest. The lightning set fire to many stacks of hay. In short, destruction marked its progress."<sup>272</sup>

On 29 August 1784, Constantinople [now Istanbul, *Turkey*] reported, "After a continuance for some weeks of the hottest weather ever remembered in this country, the contagious disorder seems to have entirely ceased in this capital and its environs; so that there has been no appearance of the plague for this last fortnight. The same cause has operated like happy effects at Smyrna [an ancient city now located at

Izmir, *Turkey*], and in the islands of the Archipelago, where, as the last letters mention, the contagion had also nearly ceased.”<sup>249</sup>

On 29 October 1784, *Scotland* reported that the harvest was very productive and the crop was the finest they had in many years. As a consequence, meal is already down to 11 *d.* per peck.<sup>247</sup>

On 23 November 1784, Elsineur [now Helsingør, *Denmark*] reported, “There has been great damage done among the shipping here, occasioned by two different gales of wind which happened last week. The first began at one o’clock on Thursday [18 November] morning, the wind westerly, and continued about 18 hours, the second began on Thursday evening, when the wind shifted to the E.N.E. [east northeast] and continued till Friday evening a very severe storm. There are a great many ships wrecked and drove on shore; about 12 vessels betwixt [between] Elsineur and the Coble, some on the Danish and some on the Swedish shore. They are mostly Swedes. A Danish West Indiaman is entirely lost, about six miles below the castle, homeward bound, with a cargo of coffee, rum, Madeira, &c. the people saved. There are several other vessels on shore, which have not yet come to our knowledge. The following is the damage done among the Scots ships. The *Nelly*, [Captain] Webster, of Montrose, for Leith, struck upon the Anholt, but is got off again; she is now at Copenhagen repairing, as she was leaky. The *Leviathan*, [Captain] Nicols, of Dysart, was run foul of by an English bark, and is greatly damaged. He also is at Copenhagen repairing. Capt. Chilton, of Sunderland, for Leith, is supposed to be a-ground somewhere, as he did not come back when the other ships returned. Capt. Anderson, of the Margaret of Inverkeithing, from Memel, with grain, is arrived here in a ship belonging to Newcastle, who took him up at sea, his own vessel having sprung a leak, and was sinking when the Newcastle ship picked him and his crew up, on Saturday last, betwixt this and Memel [now Klaipėda, *Lithuania*?].<sup>249</sup>

Great damage done in America (*United States*) from a storm, particularly in the New England area in 1784.<sup>41, 56</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 29<sup>th</sup> – raw, cold; the spring is very backward. May 9<sup>th</sup> – a pleasant day. May 15<sup>th</sup> – a hot summer day. May 25<sup>th</sup> – a deluge of rain. June 3<sup>rd</sup> – a hot morning. June 5<sup>th</sup> – a hot day; thus summer breaks in upon us. June 12<sup>th</sup> – cold. June 18<sup>th</sup> – hot. June 20<sup>th</sup> – very hot. June 27<sup>th</sup> – (Sunday). A terrible tempest, which obliged me to break off in [the middle of] my sermon. June 30<sup>th</sup> – as growing a season as we could wish; strawberries are very plenty, large and good. July – frequent rains this month. July 18<sup>th</sup> – there came suddenly as great a tempest as ever I knew, preceded by some hideous darkness, and accompanied by a vast shower. July 20<sup>th</sup> – extremely hot. July 31<sup>st</sup> – fair, and good hay season, but not before. August 4<sup>th</sup> – heavy rain. August 14<sup>th</sup> – we have had a week of very hot weather. August 18<sup>th</sup> – a wonderful growing season. August 23<sup>rd</sup> – great rains frequently. September 2<sup>nd</sup> – a deluge of rain. September 14<sup>th</sup> – uncommonly cold. September 19<sup>th</sup> – cold. September 29<sup>th</sup> – a warm, delightful day. September 30<sup>th</sup> – no frost yet to hurt the corn or do much damage.<sup>78</sup>

In 1784 during the period between 21 February and 20 March, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Ning-yang and Ho-tsê. During the period between 21 March and 19 April, a drought engulfed Hopei (now Hebei province) in northern *China* at Ta-ming. During the period between 18 June and 16 July, a drought engulfed Hupeh (now Hubei province) in central *China* at Ying-ch’êng. During the period between 8 August and 8 November, a severe drought engulfed Shensi (now Shaanxi province) in central *China* at Ning-shan and Sian.<sup>153</sup>

*Also refer to the section 1780 A.D. – 1784 A.D. for information on the drought and famine in Bangladesh, Pakistan, and India during that timeframe.*

---

### 1784 A.D. – 1785 A.D. England, France, Italy and Spain. Drought

During the two years of 1784 and 1785 around Toulouse, *France*, the drought caused the loss of all draft animals. As a result, many of the cultivators had to let their field lie fallow.<sup>87</sup>

On 3 May 1785, a dreadful drought was reported in *France, Italy, Spain*, and Piedmont [a region of Italy].<sup>251</sup>

On 9 May 1785, there was a great drought in *England*. The River Thames was so low at Kew and Richmond, that the passage-boats were obstructed. On 11 May, some persons set fire to the heath growing in Windsor Forest, which continued to burn for several days. The like accident happened near Boughton, in Kent. The heat and dryness of the season occasioned these fires to spread. On 1 July letters were received from *France, Spain*, and *Italy*, which stated that they had experienced a most uncommon heat and dryness of the season.<sup>128</sup>

---

#### **1784 A.D. – 1785 A.D. Egypt. Drought and Famine**

In November 1783, the plague was brought in from Constantinople into *Egypt*. Not less than 1,500 dead bodies were carried out of the gates of Cairo, *Egypt* each day [for burial]. During the summer of 1783, the inundation [of the Nile River] was insufficient. A great part of the lands therefore could not be sown for want of water, and another part was in the same predicament for want of seed. In 1784, the Nile again did not rise to a favorable height and a dearth immediately became extreme. Soon after the end of November, the famine carried off, at Cairo, nearly as many as the plague. The streets, which before were full of beggars, now were completely empty of them. All had perished or deserted the city. Nor were its ravages less dreadful in the villages where the inhabitants who attempted to escape death, scattered to the adjacent countries. *Syria* was full of them. In January 1785, the streets of Saide and Acre, and every town in *Palestine*, were crowded with Egyptians, easily distinguished by their tawny skin. Some of them had wandered even as far as Aleppo, *Syria* and Diarbekar [Diyarbakir, *Turkey*]. *Egypt* had lost approximately one-sixth of its population. The famine in *Egypt* was severe. As an example in 1785 under the walls of ancient Alexandria, two wretches sitting on the dead carcass of a camel were disputing its putrid fragments with the dogs.<sup>224</sup>

In November 1784, the news from *Egypt* was troubling. “In Alexandria they are almost entirely deprived of water. The troubles in Cairo having prevented the departure of the Bey, sent annually from Cairo by the government, until the Nile should overflow, for the purpose of conducting the water by the canal, which furnishes Alexandria for a whole year, the Arabs, who inhabit the borders of the river, have taken the opportunity to make so many cuts, as almost entirely to deprive Alexandria of water. The inhabitants, on the very point of perishing by drought, have retired to Rosetta. Thurat Bey, induced by their intreaties, has taken every precaution to remedy this evil; and it is hoped will succeed, as the Nile already begins to overflow; meantime the distress is extreme. The rich in Cairo and Alexandria pay six times more for grain, and other necessaries; and the poor are daily dying of famine.”<sup>249</sup>

In 1784-85, a dreadful famine raged in *Egypt* caused by a deficiency in the inundation of the Nile River. The streets of Cairo, which at first was full of beggars, were soon cleared (because they perished or fled). A vast number of unfortunate wretches, in order to escape death, spread themselves over all the neighboring countries and the towns of Syria were inundated with Egyptians. The streets and public places were crowded by famished and dying skeletons. All the most revolting modes of satisfying the cravings of hunger were resorted to, and the most disgusting food was devoured with eagerness. The depopulation of the two years was estimated at 1/6<sup>th</sup> of all inhabitants.<sup>188</sup>

---

**Winter of 1784 / 1785 A.D.** In Selborne, *England*, the winter was remarkable for the exceedingly severe cold of December 1784. From 6 November to the end of the year 1784, the weather alternated between fog, rain, and hard frost. The longest and most severe frost occurred in December. On 2 January 1785, a thaw began, and rainy weather with winds continued until 28 January. From then until 15 March, there was hard frost. To March 21, mild weather ensued with sprinkling showers. From then until 7 April there was a hard frost.<sup>70</sup>

A dreadful storm struck the north coast of *England* on December 5, 1784.<sup>41</sup>

In December 1784, there was great damage done by a storm, among the shipping at Newcastle, *England*, and along the east coast of *England* and *Scotland*.<sup>249</sup>

On 8 December 1784, the weather took a most remarkable turn in the southern climates of *Great Britain*. From very mild, a gentle frost, just intense enough to break up the roads, set in from the north. It was accompanied with a fall of snow that in less than 24 hours laid the flat country everywhere level as a plain, so that the most experienced stage coachmen had no certain signal to direct their way. Even the post-boys and their horses (the guides most to be depended upon) were unable in many places to proceed; and where they were daring enough to make the attempt, were obliged to remain at the first sheltering place till the roads could be made passable by the labor of men. The mail-coach from Bristol was twice in the night dug out of the snow on Marlborough downs; and, when it reached Marlborough town, the passengers were glad to stay behind, while the drivers with astonishing perseverance proceeded with the mail, and brought it in only a very few hours later than usual to the post-office in Lombard street. A greater interruption to business and traveling has not been felt since the general improvement of the roads by the establishment of turnpikes. For two days afterwards, the frost was intense, and the cold excessive. But though the country wore the livery of winter, the inhabitants, in comparison with those of the northern climates, felt little of the rigors of it. Much about the same time the winter began in Holland [now *the Netherlands*]: before the 13<sup>th</sup>, the rivers were all covered with ice and snow; and in *France*, the Seine River was frozen over so early as November.<sup>272</sup>

At Newcastle [Newcastle upon Tyne in northeast *England*] reported on 11 December 1784, a strong storm struck *England*.<sup>247, 249, 250</sup>

— On Sunday morning [5 December] a large fleet of upwards of 150 vessels sailed from Yarmouth Roads. About 4 p.m. between Cromer and the floating light, a violent storm arose with heavy rain, and wind, which separated the fleet. The gale increased and split all the sails into shivers, so that it was impossible to work the ships, or keep them off the land, and many were obliged to cut away their mast.

— On Sunday night at 9 p.m., a strong wind sprung up from the east, and about midnight it blew a perfect hurricane, attended with a heavy fall of hail and snow, which continued with unremitting fury until Tuesday [7 December] at noon. The snow continued intermittently until Thursday [9 December] when it was very severe the entire day. The snowfall was so great on Monday that all the roads were completely blocked. Numerous laborers were procured to clear the roads, especially the great North road, between Felton and Alnwick, and westward between Harlow Hill and Hexham. The mail on Tuesday was obliged to have an additional horse to drag it through the snow from Durham to Newcastle and from Newcastle to the North. All trade is now at a standstill. No wagons were able to arrive in town, except the Darlington yesterday.

— At sea it was dreadful beyond description. The entire coastline was strewn with wrecks, and vessels aground, so that from every part we hear of nothing but distress. A prodigious number of ships have been driven ashore, many entirely lost and a great number of seamen and passengers drowned.

— Some ships were seen to founder at sea, the crews of which immediately perished; and no doubt but many others have had the same miserable fate.

— Sunderland reports that on Monday morning about 30 keels were found sunk in the river, mostly laden with coal. Also several ships broke from their moorings, but received little damage. That day a sloop for Leith, Scotland laden with barley drove onshore between the piers. The master and mate drowned, but two men, ship and cargo were saved. On Tuesday morning, the coast wore an awful appearance, being covered with wrecks and dead bodies. Upwards of 50 sails [sailing ships] were onshore between that port and Hartlepool, and about 16 between it and Shields.

— Seaton reports the most melancholy and distressing scene of ships, some upon the rocks, others upon the sands, others at anchor some distance from the shore, which appear in the utmost danger, and the sea

running to high, that it is impossible to give them any assistance from shore. There are about 16 ships on shore near Hartlepool, one of which has no living creature onboard and appears to be a light oiler. There has been a great fall of snow in Cleveland, particularly on the mountains near Kirkleatham, Gainsborough, and Stokesley.

The storm that struck *England* between 7-9 December 1784; at sea was dreadful beyond description. The entire coastline was strewn with wrecks, and vessels aground, so that from every part we hear of nothing but distress. A prodigious number of ships have been driven ashore, many entirely lost and a great number of seamen and passengers drowned. The following is the best intelligence that can be procured, and may be depended on:<sup>249</sup>

— The *Restoration*, [Master] Hutchinson; *Broderick*, [Master] Craister; *Friendship*, [Master] Stephenson; *Loyalty*, [Master] Hillyard, [at] Druridge Sands, *England*. *Leostaff*, [Master] Tinley, off Sunderland. *Hunter*, of Sunderland; *Royal Briton*, of Whitley, to the northward. *Isis*, [Master] Ware; *Providence*, [Master] Watt, [at] Cresswell. *Friendship*, [Master] Dean, of Sunderland, [at] Prior's Haven, broke up, and the master drowned. *Leighton*, [Master] Leighton; *Newcastle*, [Master] Redhead, northward; supposed will break up. *Good Design*, [Master] C. Heron; *Elisabeth*, [Master] Greenwell; *Robert*, [Master] A. Scott, northward, lost [at sea]. *Pallas*, [Master] Shipley, [at] Hartlepool, broke up. *Elisabeth and Mary*, [Master] Armstrong, Willington, Scott, Herd, [at] Goodwin? Sands. *Grace*, [Master] Armstrong, a little to the south of the bar, with her masts gone, riding. *William and Frances*; [Master] Crescent, of Blythe [Blyth, *England*], near Sunderland. *Joseph*, [Master] D. Smith, near Hartlepool. *Northumberland*, (Clarke's), [at] Amble [in Northumberland, *England*] Pans [a natural basin], broke up. *Industry*, [Master] Spence; *Richard*, (Clarke's); *Thomas and Sarah*, [Master] Ayre, of Lynn; *John's Endeavour*, [Master] Chapman, of Sunderland, [at] Hawkesley. *Margaret*, (Rayne's), south of Bondicar [Bondicar Rocks in Northumberland, *England*]. *Eliza*, [Master ?], [at] Hudston Rocks. *Friendship*, [Master] Carling; Hartley and Broderick, south of Hudston Rocks. *Jane*, of Whitby, (Clarke's), lost; and *Mary*, [Master] Carling; *Success*, [Master] Garbutt; *Venus*, [Master] Cannaway; [at] Cresswell Sand. *English Hero*, (Story's), [at] Blythe [Blyth, *England*], thirteen drowned, and four boys saved. *Fame*, [Master] Scott, [at] Hartlepool, broke up. *Good Design*, [Master ?], [at] Herd, broke up. *Friends*, [Master] Wilson, near Storey's Landing, will be got off. *Good Agreement*, [Master] Wright; *Betsey*, [Master] Tewart, south of Sunderland, broke up. *Good Intent*, [Master] Ware, northward. *Charles and Jane*, (Cunningham's), [at] Hawkesly; *Spring*, [Master] Appleby, [at] Hawkesly, lost. *Happy Return*, [Master] Barton, [at] Sunderland. *Endeavour*, [Master] Carling, [at] Cresswell. *Adventure*, [Master] Cart, (Rowe's); *Mercury*, (Hall's), [at] Hartlepool, will be got off. *Friendship*, lost in the harbor, by some evil-disposed persons cutting her ropes. *Two Janes*, [Master] Guy, southward, gone to pieces. *Perseverance*, [Master] Jefferson, of Newcastle, northward, lost. *Active*, [Master] Gale, of Petershields, northward, lost, crew perished in going into Dunbar. *Jane*, [Master ?], of Borrowstounness [Bo'ness], with goods, gone to pieces on Cresswell Rocks, five men and passengers drowned. *Friend's Regard*; *Traveller's Restoration*, near Hartlepool. *Friendship*, [Master] Coppin, [at] Yorkshire coast. *Dorothy*, [Master] Scott, near Hartlepool, lost. *Kitty*, [Master] Harwood, [at] Hartlepool, gone to pieces. *Good Intent*, [Master] Smart, [at] Marston. *Rochester*, [Master] Rippon, south of Sunderland. *Ann and Mary*, [Master] Davidson, south of Sunderland, lost. *Susannah*, (Wallace's), off Tees, lost. *Industry*, [Master] Wood, at Cullercoates, feared will not be got off. *Folkstone*, [Master] Robinson, northward, lost. *Two Brothers*, [Master] Walton, [at] Cresswell. *Cromer*, [Master] Crook, lost, with all hands, in making the harbor. *Amity*, of Ipswich, [at] Hartley. *Hopewell*, [Master] Scarse; *Squirrel*, [Master] Hellow; *Fame*, [Master] Murray; *Brothers*, [Master] Hall, loaden from Petersburg, [at] Dunstonburg. *Elisabeth*, [Master] Greenwell, north of Sunderland, lost. *Margaret*, [Master] Alex. Stephenson, of Shields; *Samuel*, [Master] W. Dee; *William*, [Master] J. Moor; *Hartley*, [Master] J. Howe; *Elisabeth and Hannah*, [Master] Mark Liddell, of Sunderland; *Adventure*, [Master] S. Liddle, of Scarborough; *Friend's Adventure*, [Master] Jackson Kildin, of Yarmouth; *Granby*, [Master] Thomas Bygate, of Wisbech; the master and one man drowned, all on shore, off Warkworth. A sloop, attempting to make the harbor, lost, and all hands.

— Mr. Dean, the master of the *Friendship*, which went on shore in Prior's Haven, was washed overboard, and drowned, and two of his seamen nearly suffered the same fate; but were providentially thrown back by the next wave. Some men from the shore humanely lent every assistance; and particularly one Ralph Franks, who, with equal courage and humanity, dashed into the waves, swam to the ship, and, with a rope in his hand, back again to the shore. To this rope was fastened a large cable, which the people on shore pulled to them, and secured; and by that means seven of the crew got safe to land. A subscription has been opened for rewarding him.

— Mr. James Craister, master of the *Broderick*, was once washed overboard, but: was thrown back by the next waves. The lives of many are owing to the same providential circumstance.

— When the *English Hero* was cast on shore at Blythe [Blyth, *England*], the crew took to their [life] boat, and left two boys on board, whom they would not take in. One of them, determined to follow it, was preparing to throw himself in, but was hindered by the other; and when he perceived the [life] boat overset [overturned], soon after he told his companion, who kept above board, that he would go down to prayers, where he continued till low tide, when the people came to their assistance. The boy on deck, being asked if any more were on board, told them of his companion, whom he supposed was dead, not having seen him so long; but on going to the hold, they found the boy fast asleep, as if nothing had happened. Ten of the bodies of the boat's crew have been found, and buried in Blythe burying ground.

On 6 December 1784, Alemouth, *England* reported, “The effects of the late storm must be dreadful, (from what I see here), beyond any thing on this coast perhaps in the memory of man. There are eleven vessels on shore betwixt this and Cocket Island, besides what are foundered, or gone to pieces among the rocks; the lives of the crews of the eleven are providentially saved. There are fifteen ashore to the northward of this, and thirty betwixt the Cocket and Cresswell Point.”<sup>249</sup>

On 24 December 1784, Newcastle [Newcastle upon Tyne in northeast *England*] reported, “The fatal effects of the dreadful storm [of 5 December] are perceived daily, by the dead bodies and wrecks which float up the [River] Humber.” On land, the storm produced great drifts of snow deep enough to bury sheep alive. Several people died in these snow drifts.<sup>249</sup>

A dreadful storm struck *Italy* in December 1784.<sup>41, 43</sup>

In 1785, the frost in *Britain* lasted 115 days.<sup>41, 43</sup>

In *England*, the frost during the winter of 1784-85 lasted 115 days.<sup>128</sup>

In Selborne, *England*, on 7 December, the barometer sank to 28.5, and heavy snows began to fall, which continued that day and the next and the most part of the following night. So that on the morning of the 9<sup>th</sup> “the works of men were quite overwhelmed. The lanes filled so as to be impassable, and the ground covered twelve or fifteen inches without any drifting. In the evening of the 9<sup>th</sup>, the air began to be so very sharp that we thought it would be curious to attend to the motions of a thermometer.” On the morning of the 10<sup>th</sup>, the quicksilver [mercury] of Dolland's glass was down to half a degree below zero (-0.5° F, -18.1° C). During the night of 10 December, at eleven in the evening, even though the air was perfectly still, Dolland's glass went down to one degree below zero (-1.0° F, -18.3° C).<sup>70</sup>

In December 1784, the temperature fell to -1° F [-18° C] at Selburne [Selborne], *England*; +17° F [-8° C] at Newton; -5° F [-21° C] at Fyfield, near Andover; +11° F [-12° C] at S. Lambeth; +15° F [-9° C] at London; and +2° F [-17° C] at Winchester. The observed temperatures were relative with elevation. Those at the lower elevations fell the lowest. In houses without cellars, the frost penetrated into the storerooms and their entire stock of roots and fruits were destroyed by the cold. During the intenseness of the cold, shining spiculæ of ice were seen floating in the sunshine, like the particles of dust in a ray of light admitted into a dark room [diamond dust]. [Captain] Middleton observed this appearance in the

severe weather at Hudson's Bay [in *Canada*].<sup>272</sup>

At Leeds in Yorkshire, *England*, the temperature in December 1784 fell as low as 6° F [-14.4° C], a degree of cold greater than has been felt in England these many years. Beginning around 13 January 1785 there was a great fall of snow followed by intense frost. On 19 January, the temperature fell to 7° F [-13.9° C]. [As of March 1785], during the winter of 1784-85, there was 117 days of frost.<sup>272</sup>

In *England* in 1785, there was severe frost. At Hinckley (Leicestershire), the thermometer registered on the last day of February: 19° F (-7.2° C). There was much snow.<sup>47, 93</sup>

In 1785, the frost was severe throughout *Europe*; particularly in Holland [now *the Netherlands*].<sup>47, 93</sup>

In Constantinople [Istanbul, *Turkey*] in the winter of 1784-85, the weather was uncommonly mild, with soft rain, and the air so warm, that the inhabitants kept their windows open during the best part of the day. On 22 February 1785, there was a dreadful storm, which overset 40 vessels and 500 people lost their lives.<sup>272</sup>

According to accounts from *Silesia*, the degree of cold felt on the mountains on 28 February 1785 was equal to that felt at Petersburg in 1709.<sup>246</sup>

On 8 March 1785, Naples, *Italy* reported, "All our neighbouring mountains are deeply covered with snow, and that of [Mount] Somma affords a very singular spectacle, consisting of the burning lava issuing from the mountain, and melting the snow it encounters; in many parts torrents of fire and water are seen, intersecting each other in a variety of directions, amidst the white and glittering congelations with which the face of the country is overspread."<sup>272</sup>

On 10 March 1785, Prague [*Czech Republic*] reported, "that the snow had fallen incessantly from the 5<sup>th</sup> till that date; that there was not a spot to be found in the mountains that was not six feet [1.8 meters] deep; and that the birds were flying about, not knowing where to rest, so that they were easily caught by the hand. All Bohemia [now western *Czech Republic*] was in the same situation, though in lat. 32 [latitude 32° North]."<sup>272</sup>

On 12 March 1785, Warsaw, *Poland* reported, "The result of the observations made upon the cold since the year 1776, in the Royal Observatory in this city, are as follow, viz. in 1776, on the coldest day, the thermometer of Reaumur was at 21 degrees [below zero, -15° F, -26° C]; in 1777, at 17 [degrees below zero, -6° F, -21° C]; in 1778, at 16 [degrees below zero, -4° F, -20° C]; in 1779, at 18½ [degrees below zero, -10° F, -23° C]; in 1780, at 16½ [degrees below zero, -5° F, -21° C]; in 1781, at 17 [degrees below zero, -6° F, -21° C]; in 1782, the same [-6° F, -21° C]; in 1783, at 19½ [degrees below zero, -12° F, -24° C]; and in 1784, although the cold was universally severe, the thermometer was only at 17 degrees [below zero, -6° F, -21° C]; and on the 28<sup>th</sup> of Feb. this year [28 February 1785] it was at 24½ degrees [below zero, which would equal -23° F, -31° C]; our accounts from Petersburg [*Russia*] mention, that on that day the thermometer was at 30 degrees [below zero, -35.5° F, -37.5° C]."<sup>272</sup>

On 26 March 1785, Elsinore [Helsingør, *Denmark*] reported, "The ice still remains in the Sound, so that the people are continuing to walk to and from *Sweden* on the ice. There is intelligence of some ships being in the Cattagat at present. There have been in sight of Hornbeck, two days ago, six ships, but since drove away with the ice; at the same place (which is six English miles [10 kilometers] below our castle) there were found some pieces of a wreck, supposed to be a Dutch ship."<sup>272</sup>

On 2 April 1785, London, *England* reported, "The winter season, to date it from the first of snow on the 7<sup>th</sup> of October last [1784], to that which fell this day, has lasted 177 days. And if we except about 12 days

towards the latter end of January, the whole of this period has been frosty or snowy, or both. Such another instance has not occurred in this island in the memory of man. The frost too has been more intense.”<sup>272</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1784 on November 30<sup>th</sup> – a wonderful month; so moderate, and no hard frost until last night. December 9<sup>th</sup> – it has not frozen in the house yet. December 11<sup>th</sup> – perhaps there never was so moderate a season. December 13<sup>th</sup> – cold and windy; winter seems to be setting in. December 19<sup>th</sup> – a terrible windy, cold day. December 20<sup>th</sup> – snow. December 22<sup>nd</sup> – another terrible snowstorm. In 1785 on February 3<sup>rd</sup> – very cold—the harbor is frozen up. February 12<sup>th</sup> – a cold, stormy day. February 13<sup>th</sup> – very cold and stormy. February 20<sup>th</sup> – moderate for several days. February 25<sup>th</sup> – an exceeding great driving snowstorm. March 1<sup>st</sup> – very cold. March 9<sup>th</sup> – more snow, but level [not drifted]. March 15<sup>th</sup> – very cold and windy. March 24<sup>th</sup> – blustering cold. March 31<sup>st</sup> – true winter weather. April 3<sup>rd</sup> – more snow. April 7<sup>th</sup> – Middle-street is all water and mire. April 10<sup>th</sup> – Back-street, the snow is as high as the fences; no sleighs can pass. April 13<sup>th</sup> and 14<sup>th</sup> – very cold. April 24<sup>th</sup> – the snow melts surprisingly, but it is still 2 or 3 feet (0.6 or 0.9 meters) deep in the woods.<sup>78</sup>

The winter of 1784 was tolerably mild in Philadelphia, Pennsylvania in the *United States* but significant snow fell.<sup>1</sup>

---

**1785 A.D.** During the spring of 1785, letters were received from Daub [the region of the Duab Mountains in *Turkestan*] that many have perished by famine in that district. Whole bodies have been eaten by dogs and vultures.<sup>246</sup>

On 20 January 1785, an inundation in *Germany* caused the destruction of thousands of houses.<sup>128</sup>

During the evening of 13 February 1785, “the sea in sight of Alicant [Alicante, *Spain*] appeared as if on fire. This wonderful phænomenon excited every body’s curiosity, though nobody could account for the cause. The fire shone splendidly in the water, and its brilliance increased as the waves drew nearer the shore. When they broke upon it, they sent forth an infinite number of luminous particles, some great, some small, which flew to a considerable distance. This appearance began at half an hour after seven, and lasted three hours.”<sup>272</sup> [Bioluminescence from an algae bloom?]

Letters received from Rotterdam on 28 February 1785 reported a violent hurricane struck Curacoa [an island off the coast of *Venezuela*]. Several full laden ships in the harbor were driven ashore, while others were driven out to sea and never heard from again. This hurricane caused damage of immense value. A long range of warehouses, full of goods, was blown down and the goods buried in the ruins.<sup>272</sup>

On 10 March 1785, Friburg [Fribourg, *Switzerland*] reported, “The Rhine [River] is now so low at Klaussenberg [Klausenberg, *Germany*], that the rocks at the bottom of the river are entirely uncovered; an event which has not happened for many years past. An inscription, engraven on ascertains the date.”<sup>272</sup>

During the spring of 1785, there was great distress in *Germany* from inundations [floods]. A great part of the town of Writzen [Wriezen] on the Oder [River], together with 100 villages and farms, were inundated. The sleine [sluice] near New Gliezen, and the dikes above Custrim [Küstrin, now Kostrzyn nad Odrą, *Poland*], were both broken down and torrents of floodwater that issued were irresistible. Many of the strongest edifices [homes/buildings] were carried away, with whole families within. Both sheep and cattle without number perished.<sup>246</sup>

An inundation at Riga, *Latvia*, began on 21 April 1785 and continued until the 28<sup>th</sup>. The water rose 2.5 fathoms [15 feet, 4.6 meters], so that a part of the town and all the country round were overflowed. Over 2,000 masts were carried away.<sup>246</sup>

On 25 April 1785, it was reported that an epidemical disorder occurred in Calabria in Sicily, *Italy* and almost depopulated the region.<sup>251</sup>

In April 1785, the Mississippi River at St. Louis, Missouri in the *United States* reached a flood stage of 42 feet. This was 0.6 feet higher than the flood of 27 June 1844. In comparison, during the flood of 1892 in the vicinity of St. Louis, the Mississippi River reached a stage of 36 feet. During the 19<sup>th</sup> century, the Mississippi River flooded in 1815, 1828, 1844, 1849, 1850, 1851, 1858, 1859, 1862, 1865, 1867, 1874, 1882, 1884, 1890, 1892, 1893, and 1897.<sup>123</sup>

In May 1785, it was reported that, “The effects of the inundations in *Germany* this season have been unusually dreadful. The Elbe, the Oder, the Havel, and the Warta [rivers], have all overflowed their banks; and the dykes [dikes] being broken down, the whole of the neighbouring country is laid under water.”<sup>272</sup>

In May 1785, Breslau [now Wrocław, *Poland*] reported, “that the sudden melting of the snow in the mountains, and of the thick ice on the rivers, has caused so great an inundation, that almost all the *Lower Silesia* is under water. The rivers Kosbach [Valea Mare], Bober [Bóbr], Oder, and others, have so rapidly overflowed their banks, that all the roads are rendered impassable, and all communication is cut off.”<sup>272</sup>

In May 1785, Magdeburgh in Saxony [Magdeburg, *Germany*] reported, “that the dykes [dikes] of the Elbe [River] have been unable to resist the force of the waters, and that an immense tract of country is inundated. If the inhabitants have saved their lives, ‘tis well, the cattle must have perished: all the winter grain is destroyed.”<sup>272</sup>

On 12 June 1785 in *England*, there was a great storm in Cambridgeshire and Suffolk.<sup>93</sup>

On 16 June 1785 in *England*, there was a hailstorm in Yorkshire.<sup>93</sup>

On 16 June 1785, “a most dreadful storm of thunder and lightning threw the town of Green-hammerton, in Yorkshire [*England*], and its neighbourhood into the utmost consternation. Its violence exceeded any thing of the kind ever remembered by the oldest man living. It began about noon, and for 20 minutes the elements seemed to be in a blaze, and the thunder incessant and tremendous. The lightning shivered a large oak near the town, tearing it up by the roots, and casting its limbs, some half a ton weight, to the distance of 20 yards [18 meters], and others not so ponderous to the distance of 100 yards [91 meters]. Two women near the place had a miraculous escape. A great deal of damage was done in the neighbourhood by the hail-stones, some of which measured an inch and a half in circumference.”<sup>272</sup>

At Fordham in Cambridgeshire, *England*, near Newmarket, a violent hailstorm struck on 16 June 1785. It killed more than 230 sheep out of the town’s flock of 2,000.<sup>246</sup>

On 22 June 1785, the Danube River [in *Austria*] suddenly overflowed its banks in so violent a manner as to carry away bridges, houses, people and even whole villages. This unexpected inundation has done incredible damage, as no measures could be taken to prevent the effects of it. Vast numbers of cattle have been drowned. But the greatest misfortune is, that several hundred persons have some lost their lives, and others their means of subsistence. The cause of this terrible inundation is attributed to the vast quantities of snow upon the Tyrol, Saltzbourg [Salzburg], and upper Austrian mountains.<sup>246</sup>

On 25 June 1785 in *England*, there was a hailstorm in Sussex.<sup>93</sup>

On 1 July 1785 in *France*, there was a severe hailstorm in Paris.<sup>93</sup>

In Paris, *France* on the 1<sup>st</sup> of July, there was a severe hailstorm.<sup>57</sup> Hailstones as large as cherries.<sup>41, 43</sup>

A storm struck the *West Indies* on July 6, 1785.<sup>41</sup>

A violent thunderstorm struck Albrighton in Shropshire, *England* on 11 July 1785 and at Guilford in Surrey on the 12<sup>th</sup>.<sup>246</sup>

On 5 August 1785, a dreadful storm arose in Western Prussia [now part of *Poland*], accompanied with hail and laid waste to 132 villages and farms.<sup>246</sup>

In *France*, storms laid waste to one hundred and thirty-one villages and farms.<sup>57, 90</sup> Storm occurred on August 5, 1785.<sup>41, 43</sup>

The continual rains in Padolia, Walkinia, and Ukraine [now the regions of *Ukraine* and *Moldova*], which fell for ten days incessantly, about the beginning of August, has laid those provinces almost underwater. But what has astonished and frightened the neighboring inhabitants, the forest of Iarmaliniac has disappeared without any emotion [vibration] of the earth. It sunk down at once and nothing is to be seen but the tops of some of the trees.<sup>246</sup>

On 24 August 1785, a hurricane struck the island of *Saint Kitts* in the West Indies. Five vessels ran ashore and were lost at Deep Bay. Many houses and estates in that parish suffered considerably.<sup>246</sup>

About the 24<sup>th</sup> of August 1785, a heavy gale of wind did considerable damage at St. Kitt's [Saint Kitts], Antigua, Nevis, and St. Eustatius [Sint Eustatius] in the *West Indies*; and, on the 21<sup>st</sup> of September, a like gale broke forth, with more violence, which extended to Harbour-Island, Habacco [Abaco Island], Eleuthers, Long Island, and Nassau, in the *Bahama Islands*.<sup>251</sup>

On Saturday [27 August 1785], the island of *Jamaica* was again visited by an equally violent hurricane but of much longer duration than the hurricane last year. The damage sustained by the inhabitants has been immense, and must be the more severely felt by them, as they had not recovered the heavy losses occasioned by the last.<sup>246</sup>

In 1785, a hurricane struck the Cayman Islands in the *Caribbean Sea*. Many lives were lost.<sup>141</sup>

On 24-29 August 1785, a hurricane struck *Jamaica*, *Puerto Rico*, *Cuba*, and the *Caribbean island* of St. Croix causing more than 142 deaths.<sup>141</sup>

On 27 August 1785, the island of *Jamaica* suffered from a hurricane.<sup>124, 146</sup>

On Monday morning [29 August 1785], a violent tornado struck Gloucester in southwest *England*. It caused the roof and tower of the cathedral to vibrate considerably. It lasted 15 minutes. A tornado reached Bath in the evening and overset [overturned] some new houses that had been erected in the square.<sup>246</sup>

In the fall of 1785, letters were received from *Antigua* and other islands describing the distresses of the inhabitants for want of corn and other provisions. The hurricane and a variety of other bad weather had destroyed almost their whole provisions. If not allowed to trade with the Continent of America, a famine is apprehended.<sup>246</sup>

On 2 September 1785, a hurricane struck the coast of Delaware in the *United States* causing 181 deaths.<sup>141</sup>

In *England*, during 5-6 September 1785, a hurricane struck [London] and the shipping on the River Thames. That damage done to London was not so considerable as compared to the great damage done to other seaports. From the Downs, from Portsmouth, Plymouth, and all along the British Channel, the shores were covered with wrecks, and ships stranded.<sup>246</sup>

On 12 September 1785 in *England*, there was a great hailstorm in Cumberland, in Hampshire, and in Warwickshire.<sup>93</sup>

On 25 September 1785, a sudden hurricane, which lasted an hour, drove from their mooring a whole tier of ships from off Rotherhithe Church to Blackwall in London, *England* on the River Thames.<sup>246</sup>

Continual and heavy rains fell in Lille, [*France*] on 25-26 September 1785. The rains lasted for 30 hours. It greatly increased the inundation [flooding] that was already occurring.<sup>246</sup>

On 30 September 1785, letters from the Midland counties of *England* indicated this year's crop produced exceptional yields (40 bushels per acre).<sup>246</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Rieux, <i>France</i>	( 94.6° F, 34.8° C)
Vannes, <i>France</i>	( 89.8° F, 32.1° C)
Mirecourt, <i>France</i>	( 86.0° F, 30.0° C)

The year 1785 was irregular in *France*. Excessive cold and heavy snows characterized the winter. There was a stubborn drought in the spring that destroyed the forage. The summer was characterized by alternately periods of excess heat and cold, humidity and drought. Premature chills invaded the autumn.<sup>79</sup>

There were great floods in different parts of *England* in September and October.<sup>41, 43, 47</sup>

Accounts were received from *Lithuania* that constant rains from August to October 1785 have retarded the crops from maturing. The subsequent hurricane and severe frosts have completed the destruction of the crops. Within 3 miles of Wilda [now Vilnius] there arose such a terrible tempest of hail, and of such a size, that the men and cattle in the open field, were desperately wounded by it, and at the same time the wind that blew unroofed the houses and barns, and left not a leaf to be seen on the trees for miles. At about 12 miles distance from Wilda, the weather produced a fall of snow, wholly unprecedented at this season of the year. The same thing happened at Samber [Sambir, *Ukraine*] on the 28<sup>th</sup> and the 9<sup>th</sup> of September.<sup>246</sup>

During September and October 1785, the inundations in the middle counties [of *Scotland*] have been very destructive. On 23-24 September, the river Clyde inundated the city and neighborhood of Glasgow. The lower floors were filled with water and the inhabitants suffered incredible loss. At almost the same time, the waters on the River Almond rose to an uncommon height, and inundated the low grounds in the neighborhood of Edinburgh. Some farmhouses were carried away by the stream, and the corn [grain], which was not yet cut, was damaged. The River Cart rose suddenly on the people who were employed at the harvest, and it was with difficulty they saved their lives. The River Elliot [Elliot] rose so suddenly, that the boy, who carried the mail from Dundee to Montrose was carried away. The horse was saved, but the mail was driven out to sea. The River Keven swelled to such a degree, that it broke down the embankments. At Ashburn [Ashbourne] in Derbyshire Dales, *England*, the rains that fell on the 23<sup>rd</sup> inundated the low grounds in that neighborhood to a greater extent than was ever known. The river rose between seven and eight feet in four hours. On the River Lea, a recently erected cotton mill was greatly damaged.<sup>246</sup>

A flood swept through New England in the *United States* during October 1785. A considerable amount of rain fell during September and intermittently during October. A heavy rainstorm struck the area 20-22 October dumping 9 inches [23 centimeters] of rain. The rain fell principally in southeastern New Hampshire and the adjoining country.<sup>199</sup>

— The Merrimack River rose to great heights at Haverhill, Massachusetts and the Cocheco River in New Hampshire rose to its highest flood mark, 15 feet [4.6 meters] above its usual height. It carried away 7 mills and several hundred thousand feet of lumber. A store was wholly destroyed by the floodwaters. Two bridges at Dover were washed away. On the Salmon Falls branch of the Piscataqua River, the water overflowed the banks and flooded a house to the depth of 4 or 5 feet [1.2-1.5 meters]. Every bridge on the river was carried away. A sawmill in Great Falls floated downstream. The freshet raised the river all the way to the ocean. At Portsmouth, New Hampshire, several ships under construction along with stores, mills and great quantities of lumber were carried away into the sea.

— East of Portsmouth [in Maine], many bridges were destroyed. All the bridges on the Presumpscot River were also carried away.

— At Berwick, Maine, the freshet caused a great disaster. It wiped out the bridges and destroyed sawmills, double sawmills, gristmills, fulling mills. It was estimated that the flood caused twenty thousand dollars in damage.

— In the town of Kennebunk, Maine, the Mousam River overflowed sweeping away the sawmill, the gristmill, lower ironworks, the bridge and nearly every other structure on the stream. The Kennebunk River also flooded sweeping away a sawmill. Significant property was also destroyed at Wells.

— The Saco River also flooded along its whole length from Notch [mountain pass] in the White Mountains in New Hampshire to the sea on the coast of Maine, a distance of 160 miles [258 kilometers]. The area around North Conway, New Hampshire was totally devastated. Farms were entirely submerged, barns and houses floated away, crops were destroyed, and many domestic animals drowned.

— This storm even washed away into the sea part of the cemetery at Cole's hill at Plymouth, Massachusetts, where the bones of the Pilgrim Fathers were laid to rest.

In *Germany*, there were extended floods and vast destruction of property.<sup>47</sup>

In different parts of *Germany* in 1785, thousands had their houses and property destroyed by inundations.<sup>41, 43</sup>

On 12 October 1785, a most dreadful storm of thunder and lightning accompanied by hail and pieces of ice alarmed the town of Whitehaven in Cumbria, *England* and its neighborhood. In a few minutes, it inundated the lower parts of the town, and rendered the furniture and bedding of the poor, by the mud and dirt, utterly unfit for use. In Lowswater, large flakes of ice fell, the like never seen before by the oldest man living. Some of the same kind [of hail] was picked up at Portsmouth. At Statford-upon-Avon, the same storm was still more dreadful.<sup>246</sup>

On Sunday [16 October 1785], at Montreal, *Canada*, the sun at intervals appeared a dusky red, approaching a copper color. At 2:15 p.m. the atmosphere became very dark and 5 minutes later totally dark, so that people ran against one another in the open streets. In the darkness nothing could be more dreadful. The horror that it occasioned exceeded all description. The rain that fell was of a strong sulfurous smell, and when the weather cleared up appeared as black as ink. At 2:42 p.m. it appeared to clear up for about 5 minutes, then darkness returned but in less than 20 minutes it dissipated. On 9 October at Quebec, the sky appeared fiery, luminous, yellow color. This was followed by squalls of wind and rain with severe thunder and lightning, which continued most of the night. This was uncommon in Quebec for this season, it having frozen the night before. Then on Saturday the 15<sup>th</sup>, at 3:15 p.m., it became darker than the Sunday before but of the same color. On Sunday the 16<sup>th</sup> at 10:30 a.m. it became so dark that ordinary print could not be read out of doors. After a short squall of rain, the great darkness returned until 12:10 p.m. The ministers of the churches were obligated to suspend the [church] service.

From that time until 4:45 p.m. there were intermittent periods of extreme darkness, mixed in with wind, rain and thunder.<sup>246</sup>

On 1 November 1785, a whirlwind [tornado] struck Swinton, near Nottingham, *England*. It leveled a barn, unroofed several houses and tore seven trees down by the roots. It lifted up one boy in the air over several hedges into an adjacent field.<sup>246</sup>

On 19 November 1785, a temporary hurricane [tornado or straight line winds?] struck London, *England* and its neighborhood. It began at 7 p.m. and continued until 11 p.m. It caused considerable damage on the river. It unroofed many houses, blew down several trees in St. James's Park, and in the fields round the metropolis. It threw a 12-pound slate, a distance of 50 or 60 yards in Surrey Street.<sup>246</sup>

At Plymouth, *England* on the 3<sup>rd</sup> instant [3 December 1785] at night, and the 4<sup>th</sup> in the morning, they had the severest gale of wind ever remembered by the oldest man living. The wind was from the south-southeast to south. The damage done among the ships is almost incredible. *Twee Gususters*, with wine and onions from Bourdeaux [Bordeaux] to Amsterdam, sunk at anchors in the Pool [Poole]. The *Zeelust* from Nantz [Nantes] to Amsterdam, with sugar and prunes, drove from her moorings in the Pool and sunk. The *Rosamond* from Newfoundland, with fish and oil, sunk in the Pool, and her stern stove in. The *St. Antonio Boa Viagam*, from Oporto to London, stern stove in, and the vessel otherwise much damaged; in short the Pool was an entire scene of wreck. At Falmouth, several store houses and dwelling houses were washed away by the sea's rising to an uncommon height. On the 4<sup>th</sup> it blew a hurricane. At Cowes, the *James of Sunderland* was totally lost on the back of the Isle of Wight. The *Catherine*, from Lisbon to London, and *Speedwell*, from Bilboa to Plymouth were both lost. At the Isle of Scilly, a large Dutch ship drove onshore in the morning of the 6<sup>th</sup>, and about 4 o'clock foundered, and all on board perished. A large brig belonging to Dartmouth, from Newfoundland, with passengers and agents, was lost on Bigbury Bay, and all onboard perished. A Dutch vessel cast away upon Lundy Island. That island, during the storm was entirely obscured by the uncommon height of the waves, which were singularly awful to the oldest and most experienced mariners. The *Ramirez*, a French sloop of war of 16 guns, totally lost on the rock near the Isle of Alderney, and all on board perished. The *Philip and Mary*, from Jersey to Bourdeaux [Bordeaux], totally lost two hours after she sailed. The *Friends*, [Master] Collingwood, from Seville to London, totally lost off Portland. In short, never was such havoc made among the shipping on this coast in the memory of man. The *French and Dutch coasts* are said to have been equally strewed with wrecks. At the Texel, *the Netherlands*, a Dutch man-of-war broke from her mooring and lost; the people saved. The Zuydazee [Zuiderzee, a shallow bay of the North Sea in the northwest of *the Netherlands*], a large West Indies ship lost and many people perished. The mouths of the Maese, Scheldt and Dort rivers are full of wrecks. The *Thisbe* frigate, which carried Lord Keppel to Italy, on her return met with the same storm at the chops of the [English] Channel, as proved so fatal to the *Halsewell East-Indiaman*. The lightning came on with such violence as to strike the men down upon the deck, though luckily they soon recovered. The masts were split, and the rigging torn from them, so as to make it necessary to cut them quite away to clear the wreck. This ship was later dashed to pieces on the rocks of St. Purbeck, on the Isle of Portland, *England*. Upwards of a hundred people were drowned in the shipwreck. At St. Ives in Cornwall, *Wales*, the lightning and thunder was terrible; but they preceded the snow, which was afterwards remarkably heavy for several hours. In Mount's Bay, *Wales*, several vessels were driven onshore.<sup>251</sup>

On 25 January 1786, London, *England* reported, "Out of a fleet of 13 sail of Swedish merchant ships, laden with naval stores, consigned for l'Orient in France, two only have reached their destined port, the other eleven having been wrecked in that heavy gale of wind [of 3-6 December 1785] in which the *Halsewell* perished. The coast of Essex has been covered with the spoils of this unfortunate fleet."<sup>215</sup>

In 1785, droughts engulfed many regions of *China* including:<sup>153</sup>

— During the period between 5 February and 8 August, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tsinan and Ho-tsê.

— During the period between 11 March and 8 April, a drought engulfed Hupeh (now Hubei province) in central *China* at Wuchang and Ao-ch'êng.

— During the period between 6 May and 8 August, a severe drought engulfed Shantung province at Lin-i, Tsou-p'ing, Tung-a, Fei-ch'êng, T'êng, Ning-yang and Jih-chao; Chekiang (now Zhejiang province) on the east coast of *China* at Chia-shan, T'ung-hsiang and Hsüan-p'ing; and Kiangsu (now Jiangsu province) on the east coast of *China* at Soochow, Kao-ch'un, Wu-chin and Yangchow. The rivers dried up. [Lin-i is located at longitude 116.52° East and latitude 37.13° North.]

— During the period between 8 August and 8 November, a drought engulfed Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing; and Shantung province at Kuan-ch'êng, Shou-kuang, An-ch'iu, I-shui, Chu-ch'êng, Po-hsing, Ch'ang-yüeh and Huang.

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

April 28<sup>th</sup> and 29<sup>th</sup> – wonderfully warm, spring-like days. May 5<sup>th</sup> – cloudy and dull for five days past. May 8<sup>th</sup> – rainy. May 14<sup>th</sup> – a deluge of rain. May 19<sup>th</sup> – the country people are but now beginning to plant, the spring is so backward, cold and wet. May 23<sup>rd</sup> – the May storm. May 27<sup>th</sup> – deluge of rain, fatal, it is feared, to the Indian corn, just planted. May 30<sup>th</sup> – a hot day, which causes the cherry and plum trees to begin to blossom. May 31<sup>st</sup> – another hot day, which occasions great joy. June 2<sup>nd</sup> – a very hot day. June 7<sup>th</sup> – cold. June 18<sup>th</sup> – very hot weather. June 21<sup>st</sup> – cold and rainy. June 22<sup>nd</sup> – very hot. June 23<sup>rd</sup> – raw; cold. June 25<sup>th</sup> and 26<sup>th</sup> – hot. June 27<sup>th</sup> – piercing cold. June 29<sup>th</sup> – hot day. June 30<sup>th</sup> – perhaps there never was a more seasonable year for grass. July 31<sup>st</sup> – we had marvellous seasonable weather up to this time; everything is flourishing; never a better prospect. August 8<sup>th</sup> – a deluge of rain. August 9<sup>th</sup> – remarkably cold. August 18<sup>th</sup> – third day of hot weather. August 20<sup>th</sup> – the heat continues; happy season! August 22<sup>nd</sup> – a seventh hot day. August 27<sup>th</sup> – cloudy, windy and cool. September has been (except for a day or two) a month of raw, cold, uncomfortable weather, but no frost yet. October – this month has been unusually cold, raw and unpleasant. October 21<sup>st</sup> – for two days and two nights it rained without ceasing, as hard as was ever known, which raises the freshets [floods] in such a hideous manner as to carry away all the bridges on the Presumpscot River and many elsewhere, and also many mills. Saco River bridges carried away. November 6<sup>th</sup> – cold Sabbath. December 2<sup>nd</sup> – cold.<sup>78</sup>

*Also refer to the section 1784 A.D. – 1785 A.D. for information on the drought and famine in Egypt during that timeframe.*

*Also refer to the section 1784 A.D. – 1785 A.D. for information on the drought and famine in England, France, Italy and Spain during that timeframe.*

---

**Winter of 1785 / 1786 A.D.** In Selborne, *England*, there was wet rainy weather until 23 December. This was followed by frost and snow until 7 January. Then there was a week of mild and very rainy weather, followed by a week of heavy snow. From 21 January to 11 February, the weather was mild with frequent rains. Then to 21 February, there was dry weather with high winds. Then to 10 March there was a hard frost. Following this came alternating rains and frosts until 13 April.<sup>70</sup> [The source list this as the winter of 1786-87 but I believe this is a misprint because the reference describes two different winters for this period and because the entries are in sequential order with the winter of 1785-86 missing.]

On 2 January 1786, Youghall [Youghal, *Ireland*] reported. “Last night, during as hard a frost as ever we experienced, an accidental fire broke out in this town; this dreadful accident first began in an out-house [shed], at several yards distance from any other building, and was for some time thought of no consequence; but at length, from the scarcity of water [because the water was frozen], the fire communicated to many dwelling-houses, four of which, with most of their contents, were destroyed, and several others considerably damaged, before a stop could be put to the flames. The loss is supposed to amount to near 2000*l*.” [In present currency, that would be equivalent to approximately £219,000 in damages based on the inflation rates using the retail price index.]<sup>251</sup>

On 3 January 1786, there was a furious storm (mistral) in Provence, *France*. The storm was mixed with snow. Herds were driven four or five leagues (12 to 15 miles, 19 to 24 kilometers) from their pastures. Many travellers and animals perished in the plain of La Crau in southern *France*. Of five shepherds who drove eight hundred sheep; three died with almost the entire herd.<sup>79</sup>

On 4 January 1786, Dublin, *Ireland* reported, “The damages done by the late floods are immense, particularly at the following places: Carlow, Newbridge, Rathangan, Cusshines, Lucan, Cellbridge [Celbridge], Luttrellstown [Luttrellstown], Palmerstown, etc., etc., by the breaking of bridges, washing away houses, and injuring mills. Happily all the principal works of the Grand Canal are found to be so ably constructed as to have escaped the general ruin, and no injury has been done to any part of them, save to two inconsiderable places Rathangan and Monasterevan [Monasterevin]. We hear from different parts of the country, that the swell in many rivers was so great, on the sudden dissolution of the snow, as to cover hundreds of acres, which, lying rather low, resembled some of our largest natural lakes. The [River] Barrow rose to such a height, that the waters ran over several streets in Carlow; and the town of Leighlinbridge, looked like a little Venice, peeping out of an ocean. A very few days, we hope, will change these unnatural appearances, and, by an early spring, disappoint the rapacious speculators in provision, for man and beast, who enjoy the shameful pleasure of enriching themselves at the expense and ruin of their neighbours.”<sup>251</sup>

There was a great storm in the *English Channel* in January 1786, which caused the loss of the *Halswell* Indiaman along with other ships.<sup>41,56</sup> [Indiaman is a ship operating under charter or license to any of the East India Companies of the major European trading powers of the 17<sup>th</sup> through the 19<sup>th</sup> centuries.]

On 15 February 1786, Flushing [Vlissingen, *the Netherlands*] reported, “that during the late storms and furious winds which raged last week, part of the mole [a massive stone wall constructed in the sea] which forms the harbour of that town gave way. This fatal event is attributed to the sensible encroachments made by the waters of the sea (which in stormy weather violently drive back those of the Scheldt [river]) on that part of Zealand, which have been so great, that the inhabitants are very apprehensive of the consequences.”<sup>251</sup>

On 6 March 1786, Belfast, *Ireland* reported, “Saturday and yesterday, the Dublin mails arrived here, which had been retarded on account of the depth of snow lying between the Man of War and Newry; they were obligated, we understand, to be carried by persons on foot greatest part of the above road, which was totally impassable by horses, and all the stages [stagecoaches] were stopped. It is remarkable that scarce any snow lay for several miles round this town last week, nor was travelling at all impeded. It is not remembered by the oldest inhabitant here, that the Dublin post was ever detained three days by stress of weather until last week.”<sup>251</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1785 on December 4<sup>th</sup> – a snowstorm. December 7<sup>th</sup> – snow again. December 8<sup>th</sup> – horrid cold. December 17<sup>th</sup> – a deluge of rain, and a thorough thaw. December 18<sup>th</sup> – a summer's day. December 19<sup>th</sup> – another; the snow is all gone, and the frost out of the ground. December 25<sup>th</sup> – cold. December 30<sup>th</sup> – severely cold snowstorm. January 1786 – a cold month, though it ends moderately. February 18<sup>th</sup> – a warm day, but the rest of the month was cold weather and good sledding. March 7<sup>th</sup> and 9<sup>th</sup> – pleasant and moderate. March 10<sup>th</sup> – windy and cold. March 14<sup>th</sup> – moderate. March 19<sup>th</sup> – a most beautiful day. March 26<sup>th</sup> – a surprising warm summer's day. April comes in raw and cold. April 2<sup>nd</sup> – a severe snowstorm.<sup>78</sup>

The winter of 1785 was tolerably mild in Philadelphia, Pennsylvania in the *United States* but significant snow fell.<sup>1</sup>

**1786 A.D.** In 1786 in *Ireland*, there was a thunderstorm at Arklow, Coolgraney, and Redcross (Wicklow County). This storm was "succeeded by a tremendous shower of hailstones, which killed a number of lambs, and wounded many persons."<sup>93</sup>

In Ferrara, *Italy* on the 17<sup>th</sup> of July, hailstones as big as hen's eggs.<sup>41, 43, 56, 57</sup>

On 17 July 1786 in *Italy*, there was a hailstorm with "stones as big as hens' eggs."<sup>93</sup>

A storm at High Bickington, in Devonshire *England* in July, thirteen trees were removed upwards of two hundred yards from their original spot, and they remained standing upright in a flourishing state – a rock, at the same place, was divided upwards of eight feet asunder, and all the poultry and corn for several miles were destroyed by the thunder and lightning.<sup>41, 43, 56</sup>

There was a storm at the island of *Barbados* on August 11.<sup>43, 56</sup>

In August 1786, a violent storm laid waste the southern coast of Española [*Dominican Republic & Haiti*]. At the *Caribbean* island of St. Eustatius [Statia], it drove all the shipping to sea, and destroyed most of the small craft in the harbor.<sup>146</sup>

On 16 August 1786 in northeastern *England*, there was a hailstorm at North Shields [near Newcastle].<sup>93</sup>

In North Shields, *England* on the 16<sup>th</sup> of August, great hailstorm. The hailstones were as large as pigeons' eggs.<sup>41, 43, 56, 57</sup>

On 23 August 1786, a violent tornado struck Woodstock, Connecticut in the *United States*. About 5 o'clock in the afternoon, a very dark cloud appeared in the west, moving with great speed in an easterly direction. An uncommon darkness with a violent tempest and tornado followed. More than one hundred buildings were either unroofed, shattered or destroyed and an immense number of forest trees laid desolate.<sup>174</sup>

On 23 August 1786, a tornado struck Sturbridge and Southbridge in Massachusetts and Woodstock, Pomfret and Killingly in Connecticut in the *United States*. The path of destruction caused by the tornado was ¼ mile [400 meters] wide. Houses and barns were leveled. People and cattle were killed or seriously wounded. Trees and crops were destroyed. At Woodstock, more than a hundred buildings were either unroofed or destroyed.<sup>199</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Lille, <i>France</i>	( 96.1° F, 35.6° C)
Saint-Malo, <i>France</i>	( 95.7° F, 35.4° C)
Versailles, <i>France</i>	( 86.0° F, 30.0° C) on 12 June
Saint-Lô, <i>France</i>	( 77.7° F, 25.4° C)

The summer of 1786 in northern *France* was very hot.<sup>79</sup>

On Saturday, 2 September 1786, an alarming hurricane threw the inhabitants of Barbados in the *Lesser Antilles* into the utmost consternation. At eleven in the evening, when the storm was at its height, a meteor in the southeast issued from a dark cloud, and spreading its diverging rays to a vast circumference, continued, with unabated splendor, near forty minutes. In the morning of the 3<sup>rd</sup>, Carlisle Bay, Barbados was a scene of desolation — not a vessel had ridden out the storm. In the country, great damage was done to houses and crops: many persons were killed in the ruins of their own houses.<sup>146</sup>

On 2-3 September 1786, a hurricane struck Barbados in the *Lesser Antilles*. Many people were killed in the ruins of their own houses.<sup>141</sup>

On 10 September 1786, Guadeloupe in the *Lesser Antilles* was swept by a hurricane, which destroyed most of the plantations, and wrecked three ships in the harbor.<sup>146</sup>

On 12 September 1786 in *England*, there was a great hailstorm in Hampshire.<sup>93</sup>

On 5 October 1786, news was received of a dreadful hurricane in the *West Indies*. It greatly damaged Barbados and Grenada.<sup>128</sup>

In early October 1786, when the crops of corn and pumpkins were still on the ground, continuous rains produced a freshet, which had seldom been equaled in Bradford County, Pennsylvania in the *United States*. Crops were swept away and the river was covered with floating pumpkins. The loss was severely felt and many cattle died the succeeding winter for lack of sustenance. For many years, this freshet was known by the old inhabitants as the "Pumpkin Flood".<sup>178</sup>

In Sussex, *England*, there was an irruption of the sea; blockhouse at Brighthelmstone [now in the city of Brighton] washed down on October 9, 1786.<sup>41, 43, 47</sup> [The blockhouse at Brighthelmstone was a fort or storehouse for armor and ammunition. This blockhouse was a circular fort, 50 feet in diameter, 16 feet in height with walls 8 feet thick. It had 6 large guns and 10 small cannons, which long afterwards shared the fate of most of the buildings on the Brighton front and was washed away by the sea.]

On 9 October 1786, Exeter, *England* reported that the rain, which fell in their neighborhood, was most violent within the recollection of the oldest living person living. Saturday [October 7<sup>th</sup>] morning the River Exe began to rise to an unusual height, and by 11 o'clock it had covered the Bonbay and Island, forcing the inhabitants to flee their homes or move to the upper rooms. Boats were used to transport people across St. Thomas's near the bridge. The wall of a glue yard on the haven was washed away near the Vine Inn. Okehampton road was impassable and on the river a great number of sheep, cattle, and furniture passed through the bridge. There was an immense loss in various parts of the country. Cattle were carried away by the torrents. Houses were thrown down and some lives were lost. The River Culm rose so high as to cover Etherly Bridge, where a boy attempting to cross on horseback was carried off and drowned. At Stoke Canon, eight houses were thrown down, and the main pier of the bridge destroyed with the rivers Exe and Culm meeting in the midst of the village. At Uffculme, the bridge was thrown down and a single farmer lost 13 sheep and one cattle.<sup>251</sup>

On 20 October 1786, a hurricane struck *Jamaica*.<sup>124</sup>

On 20 October 1786, it blew a hurricane at *Jamaica*. The trees were stripped of their leaves, and appeared as if fire had destroyed their verdure. The shores were covered with aquatic birds that had been dashed against the trunks of the mangroves, and killed.<sup>146</sup>

On 20 October 1786, a hurricane struck *Jamaica*. Seven people died [on the island]. A small shallop [large heavy boat, usually having two masts and carrying fore-and-aft or lugsails] was wrecked off Gun Key and every soul perished. On a plantain boat all perished except for one person.<sup>141</sup>

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as: April 9<sup>th</sup> to 14<sup>th</sup> – cold and windy. April 22<sup>nd</sup> – the whole week, except Friday, has been heavy, raw, rainy weather. May 31<sup>st</sup> – the spring a thought to be forward; most people have planted. June 1<sup>st</sup> – summer commences with a hot day. June 4<sup>th</sup> – extremely hot. June 5<sup>th</sup> – cold. June 7<sup>th</sup> – very hot. June 13<sup>th</sup> – growing season. June 30<sup>th</sup> – never was more seasonable weather, and never a greater prospect as to all the fruits of the earth. July 2<sup>nd</sup> – extremely hot.

July 9<sup>th</sup> and 11<sup>th</sup> – extremely hot. July 12<sup>th</sup> – rain; happy season. July 18<sup>th</sup> – cold. July 22<sup>nd</sup> – only a few hot days thus far. July 30<sup>th</sup> – hot morning, but dismal sea wind in the afternoon. August 31<sup>st</sup> – very little hot weather this month. September – the whole of this month has been wonderfully moderate. October 30<sup>th</sup> – a wonder of a fall thus far; almost constant uniform moderate weather. It has been as dry and hot as summer; no rain but one day. November 12<sup>th</sup> – raw and cold.<sup>78</sup>

In 1786, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

In 1786 during the period between 5 February and 6 May, floods struck Shantung (now Shandong province) on the east coast of *China* at Chan-hua and Hupeh (now Hubei province) in central *China* at Ch'ung-yang. Also during the period between 5 February and 6 May, a drought engulfed Shantung province at Tung-p'ing. During the period between 27 May and 25 June, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lin-t'an. During the period between 25 July and 23 August, a drought engulfed Hupeh province at Ching-mên and Sung-tzû. During the period between 22 September and 21 October, floods struck Hupeh province at Chiang-ling.<sup>153</sup>

---

**Winter of 1786 / 1787 A.D.** Three snowstorms between 4-10 December 1786 dropped a total of 41 inches (104 centimeters) of snow on Morristown, New Jersey in the *United States* in one week.<sup>27</sup>

In December 1786, great snowstorms struck New England in the *United States*.<sup>199</sup>

— The winter of 1786-87 came very early. On 14 November 1786, the St. George's River in Maine was frozen so hard and thick that the ice bore horses and sleighs as far down as Watson's Point [near Thomaston]. The river remained frozen until the following March. By 20 November, the harbor at Salem, Massachusetts was frozen over as far out as Naugus Head. The Connecticut River froze so quickly that at Middletown, Connecticut, boats were floating over the river one day and 24 hours later, the ice on the river had become strong enough to bear heavy weights and people were driving on it with their horses and sleighs.

— Snowstorms in December were unusually severe. Great quantities of snow fell. The entire winter was severe. At Rockland, Maine, snow remained on the ground as late as 10 April and was so deep and hard-crusted that teams passed over the fences in every direction without obstruction.

— On 4 December, a two-day blinding snowstorm struck the area. The strong winds brought in one of the highest tides experience in that region. When the storm ended, the snow was 6 feet [1.8 meters] deep in Boston, Massachusetts. The tide overflowed the wharves and entered the stores causing great damage to the goods. Several ships were wrecked in the storm including the brig *Lucretia*, which ran aground on Point Shirley. Several men jumped from the ship into the terrible surf and managed to make it to shore only to die of cold in the snowstorm. The sloop *Thomas* was wrecked on Marshfield Beach where the Captain and mate froze to death. Another ship was driven onto Plum Island during the snowstorm and wrecked.

— On 8 December, another powerful snowstorm struck the region. This storm also produced a great snowfall. After this storm, the depth of snow on the ground was believed even greater than that experienced during the winter of 1716-17. Traveling was very difficult and in many places completely stopped. The roads were completely filled with snow from wall to wall throughout New England. Several people became lost in the blinding snowstorms and died.

— The storm of 8 December was very severe along the coast. In Long Island Sound [an estuary between Connecticut and New York], many vessels went ashore, and some were entirely lost. All the vessels at Stonington, Connecticut were driven ashore except for one schooner that fled to sea and was never seen or heard from again. At Newport, Rhode Island, ten or twelve ships, brigs and other vessels of the larger build were driven from the wharves and forced ashore at Brenton's Neck. Two sloops went ashore at Nantasket Beach in Massachusetts. A small schooner was cast away near Cape Ann. A sloop was driven ashore on Lovell's Island in Boston harbor, and all onboard perished. A schooner was driven ashore on Cape Cod, and all onboard perished. A schooner *Nancy* was also cast ashore at Cape Cod, about 3 miles

[5 kilometers] from Provincetown.

In Falmouth [now Portland, Maine] in the *United States*, the weather was recorded as:

In 1786 on November 17<sup>th</sup> – it snowed, and came up windy and cold. November 20<sup>th</sup> – cold. November 25<sup>th</sup> – fine sledding; true winter since the 17<sup>th</sup>. November 30<sup>th</sup> – so dry a fall was never known. The wells went dry, and the prospect for water is dark. December 1<sup>st</sup> to 3<sup>rd</sup> – very cold. December 5<sup>th</sup> – a snowstorm. December 8<sup>th</sup> – another snowstorm but greater. December 14<sup>th</sup> – moderate. December 20<sup>th</sup> – the roads are all blocked up with snow. December 24<sup>th</sup> – cold and stormy; a vast deal of damage done by the late storms. December 31<sup>st</sup> – the weather moderated. January 1787 – it has been severely cold for most of this month. February 3<sup>rd</sup> – cold weather. February 12<sup>th</sup> – a little more moderate. February 19<sup>th</sup> and 20<sup>th</sup> – cold. February 28<sup>th</sup> – there have been no deep snows with us, but from Portsmouth to Boston the roads have been blocked up, and to Newport and New London it has been vastly deeper. Truly a memorable winter. March 1<sup>st</sup> – the heavy, dull weather still continues. March 4<sup>th</sup> – last night there was a great storm of snow, near a foot (0.3 meters) of snow fell. March 12<sup>th</sup> – pleasant. March 13<sup>th</sup> – the snow is 5 feet (1.5 meters) deep in the woods. March 15<sup>th</sup> – the closest [overcast] winter remembered. March 17<sup>th</sup> – we have had the longest and coldest winter remembered.<sup>78</sup>

The winter of 1786 was tolerably mild in Philadelphia, Pennsylvania in the *United States*. There were some cold days of course.<sup>1</sup>

In Selborne, *England*, early in November 1786, there was frost. But then until 16 December there was rain with only "a few detached days of frost." Following that came a fortnight [14 days] of frost and snow and then 24 days of dark, moist, mild weather. Then from 24 to 28 January there was frost and snow. Then came mild showery weather until 16 February. This was followed by dry cool weather until 28 February. This was followed by stormy rainy weather until 10 March. The next fortnight was bright and frosty. This was followed by mild rainy weather to the end of April.<sup>70</sup>

---

**1787 A.D.** In Manchester, *England*, a great flood did much damage.<sup>47, 92</sup>

There was a great storm in the *West Indies*, where great damage was done, particularly in the French islands in July 1787.<sup>41, 56</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Nezeroy, <i>France</i>	( 99.5° F, 37.5° C)
Saint-Jean-d'Angély, <i>France</i>	( 99.5° F, 37.5° C)
Besançon, <i>France</i>	( 97.3° F, 36.3° C)
Saint-Sever, <i>France</i>	( 91.6° F, 33.1° C)

A storm struck several parts of *England* in August.<sup>41</sup>

In August 1787, Dominica in the *Lesser Antilles* was visited by three gales of wind [hurricanes], on the 3<sup>rd</sup>, 23<sup>rd</sup>, and 29<sup>th</sup>, which destroyed all the vessels at the island. All the barracks and buildings upon Morne Bruce were blown down and destroyed, and several houses in the town shared the same fate.<sup>146</sup>

In December 1787, reports were received of a dreadful hurricane in the *West Indies* that caused great damage.<sup>128</sup>

On 4 August 1787 in *Normandy*, there was a hailstorm with "stones as big as hens' eggs."<sup>41, 43, 56, 57, 93</sup>

On 15 August 1787, a tornado struck New England in the *United States*. It first appeared at Lake George, New York. It struck the cities of New Britain, Newington, Wethersfield, East Windsor, Glastonbury, Eastbury [part of Eastbury became Marlborough], Bolton, Coventry and Thompson in Connecticut. Then it struck Gloucester, Rhode Island. Then it struck Oakham, Rutland, Northborough, Mendon, Framingham, Southborough, Marlborough and Sudbury in Massachusetts. Finally it moved into Rochester, Dunbarton, and Concord in New Hampshire. The tornado leveled or unroofed homes and barns, killed and injured many people and domestic animals, and uprooted or broke many trees in two. It even picked up a ferryboat on the Merrimack River carrying it a considerable distance before dropping it into the water again. The tornados path of destruction varied between 60 and 300 feet [18-91 meters].<sup>199</sup>

On 19 August 1787 in northern *Italy*, there was a hailstorm in the city of Como and its district. The hailstones weighed 9 ounces.<sup>93</sup>

In 1787 in Dublin, *Ireland*, there was a most violent hailstorm.<sup>93</sup>

In Navarre in northern *Spain*, there were great torrents of water from the mountains; over 2,000 persons lost their lives.<sup>47, 92</sup>

In September 1878 at Navarre, *Spain*, 2,000 lost their lives in a flood, all the buildings of several villages carried away by the torrents of water from the mountains.<sup>41, 43, 56, 90</sup>

In *Ireland*, there were great floods in most of the principal rivers of *Ireland*; in Dublin there were 8-feet of water in the cathedral.<sup>47, 92</sup>

On 23 September 1787, a hurricane struck Honduras [*Belize*] causing around 100 deaths.<sup>141</sup>

On 23 September 1787, at Balize [*Belize*], between four and five in the morning, a hurricane came on from the N.N.W. About ten, it shifted to the S.W., and blew with increased violence. At the same time the sea rose and prevented the running off of the land floods. The lowlands were overflowed: not a house, hut, or habitation of any kind, on either side the Balize [*Belize*], was left standing — more than 500 were thrown down. One hundred persons perished: dead carcasses and logs of mahogany were floating about in every direction. Eleven square-rigged vessels, besides smaller ones, were totally lost.<sup>146</sup>

A terrible inundation by the River Liffey, in *Ireland*, which did very considerable damage in Dublin and its environs, 12 November 1787.<sup>41, 43, 56, 90</sup>

In Portland, Maine in the *United States*, the weather was recorded as:

March 19<sup>th</sup> – wonderful warm, pleasant day. March 21<sup>st</sup> – winter seems to be over. April 4<sup>th</sup> – a hot summer's day. April 5<sup>th</sup> – cold again. April 8<sup>th</sup> to 17<sup>th</sup> – moderate and pleasant. April 19<sup>th</sup> – five days of very blustering and tempestuous cold weather, night and day. April 30<sup>th</sup> – from the 17<sup>th</sup>, this has been a cold month; but few warm days, yet we begin to dig our garden three weeks sooner than the two years past. May 8<sup>th</sup> – a hot summer's day. May 10<sup>th</sup> – a rainstorm. May 16<sup>th</sup> – the dreadful eastern weather continues. May 25<sup>th</sup> – a deluge of rain. May 26<sup>th</sup> – horrid cold, and frosts. May 31<sup>st</sup> – a cold spring. June 2<sup>nd</sup> – dismal raw and cold. June 18<sup>th</sup> – the week past was hot weather. June 24<sup>th</sup> – a hot but windy Sabbath. June 25<sup>th</sup> – heavy rain. June 30<sup>th</sup> – Indian corn is backward, but there is a good prospect of English grass. July 1<sup>st</sup> to 3<sup>rd</sup> – raw, cold, easterly weather. July 7<sup>th</sup> – the four days past were very hot. July 17<sup>th</sup> – a fine rain. July 19<sup>th</sup> – very cold. July 28<sup>th</sup> – there has not been a hot night this summer. July 31<sup>st</sup> – nothing like summer yet. Alas, for the Indian corn! August 1<sup>st</sup> and 2<sup>nd</sup> – raw; cold. August 3<sup>rd</sup> – summer breezes. August 13<sup>th</sup> – foggy. August 21<sup>st</sup> – no hot weather yet. August 27<sup>th</sup> – cold. August 30<sup>th</sup> – warmer. September – some warm and some cold weather. October 2<sup>nd</sup> and 3<sup>rd</sup> – hot summer days. October 8<sup>th</sup> – cold. October 13<sup>th</sup> – a week of warm weather. October 20<sup>th</sup> – a week of uncommon cold, windy weather. October 24<sup>th</sup> – three surprising hot days. October 31<sup>st</sup> – the raw, heavy, cold weather returns. November 30<sup>th</sup> – this month has been

favorably moderate. The ground has hardly froze, and no snow. December – the weather this month, has been quite moderate.<sup>78</sup>

In *India* during 1787-88, there were floods in Behar and other northwest provinces of the Punjab; said to have caused loss of 15,000 lives and 100,000 herd of cattle. “The rains commenced abnormally early in 1787, and continued for months almost without cessation. In some of the districts of Bengal [*India* and *Bangladesh*] and in Behar it is stated that from the latter part of March to the latter half of July, they had continued with such violence as almost to render cultivation impossible. There was a break in the rains about the end of July, but early in September the waters were out again as widely as ever in Sylhet, and similar complaints were made from Jesson, Nuddea, and Central Bengal [*India* and *Bangladesh*]. About 1<sup>st</sup> October a tremendous storm of rain and wind swept all over the western districts of Bengal, which ended in a cyclone of unexampled extent, which seems to have swept across almost the whole of Bengal. By this disaster the late crops, which, after all previous disasters were fast getting into ear, were in a great measure destroyed over larger tracts of country.”<sup>47</sup> [Sylhet is now located in northeastern *Bangladesh*. Jesson (Jessore ?) a district located in the Khulna Division of southwestern *Bangladesh*. Nuddea (Nadia) is a district of the state of West Bengal, in the northeast of *India*.]

In May 1787 in Coringa, Hindostan [now *India*], there was a great inundation that swept away all the houses, and destroyed nearly the entire population. It extended far inland. Loss of life 15,000 people; and more than 100,000 head of cattle.<sup>92</sup> [Coringa is a tiny village of the East Godavari district, in Andhra Pradesh, on the southeastern coast of *India*. Hindostan is another variant of Hindustan.]

In *India* during 1787-88, there was a famine in Behar and the northwest provinces of Punjab, which was a consequence of the rain and floods. The Government laid an embargo on the exportation of grain.<sup>57</sup>

In 1787 from the beginning to the end of the season, there was one continued succession of excessive rains, floods, and storms in Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and Behar [now Bihar in northern *India*]. Three separate attempts to sow the land failed. Around 30 September / 1 October, a tremendous storm swept over all the western districts of Bengal, doing immense damage. The ocean passed with great rapidity carrying down houses and cattle, men, women and children. The town of Burdwan [now Bardhaman in West Bengal, *India*] was “totally destroyed, not a vestige of a mud-house remaining, and even those of brick and many of them fallen.” Then on 2 November, a cyclone of unexampled extent seemed to have swept across the whole of Bengal. The storm swept from Midnapore, *India* to Sylhet, *Bangladesh* rising to a furious hurricane that carried everything before it. As a result of this disaster, the late crops were to a great degree destroyed over large tracts of the country.<sup>183</sup>

To ease the increasing overcrowding in British jails following the loss of the American Colonies in the American War of Independence, the British established a new penal colony, which was the first European settlement in *Australia*, at Sydney Cove in January 1788. Captain James Cook had charted the east coast of the Australian continent in 1770. On 13 May 1787, the ‘First Fleet’ of eleven ships commenced a historic journey from Portsmouth, England to establish the first European settlement in *Australia* of 1,030 people including 736 convicts, livestock, grains, seeds, young plants and two years store of supplies. They arrived on 19 January 1788 in Botany Bay, *Australia*. During the eight month journey:<sup>104, 108</sup>

\* The Fleet encountered squally tropical humid weather after passing the Equator into the Southern Hemisphere, resulting in a convict woman being crushed to death and one man being thrown overboard and drowned.

\* After leaving Cape Town, South Africa on 13 November, the ships were blown off course in the Roaring Forties [below 40 degrees latitude south].

\* Ferocious weather of violent summer storms of very strong gales and heavy seas battered the Fleet in the Southern Ocean between November and December 1787. The winds were so strong that they lost a topsail in December.

\* Chilly temperatures as cold as England in December were recorded close to Christmas 1787 [the Southern Hemisphere's summer].

\* The Fleet was forced to slow down New Year's Day when they encountered the strongest winds of the journey losing one man overboard and injuring the cattle on board.

\* In the first week of January 1788, the Fleet sails past the southeast corner of Van Diemen's Land (Tasmania, *Australia*), into a violent thunderstorm and observe small patches of snow along the coastline during the height of summer.

\* Sailing north up the coast of New South Wales against strong headwinds, many ships of the Fleet and its cargo of precious seedlings, were damaged by sudden squall of wind and very high seas in a severe storm on 10 January 1788. The squall was strong enough to split the mainsail on one ship and another ship lost its main yard carried away in the slings.

\* Between 24 and 26 January 1788, a strong wind and huge seas buffeted ships sailing out of Botany Bay to the more suitable location of Port Jackson, where on 26 January 1788, a Union Jack flag, was planted to celebrate the beginning of European settlement in Australia.

In 1787 during the period between 18 April and 16 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Huang and Po-hsing. During the period between 6 May and 8 August, a severe drought engulfed Shantung province at T'êng.<sup>153</sup>

The year 1787 was a year of abundance in the vicinity of Shanghai, *China*.<sup>166</sup>

In 1787, there was a great drought in the vicinity of Shanghai, *China*. Then during the 7<sup>th</sup> moon, dragons fought. A great wind overturned houses; and carried off, no one knows where, half a stone bridge. [In early *China*, tornadoes and waterspouts were commonly described as dragons.]<sup>166</sup>

During the famine of 1787 in *China*, many died in the streets of Canton. Individuals killed their infants, their young children and their aged parents in order for them to avoid the agonizing death of starvation.<sup>188</sup>

**Winter of 1787 / 1788 A.D.** In Selborne, *England*, in November the weather was mild until the 23<sup>rd</sup>, with the last week of the month frosty. The first three weeks of December were still and mild with rain but the last week was frosty. The first thirteen days of January were mild and wet; then five days of frost, followed by dry, windy weather. February was frosty but with frequent showers. The first half of March saw hard frost, but the rest of the month was dark harsh weather with much rain.<sup>70</sup>

During the winter of 1787-88 at Kimbolton in Cambridgeshire, *England*, the thermometer fell below the freezing point [of water] on 14 & 15 January and 6, 7, 8, 10, 11, 12, 13 & 17 March.<sup>240</sup>

The winter of 1787-88 in northern *France* was a very mild winter followed by a hot dry spring.<sup>79</sup>

The winter of 1787 was tolerably mild in Philadelphia, Pennsylvania in the *United States*. There were some cold days of course.<sup>1</sup>

**1788 A.D.** On 1 January 1788, reports were received of a storm at *Honduras* that drove the sea over the low lands, by which all the houses were destroyed, and fifteen vessels wrecked.<sup>128</sup>

There was considerable damage done to Tower-ditch at London, *England* from a storm, where the ground on Little Tower-hill was trenched nearly twelve feet deep on June 20<sup>th</sup>.<sup>41, 56</sup>

On 26 June 1788, the rain fell so heavy as to flood the streets of London, *England* and blow up one of the sewers.<sup>128</sup>

On 11 July 1788, there was a great inundation in *Scotland* and the north of *England*.<sup>128</sup>

On 13 July 1788 in *England*, there was a great hailstorm in Cheshire.<sup>93</sup>

On 13 July 1788 in *France*, there was a storm.<sup>93</sup>

Almost total darkness prevailed in many parts of the country; this was followed by a hurricane of wind, rain, hail, lightning and thunder. The hail worked the greater destruction. "The whole face of nature was so totally changed in about an hour . . . instead of the smiling bloom of summer and the rich prospects of forward autumn . . . it now presented the dreary aspect of universal winter. . . . The soil was changed into a morass, the standing corn beaten into a quagmire, the vines broken to pieces, . . . the fruit trees of every kind demolished. . . . The hail was said to be composed of enormous solid and angular pieces . . . some of them weighing from 8 to 10 ounces. Even robust forest trees were incapable of withstanding the fury of the tempest."<sup>93</sup>

In the neighborhood of Paris: "the country for many square leagues is laid wholly waste, and the fruits of the earth so totally eradicated that no harvest can be expected this year. His Majesty's hunting seat has shared the common ruin. . . . He was witness to what fell, which could not be called hail: they were enormous pieces of ice of several pounds weight, by which lambs, sheep, and even cows, were killed and many people dangerously wounded." The Archbishop of Paris issued a mandate recommending all rectors, vicars, and curates in his diocese to make the largest collections possible on account of the sufferers. The King created a lottery on a large scale for a like object.<sup>93</sup>

In connection with this storm the following is on record: Some of the farmers who have been offered considerable sums to indemnify them for their losses, and to encourage them to carry on with spirit the cultivation of their lands, with new seeds, new implements, etc., have peremptorily refused, on account of a foolish report that prevails in some parts of the country where the storm happened. They say that 'two giants were seen peeping out of the clouds, and threatening with terrible countenances, gigantic frowns and high-sounding words, that they would return next year, on the same 13 July, with greater scourges than the present one. Terrified either at the report, or at the fancied sight of the giants, which terror and a weak brain will often produce, many of the unhappy sufferers have abandoned their houses and turned beggars.

"Hail fell as large as a quart bottle; and all the trees from Vallance to Lisle were torn up or destroyed."<sup>93</sup>

The estimated damage from this storm was estimated at 5,000,000 francs.<sup>93</sup>

On 13 July 1788 at St. Germain [now in Paris] in *France*, hail fell as large as pint-bottles, and did immense damage. All the trees from Vallance to Lisle were destroyed.<sup>43,47</sup> [Vallance is in southeastern *France*. Lisle is in southwestern *France*.]

At St. Germain in Laie, in *France*, hail fell as large as a quart bottle, and all the trees from Vallance to Lisle were torn up by the roots on July 13.<sup>41,56</sup>

On 13 July 1788, a terrible hailstorm struck the whole extent of *France* and even into the *Netherlands*. The hailstones were a singular form, elongated and armed with points.<sup>271</sup>

Volney, in his *Views of the Climate of America* says that after a storm [in Pontchartrain, *France*] that occurred on 13 July 1788, he picked up some hailstones [larger than] the size of a man's fist.<sup>43</sup> [The

hailstones at St. Germain weighed more than 3 pounds.] [Pontchartrain is now Jouars-Pontchartrain, a commune in the Yvelines department in the Île-de-France region in north-central *France* just 35 kilometers north of Paris.]

On 13 July 1788, a terrible storm, accompanied by wind, rain and hail, burst upon Paris, *France*. This storm had already ruined the Poitou, the Touraine, and the Beauce regions of *France* and the countryside of Chartres. This storm spread desolation throughout the kingdom to another. At Paris, this storm was preceded by a suffocating heat, which seized mostly in the streets, similar to the heat from a furnace. The first signs of the storm appeared at eight o'clock in the morning by the appearance of violent winds, clouds and the accumulation of a great darkness. An hour later, the wind blowing from the southwest, a large rolling thunder rumbled almost two hours without interruption. That's when the clouds burst, and the sky gushed floods of rain and hail. In central and southern Paris, the hail was very ordinary, and quickly drowned by the rain. But on the rue du Faubourg-St-Antoine, this storm destroyed the gardens and orchards. This storm then drove through and ravaged Ile-de-France, Picardy and Flanders [now *Belgium*]. Several provinces suffered cruelly. In less than a quarter of an hour everything was lost. It destroyed the harvests, upset the fields, broke trees in half or uprooted them, lifted off roofs, smashed game and poultry, killed or bruise livestock, even seriously wounded men and women. The storm produced enormous size hail. They found a hailstone weighing more than 750 grams (1.7 pounds). The storm passed through Paris and northern *France* in an area a hundred leagues (300 miles, 483 kilometers) and a width of twenty (60 miles, 97 kilometers). On 17 July, two monstrous clouds, travelling from the southwest to the northeast, a distance of two hundred leagues (600 miles, 966 kilometers), crossed *France* in eight hours time. These clouds of hail ravaged all the way, an area two to four leagues (6 to 12 miles, 9.7 to 19.3 kilometers) wide, without causing any damage in the intermediate band.<sup>79</sup>

The summer of 1788 was warm in various places in *Europe*. The summer in Paris, *France* was characterized by:

Hot days	52 days
Very hot days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Verona, <i>Italy</i>	( 96.1° F, 35.6° C)	in June and July
Chartres, <i>France</i>	( 96.1° F, 35.6° C)	
Chalons-sur-Marne, <i>France</i>	( 96.1° F, 35.6° C)	
Montauban, <i>France</i>	( 94.8° F, 34.9° C)	
Berne, <i>Switzerland</i>	( 92.8° F, 33.8° C)	
Paris, <i>France</i>	( 92.7° F, 33.7° C)	on 12 July
Milan, <i>Italy</i>	( 92.1° F, 33.4° C)	
Lons-le-Saunier, <i>France</i>	( 90.5° F, 32.5° C)	
Saint-Die, <i>France</i>	( 90.5° F, 32.5° C)	
Dunkirk, <i>France</i>	( 88.5° F, 31.4° C)	
Bourbonne-les-Bains, <i>France</i>	( 88.3° F, 31.3° C)	
Geneva, <i>Switzerland</i>	( 83.8° F, 28.8° C)	in August
Le Puy (upper Loire), <i>France</i>	( 81.9° F, 27.7° C)	
London, <i>England</i>	( 79.9° F, 26.6° C)	on 27 May and 2 June

On 13 July a great hailstorm struck parts of *France* causing terrible devastation. In Burgundy, the grape harvest began on 15 September. The quantity of grapes harvested was small but the wine produced was of excellent quality. The grain harvest was sufficient.<sup>62</sup>

In 8 August 1788 in [*Great Britain*], upwards of 5,000 head of horned cattle perished from want of sustenance, owing to the dryness of the season.<sup>128</sup>

In 1788, *England* experienced a defect of rain, and in consequence a great want of water on the close of the year universally felt. At Kimbolton in Cambridgeshire, *England*, the average rainfall for the 7 years preceding [years 1781-1787] was 25 inches. But the rainfall for 1788 was only 14.5 inches. It is believed that the entire island of *England* was affected by this drought.<sup>230</sup>

On 14-19 August 1788, a hurricane struck the *Caribbean Island* of Martinique, the *Dominican Republic*, the *Bahamas*, and New England in the *United States*. The hurricane caused between 600 and 700 deaths.<sup>141</sup>

In *Scotland*, the bursting in of the dam-dikes at Kirkwaid caused great destruction.<sup>47</sup> [Kirkwaid is now Kirkwall located on the largest island, known as the "Mainland" in the Orkney Islands, an archipelago in northern *Scotland*.]

On 19 August 1788, a disastrous gale struck New York and the western portions of New England in the *United States*. The wind brought in unusually high tides at New Haven, Connecticut; driving the waves against Long Wharf with such fury that it caused considerable damage. Throughout the region, a considerable number of houses, barns and other buildings were blown down or were unroofed. Hundreds of acres of tall timber trees were broken off or torn up by the roots. Roads were so blocked by the fallen trees that they became impassible for several days. Many cattle, horses and several persons were killed or injured by falling trees. Some of the towns in Massachusetts that suffered significant damage were Springfield, Northampton, Hatfield, Whately, Conway, Ashfield, Pittsfield, Petersham, Westminster and Deerfield. In Vermont the towns of Dummerston and Putney suffered. In New Hampshire, the towns of Sanbornton, Hanover, Meredith and New Hampton suffered.<sup>199</sup>

At Kirkwaid in *Scotland*, an inundation by breaking the Dam-dikes on October 4<sup>th</sup>, nearly destroyed the town.<sup>41, 43, 56</sup>

In the three Danish islands [now the *Virgin Islands* of St. Thomas, St. John and St Croix], a want of rain [drought] prevailed there for about four years [1788-1791] and killed a great number of Negroes.<sup>146</sup>

It was reported on 27 December 1788, that the greatest scarcity of water prevailed during the year in *Scotland*, as ever was known.<sup>128</sup>

In 1788 during the period between 6 April and 5 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Huang.<sup>153</sup>

In 1788, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 4 June and 3 July, floods struck Hopei (now Hebei province) in northern *China* at Lin-yü; Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang, Chin-hsien and Kiukiang; Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ang-shan and Ch'ing-yüan; and Hupeh (now Hubei province) in central *China* at I-ch'ang. At I-ch'ang, tens of house-sections were damaged by the floodwaters.

— During the period between 4 July and 1 August, floods struck Hupeh province at Wuchang, Hanyang, Ao-ch'êng, Huang-p'o, Hsiang-yang, I-ch'êng, Kuang-hua, Ying-ch'êng, Huang-kang, Ch'i-shui, I-tu, Kuang-chi, Huang-mei, Kung-an, Shih-shou, Sung-tzū, Chiang-ling, Chih-chiang and Lo-t'ien. At Chiang-ling, the dikes and houses were damaged by the floodwaters. At Chih-chiang, the houses were damaged. At Lo-t'ien, the city walls were damaged and many people drowned.

— During the period 2-30 August, floods struck Hupeh province at Chiang-ling, Ch'ien-chiang and Hanyang. At Chiang-ling, the dikes were damaged.

The year 1788 was a year of abundance in the vicinity of Shanghai, *China*. Some rice had double-

heads.<sup>166</sup>

---

**Winter of 1788 / 1789 A.D.** The winter in *England* was intensely cold from November 1788 to January 1789. The River Thames was crossed opposite the Customhouse, the Tower, Execution-dock, Putney and Brentford.<sup>2, 41, 42, 43</sup>

In *England*, the frost was long and severe.<sup>47, 93</sup>

In *England*, there were fairs on the frozen River Thames during the winter of 1788-89.<sup>90</sup>

On 14 January 1789, a most severe frost in *England*, which began on the 25<sup>th</sup> of November 1788, continued unremitted for seven weeks. The River Thames was frozen in a remarkable manner, and the ice this day for the first time, broke up at the time that a fair was held thereon.<sup>128</sup>

In Selborne, *England*, the winter of 1788-89 was very severe. Hard frost continued from 22 November 1788 until 13 January 1789. The rest of January was mild with showers. February was rainy, with snow showers and heavy gales of wind. The first thirteen days of March produced a hard frost with snow, then until 18 April, the weather consisted of heavy rain, frost, snow and sleet. This winter was also severe on the Continent [*Europe*].<sup>70</sup>

“In the year 1788, however, the citizens of London had a complete revival of the ancient sports on the river. The frost set in on the 25<sup>th</sup> of November 1788, and lasted with great severity for several weeks. The river Thames, which at this season usually exhibits a dreary scene of languor and indolence, was this year the stage on which there were all kinds of diversions, bear-baiting, festivals, pigs and sheep roasted, booths, turnabouts, and all the various amusements of Bartholomew Fair multiplied and improved. From Putney Bridge in Middlesex, down to Rotherhithe, was one continued scene of merriment and jollity; not a gloomy face to be seen, but all cheerfulness, arising apparently from business and bustle. From this description the reader, however, is not to conclude that all was, as it seemed. The miserable inhabitants that dwell in houses on both sides of the river during these thoughtless exhibitions, were many of them experiencing the extreme of misery; destitute of employment, though industrious, they were with families of helpless children pining for want of bread; and though in no country in the world are the rich more extensively benevolent than in *England*, yet their benefactions could bear no proportion to the wants of the numerous poor, who could not all partake of the common bounty. It may, however, be truly said, that in no great city or country on the continent of *Europe*, the poor suffered less from the rigour of the season than the inhabitants of *Great Britain* and London; yet, even in London, the distress was very great, and though liberal subscriptions were raised, many perished through want and cold.”<sup>29</sup>

From November 1788 to January 1789, there was a general frost throughout *Europe*. The River Thames in London, *England* was passable on the frozen ice, opposite the Custom House.<sup>90</sup>

The winter was recorded as being intensely cold throughout *Europe*. A *German* newspaper of 17 December 1788, says the cold was so intense, as to sink the mercury to -27° F (-33° C). In the *United States*, the whole winter was intensely cold. The Delaware River was closed from the 26<sup>th</sup> of December to the 10<sup>th</sup> of March.<sup>1</sup>

The winter of 1789 in *France* was very severe.<sup>79</sup>

During the winter of 1788-89. The Rhône River in *France* began to experience ice on 23 December 1788; on 25 December a temporary thaw occurred; on the 27<sup>th</sup> the river froze along the coast opposite the city of Valence to a fairly significant extent, even though in this place the river is always very rapid, and remained frozen until 13 January 1789. From the 11<sup>th</sup>, men and women crossed the river sometimes even

with loaded mules. The Rhine, the Elbe, the Danube, the Seine, the Loire, the Garonne and many other rivers, frozen to a degree that pedestrians and even wagons crossed the rivers. From 2 to 20 January individuals traveled by wagons over the ice covered Great Belt.<sup>62</sup>

In northern *France*, the memorable winter of 1788-89, one of the toughest, was followed suddenly by stubborn heat.<sup>79</sup>

The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1788-89, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

The winter was intensely cold throughout *Europe*, particularly Holland [now *the Netherlands*].<sup>41, 42, 43</sup>

The winter of 1788-89 was one of the most severe and most persistent winters, which has extended over the whole of *Europe*. In Paris, *France*, the frost began on 25 November, and with the exception of a break during a single day (25 December) lasted 50 days until 13 January. When a thaw finally came; the amount of snow was measured as 0.60 meters (2 feet). On the large channels of Versailles, to the several rivers, ponds and the ice reached a thickness of 0.60 meters (2 feet). The water froze even in some very deep wells, and the wine in the cellars froze. The Seine River began to freeze over on 26 November 1788. It was only towards the 20th of January that the river returned back to normal. The lowest temperature observed in Paris was -7.2° F (-21.8° C) on 31 December. In the remaining portion of *France* and throughout *Europe*, the cold was also severe. The Rhône River was frozen completely in Lyon, *France*. The Garonne River was completely frozen at Toulouse, *France*. In Marseille, the sides of the docks were covered with ice. On the shores of the Atlantic Ocean, the sea was frozen to a distance of several leagues. On the Rhine River, the ice was so thick that loaded wagons could travel over it. The Elbe River was completely covered with ice, and carried heavy freight wagons. The ice at the Port of Ostend, *Belgium* was frozen so hard that people could cross it on horseback and the sea was frozen to a distance of four leagues (12 miles, 19 kilometers) from the outer fortifications. And no vessels or ship could approach the harbor because of the ice. The River Thames was frozen to Gravesend, six leagues below London, *England*. The Thames Frost Fair lasted from Christmas to 12 January with the river in London covered with booths. In *Ireland*, the rivers were covered with ice, the River Shannon froze at Limerick. The straits of the *Great and Little Belts* were frozen and great wagons crossed on the ice. The Sound between Helsingborg, *Sweden* and Kronborg, *Denmark* remained open only to a width of 200 meters. The Neva River at St. Petersburg, *Russia* was completely frozen over beginning on 15 November 1788. The Lake Geneva near Geneva, *Switzerland* in January was covered with ice for 14 days. There was very abundant snow everywhere, especially in *Austria* and *Italy*. The streets of Rome, *Italy* and the surrounding fields were covered with snow for 12 days. In Constantinople (now Istanbul, *Turkey*) the cold was very violent and produced deep snow; on the adjacent seas there was so much ice that the vessels did not dare approach. In Lisbon, *Portugal*, the winter produced severe cold for three weeks.<sup>62, 70</sup>

The following are the lowest temperatures observed in different cities:<sup>62</sup>

Basel, <i>Switzerland</i>	(-35.5° F, -37.5° C) on 18 December 1788
Bremen, <i>Germany</i>	(-32.1° F, -35.6° C) on 16 December 1788
Saint Albans, <i>England</i>	(-28.8° F, -33.8° C) on 31 December 1788
Warsaw, <i>Poland</i>	(-26.5° F, -32.5° C) on 18 December 1788
Dresden, <i>Germany</i>	(-25.8° F, -32.1° C) on 17 December 1788
Erlange, <i>Germany</i>	(-24.3° F, -31.3° C) on 18 December 1788
Oseberg, <i>Norway</i>	(-24.3° F, -31.3° C) on 29 December 1788
Innsbruck, <i>Austria</i>	(-24.3° F, -31.3° C) on 30 December 1788
St. Petersburg, <i>Russia</i>	(-23.1° F, -30.6° C) on 12 December 1788
Neuf-Brisach, <i>France</i>	(-22.4° F, -30.2° C) on 18 December 1788
Hanover, <i>Germany</i>	(-20.9° F, -29.4° C) on 16 December 1788

Weimar, <i>Germany</i>	(-19.8° F, -28.8° C) on 17 December 1788
Ansbach, <i>Germany</i>	(-19.8° F, -28.8° C) on 19 December 1788
Berlin, <i>Germany</i>	(-19.8° F, -28.8° C) on 28 December 1788
Munich, <i>Germany</i>	(-19.8° F, -28.8° C) on 30 December 1788
Leipzig, <i>Germany</i>	(-17.5° F, -27.5° C) on 17 December 1788
Wettin, <i>Germany</i>	(-15.3° F, -26.3° C) on 21, 27 and 28 December 1788
Saint-Die, <i>France</i>	(-15.3° F, -26.3° C) on 31 December 1788
Augsburg, <i>Germany</i>	(-15.3° F, -26.3° C) on 30 December 1788
Grande-Chartreuse, <i>France</i>	(-15.3° F, -26.3° C) on 30 December 1788
Copenhagen, <i>Sweden</i>	(-15.3° F, -26.3° C) on 4 January 1789
Strasbourg, <i>France</i>	(-15.3° F, -26.3° C) on 31 December 1788
Colmar, <i>France</i>	(-14.1° F, -25.6° C) on 19 December 1788
Tours, <i>France</i>	(-13.0° F, -25.0° C) on 31 December 1788
Gotha, <i>Germany</i>	(-11.9° F, -24.4° C) on 17 December 1788
Lons-le-Saunier, <i>France</i>	(-11.2° F, -24.0° C) on 31 December 1788
Pontarlier, <i>France</i>	(-10.8° F, -23.8° C) on 31 December 1788
Mannheim, <i>Germany</i>	(-10.8° F, -23.8° C) on 18 December 1788
Troyes, <i>France</i>	(-10.8° F, -23.8° C) on 31 December 1788
Arras, <i>France</i>	(-10.1° F, -23.4° C) on 30 December 1788
Chalons-sur-Saône, <i>France</i>	(-9.0° F, -22.8° C) on 31 December 1788 and 5 January 1789
Moulins, <i>France</i>	(-8.7° F, -22.6° C) on 31 December 1788
Orléans, <i>France</i>	(-8.5° F, -22.5° C) on 31 December 1788
Beaugency, <i>France</i>	(-8.5° F, -22.5° C) on 31 December 1788
Osen, <i>Norway</i>	(-8.5° F, -22.5° C) on 30 December 1788
Lyon, <i>France</i>	(-7.4° F, -21.9° C) on 31 December 1788
Étampes, <i>France</i>	(-7.4° F, -21.9° C) on 31 December 1788
Rouen, <i>France</i>	(-7.2° F, -21.8° C) on 30 December 1788
L'Aigle, <i>France</i>	(-7.2° F, -21.8° C) on 30 December 1788
Paris, <i>France</i>	(-7.2° F, -21.8° C) on 31 December 1788
Tournai, <i>Belgium</i>	(-6.2° F, -21.2° C) on 30 December 1788
Verviers, <i>Belgium</i>	(-6.2° F, -21.2° C) on January 5, 1789
Liège, <i>Belgium</i>	(-6.2° F, -21.2° C)
Grenoble, <i>France</i>	(-6.2° F, -21.2° C) on 31 December, 1788
Roanne, <i>France</i>	(-5.1° F, -20.6° C) on 31 December, 1788
Joigny, <i>France</i>	(-1.7° F, -18.7° C) on 31 December, 1788
Angoulême, <i>France</i>	(-1.7° F, -18.7° C) on 31 December, 1788
Löwen, <i>Germany</i>	( 0.1° F, -17.7° C) on January 4, 1789
Marseille, <i>France</i>	( 1.4° F, -17.0° C)
Livorno (Leghorn), <i>Italy</i>	( 2.8° F, -16.2° C) on 30 December, 1788
Orange, <i>France</i>	( 3.7° F, -15.7° C)
Antwerp, <i>Belgium</i>	( 5.0° F, -15.0° C) on 5 January 1789
London, <i>England</i> (outside city)	( 6.1° F, -14.4° C)
Honfleur, <i>France</i>	( 6.3° F, -14.3° C) on 30 December, 1788
Milan, <i>Italy</i>	( 7.3° F, -13.7° C)
Limerick, <i>Ireland</i>	(10.4° F, -12.0° C)
Oxford, <i>England</i>	(12.9° F, -10.6° C) on 30 December 1788

In the region of Toulouse, *France* in almost every household the bread was frozen and could not be cut; until it was warmed by a fire. Several passengers perished in the snow to Lemberg in Galicia. In three days of December, 37 people found frozen to death. Birds, which usually reside in the far north, appeared in several provinces of *France*. Fish perished in the fishponds because of the thickness of the ice. Many fruit trees were badly damaged. A portion of the vines froze. The pear trees suffered much, and so did the apple trees. Almost all walnut trees were destroyed. In the southern provinces the orange, olive and pomegranate trees were damaged. The great cold held in the Provence from 20 December to 8 January; the thermometer fell in Orange to 3.7° F (-15.7° C). The forest trees were heavily damaged, and those who

belong to the family of the pines were destroyed in large parts; other trees burst from top to bottom. The winter crops were protected by the thick snow that covered them, against the effects of cold. When spring arrived they appear from under the snow, very green and are even denser than usual, because the cold had killed the weeds that normally suffocated them. Many sheep were trapped in unhealthy shelters and as a result lost their wool or died. But the sheep that had remained under the open sky retained their fleece and have not become ill. Of all domestic animals, the horses have suffered the least. The land birds have died of hunger because of the snow. At the time of the spring thaw ice was very destructive. On the banks of the Loire River, the bridges in Tours, Nevers and La Charité in *France* were swept away. The Saône and the Dordogne rivers which were ice-strengthened also caused great damage.<sup>62</sup> [Lemberg is now Lviv in western *Ukraine*. Galicia is a historical region in Eastern Europe, currently divided between *Poland* and *Ukraine*.]

The winter of 1788-89 was very intense. It froze the rivers, seaports and the sea off the coast of *France*. The mass of ice disrupted communication from Calais, *France* to Dover, *England*. The *English Channel* was covered with ice two leagues (6 miles, 9.7 kilometers) off the coast. The ice clogged waterways and ports, imprisoning ships. The cold, mixed with snow, appeared suddenly at the end of November 1788, and the cold reigned ever since, except a few short interruptions, until April 1789. The Rhône River and other rivers were crossed on foot, on horseback, by carriage and, in some places, with heavily laden wagons. Olive trees, vines and fruit trees suffered greatly or died.<sup>79</sup>

---

#### **1789 A.D. – 1791 A.D. Australia. Drought**

During 1789-91, there was a drought in New South Wales, *Australia*.<sup>101</sup>

No rain is said to have fallen at Sydney, *Australia* between June to November 1790 and all the grass was dried up.<sup>103</sup>

In January and February 1791, there were several weeks of excessive heat, hot winds, birds dropped dead from trees and everything burnt up, streams of water supplying Sydney, *Australia* nearly dried up.<sup>103</sup>

On 27 December 1790, the temperature in Sydney, *Australia* reached 102° F (38.9° C) in the shade. Then on 10 and 11 January 1791, the temperature in Sydney reached 105° F (40.6° C). Great heat was experienced. In January 1791, the settlement was visited by myriads of flying foxes and birds that dropped from the trees dead due to the extreme heat. The heat continued into February. On February 12, the country around Rose Hill and Parramatta was on fire for many miles.<sup>103</sup>

On 10 and 11 February 1791 the temperature at Sydney, *Australia*, stood in the shade at 105° F (40.6° C). The heat was so excessive at Parramatta, made worse by the bush fires, that immense numbers of the large fox-bats were seen to drop from the trees into the water, and many dropped dead on the wing. At Sydney about the harbor in many places the ground was found covered with small birds, some dead, others gasping for water. At Parramatta, an officer of the relief guard left the beat to find a drink of water, he had to walk several miles in a dry watercourse before he found it, many birds dropping dead at his feet. The wind was northwest, and burned up everything before it. Persons whose business obliged them to go out declared that it was impossible to turn the face for five minutes to the wind.<sup>103</sup>

---

**1789 A.D.** In *England* and *Wales*, the land was so inundated with continuous rains that scarcely an article of food was raised.<sup>1</sup>

On 10 April 1789, a violent storm struck off the coast of North Carolina in the *United States*. In the Albermarle [Albemarie] Sound there was a very violent gale of wind, with an amazing rise of tide, about 9 feet above common high water mark. A number of ships were lost along the Outer Banks; at least two of these wrecks resulted in the death of the entire crew.<sup>141</sup>

A storm struck Liverpool, *England* on June 29, 1789.<sup>41</sup>

On 29 June 1789, Liverpool, *England* was much damaged by a storm.<sup>128</sup>

In *Scotland* and the north of *England*, inundations in July 1789.<sup>41, 43</sup>

On 16 July 1789, there were great inundations in *Scotland* and the north of *England*.<sup>128</sup>

On 22 July 1789 in *England*, there was a great hailstorm in Cambridgeshire.<sup>93</sup>

On 3 August 1789 in *England*, there was a great storm of hail at Amersham (Bucks). The hail fell with such violence as to kill birds, destroy fruit trees, crush garden frames, and accomplish similar damage on a large scale. The storm extended into Suffolk and Leicestershire.<sup>93</sup> [Bucks is an abbreviated form of the county of Buckinghamshire.]

On 16 August 1789, a famine was felt at Paris, *France*.<sup>128</sup>

On 22 August 1789 in *Scotland*, there was a great hailstorm at Kelso and Hawick. The hail was accompanied with angular pieces of ice, which fell in great abundance, and did much damage.<sup>93</sup>

In *England*, there were great rainstorms in the north.<sup>47, 92</sup>

In the south [of *France*] after the very severe winter of 1788-89, summer, autumn and winter began a little early again. In Burgundy, the grape harvest began on 7 October. The yield was negligible and the wine was bad. The cereal harvest in *France* produced very poor results.<sup>62</sup>

In *France* in 1789, there was a grievous famine in the province of Rouen.<sup>57, 90, 91</sup>

In the three Danish islands [now the *Virgin Islands* of St. Thomas, St. John and St Croix], a want of rain [drought] prevailed there for about four years [1788-1791] and killed a great number of Negroes.<sup>146</sup>

In 1789, there was not any rain that fell in Antigua, a Leeward Island in the *West Indies* for seven months. The crop of sugar was destroyed and 5,000 horned cattle perished for want of water.<sup>146</sup>

In 1789, a powerful cyclone struck Coringa, *India* causing 20,000 deaths.<sup>98</sup>

In 1789-92, there was a famine in the Madras Presidency in *India*.<sup>156</sup>

In 1789 during the period between 27 March and 22 June, a severe drought engulfed Hupeh (now Hubei province) in central *China* at I-tu. During the period between 25 May and 22 June, floods struck Hupeh province at I-ch'ang and Chekiang (now Zhejiang province) on the east coast of *China* at Shui-an and Ning-hai. During the period between 19 September and 18 October, floods struck Hopei (now Hebei province) in northern *China* at An-hsin and Lin-yü.<sup>153</sup>

*Also refer to the section 1789 A.D. – 1791 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1789 / 1790 A.D.** The winter of 1789-90 in Selborne, *England* was very mild. In November to the 17<sup>th</sup>, there were heavy rains with violent gust of wind. To 18 December, there was mild dry weather with a few showers. Then to the end of 1789, there was rain and wind. To 13 January 1790, the weather was mild and foggy with occasional rain. To 21 January, (5 days only) there was frost. Then to

28 January, the weather was dark with driving rains. Then to 14 February, it was mild dry weather. Then to 22 February (8 days) of hard frost. Then to 5 April, bright cold weather with a few showers.<sup>70</sup>

The winter of 1790 was unusually mild in *France*. However, spring and summer were severely cold, which often kept them constantly below normal temperature.<sup>79</sup>

In Philadelphia, Pennsylvania in the *United States* the winter of 1789 was very mild until the middle of February, when the weather became exceedingly cold to the close of the month. The whole spring was so cold that fires were comfortable until June. The summer months were exceedingly hot, the mercury frequently rising to 96° F (35.6° C) in the shade.<sup>1</sup>

---

**1790 A.D.** In *India*, there was a great drought in the district of Baroda, and in some adjoining districts, resulting in a severe famine.<sup>47</sup>

In *India* during 1790-91, there was a famine in the district of Baroda [Vadodara], and in many adjoining districts, in some of which, however, it was only partial and local. "Very little is known concerning the famine in many of the districts named, beyond the fact that in 1790 tradition records the occurrence of a very severe famine. An almost total failure of rain was the immediate cause, apparently, of the calamity; and sufficient information exists to prove that it was one of the most remarkable on record. So great was the distress that many people fled to other districts in search of food; while others destroyed themselves, and some killed their children, and lived on their flesh. In Belgaum the scarcity was aggravated by people flocking into the district boarding on the Godavery [Godavari River]."<sup>57</sup> [Vadodara is in the state of Gujarat in northwestern *India* on the Arabian Sea. Belgaum is in western *India*. The Godavari River runs from western to southern *India*.]

In *India* during 1790-92, there was serious dearth in the northern districts of the Madras Presidency, and the pressure continued for about two years, from November 1790 to November 1792. "Many deaths from starvation occurred. At an early period Government suspended the import and transit duties on all kinds of grain and provisions, and they imported grain from Bengal [*India* and *Bangladesh*]. In the latter part of 1791 the export of rice from Tranjore [Thanjavur] was prohibited, except to the distressed districts. Rice was distributed by Government, and relief was afforded by employing the poor on public works." [This is the first occasion of the poor being employed on public works by the government in *India*.]<sup>57</sup> [The northern districts of the Madras Presidency is now the state of Tamil Nadu in southeastern *India*. Tranjore is located in Tamil Nadu State and is the main rice producing region and hence known as the Rice Bowl of Tamil Nadu.]

In 1790, there was a famine at Bombay and nearby regions in *India*.<sup>156</sup>

From November 1790 to November 1792, a serious dearth took place in the northern districts of the Madras Presidency in *India*. In April 1791, it was stated that 1,200 people died of starvation in the neighborhood of Vizagapatam [now Visakhapatnam along the southeast coast of India]. Early in 1792, the district of Ganjam in the state of Odisha, India] was in great straits for food, and those of Ellore, Rajamundry and Condapilly were in serious distress. In Masulipatam [now Machilipatnam in the state of Andhra Pradesh, *India*], there were numerous deaths from starvation in all quarters of the neighboring countryside.<sup>188</sup>

In 1790 during the period between 10 August and 8 September, floods struck Shantung (now Shandong province) on the east coast of *China* at Ch'ang-ch'ing, Pin, Yü-ch'êng and P'ing-yüan. During the period between 9 September and 7 October, floods struck Hopei (now Hebei province) in northern *China* at Luan, Yüeh-t'ing, Wu-ch'iang and Kao-t'ang.<sup>153</sup>

In the three Danish islands [now the *Virgin Islands* of St. Thomas, St. John and St Croix], a want of rain [drought] prevailed there for about four years [1788-1791] and killed a great number of Negroes.<sup>146</sup>

A hurricane struck *Jamaica*.<sup>41, 42</sup>

On 30 July 1790 in [northeastern] *Scotland*, there was a hailstorm at Monymuch [Moneymusk]. The ice was in angular pieces, about the size of a musket ball. The hailstones fell to the depth of 3 feet on the ground. The hailstones did much damage to vegetation of all kinds.<sup>93</sup>

In August 1790, twenty vessels in Tobago, *Republic of Trinidad* were driven on shore by a hurricane, and completely lost. Mr. Hamilton's sugar-works, with all the stores, were completely destroyed. His new mansion, which had been built upon pillars, was lifted up by the tempest, and removed to some distance; but being well made, did not go to pieces. Mrs. Hamilton, two ladies, and five children, were in the house, and suffered little or no harm. Mr. Hamilton, being absent from home, knew not what had happened; but returning in the night, which was excessively dark, and groping for his door, fell over the rubbish left on the spot, and so far hurt himself, that he was confined for a week. An old uninhabited building, which stood close by the house, was lifted from the ground and thrown upon their habitation; so that they expected every moment to be buried in the ruins of both.<sup>146</sup>

In the memoirs of James Montgomery who was visiting Tobago, *Republic of Trinidad* when the hurricane struck in August 1790:

— “In the country the devastation was no less sudden and terrible. Mr. Hamilton's sugar-works, being above seventy feet long, were totally destroyed, with all the stores they contained. His elegant new mansion, which was built upon pillars, was lifted up by the wind and removed to some distance; but being very well put together, did not go to pieces, but was only put out of square. Mrs. Hamilton fainted away and hurt her face in the fall; but two ladies, and five children, who were in the house at the time, suffered little or nothing. Mr. Hamilton happened to be absent, and not knowing what had occurred, went home in the dark; but in seeking the door fell over the rubbish that was left upon the spot, and hurt himself so much that he was confined for a week. My wife had a violent fever; and three days before this took place, the physician visited her twice a day. I had watched with her three nights. Our dwelling is old and out of repair, and close adjoining was an old house uninhabited, and in a ruinous condition. About eleven at night, when the storm arose to a hurricane, a great part of this old building was thrown upon our house, and we expected every moment to be buried in the ruins of both. I ran out of the house to look about me, but could see nothing for rain and lightning. Rafters and shingles were flying about in the air, and the storm soon forced me back into our dwelling. In these few minutes the rain had as thoroughly penetrated my clothes, as if I had fallen into the sea. I now carried my poor sick wife into an adjoining chamber; but though it was very firmly built, the rain beat in at all corners, so there was but one small spot where my wife could sit dry. In this situation we waited till the storm abated, and were graciously preserved from further harm, except that my wife's illness increased, and I got so violent a cold that I did not recover within a fortnight after.”

On 21 November 1790 in *England*, there was a great hailstorm in the neighborhood of London, and in Hampshire and Wiltshire.<sup>93</sup>

In *Northern Europe*, the summer of 1790 was hot and excessively dry with the exception of *Sweden*. The summer in Paris, *France* was characterized by:

Hot days                      40 days

Very hot days                6 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:

Verona, <i>Italy</i>	( 96.1° F, 35.6° C ) in August
Paris, <i>France</i>	( 94.3° F, 34.6° C ) on 22 June
London, <i>England</i>	( 86.0° F, 30.0° C ) on 22 June

There were very strong rains in Provence and Languedoc. In Burgundy, the grape harvest began on 27 September. The wine was not very plentiful and of mediocre quality. The grain harvest was poor.<sup>62</sup>

A flood broke out in 1790 in *France*. The amount of rainfall exceeded the average annual rainfall levels almost everywhere in *France*. But it was particularly large in the Languedoc and Montpellier. Here the rainfall was 47.6 inches (1,208 millimeters) almost double the yearly average and the highest amount in thirty-two years. The month of November alone gave more than 19.1 inches (486 millimeter) rainfall. The remainder is split primarily between the months of May and March.<sup>79</sup>

In *England*, almost over the entire kingdom, there was a storm that did considerable damage on December 23.<sup>41, 56</sup>

*Also refer to the section 1789 A.D. – 1791 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1790 / 1791 A.D.** In Selborne, *England* in November 1790, mild autumnal weather prevailed till the 26<sup>th</sup>, after which there were five days of hard frost. Then to the end of the year the weather consisted of rain, snow, with a few days of frost. The whole month of January 1791 was mild with heavy rains. February was windy with much rain and snow. Then to the end of April, it was dry but rather cold and frosty.<sup>70</sup>

On 23 December 1790, a violent storm did considerable damage; the whole roof of copper, on the top of the Chancery-Offices, was rolled up by the wind, and blown off. The storm was felt in most parts of *England*.<sup>128</sup>

On 14 January 1791, the fog was so dense at Amsterdam, *the Netherlands* that over 230 persons fell into the canals and were drowned.<sup>128</sup>

The winter of 1791 was unusually mild in *France*. However, spring and summer were severely cold, which often kept them constantly below normal temperature.<sup>79</sup>

---

**1791 A.D.** On 2-3 February 1791 in *England*, the tide in the River Thames was so uncommonly high that it overflowed its banks and boats were floated into Westminster Hall. In Essex, it did great damage.<sup>128</sup>

In June 1791 in *England*, there were several violent hailstorms.<sup>93</sup>

In June 1791 in *Italy*, there was a violent hailstorm.<sup>41, 56, 57, 93</sup>

In 21 June 1791 in *Cuba*, great torrents of rain; 3,000 persons and 11,700 head of cattle of various kinds drowned.<sup>47, 92</sup>

Rains in the island of *Cuba*, on the 21<sup>st</sup> of June 1791, caused 3,000 persons and 11,700 cattle of various kinds to perish, by the torrents, occasioned by the rain.<sup>41, 56</sup>

On 21-22 June 1791, a great hurricane struck western *Cuba* causing approximately 3,000 deaths.<sup>107, 141</sup>

At day-break on 21 June 1791, it began to rain near the Havana, *Cuba*, which continued till half-past two in the afternoon of the following day, with such force as to cause the greatest flood ever remembered in that country. The royal tobacco mills, and the village in which they stood, were washed away, and 257 of the inhabitants killed. In the spot where the mills stood, the water, or a partial earthquake, opened the ground to the depth of forty-five feet, and in one of the openings a river appeared of the purest water. Where the Count Baretto's house stood, was a cavity more than sixty feet deep, from which a thick smoke

rose. Four leagues [12 miles] from thence, the torrent was so great, that none of the inhabitants within its reach escaped. All the crops of corn and growing fruits were carried away. Three thousand persons, and 11,700 head of cattle, are said to have perished in the flood.<sup>146</sup>

On 27 September 1791, reports were received of great damage done to the island of *Cuba*, by a storm.<sup>128</sup>

In several parts of *England* in June, there were violent hailstorms.<sup>41, 56, 57</sup>

Frost and snow, with hail, struck different parts of *England* at Midsummer [around 21-24 June].<sup>2, 41, 43</sup>

On 18 July 1791 in *England*, there was a great hailstorm in Berkshire, Gloucestershire, and Wiltshire.<sup>93</sup>

The summer of 1791 was considerably hot. The summer in Paris, *France* was characterized by:

Hot days                                      48 days

Very hot days                                9 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:

Verona, *Italy*                                ( 95.7° F, 35.4° C) in August

Paris, *France*                                ( 93.4° F, 34.1° C) on 15 August

London, *England*                            ( 80.1° F, 26.7° C) on 7 June

In Burgundy, *France*, the grape harvest began on 19 September. The quantity of wine was low but the quality was very excellent.<sup>62</sup>

On 3 August 1791 in *England*, there was a hailstorm in Leicestershire.<sup>93</sup>

In Thornton, (Leicestershire) *England* on the 3<sup>rd</sup> of August, there was a hailstorm that did great damage.<sup>57</sup>

In September 1791 in Naples, *Italy*, there was a hailstorm in Calabria. The hailstones weighed a pound. Vines were destroyed.<sup>93</sup>

In Calabria, (Naples) *Italy* in September, there was a violent hailstorm; stones weighed one English pound, which destroyed all hopes of producing a vintage of wine.<sup>41, 43, 56, 57</sup>

On 22 October 1791 in *England*, there was a hailstorm in Kent and Sussex.<sup>93</sup>

In Sussex, *England* in October, there was a severe hailstorm.<sup>57</sup>

A hailstorm struck Sussex, *England* in October, the hailstones were four inches in circumference.<sup>41, 43, 56</sup>

A storm struck the church of Speldhurst, (Kent) *England* on October 25. Lightning destroyed the church, and the church bells were melted. Other damage was done at Raynham.<sup>41, 43, 56</sup>

On 26 October 1791 in *England*, there was a hailstorm in Cornwall.<sup>93</sup>

In *England*, the river Don, near Doncaster, and the rivers Derwent, and Trent all greatly overflowed on November 20, 1791.<sup>41, 43, 47</sup>

In northern *Italy*, there were floods of great extent at Placentia in November.<sup>41, 43, 47</sup>

In the three Danish islands [now the *Virgin Islands* of St. Thomas, St. John and St Croix], a want of rain [drought] prevailed there for about four years [1788-1791] and killed a great number of Negroes.<sup>146</sup>

[In 1791, there was a famine in *Pakistan* that does not appear to be weather related. In Kach [*Pakistan*] there was a famine caused by innumerable black ants which swarmed in almost all parts of the country, and destroyed vegetation.<sup>57</sup>]

In 1791, there was a famine in Cutch [Kutch district in western *India*] caused by black ants.<sup>179</sup>

In 1791 during the period between 3 February and 4 March, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou. During the period 2-30 June, a severe drought engulfed Hupeh (now Hubei province) in central *China* at Ying-shan. During the period between 27 October and 25 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Chi-mo. During the period between 26 November and 24 December, floods struck Hupeh province at Pao-k'ang. At Pao-k'ang, houses and fields were damaged by the floodwaters.<sup>153</sup>

In 1791 during the 4<sup>th</sup> moon on the 5<sup>th</sup> day in the vicinity of Shanghai, *China*, there was a severe hailstorm.<sup>166</sup>

*Also refer to the section 1789 A.D. – 1791 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1791 / 1792 A.D.** In *England* in December 1791, very cold weather and snow hit *Italy* and *Spain*.<sup>2, 41, 43</sup>

In Selborne, *England* in November 1791, the weather was very wet and stormy. In December it was frosty. There was some hard frost in January 1792, but the weather was mostly wet and mild. In February, there was some hard frost and a little snow. March was wet and cold.<sup>70</sup>

The winter of 1792 was unusually mild in *France*. However, spring and summer were severely cold, which often kept them constantly below normal temperature.<sup>79</sup>

On 27 January 1792, there was a storm at Plymouth, *England*, which inundated the town, and the sea made a breach over the Eddystone lighthouse.<sup>128</sup>

---

**1792 A.D.** In 1792, there were several good crops of wheat at Parramatta in New South Wales, *Australia* in spite of the drought.<sup>103</sup>

In Waterford, *Ireland*, there was a great storm on April 4<sup>th</sup>.<sup>41, 56</sup>

In 1792, there was a great flood on the island of St. Kitts in the *West Indies*.<sup>144</sup>

Before 11 April 1792, a great flood took place at St. Kitts in the *West Indies*. In the town of Basse Terre, heavy rainfall and violent gusts of flying showers over the entire night caused streams to begin to overflow. The next day, the storm increased. The currents began to carry away the Negro houses with their inhabitants. The storm continued into the night and finally ended in the morning. In one plantation, two women with two children were lost. In another estate, a woman, her husband and their 4 children along with a blind woman stood in the water, imploring God to help them. They were preserved. In College Street, the torrents of rain carried away fences, walls and steps, and in some places tore down the houses. The English church and the Methodist chapel were filled with mud and water. Several houses were carried into the sea, with all their furniture and dashed to pieces. The strongest walls were unable to withstand the vehemence of the main current and the oldest inhabitants could not remember so formidable and destructive an inundation, whereby so many lives were lost. In the town of Old Road, some houses had been washed into the sea, and on the north side much injury had been done.<sup>146</sup>

On 12 April 1792 in Kent, *England*, there was a great hailstorm between Gravesend and Chatham, extending over a district of 2 miles only.<sup>93</sup>

In Worcestershire in the West Midlands *England*, there were extended floods near Broomsgrove on 13 April.<sup>47</sup>

In different parts of Kent, *England* on April 13, there was a great storm.<sup>41, 56</sup>

On 18 April 1792, the city Bromsgrove in *England* was much injured by a waterspout.<sup>128</sup>

On 23 June 1792 in *England*, there was a hailstorm in Northumberland.<sup>93</sup>

There was a storm in the north of *England* on July 16<sup>th</sup>.<sup>41, 56</sup>

On 17 July 1792 in *England* there was a hailstorm in Lancashire.<sup>93</sup>

In 1792 in *Ireland*, there was a hailstorm in the neighborhood of Dublin. Hailstones of uncommon dimensions fell, accompanied by awful claps of thunder.<sup>93</sup>

The maximum temperature during the summer in Bordeaux, *France* was 99.3° F (37.4° C).<sup>62</sup>

The weather of 1792 in southern *France* produced excessive rains, cold, stinking fogs, storms and late frosts.<sup>79</sup>

In 1792 in southern *France*, there were excessive rains, foul mists, storms, early frost and late frost along with great agitation of the atmosphere.<sup>79</sup>

On 1-2 August 1792, a hurricane struck the *Lesser Antilles*. Many lives were lost in St. Kitts and Antigua in the *West Indies*. There was a great loss of life from ten ships in St. Barthélemy [or St. Barts] in the *Leeward Islands*. There were only two survivors from a Spanish brig sunk between St. Kitts and St. Eustatius.<sup>141</sup>

On 1 August 1792, several plantations at Antigua in the *West Indies* were destroyed by a hurricane. Most of the other islands also suffered.<sup>146</sup>

In Lancashire, *England*, there were great floods in August.<sup>43, 47</sup>

On 10 September 1792, reports were received that a hurricane at *Antigua* destroyed many estates.<sup>128</sup>

In 1792, there was a famine at Orissa in *India*.<sup>156</sup>

In 1792, there was a famine in Rajamundry [now Rajahmundry], Ellore, etc. in *India* in which one half of the inhabitants perished.<sup>182</sup>

In 1792 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tsinan, Chan-hua and Huang. During the period between 8 August and 8 November, a drought engulfed Hopei (now Hebei province) in northern *China* at Hsing-t'ai, Wu-ch'iang, Nan-kung, Ch'ing-yün, Ching-hai [‘Ching’, the word ‘hai’ possibly left off by mistake], Li, Wang-tu and Yüeh-t'ing. During the period between 14 November 1792 and 11 January 1793, floods

struck Kiangsi (now Jiangxi province) in southern *China* at Ch'ing-chiang, Chi-an, Lin-ch'uan and Kiukiang.<sup>153</sup>

---

**Winter of 1792 / 1793 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1792 occurred on 23 November. It snowed for two days; drifted very much; roads impassable.<sup>116</sup>

The winter of 1792-93 produced excessive moisture in *France*.<sup>79</sup>

The night of 6 December 1792 will long be remembered as one of the stormiest nights in *England*.<sup>128</sup>

---

**1793 A.D.** A severe drought struck Philadelphia, Pennsylvania in the *United States* in September. Lakes, streams, springs and wells, that had never been known to be dry, were then without water. Individuals in the country hauled water from the Delaware and Schuylkill Rivers in casks up to twenty miles. The earth was literally like powder and dust, except clay land, which baked as hard as a pine board.<sup>1</sup>

In Whitehaven, *England* in March, there was a storm, which did great damage, when the tide rose six feet above its usual height.<sup>41, 43, 56</sup>

A great storm struck *England* in the night of the 2<sup>nd</sup> of March 1793. It destroyed one of the towers at Sheffield manor.<sup>59</sup> [Sheffield manor is located in Sheffield, South Yorkshire.]

A violent storm of hailstones, which measured 3½ inches in circumference, struck *Jamaica* on April 25, 1793.<sup>41</sup>

In 1793 in *France*, a cold and rainy spring suddenly was followed by excessive prolonged heat. The violent heat of summer was abruptly replaced by very severe winter-like weather. The [grape] vines especially suffered and they froze, in all of *France* on the night of 30 to 31 May 1793. This caused an almost dearth of wine.<sup>79</sup>

The summer of 1793, despite its dryness, spawned five or six disastrous storms in *France*. A thunderstorm with hail prematurely appeared on the 1<sup>st</sup> and 2<sup>nd</sup> of May. A series of thunderstorms succeeded each other in July on the 8<sup>th</sup>, 9<sup>th</sup>, 10<sup>th</sup>, 13<sup>th</sup> and 17<sup>th</sup>. Thunder, wind, hail and floods ravaged the land, destroyed the crops, toppled buildings, and damaged the herds of livestock. On July 8<sup>th</sup> at Blincourt, near Senlis, there were hailstones as large as eggs. The wind brought down over 120 houses, and the floods carried away the cattle, furniture, women and children. At Puisieux, above Chambly, flash flood waters beyond 6.6 feet (2 meters) forced the inhabitants to flee in haste over the roofs of their houses. The ravages of this storm desolated in a similar manner, in less than twenty-five minutes, the cities and villages of Maïssel, Bougueval [now Bougival], Ermis, Neuilly-en-Thelle, Dieudonne, Foulangues, etc. The storm of July 10<sup>th</sup> produced hail and rain in the suburbs Ablon and Corbeil [of Paris]. The storm of July 17<sup>th</sup> headed to the north and destroyed the crops from Saint Denis to Saint-Germain-en-Laye.<sup>79</sup> [Blincourt is near Senlis and near Paris. Puisieux, above Chambly is in northern *France*. Neuilly-en-Thelle is in northern *France*. Dieudonne is in the Picardy area in northern *France*. Foulangues is in northern *France*.]

The summer of 1793 was very remarkable for the extraordinary heat, which was without precedence since the last century. The heat came in July and August. The summer in Paris, *France* was characterized by:

Hot days	36 days
Very hot days	9 days
Extremely hot days	6 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Valence, <i>France</i>	(104.0° F, 40.0° C) on 11 July
Paris, <i>France</i>	(101.1° F, 38.4° C) on 8 July
<i>Ibid.</i>	( 99.1° F, 37.3° C) on 16 August
Chartres, <i>France</i>	(100.4° F, 38.0° C) on 8 August
<i>Ibid.</i>	(100.6° F, 38.1° C) on 16 August
Verona, <i>Italy</i>	( 96.1° F, 35.6° C) in July and August
London, <i>England</i>	( 89.1° F, 31.7° C) on 16 July

In addition to the intense heat of the summer, the year held other strange weather events. In *France* in May and June of 1793, the weather was moist and cloudy and it rained often. The temperature remained cool. During these two months many homes were heated with indoor fires. In Vienna, *Austria*, between 30 May and 5 June there was extraordinary cold. There was snowfall on the mountains. Towards the end of June, heavy wagons could cross on the frozen Enns River in *Austria*.<sup>62</sup>

The great heat began on 1 July in Paris, *France* and grew very quickly. The sky was stable during that period, blue, clear and without clouds, the wind was always north, mostly it was calm and the barometer remained at a very strong low. The hottest days were on 8 and 16 July. On 8 July, the sky began to cloud up and rain and thunder rolled in. On 9 July at 4:30 in the afternoon, a terrible storm devastated Senlis, *France* and its surroundings. Hail the size of eggs destroyed the crops. Violent winds knocked over more than 120 homes. A tremendous rainstorm followed. Water collects in the fields and tore away animals, men, women and children. In Bonneval, *France*, an unhappy mother after her strength was exhausted was carried away by currents of water. This occurred after they had rescued her nine children. The National Assembly provided disaster relief of 30,000 livres. Later in a meeting of 8 August, it was decided that the Minister of the Interior should provide 6 million livres to support the owners of the devastated estates.<sup>62</sup>

In *France*, the heat was very great during the whole month of July and a good part of the August. On 7 August, the heat was particularly remarkable; overwhelming, and clear skies. The wind from the northeast felt so burning hot that they seemed to come from a brazier, or from the mouth of a limekiln. Even in the shade it was so hot, as if directly exposed to the scorching rays of the sun. In all the streets of Paris, *France*, the heat was painful, and this effect was also in the countryside as well. This stifling heat paralyzed respiration, and 7 August was felt more painful than on 8 July, when the thermometer had risen to 101.1° F (38.4° C). Even though on 7 August, the thermometer had only risen to 97.3° F (36.3° C). This was because of the suffocating state of the atmosphere.<sup>62</sup>

In Valence, *France* the heat came on very suddenly. The temperature readings in the shade were: 97.7° F (36.5° C) on 7 July; 99.5° F (37.5° C) on 8 July; 102.9° F (39.4° C) on 9 July; 101.8° F (38.8° C) on 10 July; 104.0° F (40.0° C) on 11 July; 101.8° F (38.8° C) on 12 July; 93.9° F (34.4° C) on 13 July; 99.5° F (37.5° C) on 14 July; 92.8° F (33.8° C) on 15 July; 91.6° F (33.1° C) on 16 July; 100° F (37.8° C) on 17 July; and 90.5° F (32.5° C) on 18 July. From 13 June, no rain fell in this area of *France*. The soil was so dry that most low growing plants and even many young trees were destroyed.<sup>62</sup>

This pernicious heat stretched across *France* and a great part of *Europe*. The wind was blowing fairly constant in the direction from north to south, the sky was completely pure and clear. Although the sun was burning hot, the edges were still without undulation, and it was during the whole time of the heat wave that no spots were observed on its disk [no sunspots].<sup>62</sup>

The drought was visible in the end of July. The water level of the Seine River in late August and mid-September fell to its lowest level duplicating the year 1719. In Paris, *France* the annual rainfall was measured as only 331 millimeters (13 inches). In the countryside, the chestnut, apple, nut and cherry trees, the hazels, the honeysuckle, and the grapevines had burnt leaves. The fruits were scarred by the heat. The lack of vegetables was very noticeable; and when they could be found in the marketplace, rose to enormous prices. The parched, cracked earth became so hard that it could not be turned by a plow or a spade. In the garden of the Luxembourg castle showed the soil to lack the slightest trace of moisture to the depth of a meter (39 inches). [There is a Luxembourg palace in Paris.] Diggers charged with digging a new well in a very exposed place to the sun's heat, found the soil dry to a depth of 1.6 meters (63 inches). On 1 September, the trees of the Royal Palace were almost completely stripped of their leaves. One hundred and fifty of these trees were quite bare. They were cracked by the drought and the heat; and the bark and the branches seemed dead.<sup>62</sup>

In *Jamaica* on 2<sup>nd</sup> of July, hailstones as large as pigeon's eggs.<sup>57</sup>

On 2 July 1793 in *Jamaica*, there was a hailstorm. Hailstones were as large as pigeons' eggs.<sup>93</sup>

At Savannah la Mar, in *Jamaica*, hailstones as large as pigeons' eggs fell on June 2.<sup>41, 43, 56</sup>

At Thornton, in Leicestershire *England* on August 3, there was a hailstorm. The hailstones measured from 4 to 6½ inches in circumference, and did great damage.<sup>41, 43, 56</sup>

On 7 August 1793 in *England*, there was a hailstorm in Leicestershire.<sup>93</sup>

On 13-16 August 1793, a hurricane struck the *Virgin Islands* causing 28 deaths. [*The London Times* reported the loss of 28 of 42 slaves, with additional loss of some crew on board the *Bristol*. *Lloyd's List* indicates only 10 men saved during a period when slaves were sometimes not included in the statistics. In addition, *Lloyd's List* indicates, "Three vessels, from Africa with slaves, are lost [lost] in the West Indies, in the late Hurricane."]<sup>141</sup>

In August 1793, considerable damage was done by a hurricane at St. Christopher's [St. Kitts] in the *West Indies*. On the evening preceding the storm, there were near thirty sail at anchor in the roads, but in the morning none were to be seen, except those stranded at different places along the coast.<sup>146</sup>

In Paris, *France*, at 11 o'clock in the morning on 17 August, a terrible storm rose up that lasted until midnight. The wind was blowing from the southwest and during the entire time with unprecedented ferocity. Several makeshift stalls, which were on the bridges of Paris, were overturned and many trees suffered greatly from wind damage.<sup>62</sup>

In 1793, the rains in New South Wales, *Australia* came too late to save the corn. August wheat was quite yellow.<sup>103</sup>

The drought of 1793 in *France* lasted four months. The first two months occurred in May and June and were characterized by severe cold. The last two months, July and August, were characterized by fiery heat.<sup>79</sup>

The heat in the year 1793 broke out suddenly. The months of May and June were very cold. The temperatures were cold enough to freeze ice during these two months; a lot of snow fell on the Alps and other mountains. In Lower *Austria*, fully loaded carts cross a frozen river at the end of June. The great heat began in Paris, *France* on 1 July; and at Montmorency, *France* after 4 July. The temperature increased so rapidly that by the 8<sup>th</sup> it was already producing peak temperatures. The maximum heat

observed was 101.1° F (38.4° C) on July 8 at the Royal Observatory of Paris, *France* and 104° F (40° C) on July 16 at the Observatory to the Navy [this observatory was located in the Hotel de Cluny in Paris]. During the hot weather, the wind remained to the north, the sky was almost always beautiful, clear and cloudless, and the barometer was kept constant. Less than four times in August was the barometer reading over 758 millimeters.<sup>79</sup>

This summer in *France* produced very hot, very dry days punctuated by violent thunderstorms. The weather was heavy and oppressive. The temperature differed little from day to night and morning to evening. Objects exposed to the sun warm to such a degree that they were hot to the touch. Men and animals died of asphyxiation. Vegetables and fruits were roasted and eaten by the caterpillars. Furniture and woodwork creaked and doors and windows buckling. Meat, freshly killed, spoiled quickly. Individuals suffered from incessant sweating of skin. The human body swam continuously in a bath of sweat, which was very inconvenient. Some individuals were becoming macerated. [Maceration of the skin occurs when it is consistently wet. The skin softens, turns white, and can easily get infected with bacteria or fungi.] These effects primarily became visible on July 7<sup>th</sup>. The north wind came and made this day so extraordinary hot that air seemed to exhale a fiery inferno or mouth of a limekiln. The heat was stifling, ruled by a very clear sky. The heat came in intermittent bursts, and produced an impression even in the shade equal to an exposure to the most ardent rays of the sun. It is felt with equal intensity in all the streets of Paris and the countryside. The heat took away the breath and produced extreme exhaustion. Even when the temperature reached 104° F (40° C) on July 16 it could not compare to what was felt on July 8<sup>th</sup>. The high temperature of this summer ended during the evening of August 17 by the arrival of a terrible storm that lasted all day.<sup>79</sup>

In Verona, *Italy*, the heat from the sun when the temperature reached 96.1° F (35.6° C) was so suffocating that many reapers were killed in the field.<sup>62</sup>

In Burgundy, *France*, the grape harvest began on 23 September. The wine was plentiful, but of mediocre quality. A cold rainfall struck which harmed the quality of the wine. In the area around Toulouse, the summer was dry and hot and the harvest of maize was entirely destroyed. The year of 1793 was known as a year of extraordinary scarcity in *France*.<sup>62</sup>

In 1793 during the period between 5 February and 6 May, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at Ch'ing-p'u and Kweichow (now Guizhou province) in southwestern *China* at Kuei-ting. At Kuei-ting, houses were damaged by the floodwaters. Also during the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Pao-ting, Tung-kuang and Ta-ming. During the period between 12 March and 9 May, a drought engulfed Kwangsi (now Guangxi province) in southern *China* along the border with *Vietnam* at Lu-ch'uan. During the period between 10 May and 7 June, floods struck Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang and Hupeh (now Hubei province) in central *China* at Sui and Huang-an. During the period between 7 August and 4 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hai-yen and Hopei province at Ta-ming. At Hai-yen, houses were damaged by the floodwaters. Also during the period between 7 August and 4 September, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tê-p'ing.<sup>153</sup>

---

**Winter of 1793 / 1794 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1793 occurred on 29 October. It snowed all day; very cold.<sup>116</sup>

During the winter of 1793-94, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 81 days.<sup>202</sup>

The winter of 1793-94 in *France* was almost as rigorous as the winter of 1788-89.<sup>79</sup>

Almost universally throughout *Great Britain* on January 16, storms struck and did great damage.<sup>41, 43, 56</sup>

---

**1794 A.D.** In March 1794 a tornado swept through the southwestern part of Bradford County, extending into Sullivan County, Pennsylvania in the *United States*. It cut a path a mile [1.6 km] in width and left scarcely a tree standing.<sup>178</sup>

On 3 June 1794 in *England*, there was a great hailstorm in Berkshire.<sup>93</sup>

On 11 & 12 June 1794 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 19 June 1794, a tornado struck New England in the *United States*. It passed through Poughkeepsie, New York and then the towns of New Milford, Newtown, Watertown, Waterbury, Northford and Branford in Connecticut. Those persons who were carried up by the wind into the cloud and yet escaped with their lives said that it was very dark as night during the three or four minutes they were in it, and that the noise was deafening and awful. The tornado left a path of destruction. Houses, barns, and other buildings were blown to pieces, a number of cattle killed, and several human lives were lost. Strong oaks, sturdy maples and elastic walnuts were torn up by the roots or twisted off leaving stumps from 3 to 15 feet [0.9-4.6 meters] in height.<sup>199</sup>

On 22 June 1794, a violent tornado struck New Milford, Connecticut in the *United States*.<sup>174</sup>

On 27 June 1794, a hurricane struck *Jamaica*. The Prize Ships from St. Domingo to Jamaica, met with a severe gale of wind, one of which was totally lost near Kingston.<sup>141</sup>

On 6 July 1794 in *England*, there was a great hailstorm at Albourne (Wilts). Some of the hailstones that fell measured 5 inches in circumference.<sup>93</sup>

On 6 July 1794, a violent storm of thunder and lightning did great damage in the country [*England*].<sup>128</sup>

On 30 July 1794, a hurricane struck *Jamaica* and lives were lost.<sup>141</sup>

In 1794 the month of July was very hot in Paris, *France*. In Burgundy, *France*, there was intense heat and frequent rains. The grape harvest began early, on 15 September. The wine was plentiful and of pretty good quality. The highest temperature was observed in Verona, *Italy* in July at 93.2° F (34.0° C); in Paris, *France* on 30 July at 86.9° F (30.5° C); and in London, *England* on 13 July at 84.0° F (28.9° C).<sup>62</sup>

On 7 August 1794 in London, *England*, there was a great storm of rain and hail, causing much damage.<sup>93</sup>

On 27-28 August 1794, a hurricane struck *Cuba* causing more than 100 deaths.<sup>141</sup>

In *Great Britain* on the 6<sup>th</sup> of October, there was a great storm, which prevailed throughout; several hundred sail of shipping destroyed.<sup>57, 90</sup>

A most violent storm occurred on the eastern coast of *England*, when much damage was done to the shipping on October 6<sup>th</sup>.<sup>41, 56</sup>

A most violent storm of rain in Norfolk, *England* in November, inundated many towns, particularly Norwich.<sup>41, 43, 56</sup>

A most violent storm struck Cumberland in northwestern *England* on December 2, 1794.<sup>41</sup>

In 1794, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

In 1794 during the period between 31 March and 28 April, floods struck Shantung (now Shandong province) on the east coast of *China* at Wu-ch'êng; Hopei (now Hebei province) in northern *China* at Pao-ting, Li and Fu-ning; and Hupeh (now Hubei province) in central *China* at Hsiang-yang, Kuang-hua, I-ch'êng and Huang-an. Also during the period between 31 March and 28 April, a drought engulfed Shantung province at Wên-têng and Jung-ch'êng. During the period between 8 August 1794 and 5 February 1795, a drought engulfed Shantung province at Huang.<sup>153</sup>

---

**Winter of 1794 / 1795 A.D.** *Scotland* was pounded by a massive snowstorm. In one single night, snow fell to the depth of eight or ten feet (2.4-3.0 meters), and in some places the loftiest trees were entirely covered. By this one night's storm seventeen shepherds lost their lives, and thousands of sheep, besides other animals were destroyed. One farmer alone lost fourteen hundred sheep. After the storm had somewhat disappeared; there were found collected together (by its violence) in one spot, the dead bodies of two men, one woman, forty-five dogs, three horses, nine black cattle, one hundred and eighty hares, and one thousand eight hundred and forty sheep.<sup>30</sup>

A London newspaper said that on 1 January 1795, the cold was so intense in *England*; that the River Thames froze over in ten minutes while the tide was turning.<sup>1</sup>

In 1795 in Paris, *France*, there were 42 days of frost.<sup>58, 80</sup>

The cold and snow of 1795 killed the olive trees in *France*. In Montpellier, it froze continuously from January 15 to 26. The coldest day was on January 17<sup>th</sup> when the temperature dropped to 15.8° F (-9° C). In Paris, the thermometer was -10.3° F (-23.5° C) on January 25, and there was forty-two consecutive days of frost.<sup>79</sup>

During the winter, the Seine River in *France* was frozen at the Bridge "Pont de la Tournelle" in Paris from 25 December 1794 until 28 January 1795. Wagons drove near Liege, *Belgium* on the Meuse River. The Zuiderzee was frozen and the sound was ice covered.<sup>62</sup>

[One source lists this winter as 1795-96] During the winter of 1795-96 in *England*, the winter was very severe; Thames frozen. The Antiquarian Society of Newcastle recorded that the ice on the Tyne was 20 inches thick.<sup>47, 93</sup>

[In *England*] there was a frost from 24 December 1794 to 14 February 1795 with the intermission of one day's thaw that occurred on 23 January 1795.<sup>90</sup>

There were great floods throughout *England* caused by the melting snow in February 1795. A great part of the bridges were either damaged or destroyed.<sup>41, 43, 56</sup>

The winter of 1794-95 in *Europe* was remarkably long and severe. In Paris, *France*, there were 42 frost days in succession. On 25 January, there was the greatest cold ever seen in Paris. The thermometer dropped to -10.3° F (-23.5° C). In London, *England*, the lowest temperature on the same day was 8.0° F (-13.3° C). On the banks of the Rhône River, near Geneva, *Switzerland* at midnight the temperature fell to 6.8° F (-14° C). The Main, the Scheldt, the Rhine and the Seine rivers were frozen so thick, that they were crossed by wagons and army detachments in several places. The Thames River, despite the height of the floodwaters in the first days of January, froze in the neighborhood of White Hall in London, *England*. The French General Jean-Charles Pichegru sent a detachment of cavalry and light artillery into

North *Holland* on 20 January, with orders directing the cavalry to travel to Texel, to approach the warships frozen at anchor, surprised Holland [now *the Netherlands*] and take possession of them. The French cavalry sat at a gallop on the ice, came to the ships, they called for their surrender, and took possession of them without a fight and the marines took prisoners. In the south of *France* and *Italy*, the winter was severe, and the cold lasted until the beginning of spring. The thaw caused great flood damage, especially on the banks of the Rhine River.<sup>62, 70</sup>

It is said that in the year 1795, that the King of Denmark came to Venice, *Italy* and froze the Lagoons.<sup>81</sup>

---

**1795 A.D.** In Retford, Nottinghamshire, *England*, there were great floods, which caused much damage to the town; and in other parts of the country caused by the melting of snow.<sup>47, 92</sup>

On 26 February 1795, there was an awful storm of wind and rain at Norfolk Island, *Australia*. Large pines 180 to 200 feet (55 to 61 meters) in height and 20 to 30 feet (6 to 9 meters) in circumference were blown to the ground.<sup>103</sup>

In 1795 in New South Wales, *Australia*, there was 5 feet less water at Windsor in April than in February, owing to the previous dry weather since August 1794.<sup>103</sup>

On 18 May 1795 in *England*, there was a great hailstorm in Essex.<sup>93</sup>

In June 1795 in *England*, there was a great hailstorm in Wiltshire. This storm caused a great number of newly shorn sheep to perished from the cold to which they were exposed. The storm also struck Herefordshire and Middlesex, *England* and Monmouthshire, *Wales*.<sup>93</sup>

On 12 June 1795 in *England*, there was a hailstorm in Essex and Herts [abbreviation for Hertfordshire], which suffered severely.<sup>93</sup>

In Essex and Herts, *England* on 12<sup>th</sup> of June, there was a storm of hail, which did great damage.<sup>41, 57</sup>

On 2 August 1795, a hurricane struck North Carolina and Virginia in the *United States*. A fleet of eighteen Spanish ships, sailing from Havana, Cuba to Spain, was struck off Cape Hatteras, North Carolina, and some of these ships were lost. A ship sank off Cape Charles, Virginia, with a total loss of life.<sup>141</sup>

On 5 August 1795 in *England*, there was a hailstorm in Lancashire.<sup>93</sup>

On 21 August 1795 in *England*, there was a hailstorm in Surrey.<sup>93</sup>

In *England* in 1795, the scarcity of food was severely felt.<sup>57, 91</sup>

In 1795, there was a very severe famine felt in *England*.<sup>90</sup>

A storm struck different parts of *England*, particularly in the Channel and in London on November 4, 1795.<sup>41</sup>

During the period between 8 August 1794 and 5 February 1795, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Huang. Then in 1795 during the period between 5 February and 6 May, a drought engulfed Shantung province at Tsou-p'ing, Shou-kuang, Ch'ang-yüeh and Chu-ch'êng. During the period between 17 June and 15 July, a drought engulfed Shantung province at P'êng-lai, Huang, and Ch'i-hsia; and Chekiang (now Zhejiang province) on the east coast of *China* at

Chiang-shan and T'ang-ch'i ["Ch'i-t'ang", possible that the word order is inverted]. Also during the period between 17 June and 15 July, floods struck Chekiang province at Li-shui; Kiangsi (now Jiangxi province) in southern *China* at Yü-shan and Fên-i; and Hupeh (now Hubei province) in central *China* at Ch'ien-chiang, Mien-yang and Sung-tzū. At Sung-tzū, the dikes were damaged. During the period between 8 August and 8 November, a drought engulfed Shantung province at Wên-têng.<sup>153</sup>

On 19 January 1796, the fleet of Admiral Christian returned to port, having suffered storms for a month. They sailed with 200 sails, but returned with only fifty.<sup>128</sup> [Admiral Hugh Christian set sail from *England* to the West Indies in November 1795. The storm struck the English Channel on 18-19 November 1795].

---

**1796 A.D.** On June 7, a storm at Petersburg, *England*, destroyed upwards of 90 vessels and a large magazine of naval stores.<sup>41, 43, 56</sup>

On 16 June 1796 in *England*, there was a hailstorm in Lancashire.<sup>93</sup>

The summer of 1796 was, especially in Burgundy, *France*, cold and rainy. The grapes were harvested on 7 October. The yield was very low, and the quality of the wine poor. The maximum temperature in Paris, *France* did not rise above 85.1° F (29.5° C). In the south, however, the summer was dry and warm, as well as during a large part of autumn.<sup>62</sup>

In October, the *Bahama* Isle received immense damage among the shipping by a storm.<sup>41, 56</sup>

On 5 November 1796 in *England*, there was a severe hailstorm at Norwich, which appeared impregnated with lightning. "An awful and singular hailstorm occurred at Norwich. Two very vivid flashes of lightning illuminated the southern and northern hemispheres, succeeded by heavy peals of thunder, while the hail, which fell profusely, appeared impregnated with fire."<sup>93</sup>

In December 1796, there was a heavy hailstorm or fall of ice on the Hawkesbury River in *Australia*. The produce of four farms were completely destroyed; some of the frozen flakes [hailstones] found on the second day were 8 inches in length.<sup>103</sup>

In 1796 during the period between 5 February and 6 May, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at P'u-chiang. During the period between 6 May and 8 August, a drought engulfed Shensi (now Shaanxi province) in central *China* at Lo-ch'uan and Hêng-shan. During the period between 5 June and 4 July, a drought engulfed Hupeh (now Hubei province) in central *China* at Ku-ch'êng and Ma-ch'êng. During the period between 8 August and 8 November, a drought engulfed Hopei (now Hebei province) in northern *China* at Chi. [Chi is located at longitude 117.24° East and latitude 40.03° North.]<sup>153</sup>

---

**Winter of 1796 / 1797 A.D.** 25 December 1796 was remembered as the most severe (coldest) day in the memory of man.<sup>2, 41, 42</sup>

In December 1796, the temperature [in London, *England*] fell to 5° F (-15° C).

During all of December 1796, there were intense frosts [in *England*].<sup>90</sup>

On 3 January 1797, Bois-le-Duc, in Holland [now *the Netherlands*] was inundated.<sup>128</sup>

---

**1797 A.D.** In 1797 in New South Wales, *Australia*, there were heavy brush fires in January. Flinders and Bass experienced signs of drought at Bateman's Bay and Western Port.<sup>103</sup>

In London, *England* on the 6<sup>th</sup> of May, hailstorm; did great damage to the gardens round Metropolis.<sup>57</sup> The stones measured 1½ inches in circumference.<sup>41, 43, 56</sup>

On 6 May 1797 in London, *England*, there was a hailstorm that did great damage in the suburbs; and on the same day at Lewes (Sussex).<sup>93</sup>

On 5 June 1797 in *England*, there was a severe hailstorm.<sup>93</sup>

In Lewes, (Sussex) *England* on the 5<sup>th</sup> of June, there was another hailstorm; stones weighed from 4 to 7 ounces.<sup>57</sup> The hailstones measured 3 inches in circumference and some weighed three ounces.<sup>43, 56</sup>

On 5 August in *England*, there was a hailstorm in Sussex.<sup>93</sup>

Major storms reigned in *France* in 1797.<sup>79</sup>

In 1797 during the period between 26 May and 24 June, a drought engulfed Hupeh (now Hubei province) in central *China* at Chiang-ling.<sup>153</sup>

In 1797, floods struck many regions of *China* including:<sup>153</sup>

— During the period between 25 June and 23 July, floods struck Hopei (now Hebei province) in northern *China* at Liang-hsiang, Tientsin, Ching-hai, Ch'ing and Ts'ang; Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin; and Shantung (now Shandong province) on the east coast of *China* at Tung-p'ing.

— During the period between 22 August and 19 September, floods struck Hopei province at Yüeh-t'ing; Chekiang (now Zhejiang province) on the east coast of *China* at Yüeh-ch'ing [possibly a misprint, "Li-ch'ing"]; and Kiangsi (now Jiangxi province) in southern *China* at Ning-tu. At Ning-tu, 20,175 house-sections were damaged by the floodwaters and 4,392 persons were drowned.

**Winter of 1797 / 1798 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1797 occurred on 17 November. Exceeding cold for the season; snowed considerably.<sup>116</sup>

**1798 A.D.** In Halifax, Nova Scotia, *Canada*, on September 25, a storm did 100,000*l.* damage.<sup>41, 56</sup>

The spring and summer of 1798 were very hot and dry in the south of *France*. The harvest was very satisfactory having been spared from the hailstorms. The fruit was plentiful and of excellent quality. The summer in Burgundy was also hot and favorable. The grape harvest began on 15 September. The yield was low, but of excellent quality. The highest temperature was observed in Paris, *France* on 1 August at 90.9° F (32.7° C); and in London, *England* on 28 June at 86.0° F (30.0° C).<sup>62</sup>

In 1798-99, there was a severe drought in *Australia*. The drought destroyed the wheat and maize crops.<sup>101</sup>

In 1798 in New South Wales, *Australia* in September, the pastures and gardens needed rain. There were brush fires in December. The thermometer read 107° F (41.7° C) in the shade at Windsor.<sup>103</sup>

In 1798 during the period between 6 May and 8 August, floods struck Hupeh (now Hubei province) in central *China* at Ao-ch'êng and Hopei (now Hebei province) in northern *China* at Wên-an. During the period between 16 May and 13 June, a drought engulfed Hupeh province at Huang-an. During the period between 14 June and 12 July, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Ch'ing-p'u. During the period between 13 July and 11 August, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Wên-têng and Jung-ch'êng.<sup>153</sup>

**Winter of 1798 / 1799 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1798 occurred on 2 November. Last night it snowed a good deal.<sup>116</sup>

The Delaware River near Philadelphia, Pennsylvania in the *United States* was closed by ice from 22 January until past the middle of March.<sup>1</sup>

In the *United States*, the winter was known as the Long Winter of 1798-99. The winter began in New York City on 20 November 1798 when 18 inches (0.5 meters) of snow fell on New York City. Up to 3 feet (0.9 meters) of snow fell over the interior of New England. Rough, wintery weather struck over the next 5 months. On the second week of March 1799 there were 3 feet (0.9 meters) of snow on the ground in Washington County, Pennsylvania near Pittsburg. At the same time, there were 5 feet (1.5 meters) of snow covered the ground near Lake Erie. Snowflakes continued to fall in April and May in New England.<sup>27</sup>

The winter of 1798-99 in New England in the *United States* was long and severe. On 17 November 1798, a severe snowstorm struck the region. The storm came to an end 5 days later. The storm blew with the force of a gale. Great quantities of snow fell during the storm. All the roads were impassible afterward. Mail carriers had to resort to riding through the fields. Many houses were so deeply buried by the snow that the families, which lived in them, found it difficult to escape without tunneling through the drifts. The storm caused considerable damage along the coast. Many vessels were wrecked on the Cape, and seven of them were broken to pieces and all onboard perished.<sup>199</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

In 1799 the temperature in Florida in the *United States* was very low.<sup>115</sup>

In 1798 in Paris, *France*, there were 32 days of frost.<sup>58, 80</sup>

The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1798-99, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

During the winter, the Seine River in *France* was frozen at the Bridge "Pont de la Tournelle" in Paris from 29 December 1798 until 19 January 1799. The Rhine River and the Meuse River were also frozen.<sup>62</sup>

The winter of 1798-99 in *Europe*, produced severe cold weather. In Paris, *France*, there were 32 frost days in succession. The Seine River was frozen completely from 26 December 1798 to 19 January 1799 from the Pont de la Tournelle to the Pont Royal. On 9 January, a man tried to cross the river near Pont-Neuf but the ice gave way under his feet and he fell into the water. The lowest temperature observed, was on 10 December 1798 at 0.3° F (-17.6° C). The Meuse, the Elbe and the Rhine rivers were frozen solid as the Seine River. On the Meuse River, carriages rode across on the ice. At The Hague and at Rotterdam in *the Netherlands* stalls and all sorts of plays were set up on the ice [frost fair]. At Mainz (Mayence) *Germany*, the Dragoon Regiment crossed the frozen Rhine River on the ice, because the bridge between Mainz-Kastel (Wiesbaden, *Germany*) had been destroyed. In all of Liguria, *Italy* the weather was very severe. It froze all the rivers and destroyed the orange trees. In *Provence*, the olive trees were severely damaged. In Languedoc, the cold destroyed a "great portion of the seed."<sup>62, 70</sup>

---

**1799 A.D.** In France there was a flood. On 4 February 1799, the Seine River in Paris, *France*, at the bridge "Pont de la Tournelle" reached a height of 6.97 meters (22.9 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

In March 1799 in *Australia*, the Hawkesbury River flooded. Animals and stacks of wheat were swept away. One man drowned. Many settlers spent the night clinging to their roofs of their homes.<sup>101</sup>

In March 1799, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 50 feet (15.25 meters) above the water mark at Windsor. The whole village at the site of what is now Windsor was washed away. Because this was the colony's major farming center, the flood caused great shortages and hardship.<sup>99, 109</sup>

On 18 March 1799, the river, by great land floods, overflowed at Bath, *England*.<sup>128</sup>

After the severe winter of 1798-99, the summer of 1799 in Burgundy, *France* was rainy and cold. The grape harvest began late on 10 October. The yield was plentiful, but the wine was only of very mediocre quality. Nonetheless there was in the south after a rainy spring, hot days. In Paris, the maximum temperature occurred in August when it rose to 86° F (30° C).<sup>62</sup>

On 15 July 1799, a destructive hailstorm struck Connecticut in the *United States*. The storm passed over Litchfield County, crossed the Connecticut River near its mouth, and then struck Lebanon, Bozrah and Franklin. As the hailstorm hit, it sounded like bricks being thrown upon the roofs of houses. The hailstones measured from 2 to 3 inches [5-8 centimeters] in diameter, and from 4 ¼ to 6 inches [11-15 centimeters] in circumference. Banks of hail 5 or 6 inches [13-15 centimeters] deep remained on the ground a week later. The hail not only destroyed the windows but also the sashes. The shingles of the roofs were split and broken off. Crops and trees were destroyed. Some pigs, four months old, and a number of sheep were killed by the hail. Geese, turkeys and other domestic fowls met the same fate. Many birds were found dead in the fields and gardens. Some cows were so wounded that their backs were bloody.<sup>199</sup>

On 16 August 1799 in *England*, there was a great hailstorm in Gloucestershire and Somersetshire.<sup>93</sup>

On 23 September 1799, a hurricane struck offshore *Jamaica* causing 27 deaths.<sup>141</sup>

In 1799 in Hindostan [variant of Hindustan], there was a famine in the district of Midnapore [West Bengal, *India*].<sup>91</sup>

In early 1799, there was considerable distress due to scarcity in the district of Dindigul in the state of Tamil Nadu, *India*.<sup>188</sup>

In 1799 during the period between 6 March and 4 April, floods struck Hopei (now Hebei province) in northern *China* at Li. During the period between 6 May and 8 August, a severe drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chiang-shan. During the period 1-30 August, floods struck Shantung (now Shandong province) on the east coast of *China* at Ch'ang-ch'ing.<sup>153</sup>

In 1799 in New South Wales, *Australia*, there were bushfires; drought; the grass burnt up and cattle were in great distress.<sup>103</sup>

---

**Winter of 1799 / 1800 A.D.** In January snow fell over most of the *United States*, including the Carolinas, Georgia and New Orleans. There was a great scarcity of fuel, and much suffering among the poor.<sup>1</sup>

In 1800, the weather in South Carolina and Georgia in the *United States* was uncommonly cold. During the beginning of the year in January and February, there were several snowfalls. The grounds of the lower country were covered six inches with snow and those in the upper country were two or three feet

deep. In the upper country, the snow lay several weeks. Sleet, at this time, loaded the trees with ice, from Broad river toward the Savannah, a space of 10 or 15 miles, and made great devastation of the forests. A letter from Savannah, dated 11 January, states that the evening before, there was “a heavy fall of snow and a severity of cold never before known” in that state; and that “the depth of snow was from two to three feet.” A letter from Midway, Georgia dated 17 February indicated the snow had been three feet deep in some places and from 16 to 18 inches deep on the level.<sup>174</sup>

In the *United States*, early settlers routinely waited till winter to cross the frozen Mississippi River in their wagon trains. In 1799, George Frederick Bollinger led a group of early pioneers from North Carolina to establish early settlements in Missouri. They hoped to cross their largest obstacle, the Mississippi River, on the ice, frozen solid in mid-winter. They arrived on the east bank of the Mississippi River opposite St. Genevieve in late December, pitched camp and explored potential river crossings. St. Genevieve is located about a hundred miles downstream from St. Louis. Daily the thickness of the ice was measured and then on December 31, a chopped hole in the ice indicated thickness well over two feet (0.6 meters). The next day the settlers successfully drove their heavy loaded wagons across the river.<sup>15</sup>

During the winter of 1799-1800, the Seine River in *France* was frozen at the Bridge “Pont de la Tournelle” in Paris from 21 December 1799 until 14 January 1800.<sup>62</sup>

The winter of 1799-1800, there were 49 frost days in Paris, *France*, including 15 in succession, from 19 December 1799 to 2 January 1800. Record lows were observed in Paris on 31 December and on 30 January at 8.4° F (-13.1° C). The Seine River at the Pont de la Tournelle was covered with ice from 29 December 1799 to 14 January 1800. At Moens [now Prévessin-Moëns] in eastern *France* the temperature fell to 8.4° F (-13.1° C) on 1 January. In London, *England* on 31st December the temperature was 17.1° F (-8.3° C). In the *Southern Europe*, the winter was severe only during month of December. The grain was damaged by the December frost, which occurred before the snow fell. The fig trees froze, and most died off.<sup>62</sup>

The winter of 1799 in *France* caused much suffering to olive trees. The cold in Paris, arrived December 31 with a cold temperature of 8.4° F (-13.1° C).<sup>79</sup>

---

**1800 A.D.** In January 1800, there were riots in various parts of *England* on account of the high price of bread. On 15 September, there were again riots in various parts of *England* on account of the high price of bread.<sup>128</sup>

In March 1800, there was a serious flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 40 feet (12.2 meters) above the water mark at Windsor. This was at the same site as the flood a year earlier. Again, crops and the whole village were washed away. After this flood, the settlement was moved to the current location of the city of Windsor.<sup>99, 109</sup>

In *China*, there were great floods.<sup>41, 43, 47</sup>

The summer of 1800 was remarkable for very high heat, which extended over a large part of *Europe*. Between 6 July and 21 August, the temperature in Paris, *France*, five times reached 90.3° F (32.4° C). The summer in Paris was characterized by:

Hot days	25 days
Very hot days	5 days
Extremely hot days	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The temperature in Paris was: 88.5° F (31.4° C) on 3 August; 88.7° F (31.5° C) on 4 August;

89.4° F (31.9° C) on 11 August; 84.2° F (29.0° C) on 12 August; 84.0° F (28.9° C) on 13 August; 86.0° F (30.0° C) on 14 August; 94.3° F (34.6° C) on 15 August; 90.7° F (32.6° C) on 16 August; 97.9° F (36.6° C) on 17 August; 95.9° F (35.5° C) on 18 August; 82.2° F (27.9° C) on 19 August; and 80.8° F (27.1° C) on 20 August.

The high temperatures observed during the summer were:<sup>62</sup>

Island of Philae, <i>Egypt</i>	(109.6° F, 43.1° C)
Bordeaux, <i>France</i>	(101.8° F, 38.8° C) on 6 August
Nancy, <i>France</i>	(101.8° F, 38.8° C) on 18 August
Rouen, <i>France</i>	(100.4° F, 38.0° C) on 18 August
Montmorency, <i>France</i>	(100.2° F, 37.9° C) on 18 August
Limoges, <i>France</i>	( 99.5° F, 37.5° C)
Paris, <i>France</i>	( 95.9° F, 35.5° C) on 18 August
Moens, <i>France</i>	( 95.0° F, 35.0° C) on 18 August
London, <i>England</i>	( 88.0° F, 31.1° C) on 2 August
Bath, <i>England</i>	( 75.0° F, 23.9° C) on 3 August
Edinburgh, <i>Scotland</i>	( 72.5° F, 22.5° C) on 2 August

The summer of 1800 was extremely dry in northern *France*. This drought began June 15 and grew more severe on June 23. The drought went on doggedly, with a few short rains, until 13 August. From June 5 to August 18 at Montmorency, *France*, there was only 1 inch (26 millimeters) of rainfall. Half of this rainfall came from a single rainstorm. For nearly two months, the prevailing winds came from the north and especially the northeast. The sky was almost constantly serene. Most of the ponds and the sources of water [springs, creeks] dried up. Many plants died. The Seine River [at the bridge “Pont de la Tournelle”] on August 20 dropped to 6.9 inches (176 millimeters) lower than the zero mark [the low water mark of] the year 1719. This river water level was the lowest observed in sixty-eight years.<sup>79</sup>

In *Germany* during the month of April, the weather was very hot. But in July in Düsseldorf in west-central *Germany*, there were frosts. There were terrible droughts in the north, and south. In Montmorency, *France* only 26 millimeters (1 inch) of rain fell from 5 June to 18 August. Many fires began in August. In *France*, an entire village in the forest of Haguenau, a part of the Black Forest, was destroyed by fire. Countless locusts descended on Strasbourg, *France* and nearby districts. On the night of 20 July, lightning struck the old Augustinian convent in Paris, and set it ablaze. Many cases of hydrophobia [rabies] were observed in the south of *France*.<sup>62</sup>

A very rigorous and wet winter of 1800 was followed by a wet spring that was quite cold. Hot dry weather suddenly began May 2<sup>nd</sup>, and stopped almost as abruptly on May 9<sup>th</sup>, and resumed again on June 5<sup>th</sup>. The heat became very lively from July 15 to August 19 with the thermometer generally between 77° F (25° C) and 96.8° F (36° C). The peak temperature was recorded on August 18, with a reading of 95.9° F (35.5° C) at the Royal Observatory, and 99.7° F (37.6° C) at the Naval Observatory in Paris, *France*.<sup>79</sup>

In Burgundy, *France*, the year was rainy and cold. The grape harvest only began on 25 September. The yield of wine was quite insignificant, and only of mediocre quality. This was also the case in the rest of the south of *France*. The grain harvest was poor.<sup>62</sup>

In the year 1800 in Bradford County, Pennsylvania in the *United States* locusts appeared and devoured every green thing before them. At first a worm that worked itself out of the earth in vast numbers appeared. The ground was alive with them. A shell next formed, which after a little time, opened on the back and the locust came out with wings and legs, resembling the grasshopper, but much larger. They soon flew to the trees and bushes in multitudes and devoured the foliage, but passed away the same season. They also swarmed throughout the wilderness in 1795, 1814, 1829 and 1846.<sup>178</sup>

On 10 August 1800, a person by accident set fire to Radnor forest in *Wales*, or sheep-walk; and owing to the weather being dry, it burned for several miles in circumference.<sup>128</sup>

On 14 August 1800, Newberg [Neuburg, *Germany*], in the Palatinate, totally burned; 10,000 acres of forest of Salzburg, *Austria* destroyed by fire.<sup>128</sup> [Neuburg is located in Bavaria in southern *Germany*. Salzburg is in central *Austria* on the northern boundary of the Alps.]

In *England*, there was no rainfall for seventy-four days, when on Tuesday morning, 19<sup>th</sup> August, “a glorious rain came down.”<sup>47</sup>

On 19 August 1800 in *England*, there was a hailstorm in Oxfordshire and Bedfordshire. Irregular pieces of ice fell. Hares and partridges were killed in the fields.<sup>93</sup>

In Oxfordshire and Bedfordshire, *England* on the 19<sup>th</sup> of August, there was a hailstorm at Heyford (Oxen, abbreviation form of Oxfordshire); irregular pieces of ice the size of hen’s eggs fell. In Bedfordshire, the same storm produced hailstones eleven inches in circumference that killed hares and partridges in the fields.<sup>56, 57</sup>

At Heyfords in Oxfordshire, *England* on August 19, 1800, a hailstorm produced irregular pieces of ice the size of a hen’s egg. The same storm did damage to Bedfordshire where hailstones fell of 11 inches circumference and killed the hares and partridges in the fields.<sup>41, 43</sup>

On 19 August 1800, a hailstorm struck *England*. The hailstones consisted of balls of ice that were from six to nine inches in circumference. The storm was 1 ½ miles wide and traveled 15 miles from Fenny Stratford in Buckinghamshire and passed into Bedfordshire.<sup>196</sup>

On 22 August 1800 in *England*, there was a storm of great severity (after a very hot afternoon) at Woburn and other parts of Bedfordshire. Some of the stones measured 9, 10, and 11 inches in circumference.<sup>93</sup>

On 10 September 1800 in *England*, there was a hailstorm in Lincolnshire and Rutland.<sup>93</sup> [Lincolnshire is a county in eastern *England*. Rutland is a county in central *England*.]

On 15 September 1800, there was a great storm of thunder and lightning throughout *England*.<sup>128</sup>

In the *West Indies* in October, there was great destruction from flooding at St. Domingo; 1,400 lives lost.<sup>41, 43, 47, 56</sup>

On 9 October 1800, a hurricane struck the southwest *Atlantic Ocean*. The ship *Galgo* was upset during a squall in latitude 21, longitude 61 West. Twenty-five individuals were saved.<sup>141</sup>

In *England* on the 3<sup>rd</sup> of November, a great storm inflicted serious damage in various parts, and especially in London.<sup>41, 57</sup> [Other sources places this event on 8 November.] On 8 November 1800, a storm did vast damage in London, and throughout almost the whole of *England*.<sup>43, 90</sup>

In the end of the year 1800, the Rhine River in *Germany* flooded.<sup>175</sup>

In 1799-1801, there was a famine in the Bombay Presidency and Madras Presidency in *India*.<sup>156</sup>

In 1800, floods struck Yunnan province in southwest *China* at Chin-ning and Hopei (now Hebei province) in northern *China* at Pa, Ho-chien, Jên-ch’iu, Lung-p’ing and Ting. During the period between 5 February and 6 May, a drought engulfed Hupeh (now Hubei province) in central *China* at Chin-chiang.

During the period between 6 May and 8 August, a drought engulfed Shensi (now Shaanxi province) in central *China* at An-k'ang.<sup>153</sup>

---

**Winter of 1800 / 1801 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1800 occurred on 21 November. Snowed hard all day; storm very severe. November 23, snowed some; believe the snow is a foot deep; very good sleighing.<sup>116</sup>

---

**1801 A.D.** Beginning on 18 March 1801, a 4-day rainstorm pounded New England in the *United States* resulting in a flood. At Groton, Massachusetts, the flood was very severe. In the southeastern portion of Vermont, mills, bridges and other property washed away or were destroyed, valued at more than \$200,000. [In present currency, that would be equivalent to \$3 million in damages based on the Consumer Price Index (CPI) inflation rates.] In Connecticut on the Farmington River, fourteen bridges, seven gristmills, five sawmills, two clothiers' shops and works, one dwelling house, and two barns were carried away and destroyed.<sup>199</sup>

The maximum temperature during the summer in Mons, *Belgium* was 97.3° F (36.3° C) on 15 July.<sup>62</sup>

On 16 July 1801 in *England*, there was a hailstorm in Oxfordshire.<sup>93</sup>

On 22 July 1801, the *Bahama* Isle received immense damage from a storm and inundation.<sup>41, 56, 128</sup>

In December 1801, the Rhône River produced floods at Lyon, *France*. Docks and adjacent streets, the neighborhood of Brotteaux and the suburb of Guillotière disappeared beneath the river. The height of the water on the river reached the water level of the flood of 1756, one of the strongest outbursts. The rainfalls exceed the average annual amount. In particular, Viviers, where this quantity [annual rainfall] equalled 35.8 inches (910 millimeters). 51.3 inches (1,302 millimeters) more fell than had fallen per year in 46 years. The rains of 1801 occurred primarily in the season of autumn. On September 6 at Viviers, 14 inches (356 millimeters) of rain fell in eighteen hours. This is the highest 18-hour rainfall within 46 years of observations.<sup>79</sup>

In Holland [now *the Netherlands*] and *Germany* in November, there was great damage on the seacoast from flooding.<sup>41, 43, 47, 56</sup>

On 21 November 1801, there were inundations on the coast of Holland [now *the Netherlands*] and *Germany*.<sup>128</sup>

On 21 November 1801, there was a great storm in Devonshire, *England* and in the *Baltic*.<sup>128</sup>

A storm struck Devonshire, *England* and the *Baltic* in November.<sup>41</sup>

In the *United Kingdom* in 1801, there was a great scarcity. Flour obtained from *America*. Committees of both Houses of Parliament were appointed to inquire into means of supplying food.<sup>57, 91</sup>

In 1801, there was a famine felt throughout the kingdom [*Great Britain*].<sup>90</sup>

In 1801, *England* suffered a scarcity. For 5 years, the harvests (with the exception of 1796) had been unfavorable.<sup>188</sup>

In 1801, many regions of *China* experienced flooding including:<sup>153</sup>  
 — During the period between 5 February and 6 May, floods struck Shantung (now Shandong province) on the east coast of *China* at Yü-ch'êng, Ch'ang-ch'ing, Kuan-ch'êng and Huang; Hopei (now Hebei

province) in northern *China* at Jên-ch'iu, Ching-hai and P'ing-hsiang; and Sinkiang (now Xinjiang province) in far northwestern *China* at Chên-hsi. At Chên-hsi the dikes were damaged.

— During the period between 11 July and 8 August, floods struck Hopei province at Wu-ch'ing, Cho, Chi, Ch'ang-p'ing, P'ing-ku, Wu-ch'iang, Yü-t'ien, Ting, Nan-yüeh, Wang-tu, Ta-hsing, Wan-p'ing, Hsiang-ho, Mi-yün, Ta-ch'êng, Yung-ch'ing, An-tz'ü, Fu-ning and Nan-kung; Chahar province (now eastern *Inner Mongolia*) at Wan-ch'üan; and Chekiang (now Zhejiang province) on the east coast of *China* at Chin-hua. [Chi is located at longitude 117.24° East and latitude 40.03° North.]

— During the period between 9 August and 7 September, floods struck Chekiang province at Hsin-têng, I-wu and Chin-yün.

In 1801 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Chang-ch'iu. During the period between 6 May and 8 November, a severe drought engulfed Shantung province at Jung-ch'êng. Plants withered.<sup>153</sup>

**Winter of 1801 / 1802 A.D.** The Meuse River, the Rhine River in *Germany*, and the Saône River in *France* froze.<sup>62</sup>

In January 1802, southern *France* experienced cold temperatures that dropped down to 13.5° F (-10.3° C).<sup>79</sup>

The winter of 1801-02 in *Northern Europe* was very severe. The Maas (Meuse), the Waal and the Rhine rivers were frozen. The River Thames had ice. The Saône River was frozen at Dijon, *France*. The lowest temperatures observed during the winter were:

Moens, <i>France</i>	( 0.5° F, -17.5° C)
Paris, <i>France</i>	( 4.1° F, -15.5° C) on 16 January
Avignon, <i>France</i>	(13.3° F, -10.4° C) on 17 January
Maastricht, <i>the Netherlands</i>	(13.5° F, -10.3° C) on 15 January
London, <i>England</i>	(16.0° F, -8.9° C) on 16 January

In *France* the snowmelt in the spring thaws produced large floods.<sup>62</sup>

In *France* there was a flood. On 3 January 1802, the Seine River in Paris, *France*, at the bridge “Pont de la Tournelle” reached a height of 7.32 meters (24.0 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

On 21 January 1802, there was a great storm at Liverpool, Manchester, Chester, and Whitehaven, *England*.<sup>128</sup>

The winter of 1801-02 in general was very mild in New England in the *United States*. On the Merrimack River, the ice broke up on 24 January. On 28 January 1802, the temperature at Salem, Massachusetts was 60° F [16° C]. It was one of the warmest January's that people remembered. Then on 21 February, a great snowstorm struck. The storm lasted nearly a week. It covered the earth with snow and sleet to a depth of several feet. Intense cold prevailed which caused much suffering. The sleet froze on the snow, forming a thick hard crust. The depth of the snow was so great that people could no longer see the roads, so they drove their sleighs on the crust of the snow across the fields and pastures. They drove over fences and walls buried in the snow.<sup>199</sup>

— This storm proved disastrous to the vessels along the coast of Massachusetts. A schooner went ashore at Plum Island. A brig [a sailing vessel with two square-rigged masts] and a sloop were cast away at Cape Ann. A ship and a schooner were wrecked on Chelsea Beach. A brig *Eliza* was driven ashore near Boston. Two other schooners also went ashore near Boston. Two pilot boats were driven ashore in the Bay of Braintree. A schooner was wrecked on Cohasset Rocks. The ship *Florenzo* was driven ashore at Marshfield. Several ships were driven ashore on Cape Cod, including a schooner that was driven ashore

at Sandwich. Three full-rigged ships, *Ulysses*, *Brutus* and *Volusia*, were also driven ashore on the Cape during the storm.

### 1802 A.D. – 1807 A.D. India. Famine

In *India* during 1802-04, there was a famine in the Nizam's dominions (Bombay Presidency). "This famine was caused in the several districts affected by it by four distinct causes, which operated apparently about the same time. In Kach [in *Pakistan*], the crops are said to have been destroyed by locusts. In Pahlumpur [Palampur], Rerva Kanta, Surat, Guzerat [Gujerat], Hyderabad, Belgaum, and Rutnagherry [Ratnagiri], the famine is stated to have been caused by want of rain. Candeish was overrun by the armies of Holkar; and the Pindaree bands sacked and burned villages in every direction, even destroying the grain standing in the fields; and the same fate attended the districts of Ahmednagar, Poona [Pune], and Sholapur [Solapur]; whilst the influx of starving people from other districts into Sattara [Satara], Kolapur [Kolhapur], Dharwar [Dharwad], and Colaba, caused a scarcity of food in those districts."<sup>57</sup> [The Bombay Presidency during this time, included much of northwest, western and central *India*. Palampur is in the northern tip of *India*. Reva Kantha is in Gujarat State in western *India*. Surat is in western *India*. Guzerat [Gujarat] is in western *India*. Hyderabad is in southeastern *India*. Belgaum is in southwestern *India*. Rutnagherry [Ratnagiri] is in western *India*. Candeish now called Khandesh is in west-central *India*. Ahmednagar is in central *India*. Poona [Pune] is in central *India*. Sholapur [Solapur] is in central *India*. Sattara [Satara] is in western *India*. Kolapur [Kolhapur] is in western *India*. Dharwar [Dharwad] is in southwestern *India*. Colaba is now part of Mumbai in northwestern *India*.]

In northern *India*, there was a total failure of rain in the "ceded districts" of Allahabad. "Not a shower fell after the 12<sup>th</sup> August, 1803, and in September hot winds were blowing just as in May or June, and scorched up the crops. The winter rains also failed. This drought was followed by heavy hailstorms early in 1804."<sup>47</sup>

In 1803 in Khandesh (Hindustan, now called *India*), a famine carried off a large number of the population.<sup>91</sup>

In 1803, there was a famine in the Northwest Provinces and Bombay in *India*. The famine severely impacted the Northwest Provinces till the autumn of 1804. It appears this dearth was partly due to the shortsighted policies of the British Government. The government imposed heavier rates of revenue [taxes] on the population at the same time a drought was occurring. This was more than what the population could bear.<sup>156</sup>

In 1803, there was a famine in Cutch [Kutch district in western *India*] caused by locusts. During the same year, there was a minor famine in Bombay [now Mumbai, *India*], Hyderabad [in southern *India*], Northern Madras [now northern Chennai] and the North-Western Provinces.<sup>179</sup>

In 1803, there was a famine in Bombay [now Mumbai, *India*].<sup>182</sup>

In 1803-04, there was a scarcity centered in the Buab [river region] of *India* partly caused by drought and partly due to the interruption of [animal] husbandry by the contending armies.<sup>181</sup>

In 1804, there was a famine in Kandeish [now Khandesh, *India*].<sup>182</sup>

Towards the end of 1804, due to an unfavorable season, there was scarcity in the Tanjore [now Thanjavur] and South Arcot districts in the state of Tamil Nadu in *India*. In early 1805, the distress became severe. During the end of 1805, the famine, due to a general failure of the crops, spread through all parts of the Madras Presidency. The dearth was most severe in the districts of North Arcot, Nellore, and Chingleput, though it was also felt to a lesser degree in the Ceded Districts, South Arcot, Tanjore and

Trichinopoly. The scarcity ended in October 1807. The mortality rate in Madras [now Chennai] in 1807 was 5 times the rate of 1805.<sup>188</sup>

In *India* during 1804-07, there was scarcity in the Bombay Presidency, following the unfavorable season of 1804. This caused severe pressure on the poorer classes. "In the latter part of the following year a general failure of crops appears to have occurred in most parts of the presidency, and the scarcity caused thereby had not passed over until October 1807."<sup>57</sup>

In 1805-06, there was a minor famine in Deccan in southern *India*.<sup>179</sup>

In 1807, there was a minor famine in southern *India*.<sup>179</sup>

In 1807, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

**1802 A.D.** In *England*, there were great floods; much damage to shipping.<sup>47, 92</sup>

In Dublin, *Ireland* during January and February, there was a great overflow of the River Liffey causing immense damage.<sup>47, 56, 92</sup>

On 21-23 February 1802 a most boisterous winter storm traveled from South Carolina to Maine in the *United States* at a rate of about 100 miles in a hour.<sup>204</sup>

On 14 April 1802, an inundation at Lorca, a city of Murcia, in *Spain*, was destroyed by the bursting of a reservoir, which inundated more than 20 leagues (60 miles, 97 kilometers), and killed 1,000 persons, besides cattle.<sup>47, 90, 92</sup>

On 18 July 1802, there was a violent storm, which did considerable injury in the North of *England*.<sup>128</sup>

On 10 August 1802 in *England*, there was a hailstorm in Leicestershire and Warwickshire.<sup>93</sup>

A storm struck the north of *England* on August 18, 1802.<sup>41</sup>

On 24 August 1802 in *England*, there was a great storm in Durham and Northumberland.<sup>93</sup>

On 28 August 1802 in *England*, there was a hailstorm in Northumberland.<sup>93</sup>

On 2-3 December 1802, there was an inundation in Dublin, *Ireland*, and parts adjacent.<sup>43</sup>

On 2-3 December 1802, an inundation of the River Liffey, did immense damage in Dublin, Ireland.<sup>90, 128</sup>

In 1802 in *Southern Europe*, there were great rainstorms.<sup>47, 92</sup>

The summer was in *the North, the East*, and a portion of *the South of Europe* very hot and very dry. In Holland [now *the Netherlands*] and a part of *Jutland*, the heat was extremely abnormal. The highest observed temperatures during the summer were:<sup>62</sup>

Avignon, <i>France</i>	(100.6° F, 38.1° C) on 14 August
Vienna, <i>Austria</i>	( 98.4° F, 36.9° C) on 10 & 11 August
<i>Ibid.</i>	(100.0° F, 37.8° C) on 14 August
Paris, <i>France</i>	( 97.5° F, 36.4° C) on 8 August
Verona, <i>Italy</i>	( 96.1° F, 35.6° C) in August
Turin, <i>Italy</i>	( 95.0° F, 35.0° C) on 21 August

Maastricht, <i>the Netherlands</i>	( 95.0° F, 35.0° C ) on 9 August
Geneva, <i>Switzerland</i>	( 94.1° F, 34.5° C )
Moens, <i>France</i>	( 90.5° F, 32.5° C ) on 9 August
London, <i>England</i>	( 81.0° F, 27.2° C ) on 30 August

The drought from the previous year carried over into 1802 to haunt *Europe*. The plants were burned, the grass withered to the roots and the fruits of summer and even winter were threatened. It robbed the trees of their leaves, and only the grapes retains its green tendrils.<sup>62</sup>

In London, *England*, the second driest years in the 23-year period [1797-1819] occurred in 1802 with 18.43 inches of rainfall.<sup>175</sup>

In Burgundy, *France*, the grape harvest began on 20 September. The yield was low, because the freeze that occurred on 16 and 17 May; which had hurt the vines greatly. But the quality of the wine was excellent. The grain harvest was poor and the grain was very dear. In *England*, the harvest was one of the richest that had ever been seen in that country.<sup>62</sup>

In 1802, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period 2-30 May, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at I-wu. Crops were damaged by the floodwaters.

— During the period between 31 May and 29 June, floods struck Chekiang province at Ting-hai. Crops were damaged by the floodwaters.

— During the period between 29 July and 27 August, floods struck Hupeh (now Hubei province) in central *China* at Han-ch'uan, Mien-yang, Chung-hsiang, Ch'ien-chiang, T'ien-mên, Kung-an, Sung-tzū, Chiang-ling, Ching-shan and Chien-li; and Chekiang (now Zhejiang province) on the east coast of *China* at Hsin-têng. At Ching-shan, houses and granaries were damaged by the floodwaters. In Hsin-têng, over 17,000 house-sections were damaged.

In 1802, a drought engulfed several regions of *China* including:<sup>153</sup>

— During the period 2-30 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Peiping.

— During the period between 31 May and 29 June, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chin-hua, Chiang-shan and Ch'ang-shan.

— During the period between 30 June and 28 July, a drought engulfed Hupeh (now Hubei province) in central *China* at Ao-ch'êng, Hanyang, Huang-kang [possible misprint, "Huang-ch'uan"], Hsien-ning, Huang-kang and An-lu.

— During the period between 28 August and 26 September, a drought engulfed Chekiang province at Hsüan-p'ing and Ch'êng: and Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang and Ch'ing-chiang.

*Also refer to the section 1802 A.D. – 1807 A.D. for information on the famine in India during that timeframe.*

**Winter of 1802 / 1803 A.D.** In December 1802, in the *United States*, a violent snowstorm struck the Philadelphia area dropping one foot of snow. The winds blew this snow into banks of considerable height, which obstructed the roads. The storm was very severe in the North and East and snow fell to great depths.<sup>1</sup>

Beginning on 14 March 1803, a most severe snowstorm dumped fifteen inches (0.4 meters) of snow in Philadelphia, Pennsylvania and vicinity in the *United States*; and twenty inches (0.5 meters) in Baltimore and Washington D.C. Snow fell to great depths in the Northern, Western and Eastern U.S.<sup>1</sup>

During the winter of 1802-03 in Bradford County, Pennsylvania in the *United States*, there were a couple late May snowfalls. On 4 & 5 May 1803, snow fell to a depth of 6 inches [15 cm]. On 8 May, snow fell to a depth of 6 inches [15 cm].<sup>178</sup>

The Meuse River was frozen. The Seine River in *France* was frozen at the Bridge “Pont de la Tournelle” in Paris from 17 January until 17 February 1803.<sup>62</sup>

On 1 January 1803, there was a violent whirlwind at Falmouth, *England*, which stripped the roof of every house. On 5 January at Plymouth, *England*, a whirlwind passed over the town, and did extensive damage.<sup>128</sup>

The winter of 1803 came rather late, but was very severe. The Meuse, the Elbe and the Seine rivers froze. The Seine River was covered with ice from 17 January to 17 February 1803. In Holland [now *the Netherlands*] and *Germany* several travelers froze to death, and all ports were blocked by ice. The *Sound* was frozen; on 30 January more than 6,000 people crossed over on the ice. In *Austria*, the snow blocked the roads. The lowest temperatures observed during the winter were:<sup>62</sup>

Moens, <i>France</i>	( 2.7° F, -16.3° C) on 12 February
Brussels, <i>Belgium</i>	( 3.9° F, -15.6° C) on 11 February
Maastricht, <i>the Netherlands</i>	( 3.9° F, -15.6° C) on 11 February
Paris, <i>France</i>	( 9.5° F, -12.5° C) on 12 February

During the winter of 1802-03 in *France*, the weather was very mild during the month of December 1802 and the first ten days of January 1803. The temperature fell abruptly from 11 to 16 January. A thaw occurred from 17 to 24 January. Frost reappeared from 25 to 31 January. This was followed by a thaw that ended on 4 February. The frost resumed from 4 to 13 February. Then it was extremely mild until 3 March. Frost began on March 3 with heavy snow and this continued for ten days. The temperature rose after March 14 and remained soft and quite warm for the rest of the month. In April and May, a sharp wind blew in very cold and very dry air. There were even frosts and ice on April 30<sup>th</sup>, and on May 14<sup>th</sup>, 15<sup>th</sup>, and 18<sup>th</sup>. Cold rains followed this cold dry spell and lasted from May 20<sup>th</sup> to June 3<sup>rd</sup>, except 28<sup>th</sup> and 29<sup>th</sup>, where the air is suddenly softened to cool soon after to June 8<sup>th</sup>. From 8 to 20 June, the heat proved strong enough. But on 21 June, the cold and bitter wind returned. There was still frost on the 21<sup>st</sup>.<sup>79</sup>

---

**1803 A.D.** The River Thames went dry in London, *England* and people were able to cross the river on foot.<sup>1</sup>

In *Russia*, in St. Catherine's Castle, unusual changes in temperature were observed. On 9 May the temperature stood at 25.2° F (-3.8° C). Two days later on 11 May, the temperature had risen to 86.0° F (30.0° C).<sup>62</sup>

In 1803 in New South Wales, *Australia*, in March the drought was severely felt in all parts of the colony. On 29 May, there had been no rain except passing showers since July 1802.<sup>103</sup>

On 9 June 1803 in London, *England*, the Haymarket and several adjoining streets suffered terribly from a hailstorm. Windows were demolished wholesale. In no other part of London was any damage sustained by this storm.<sup>93</sup>

On 21 July 1803 in *England*, there was a hailstorm in Leicestershire.<sup>93</sup>

In 1803 in *France* after the long winter and cold spring, the weather suddenly turned warm. On the 28<sup>th</sup> of June, hot dry air suddenly burst out this year and lasted for 76 to 94 consecutive days [in various regions of *France*] except for a few brief interruptions on July 5<sup>th</sup>, August 1<sup>st</sup> and early October. Early

frost appeared on 1 November. This weather was succeeded with frost with intermittent high winds from the southwest, and mild rainy weather, with alternating periods of mild and cold weather until the end of the year.<sup>79</sup>

[In *France*], the summer of 1803 was remarkable for the sustained high heat and drought. The heat began in late June and lasted until the end of August. The drought was from 15 June to 1 October; all this time it only rained for 9 days. The wells and springs were dried up, and in some areas, individuals had to travel for 3 to 4 hours to fetch water. To water a horse for a day cost 1 franc, 50 centimes. The drought greatly damaged the grass, fruits, vegetables and the grapes. The Seine River in Paris, *France* fell to its lowest level ever seen. For more than 3 months, the water level on the river at the bridge de la Tournelle stood below 0; on 19 September it was 27 centimeters (10.6 inches) deep. The drought extended across *France* and much of *Europe*; except in Friuli in *Italy*, Carinthia in *Austria* and part of the Archduke *Austria*, where several rivers flooded out of their banks.<sup>62</sup>

The summer of 1803 in *France* produced extraordinary heat and dryness. The heat began on June 28 and it lasted almost without interruption until 11 September. At Montmorency, *France*, the maximum occurred on July 31, with a reading of 97.2° F (36.2° C) in the shade and 117.5° F (47.5° C) in direct sunlight in a secluded location. In Paris, the maximum also occurred on July 31 with a reading of 98.1° F (36.7° C). During this heatwave, the wind blew steadily from the northeast. The sky was cloudless. And the barometer was fairly fixed beyond its average height. Spontaneous fires consumed a large number of woods and forests.<sup>79</sup>

In *France* in 1803, it rained very little from June 4 to October 1. There was some rain during the beginning of October but then the drought again took hold and continued until November 9. Wells and springs dried up. In Paris, the small arm of the Seine remained almost dry and the water level indicated on 21 and 27 September, 9.5 inches (24 centimeters) below the zero water mark of 1719. In Montmorency, it rained only 9 days during those four months producing only that 1-inch (25 millimeters) of rainwater. Viviers produced about 8.5 inches (216 millimeters) of rainfall this year; which was less than average. In some departments of *France* there was no water to be had. One would have to travel three or four leagues (9 to 12 miles, 14.5 to 19.3 kilometers) to seek water. It would cost thirty sous to water a horse.<sup>79</sup>

The highest observed temperatures during the summer were.<sup>62</sup>

Avignon, <i>France</i>	(100.6° F, 38.1° C) on 16 August
Paris, <i>France</i>	( 98.1° F, 36.7° C) on 31 July
Alais, <i>France</i>	( 97.0° F, 36.1° C) on 3 August
Maastricht, <i>the Netherlands</i>	( 92.8° F, 33.8° C) on 1 August
Moens, <i>France</i>	( 89.4° F, 31.9° C) on 31 July
London, <i>England</i>	( 84.9° F, 29.4° C) on 2 July

In August 1803, a hurricane struck between *Jamaica* and *England* causing 121 deaths.<sup>141</sup>

In Burgundy, *France*, the weather was nice, but there was very little heat. The grape harvest began on 26 September. The yield was very plentiful and the quality of the wine fair. The south of *France* had less heat and drought than in the north; and the grain harvest was satisfactory. In *Switzerland*, *Italy* and *Hungary*, the summer was very good.<sup>62</sup>

Major storms reigned in *France* in 1803.<sup>79</sup>

In 1803 in *Australia*, there was a severe drought in New South Wales.<sup>101</sup>

In 1803 during the period between 5 February and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chiang-shan. Then during the period between 19 June and 18 July, floods struck Hupeh (now Hubei province) in central *China* at Sui. During the period between 8 November 1803 and 5 February 1804, floods struck Hupeh province at Yün-mêng; Shantung (now Shandong province) on the east coast of *China* at Tung-a, Liao-ch'êng, P'u-t'ai, Li-ching, Pin, Chan-hua, Fan and Kuan-ch'êng; and along the Yellow River. At Tung-a, houses and fields were damaged by the floodwaters.<sup>153</sup>

*Also refer to the section 1802 A.D. – 1807 A.D. for information on the famine in India during that timeframe.*

---

**1804 A.D.** On 8 January 1804, a hurricane did considerable damage in Devonshire and Cornwall, *England*. At sea, several ships were lost and many damaged.<sup>128</sup>

On January 19<sup>th</sup> a violent hurricane of wind did great damage in Devon and Cornwall, *England*. Another storm on January 22, blew down a garden wall at Shenfieldplace, Kent, of 300 feet in length.<sup>41, 56</sup>

On 4 May 1804 in *England*, there was a great hailstorm in Cheshire and Lancashire.<sup>93</sup>

On 4 May 1804, there was a tremendous storm of rain took place in the neighborhood of Bath, *England*, by which roads were torn up, gardens destroyed, and considerable portions of land removed from their situation. The same night, a storm was experienced in Lancashire and Cheshire; the River Irwell was so swelled as to sweep away many buildings.<sup>128</sup>

On May 11, there was a great storm at Newfoundland, *Canada* and eighty vessels were lost.<sup>1</sup>

On 8 May 1804 in *England*, there was a hailstorm in Lancashire and in *Wales* at Montgomeryshire.<sup>93</sup>

In 1804, there was unprecedented exceedingly severe drought in the Midwest of the *United States*.<sup>111</sup>

In early 1804 in *India*, there were several hailstorms in Allahabad.<sup>57, 93</sup>

In June 1804, the island of Antigua, a Leeward Island in the *West Indies* scarcely did not have any rain during the previous 5 months. Individuals had to ride 3 miles to get water for their horses.<sup>146</sup>

In September 1804, at St. Christopher's [St. Kitts] in the *West Indies*, thirteen sail [sailing ships] were wrecked in a hurricane, which did great damage at all the windward islands.<sup>146</sup>

From 4-6 September a destructive hurricane struck the *West Indies*. At St. Kitts, one hundred and twenty vessels with many of their crews were lost. At Antigua, fifty-nine vessels were lost, and most of their crews perished. At St. Bartholomew [St. Barts], fifty vessels and many lives were lost. At St. Thomas, forty-four vessels with their crews were lost. At other islands, many vessels with their crews were lost.<sup>1</sup>

On 7 September 1804, Charleston, South Carolina in the *United States* was struck by a hurricane and high water that did much damage.<sup>124</sup>

On 7-9 September 1804, a hurricane struck Georgia, South Carolina and North Carolina in the *United States*. Most sources cite approximately 500 fatalities.<sup>141</sup>

During 3-9 September 1804 a great hurricane moved from the Caribbee [Caribbean] Islands, in the *Bahamas* and on the coast of Florida, Georgia and South Carolina in the *United States*. This storm was one of the most destructive storms within the memory of man. The hurricane overwhelmed and destroyed

a large number of vessels, cargoes and crews, both on the ocean and in the port, and caused great damage on shore. The storm caused the ocean to flood a great portion of the shoreline and the islands of Georgia and South Carolina. The following paragraphs describe the damage wrought by this hurricane: <sup>204</sup>

— On 3 September, the storm struck the island of *Martinique*. Many vessels quit their anchor and were driven ashore. A number of vessels were driven ashore at the island of *St. Croix* [*Santa Cruz*] in the Virgin Islands. Of the 32 sails [sailing vessels] at Guadeloupe in the island of St. Bartholomew [now *Saint Barthélemy*], only two successfully rode out the storm. On 4 September, every vessel was lost at Dominique [now the island of *Dominica*]. At the island of *St. Thomas*, the hurricane lasted 3 days and 42 sails of vessels were destroyed. At Tortola, *St. Kitts*, Antigua, four sails were driven ashore, a packet foundered at anchor and much damage was done to the estates in the mountains. At Eustatia, *St. Martin's* much property and many vessels were destroyed. There were four wrecks at Anegado [*Anegada*] in the Virgin Islands. On 4 September, the hurricane struck *Puerto Rico* and drove ashore every vessel at the west end. The hurricane was not felt in Demarara [now *Guyana*] nor on the island of *Grenada*, nor at Jeremie in St. Domingo [now *Haiti*]. The storm was felt at Matanzas [*Matanzas, Cuba*], but not much damage was done there.

— A ship commanded by Captain Smith was overtaken by the storm. The ship was thrown on its beam-ends and lost its foremast and bowsprit. The ship was rendered so leaky that it was abandoned on the 8<sup>th</sup> as a wreck. Another ship commanded by Captain Day was overtaken by the storm on the leeward side of *Tobago*. A ship commanded by Captain Beard encountered the storm on 3 & 4 September at Latitude 33° N., Longitude 74° W., where it was wrecked in the gale.

— On 4 September, the storm struck the *Turk Islands* in the Bahamas with extreme violence. On Turk Island, all the vessels were driven ashore except for two, which put out to sea. Most of these ships were total losses. On 5 & 6 September, the hurricane struck Nassau in *New Providence*. Around 30 sails of small craft were driven ashore, but there was not much damage to the square-rigged vessels.

— On the night of 5 September, the British armed ships *Theseus* and *L'Hercules* encountered the hurricane at Latitude 22° 12' N., Longitude 63° 44' W. They fought the storm for 2 days and its violence reduced them to the utmost distress. A ship commanded by Captain King encountered the gale on 6 September at sea in the Latitude of 21° 51' N. His vessel was thrown on her beam-ends. He was forced to cut away her mainmast. One of his men was washed overboard. On the night of 7 September, a ship commanded by Captain Mood encounter the hurricane to the east of Charleston, South Carolina. The storm threw his vessel on her beam-ends. Several of his crew were washed overboard. On the same night, a ship commanded by Captain Miller encountered the storm. The storm was so violent that it heaved his vessel on her side, as she was lying-to under her jib, to unstep her masts, and to tear up her deck. On the same night, another vessel commanded by Captain Andrews at Latitude 26° N., Longitude 77° W. encountered the storm. The ship was thrown on her beam-ends, her boom was broken in pieces, her main topsail and rigging carried away and two men washed overboard.

— In Florida, the hurricane was excessively hard. At St. Augustine, Florida, the tide rose to an uncommon height. Of the nine vessels in the harbor, only one successfully rode out the storm.

— The storm struck Savannah, Georgia on the morning of the 8<sup>th</sup>. The storm lasted 17 hours. The water rose 8-10 feet [2.4-3.0 meters] above the normal spring tides. Houses and stores were blown down by the wind or undermined by the water. Fences and trees were knocked down. Ships and vessels were stranded and left high and dry on the tops of the wharves. Wilmington Island and Skidaway Island suffered great damage. Fort Green on Cockspar Island was completely leveled. All the buildings were leveled and 13 lives were lost. The water rose 15-20 feet [4.6-6.1 meters] above the level of the fort. One of the national gunboats was carried about 8 miles [13 kilometers] from her mooring and landed in a cornfield on Whitemarsh Island. A cannon weighing 4,800 pounds [2,177 kilograms] was carried 30-40 feet [9.1-12.2 meters] from its original position by the storm. A 300-pound [136-kilogram] bar of lead was carried 100 feet [30 meters]. Cases of canister shot were carried from 100-200 feet [30-61 meters] and muskets were scattered all over the island. At Savannah, sand was blown into the upper stories of houses, 30 feet [9.1 meters] higher than the surface of ground. The rain that fell was impregnated with sea salt. In Georgia, St. Simon's Island and St. Catharine's Island and other islands along the coast suffered great damage

from the inundation of the crops and the many Negroes were drowned. At Sunbury, the bluff was transformed into a perfect beach by the storm and almost every chimney was leveled to the ground. The storm was felt 300 miles [483 kilometers] inland where the winds were strong enough to blow down the corn but not strong enough to blow down the trees.

— The hurricane pounded Charleston, South Carolina for 36 hours from 7-9 September. All but 3 or 4 vessels in the harbor escaped without injury. But the others were damaged or wholly lost. The entire wharves, from Gadsden's on the Cooper River, to the extent of South Bay, received considerable damage. Many houses were unroofed and many trees overturned. Many stores were washed away or blown down and much property lost. On Sullivan's Island, 15-20 houses were undermined by the water and carried away. Fort Johnson was completely destroyed. The breastwork and pallsadoes [palisades] of Fort Pinckney [now Castle Pinckney] were washed away. Fort Moultrie was underwater. At Jacksonburgh [now Jacksonboro], the bridge between Charleston and Georgetown was washed away and so many trees were blown down that it obstructed the stages [stage coaches] for several days. At May River, all the crops, cotton, and Negro houses, machines, etc. were completely swept away. The tide rose higher than the highest spring tide. On Hutchinson Island, many Negroes, and some white people were drowned. The same thing happened at Dawfousky [Daufuskie] and Broughton Islands. At Coosahatchie [Coosawhatchie], many trees were thrown across the roads and the bridges were carried away and the entire village was surrounded by seawater. In Prince William's parish, Beaufort district, the sea formed a junction through the streams of Pocotaligo, Stoney Creek, and Huspa Rivers, which turned Scotch Neck into an island. Water covered the plantations four feet [1.2 meters] deep from Sheldon to Motley. The rice and cotton crops were destroyed and many animals drowned. Nothing but the high ground was visible on the roads of Fishpond and Horseshoe savannas. The hurricane violently hit Georgetown on 8-9 September. Rain came down in torrents. The gale extended deep into the country to a distance of 250 miles [402 kilometers]. The winds at 100 miles [161 kilometers] from the coast blew down the forest trees in great numbers causing the roads to be impassable.

In September 1804, an extensive hurricane struck. It swept over the Windward Island [in the *Lesser Antilles*] on the 3<sup>rd</sup>; the *Virgin Islands* and Porto Rico [*Puerto Rico*] on the 4<sup>th</sup>; *Turks' Island* on the 5<sup>th</sup>; *the Bahamas* and gulf of Florida on the 6<sup>th</sup>; the coast of Georgia and the Carolinas in the *United States* on the 7<sup>th</sup>; the great bays of Chesapeake and Delaware, and the contiguous portions of Virginia, Maryland, and New Jersey on the 8<sup>th</sup>; and the states of Massachusetts, New Hampshire, and Maine on the 9<sup>th</sup>; being on the highlands of New Hampshire, a violent snow storm. This hurricane appears to have passed from Martinico [Martinique], and the other Windward Islands, to Boston, Massachusetts in about 6 days; a distance of more than 2,200 miles.<sup>228</sup>

On 9 October 1804, a tremendous storm of rain, accompanied with a violent easterly wind struck Boston, Massachusetts in the *United States*. The storm began in the morning and continued for 24 hours. It caused great damage to the shipping in Boston Harbor and in many other ports in New England.<sup>174</sup>

A strong storm struck New England in the *United States* on 9 October 1804. The southern part of New England received rain and the northern part received snow. The winds blew with such force that it blew down homes, barns, chimneys and trees. So many great oaks were destroyed by this storm that shipbuilding in Massachusetts declined [and after the great gale of 1815, it was entirely abandoned in many areas].<sup>199</sup>

— In Vermont, snow was 4 to 5 inches [10-13 centimeters] deep. But the winds created such large drifts that the roads were blocked. At Concord, New Hampshire, the snow was 2 feet [0.6 meters] deep. Snowfall in Massachusetts was between 5 and 14 inches [13-36 centimeters]. This was one of the earliest snowfalls experienced in eastern Massachusetts.

— The storm caused the death of a large number of cattle, sheep and fowls, especially at Walpole, Newbury, and Topsfield, Massachusetts. At Newbury, nearly a hundred cattle were killed. Many trees were destroyed. Many woodlands were leveled causing new landscapes to appear. Houses and other

buildings and hills that could not be seen before were now plainly visible.

— Buildings and chimneys were blown down or greatly damaged by the wind. The South Church and the Baptist church at Danvers, Massachusetts had their roofs torn off. At Beverly, the spire of the lower meetinghouse was broken off. At Salem, the dome and belfry of the Tabernacle Church were torn to pieces. At Charlestown, the roof of the Baptist church was blown off. A new brick building at the navy yard was damaged to the point that it had to be torn down. The tower at King's Chapel lost its roof, which was swept 200 feet [61 meters] away by the winds. The beautiful steeple on the North Church fell. — The great winds from this storm damaged shipping all along the coast from Rye, New Hampshire to Newport, Rhode Island. The lives of many seamen were lost. A sloop was upset and all hand lost in Vineyard Sound [Vineyard Sound is a stretch of the Atlantic Ocean which separates the Elizabeth Islands and the southwestern part of Cape Cod from the island of Martha's Vineyard, offshore from the state of Massachusetts]. The schooner *John Harris* was lost with all hands on board on the back of Cape Cod. A large ship *Protector* of about five hundred tons burden went ashore stern first, five miles [8 kilometers] south of Cape Cod lighthouse. Several vessels were driven ashore at Plymouth. Vessels from Marblehead and Manchester were driven out to sea and never seen or heard from again. The brig *Thomas* went ashore on Scituate Beach, Massachusetts. The sloops, *Hannah* and *Mary*, were driven ashore at Cohasset. Three other vessels went ashore at Cohasset and were wrecked. In Boston harbor, many were damaged when they were driven into the wharves. The *Laura* was nearly beaten to pieces at Long wharf. Two schooners at Salem harbor were driven ashore. A sloop and a schooner were lost near Fresh Water Cove in Gloucester. Several other vessels were wrecked on different parts of the Cape. The schooner *Dove* was wrecked on Ipswich Bar and everyone onboard perished. Near Rye, New Hampshire, an eastern vessel and a schooner *Amity* were wrecked.

On 5 November 1804, reports were received of a hurricane in the *West Indies* resulted in 244 ships lost in the English islands.<sup>128</sup>

On 1 November 1804 in *England*, there was a great hailstorm in Cornwall.<sup>93</sup>

During the summer of 1804, the temperature in Provence, *France* rose to 98.6° F (37° C).<sup>79</sup>

In 1804 during the period between 12 March and 9 April, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Lin-ch'ü. Then during the period between 10 April and 8 May, floods struck Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang, Lin-ch'uan, Kan and Kiukiang. During the period between 6 May and 8 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Hanyang. During the period between 8 August and 8 November, a drought engulfed Kansu (now Gansu province) in northwest *China* at Ning.<sup>153</sup>

*Also refer to the section 1802 A.D. – 1807 A.D. for information on the famine in India during that timeframe.*

---

**Winter of 1804 / 1805 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1804 occurred on 12 November. Yesterday and today, it has snowed considerably. November 14, it snowed pretty hard most of the day.<sup>116</sup>

The winter of 1804-05 was very severe in the *United States*. The weather was intensely cold in January. The temperature fell on 26 January and snow fell in Washington D.C., and a mixture of rain and snow at Georgetown, Maryland. The storm struck New York City in the evening and by 8 P.M. it reached Boston, Massachusetts. It reached Newburyport, Massachusetts on the 27<sup>th</sup>. The fall of snow was moderate in Washington D.C. but at New York and Massachusetts, the snow was uncommonly great. Many vessels were wrecked and lost on the coast of Massachusetts.<sup>204</sup>

From 1803 to 1806, Captains Lewis and Clark lead a transcontinental expedition to explore the greater Northwest in the *United States*. During the winter of 1804/1805, the explorers set up a winter base camp near the Big Knife River near what is today the town of Bismarck, North Dakota. The winter was bitterly cold. There were 6 days with temperatures of  $-31^{\circ}\text{F}$  ( $-35^{\circ}\text{C}$ ) or lower. These occurred in 1804 on December 12 ( $-38^{\circ}\text{F}$ ,  $-39^{\circ}\text{C}$ ), December 17 ( $-45^{\circ}\text{F}$ ,  $-48^{\circ}\text{C}$ ), December 18 ( $-32^{\circ}\text{F}$ ,  $-36^{\circ}\text{C}$ ), in 1805 on January 10 ( $-40^{\circ}\text{F}$ ,  $-40^{\circ}\text{C}$ ), January 11 ( $-38^{\circ}\text{F}$ ,  $-39^{\circ}\text{C}$ ), and January 13 ( $-34^{\circ}\text{F}$ ,  $-37^{\circ}\text{C}$ ). Compare this to the current low temperatures of Bismarck, North Dakota in which only one day in the past decade [from April 1999 to April 2009] fell below  $-30^{\circ}\text{F}$  ( $-34^{\circ}\text{C}$ ). On January 15, 2009, the temperature fell to  $-44^{\circ}\text{F}$ , ( $-42^{\circ}\text{C}$ ).<sup>16, 17</sup>

On 28 December 1804, the tide of the River Thames in *England* was higher than ever known, and did great damage to the cellars and warehouses.<sup>128</sup>

---

**1805 A.D.** On 28 June 1805 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On July 6, a dreadful storm struck Kingston upon the River Thames in *England*.<sup>41, 56</sup>

On 6 July 1805, there was a dreadful storm at Kingston-upon-Thames [in southwest London] in *England*.<sup>128</sup>

The maximum temperature during the summer in Stockholm, *Sweden* was  $99.5^{\circ}\text{F}$  ( $37.5^{\circ}\text{C}$ ) on 12 July.<sup>62</sup>

On 30 July 1805 in *England*, there was a hailstorm in Northumberland.<sup>93</sup>

On 8 and 9 November an awful destructive storm struck the *British Channel*. Many vessels and several hundred lives were lost.<sup>1</sup>

On 28 and 29 December 1805 a very violent and destructive storm struck over most of the *United States*. The winds blew a complete hurricane. Many vessels were stove and sunk in the Delaware River, in New York and Boston.<sup>1</sup>

In Philadelphia, Pennsylvania in the *United States* during the winter of 1805, snow drifts reached thirty inches (0.8 meters) high, the price of a cord of oak wood—traditionally defined as a stack four feet high, four feet wide, and eight feet long—shot up to \$12. That was more than double the price per cord earlier that year. The city's working poor suffered the most under such conditions. The Philadelphia American Daily Advertiser reported that one family, "having expended all their wood, was under the direful necessity, in order to keep themselves from perishing, to burn their table, washing-tub, and many other articles of household furniture." Many froze to death in their own homes.<sup>18</sup>

In 1805 during the period between 27 June and 25 July, floods struck Hopei (now Hebei province) in northern *China* at Wên-an, An-hsin, Hsin-ch'êng and Pa. During the same time, a severe drought engulfed Shantung (now Shandong province) on the east coast of *China* at Chang-ch'iu.<sup>153</sup>

*Also refer to the section 1802 A.D. – 1807 A.D. for information on the famine in India during that timeframe.*

---

**Winter of 1805 / 1806 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1805 occurred on 26 October. It snowed most of the day.<sup>116</sup>

During the winter of 1805-06, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 45 days.<sup>202</sup>

---

**1806 A.D.** On 17 January 1806, a lunar rainbow [also called a moonbow] appeared near Wakefield, England.<sup>128</sup>

In March 1806 in *Australia*, the Hawkesbury River flooded. Five people were drowned. Animals and stacks of wheat were swept away.<sup>101</sup>

In March 1806, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 48 feet (14.64 meters) above the water mark at Windsor. Because the village was relocated in 1800, damage to it was not as severe as in the two previous floods, but all the crops were lost once again. Seven people were reportedly killed. One ship was believed lost at sea off the northern coast of Tasmania, *Australia* when overtaken by a storm while returning to Port Dalrymple, Tasmania, from the Bass Strait islands with a seal gang and seal skins.<sup>99, 109</sup>

There was a most destructive overflowing of the River Hawkesbury in *Australia* took place in March 1806; 6,000 bushels of com were destroyed, one hundred persons, men, women, and children, who had taken refuge on the roof of their houses and "on rafts of straw floating on the deluge," were saved by the exertion of one Mr. Arundell, a resident, and Mr. Biggers. The value of property destroyed amounted to £35,000; by this flood the colony was almost reduced to a famine. [In present currency, that would be equivalent to £2.5 million in damages based on the retail inflation price index.] On 24 September 1806, wheat rose to £4 a bushel, and the 2 pound loaf of bread to 5s.<sup>103</sup>

In consequence of a destructive flood in New South Wales, *Australia*, on the Hawkesbury River, which rose 8 feet higher than on any previous occasion, several lives were lost and £36,000 worth of property was destroyed. The flood commenced in the last week of February, and its greatest height was reached on 22 March 1806. This reduced the colony to a state of famine. Wheat rose to 70s. or 80s. a bushel. A 2 pound loaf of bread rose to 4s. 6d. or 5s. Vegetables were not procurable at any price.<sup>103</sup>

In March 1806, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*.

Many individuals lost everything they possessed, and several perished in the deluge. At the time many people had the false notion of security and confidence that there never would be another heavy flood in the main river. The first hint of what was to come appeared on Thursday, March 20<sup>th</sup> when the river rose several feet above the high water mark and the color of the water became discolored. But during the course of the night the rise abated, and by the next morning apprehension had totally subsided. The incessant rains on Friday night gave the inhabitants new fears. By daylight on Saturday morning a scene of horror presented itself in every quarter. Many farms were then underwater; the rain continued without interruption, and a rapid rise of the river became very observable. Mr. Thompson, the Chief Constable, with his boat saved the lives of a hundred people, whom he took from the roofs of houses, and rafts of straw floating on the deluge. Mr. Thomas Biggers, often at the risk of his own life, saved upwards of 150 men, women, and children; and others who possessed boats, particularly the District Constables, were very active in rescue operations.<sup>110</sup>

During the course of this dreadful day upwards of 200 wheat stacks were swept into the stream, and carried down the river with incredible velocity: livestock of all descriptions were seen floating about and on the tops of stacks, but could not be saved for want of boats, those of Messrs. Thompson, Biggers, and others being constantly employed taking the settlers families from the roofs and ridges of the houses, where many had for hours clung despairing of assistance, and expecting to be shortly washed into the watery waste. Towards Richmond Hill it seemed to abate on Saturday evening; down the River it still rose. Not a house, except at the Green Hills, could be seen, the roofs of one or two of the highest on the opposite side of the water being then only visible. Muskets were discharged by the settlers from the trees and roofs all day, and the great number had been taken up, and left in safety on the higher ground; but many were devoted to undergo a night of horror the most inexpressible: in the evening the dismal cries from distant

quarters, the report of fire-arms dangerously charged in order to increase the noise of explosion; the howling of dogs that had by swimming got into trees, all concurred to shock the feelings of the few that were out of reach, but were sorrowful spectators of the calamity they could not relieve.<sup>110</sup>

On Sunday morning the rigor of the weather abated, and in the course of the day the rains stopped. Nearly 300 persons, saved from the deluge by the humane perseverance and incredible exertions of their rescuers, were released from a state of actual famine by a supply sent from the Green Hills.<sup>110</sup>

Five persons are at present known to have lost their lives. Mr. Chalker along with four others attempted to flee the rising waters in a boat. But the boat overturned. Chalker with a young boy clinging to his neck tried to swim almost a mile to the shoreline. But he didn't make it and all five drowned. Among those that escapee was William Leeson, a settler who with his mother, wife and two children, and three men, was carried from his farm upon a barley mow. They were driven by the impetuous current nearly seven miles; and were taken off in the dark by Richard Wallis, with the greatest difficulty.<sup>110</sup>

The number of livestock loss was serious and considerable. Many of wheat and barley that floated off were forced by the current into the ocean; upward of sixty were seen by one observer to clear Cumberland Reach, and twenty were seen by two lime burners in a very short space of time drifting towards Pittwater: upon some were many pigs, dogs, and prodigious quantities of poultry, a great many of which took flight and got to land as they occasionally approached the banks.<sup>110</sup>

On 6 June 1806 in *England*, there was a hailstorm in Worcestershire and Herefordshire.<sup>93</sup>

On 7 July 1806 in *England*, there was a hailstorm in Rutlandshire.<sup>93</sup>

On 22 July 1806 in *England*, there was a hailstorm in Suffolk.<sup>93</sup>

On 24 July 1806 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 24 July 1806, a tremendous storm visited the metropolis [London, *England*]. The clouds appeared to be nearly as low as the housetops. The darkness was extraordinary. The rain came down in torrents. The lightning did much damage.<sup>128</sup>

On 9 and 21 August 1806 in Dublin, *Ireland*, there were great hail showers.<sup>93</sup>

In August 1806, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 47 feet (14.33 meters) above the water mark at Windsor.<sup>99, 109</sup>

The maximum temperature during the summer in Arles, *France* was 99.5° F (37.5° C) on 20 August.<sup>62</sup>

On 23 August 1806, a hurricane struck offshore the eastern coast of the *United States* causing 42 deaths.<sup>141</sup>

On 29 August 1806 in *England*, there was a hailstorm in Somersetshire.<sup>93</sup>

In 1806, *the Bahamas* were afflicted in a manner never known before by the oldest inhabitants; first by a great drought, and afterwards by four dreadful gales of wind [hurricanes]. At Eleuthera, on 30 August 1806, a gale began about eight in the evening, and lasted till daylight the next morning; it entirely destroyed everything, which the inhabitants had in their fields. September 13<sup>th</sup>, a more dreadful gale

threw down the houses, tore up trees by the roots, leaving almost everything in a state of destruction. On the 27<sup>th</sup> of September and on the 5<sup>th</sup> of October there were two more gales.<sup>146</sup>

Long rains in 1806 ruled in Languedoc and Provence, *France*. In Viviers this year produced an annual rainfall of 48.8 inches (1,240 millimeters) compared to the average 35.8 inches (910 millimeters). There were one hundred and eighteen rainy days instead of the nominal ninety-eight. At Joyeuse, there were one hundred and seventeen rainy days instead of the typical ninety-seven. Provence had repeated showers, which made it permanently damp.<sup>79</sup>

On 9 September 1806, reports were received of a tremendous hurricane that struck *Dominica*. Many persons died.<sup>128</sup>

On 9 September 1806, a hurricane struck Dominica in the *Lesser Antilles*. [Various accounts list 457, >300 and 131 fatalities.]<sup>141</sup>

On 9 September 1806, a hurricane struck Dominica in the *Lesser Antilles*. The following is from the *Dominica Journal* entry dated 20 September 1806:<sup>146</sup>

— "We again resume our journal, after an interruption occasioned by the confusion and loss sustained in the office during the late hurricane, one of the greatest calamities this colony has sustained within the memory of its oldest inhabitants. To give a detail of all the particulars of that unfortunate event would be a task impossible to fulfil with accuracy, until things commence to be a little more settled, and that a regular communication with the country should be opened, the roads being entirely destroyed. We shall therefore confine ourselves chiefly to the giving a general idea of the whole, as far as the intelligence received from the different parts of the colony may enable us.

— "On Tuesday the 9<sup>th</sup> instant, about seven o'clock in the evening, the sky became totally overcast, and tremendous flashes of lightning, accompanied by heavy puffs of wind, presaged to the more experienced part of the inhabitants an approaching storm; but few expected it would have been so fatal in its consequences. The wind continued increasing until ten o'clock, when it began to be accompanied by a most dreadful fall of rain, the effect of which, accompanied by a pitch-like darkness, each moment illuminated by a sheet of livid fire, and the roaring of the wind, which every instant became louder, was awful enough to impress a dread upon the heart of the most intrepid. Soon after, to complete our misfortune, the river Roseau, increased by the heavy rains, overflowed its banks, inundated the town in every direction, and then the destruction became general. Every house which obstructed its passage was thrown down, or carried away by the stream; and a great proportion of their unfortunate inhabitants perished. About ten o'clock every vessel in the harbour was driven from its moorings, except a small Swedish schooner, which was cast ashore under the fort a little after midnight; and those who were driven out generally met with the same fate, amounting, in the whole, to sixteen sail, of different descriptions.

— "No pen can paint the horrors of that dreadful night; the tremendous noise occasioned by the wind and rain, the roaring of the waters, together with the shock of an earthquake, which was sensibly felt about midnight — the shrieks of the poor sufferers crying out for assistance — the terror of those who in their houses heard them, and dared not open a door or window to give succour, and who expected momentarily to share the same fate, formed a scene which can hardly be conceived, and still more difficult to be described. Fortunately for the inhabitants of the town, and, indeed, for the whole colony, the force of the wind and rain abated about three o'clock in the morning, and near the same time the water began to fall. If it had continued another hour, there is not a doubt but the town would have been entirely destroyed.

— "The spectacle which presented itself, on the return of daylight, was horrid beyond every power of description. Heaps of mud and sand, (in some places five or six feet deep,) through all parts of the town — the form of a street hardly to be discerned — two large streams, or rather torrents, running through the midst of the town — ruins of houses blown down, and others brought down by the flood, obstructing every passage — the carcasses of several of the unfortunate victims of this event drawn out from the ruins, and lying in the streets — while numbers, almost distracted, were searching for some near relation or friend, who had perished in the storm — the lamentations of those who had lost some of their nearest and dearest connections, joined to the despair of those who had lost their little all, formed altogether a scene fit to draw tears from the eyes of the most unfeeling.

— "From the most authentic accounts which have been gathered during the confusion occasioned by this fatal occurrence, there has been ascertained to have perished in the town of Roseau and its vicinity, eight white persons of

different sexes and ages, fifty-seven free persons of colour, and sixty-six slaves, forming a total of 131, besides numbers of others yet missing, and several wounded.

— "On Morne Bruce, where that part of the garrison stationed at Roseau is quartered, the whole of the barracks were blown down, excepting one; three men and one woman killed, and one man wounded.

— "The planters have equally suffered with the inhabitants of the town. Every plantation on the windward coast of the island, from the river Tabarie to Morne Paix Bouche, are almost entirely destroyed; only three mills standing in the whole extent, and these considerably damaged. No other building left on either sugar or coffee estate, and the numerous inhabitants of that quarter have only for shelter four houses situated at some distance from the sea, to which most of the white inhabitants have retired. On the different estates on that coast, as far as accounts have reached town, there have perished about thirty Negroes, and upwards of 180 dangerously wounded. Round the coast from the river Tabarie, by way of La Soye, the estate which bears the name of that river, is perhaps the only one that has not received any considerable damage in this general disaster.

— "All the plantations to leeward of the island have experienced the effects of the hurricane. Every house, from the river Mahaur down to Prince Rupert's, either laid flat, or greatly damaged — the town of Portsmouth entirely destroyed — the greatest part of the barracks on Morne Cabrit carried away; and, in general, the whole island offers a scene of devastation and ruin."

On 20 September 1806, a hurricane struck Dominica in the *Lesser Antilles* causing more than 165 deaths.<sup>141</sup> [I suspect this is the hurricane of 9 September that appeared in the journal entry dated 20 September.]

On 24 September 1806, there was a heavy hailstorm that did much damage to crops at the Hawkesbury River, in New South Wales, *Australia*.<sup>103</sup>

On 29 September 1806, a hurricane struck offshore in Virginia in the *United States*. The schooner *Charming Mary* was found partially submerged.<sup>141</sup>

In 1806 during the period between 6 May and 8 August, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at T'ai. Then during the period between 14 August and 11 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Wên-chou and Ningpo; Hupeh (now Hubei province) in central *China* at Chung-hsiang; and Szechwan (now Sichuan province) in southwest *China* at Kung.<sup>153</sup>

*Also refer to the section 1802 A.D. – 1807 A.D. for information on the famine in India during that timeframe.*

---

**Winter of 1806 / 1807 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1806 occurred on 16 November. Snowed all day; snow 8 or 9 inches deep; quite wintry weather.<sup>116</sup>

On 26 December 1806, one of the highest tides ever remembered happened. Boats rowed in Palace Yard in London, *England*.<sup>128</sup> [The Old Palace Yard is immediately to the west of the Houses of Parliament (the Palace of Westminster) in Westminster, London.]

In the *United States*, 7 February 1807 was known for many years as Cold Friday by reason of the low temperatures in the Middle States reached during that day.<sup>123</sup>

In the *United States* a massive late-season snowstorm traveled from the Tennessee Valley to southeastern Pennsylvania on March 30-April 1, 1807. The depth of the heavy wet snow in Pennsylvania was 36 inches (91 centimeters) at Huntingdon; 36-42 inches (91-107 centimeters) in the Nittany Valley; and 54 inches (137 centimeters) in Montrose. In Bradford County, Pennsylvania near the New York border "snow fell continuously three days and was between four and five feet (1.2-1.5 meters) deep".<sup>27</sup>

In the winter of 1806-07 in Bradford County, Pennsylvania in the *United States*, there was a very heavy March snowfall. Beginning on the 31 March 1807, it snowed continuously two days and the snow was between 4 and 5 feet [1.2 – 1.5 m] in depth. In April, following the rapid thaw of this snow, one of the most notable floods of the Susquehanna River took place.<sup>178</sup>

---

**1807 A.D.** In Dublin, *Ireland*, there were great floods in the neighborhood.<sup>47, 92</sup>

A great flood struck New England in the *United States* during the beginning of February 1807. The freshet was caused by heavy rains, which melted the snow and swelled the rivers until they overflowed, carrying away bridges and mills, entering warehouses and stores and doing great damage. The floods carried away several bridges east of Portsmouth, New Hampshire. It also took out a bridge over the Little River in Haverhill, Massachusetts. The principal bridge at Lawrence [connecting Andover and Methuen] was destroyed. Other bridges further up the Merrimack River were destroyed. The Watertown Bridge and the Milford Bridge were carried away. At Pawtucket, Rhode Island, the bridge was destroyed along with a cotton factory and four or five other buildings. In Connecticut, the stone bridge over Swallow-Tail Brook at East Chelsea was destroyed. The Shetucket River rose from 18 to 20 feet [5.5-6.1 meters]. At Norwich, Connecticut, the Lord and Lathrop bridges were swept away. The Lovett, Geometry and Quarter bridges were damaged. Water rose in houses compelling the inhabitants to climb out of their windows and be evacuated by boats.<sup>199</sup>

In France there was a flood. On 3 March 1807, the Seine River in Paris, *France*, at the bridge “Pont de la Tournelle” reached a height of 6.7 meters (22 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

On 2 May 1807 in *England*, there was a great hailstorm in Suffolk, also in Cumberland, Lancashire, and Leicestershire.<sup>93</sup>

On 10 May 1807 in *England*, there was a hailstorm in Staffordshire.<sup>93</sup>

On 26 May 1807 in Brunswick, *England*, a district of nearly 30 English miles was laid waste by a hailstorm. The stones were about the size of an ordinary fowl's egg.<sup>93</sup>

The summer of 1807 was remarkable for its troublesome heat, thunderstorms, hail and a major drought that extended over *Europe*. The high temperatures observed during the summer were:<sup>62</sup>

Naples, <i>Italy</i>	(104.0° F, 40.0° C) in August
Nîmes, <i>France</i>	( 99.5° F, 37.5° C) on 18 July
Frankfurt, <i>Germany</i>	( 97.2° F, 36.2° C) in July
Strasbourg, <i>France</i>	( 96.4° F, 35.8° C) on 13 July
Avignon, <i>France</i>	( 96.3° F, 35.7° C) on 30 July
Maastricht, <i>the Netherlands</i>	( 95.5° F, 35.3° C) on 31 July
Karlsruhe, <i>Germany</i>	( 95.0° F, 35.0° C) on 13 July
Moens, <i>France</i>	( 95.0° F, 35.0° C) on 31 July
Paris, <i>France</i>	( 92.5° F, 33.6° C) on 11 July
London, <i>England</i>	( 84.9° F, 29.4° C) on 22 July

In London, *England*, the driest years in the 23-year period [1797-1819] occurred in 1807 with 18.01 inches of rainfall.<sup>175</sup>

In *France*, lightning caused many fires and there were severe hailstorms. In *Italy*, a long heat wave was truly remarkable. For three continuous weeks in Naples, *Italy*, the temperature was over 89.6° F (32° C). During this time, frequent apoplexy and sudden deaths were observed. Throughout the north, the heat and drought was very great. In Berlin, *Germany*, the mean temperature for August rose to 73.9° F

(23.3° C). In Stuttgart, *Germany* a tremendous heat prevailed on 31 July, and many people complained of severe headaches. In *Sweden*, the summer was long. In St. Petersburg, *Russia* there were three weeks of stable temperatures at 73.4° to 77° F (23° to 25° C).<sup>62</sup>

In Burgundy, *France*, the grape harvest began on 24 September. The weather had been warm with rain showers. The weather alternated with frequent rain and high heat. The yield [of wine] was plentiful and the quality good. The corn crop in *France* did quite well.<sup>62</sup>

The rainfall of 1807 in *France* dropped below the typical annual rainfall by 7.4 inches (189 millimeters) in Marseille; 11.7 inches (297 millimeters) in Montpellier; 3.2 inches (81 millimeters) in Joyeuse; and 2.1 inches (54 millimeters) in Viviers. The number of rainy days decreased by 27 in Montpellier, by 16 in Joyeuse, by 26 in Viviers.<sup>79</sup>

On 17 October 1807, a hurricane struck the *Spanish Main*. [In the days of the Spanish New World Empire, the mainland of the American continent enclosing the Caribbean Sea and the Gulf of Mexico was referred to as the Spanish Main.] From the ship *Firefly*, "all except the Surg. & 3 men (lost when vessel) foundered in a hurricane off the Spanish Main."<sup>141</sup>

On 10 November 1807, Honiton Bridge [Devon, *England*] carried away by a flood.<sup>128</sup>

In 1807, a drought engulfed many regions of *China* including:<sup>153</sup>

— During the period between 9 March and 7 April, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin and Shantung (now Shandong province) on the east coast of *China* at Huang.

— During the period between 8 May and 5 June, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Yüeh-ch'ing.

— During the period between 6 June and 4 July, a drought engulfed Hupeh (now Hubei province) in central *China* at Ch'ung-yang and Shih-shou.

— During the period between 4 August and 1 September, a drought engulfed Chekiang province at Hsüan-p'ing.

— During the period 2-30 September, a drought engulfed Hopei (now Hebei province) in northern *China* at Luan.

*Also refer to the section 1802 A.D. – 1807 A.D. for information on the famine in India during that timeframe.*

**Winter of 1807 / 1808 A.D.** On 20 November 1807, a fiddler near Alston Moor in Cumbria in northwestern *England* returning home in a snowstorm took shelter in a hovel, which was soon overwhelmed with snow. Some shepherds heard him next day playing on his fiddle, and relieved him from his perilous situation.<sup>128</sup>

On 2 February 1808, the breakwater at Cherbourg [in northwestern *France*] injured by a storm.<sup>128</sup>

On 16 February 1808, a snowstorm halted travelling in the north [of *England*].<sup>128</sup>

**1808 A.D.** In *England*, there were floods in various parts.<sup>41, 43, 47, 56</sup>

On 25 June 1808, there was a violent hurricane, attended by an earthquake at Montaldo in northwestern *Italy*.<sup>128</sup>

On 13 July 1808 in *England*, there was a hailstorm in Somersetshire, and in Gloucestershire.<sup>93</sup>

In July 1808, the temperature [in London, *England*] rose to 93.5° F (34.2° C).<sup>128</sup>

On 15 July 1808, there was a thunderstorm in Somersetshire, *England*, when the hailstones measured from six to seven inches.<sup>128</sup>

On 15 July 1808 in *England*, there was a hailstorm in Oxfordshire, and in Somersetshire. Hailstones measured 6 or 7 inches in circumference.<sup>93</sup>

In Somersetshire, *England* on the 15<sup>th</sup> of July, there was a great thunderstorm, accompanied by hailstones, measured 6 and 7 inches in circumference.<sup>41, 43, 56, 57</sup>

On 16 July 1808 in *England*, there was a great hailstorm in Gloucestershire and Somersetshire.<sup>93</sup>

On 16 August 1808 in southwestern *England*, there was a great hailstorm at Bristol. This destructive hail shower consisted of masses of ice, many of them from 3 to 9 inches in circumference. The tempest arose in the southwest, and passed away in the northwest. The destruction of glass was enormous, as also of trees.<sup>93</sup>

The vineyards of Tokaj in northeastern *Hungary* were destroyed by a hailstorm.<sup>41</sup>

On 30 August 1808, the greater part of the vineyards of Tokay, in *Hungary* was destroyed by a storm. The hailstones were the size of walnuts; seven men and a boy lost their lives, and great number of cattle perished.<sup>128</sup>

The summer of 1808 was again remarkable for the drought and the great heat in *Russia, Belgium, France* and *Italy*. The high temperatures of the summer were:<sup>62</sup>

Avignon, <i>France</i>	( 98.6° F, 37.0° C) on 16 July
Maastricht, <i>the Netherlands</i>	( 98.1° F, 36.7° C) on 14 July
Moens, <i>France</i>	( 97.3° F, 36.3° C) on 15 July
Paris, <i>France</i>	( 97.2° F, 36.2° C) on 15 July
Dijon, <i>France</i>	( 96.1° F, 35.6° C) in July
London, <i>England</i>	( 91.9° F, 33.3° C) on 13 July

In *Russia*, the heat began in June and at St. Petersburg the first days of July were very intense. Also in *Denmark*, the temperature was significantly elevated. In *England*, the heat was so overwhelming that many post horses collapsed on the roads. In mid-May individuals in the south of *France* began to complain about the exceptional drought and heat, calling them the dog days [of summer]. The summer was also warm and dry; but on the other hand, autumn was rainy. In *France*, there were numerous thunderstorms and many fires caused by the lightning. Several vineyards in Burgundy, *France* were devastated by hailstorms. In Burgundy, the grape harvest only began on 28 September. The wine was quite abundant, but only of mediocre quality. Fruits were in abundance, but there was a lack of vegetables. The grain harvest in *France* was rather abundant. In *Russia* and *Italy*, very good yields were produced.<sup>62</sup>

In 1808 during the period between 5 February and 6 May, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Yüeh-ch'ing. During the period between 5 February and 8 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Huang-an.<sup>153</sup>

In 1808, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 27 March and 25 April, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin and Hopei (now Hebei province) in northern *China* at Wang-tu, Ting and Pao-ting.

— During the period between 25 May and 23 June, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hsin-têng and Ch'ing-yüan.

— During the period between 22 August and 19 September, floods struck Chekiang province at Ch'ing-yüan.

— During the period between 12 October and 17 November, floods struck Hopei province at Nan-kung and Kiangsi (now Jiangxi province) in southern *China* at I-ch'un and Kiukiang.

**Winter of 1808 / 1809 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1808 occurred on 15 November. Snowed steadily all day.<sup>116</sup>

On 18 December 1808, a sheep, one year old, buried in the snow [in *Great Britain*] since the 19<sup>th</sup> of November was found alive.<sup>128</sup>

On 9 December 1808, great damage done to the adjoining warehouses and cellars by the overflowing of the River Thames in *England*.<sup>128</sup>

During the Finnish War [between Sweden and the Russian Empire], two Russian armies crossed the frozen *Baltic Sea* through the Gulf of Bothnia and invaded *Sweden*. One army of 17,000 crossed the frozen sea traveling from Turku, *Finland* to the Åland Islands. A vanguard of these troops then crossed over the ice and reached the Swedish shore within 70 km from Stockholm on 19 March 1809. Another army of 5,000 troops crossed the frozen *Baltic Sea* from Vaasa, *Finland* reaching Umeå, *Sweden* on March 24.<sup>36</sup>

The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1808-09, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

The winter of 1808-09 was mild in *Southern Europe*; but in *the North*, the cold was very severe. In Paris, *France*, the Seine River froze twice. The first time was from 20 to 29 December 1808 and the second time from 19 to 20 January 1809. The lowest temperatures observed during the winter were:

Paris, <i>France</i>	( 10.0° F, -12.2° C) on 21 December 1808
<i>Ibid.</i>	( 14.7° F, -9.6° C) on 18 January 1809
Maastricht, <i>the Netherlands</i>	( 13.1° F, -10.5° C) on 22 December 1808
<i>Ibid.</i>	( 5.5° F, -14.7° C) on 17 January 1809
Moens, <i>France</i>	( 12.9° F, -10.6° C) on 19 December 1808
<i>Ibid.</i>	( 11.7° F, -11.3° C) on 17 and 19 January 1809

In Moscow, *Russia*, the mercury froze several times in the thermometer towards the end of March and great quantities of snow fell.<sup>62</sup> [The mercury in mercury thermometers solidifies (freezes) at -37.89 °F (-38.83 °C).]

### 1809 A.D. – 1811 A.D. Australia. Drought

There was a drought in New South Wales, *Australia*. Crops were destroyed. There was a serious water shortage. The drought was said to be the worst since the drought of 1789-1791.<sup>101</sup>

In January 1809 in New South Wales, *Australia*, there was a drought. In April there was a long period of dry weather.<sup>103</sup>

On 11 February 1810 in New South Wales, *Australia*, town gangs cleaned out [water] tanks.<sup>103</sup>

In 2 March 1811 in New South Wales, *Australia*, the drought destroyed the maize crop; [water] tanks empty; water sold for 6d. per full pail.<sup>103</sup>

---

**1809 A.D.** On 28 March 1809 in *England*, there was a hailstorm in Sussex.<sup>93</sup>

In April 1809, there was a major flood when the Derwent River overflowed its banks in Tasmania, *Australia*.<sup>99</sup>

In May 1809, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 48 feet (14.64 meters) above the water mark at Windsor.<sup>99, 109</sup>

On 18 May 1809 in *England*, there was a great hailstorm in Essex and Middlesex.<sup>93</sup>

In Burgundy, *France*, the summer of 1809 was very unfavorable for the [grape] vines. The grape harvest only began on 16 October. The yield of wine was very small and of poor quality. In southern *France* the summer was cold, rainy and produced many thunderstorms. At the beginning of October in many places the grain was cut. The hay was spoiled. The fruit did not ripen and as a result produced rotted grapes. In Paris, *France* the highest temperature was only 88.2° F (31.2° C) which occurred on 17 August. The average temperature during the summer was 62.4° F (16.9° C). The grain harvest was insufficient in *France*.<sup>62</sup>

In 1809 in Tasmania, *Australia*, the Derwent River overflowed its banks.<sup>101</sup>

In August 1809, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 47.5 feet (14.49 meters) above the water mark at Windsor.<sup>99, 109</sup>

In 1809 in *Australia*, the Hawkesbury River flooded.<sup>101</sup>

In August 1809, a hurricane struck near Tortola, Montserrat in the *Leeward Islands* causing 62 deaths.<sup>141</sup>

On 3 August 1809, a hurricane struck off the coast of *Puerto Rico*. The 18-gun ship *H.M.S. Lark* foundered and all her crew, except one man, perished.<sup>141</sup>

On 6 August 1809, lightning struck Swinton, three miles [5 kilometers] from Manchester, *England*. “The lightning produced remarkable mechanical effects on part of a house belonging to Mr. Childwick. At two o’clock in the afternoon, after repeated discharges of distant lightning, which seemed to be approaching, a frightful explosion took place. It was immediately followed by torrents of rain. For some minutes a sulphurous vapour surrounded the home. The outside wall of the small building, cellar, and cistern was torn up by its foundation and lifted up bodily; the explosion carried it vertically without overturning it, to a short distance from the place which it had occupied. One of its ends had been moved nine feet [2.7 meters], the other four [1.2 meters]. The wall thus lifted and carried was composed of 7,000 bricks, and, without counting the mortar, would weigh about twenty-six tons.”<sup>271</sup>

On 17-19 August 1809, a hurricane struck *Puerto Rico* and there was a great death toll.<sup>141</sup>

On 27 August 1809, a hurricane struck the central *Atlantic Ocean*. The cutter *Express*, together with several other ships of the fleet was believed to have foundered during the storm and several people on the wrecks were seen to go down.<sup>141</sup>

In 1809 during the period between 14 May and 12 June, floods struck Hopei (now Hebei province) in northern *China* at Wang-tu and Hupeh (now Hubei province) in central *China* at Fang. During the same time period, a drought engulfed Hopei province at Hsing-t'ai and Hupeh province at Ying-shan. During the period between 13 July and 10 August, floods struck Hopei province at Nan-kung.<sup>153</sup>

*Also refer to the section 1809 A.D. – 1811 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1809 / 1810 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1809 occurred on 24 November. A severe snowstorm lasted all day. November 25, snow nearly a foot deep; people move in sleighs.<sup>116</sup>

A dramatic cold spell struck New England in the *United States* on 19 January 1810. The winter had been warm and little snow had fallen. A strong gale struck and at Salem, Massachusetts, temperatures dropped from 45° F to -5° F [from +7° C to -21° C]. At Amherst, New Hampshire, the temperature reached -14° F [-26° C]. The temperature drop was so extreme that many people froze to death while traveling along the highways. The winds were exceptionally strong and destroyed houses, barns and a vast number of timber trees. This day became known as “Cold Friday”.<sup>199</sup>

The Loire, the Saône rivers in *France*, and the Maas (Meuse) River were frozen.

During a part of January 1810, the cold was so intense at Moscow, *Russia* that the mercury froze. [The mercury in mercury thermometers solidifies (freezes) at -37.89 °F (-38.83 °C).]<sup>1</sup>

The winter of 1809-10 was very cold all over *Europe*, even in the south. Ice formed on the Seine River. For several days individuals went across the ice over the Saône River. The Maas (Meuse) River was frozen beginning in the last days of December through the greater part of January. The coldest temperatures observed during the winter were:

Lyon, <i>France</i>	( 5.0° F, -15.0° C) in January
Moens, <i>France</i>	( 5.0° F, -15.0° C) on 21 February
Maastricht, <i>the Netherlands</i>	( 5.5° F, -14.7° C) on 16 January
Brussels, <i>Belgium</i>	( 5.5° F, -14.7° C) on 3 and 7 January
Paris, <i>France</i>	( 9.9° F, -12.3° C) on 31 January
Avignon, <i>France</i>	(15.1° F, -9.4° C) on 22 February

Lake Geneva at Geneva, *Switzerland* was frozen until 22 February. The Loire River froze at Nantes, *France*. The Danube, the Inn, the Isar, the Roth, the Vils and the Ilz rivers (up to a considerable distance from Passau, *Germany*) were frozen. In St. Petersburg, *Russia*, the cold was very severe. The Dvina (Daugava) River was completely frozen beginning in November 1809 and the port of Archangel (Arkhangelsk) was blocked by ice.<sup>62</sup>

On 19 January 1810, intense cold swept through the *United States*. The weather became simultaneously cold from North Carolina to the extreme West, and through all the middle, northern and eastern States and continued cold until March.<sup>1</sup>

During the winter of 1809-10 in Bradford County, Pennsylvania in the *United States*, temperatures dropped to -20° F [-29° C] on January 19<sup>th</sup>.<sup>178</sup>

**1810 A.D.** Towards the end of January 1810, a dreadful gale of wind from the southeast struck Ochotsk in Siberia, *Russia*. This gale lasted two days; waters of Ochotsk rose 12 feet, flowed over the tops of the houses, and a transport was driven into the middle of town.<sup>43</sup> [Ochotsk is a seaport at the mouth of the Okhota River on the Sea of Okhotsk in eastern *Russia*]

The four famines of 1810, 1811, 1846, and 1849 in *China* are said to have taken a toll of not less than 45,000,000 lives.<sup>84</sup>

In Lincolnshire, *England*, an inundation broke down the seabanks.<sup>47</sup>

From the 6<sup>th</sup> to the 8<sup>th</sup> of March in 1810, there was a violent tempest at Cadiz, *Spain*, which caused great destruction among the shipping.<sup>43</sup>

On 6 March 1810, a storm at Cadiz, *Spain* destroyed thirty-six ships.<sup>128</sup>

In 1810 in the northwest provinces of *India*, there was a famine. Between 2% and 8% of the population died. In one central district alone, 90,000 people died of famine.<sup>91</sup>

In 1810, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

On 20 June 1810, it was reported that a forest in *India*, 23 miles broad and 65 miles long, was set fire and burned for five weeks; 50 villages destroyed. [The same incident was reported in December 1812.]<sup>128</sup>

On 1 July 1810, there was a violent storm in London, *England*. The effects of which were felt in most parts of *England*.<sup>43</sup>

On 15 July 1810 in *England*, there was a great hailstorm in Berkshire and Middlesex.<sup>93</sup>

On 4 August 1810 in *England*, there was a hailstorm in Cumberland.<sup>93</sup>

On 14 August 1810 in London, *England*, there was a great hailstorm and much damage in the northwest districts.<sup>93</sup>

On 14 & 15 August 1810, the thunder and lightning [in *England*] of these two days did immense damage. Many persons were killed.<sup>128</sup>

On 15 August 1810 in *England*, there was a hailstorm at Windsor. There was great destruction by unusually large hailstones.<sup>93</sup>

On 15 August 1810, a hurricane struck *Jamaica*. Some lives were lost at sea.<sup>141</sup>

On 28 August 1810, it was reported that there was a great hurricane at *Barbados*.<sup>128</sup>

On September 7 1810, a very destructive hurricane struck South Carolina and Georgia in the *United States* and many lives were lost.<sup>1</sup>

On 3 November 1810, it was reported that at Boston [in Lincolnshire on the east coast of *England*], the tide rose some feet above its usual level and continued so nearly an hour. It overflowed its banks and did great damage. Numerous sheep perished.<sup>128</sup>

In November 1810, an exceptional flood occurred in Pittsburg, Pennsylvania in the *United States*. This flood was referred to as the "Pumpkin Flood".<sup>124</sup>

On 10 November 1810, there was an inundation at Boston [*England*], caused by the tide breaking down the sea banks.<sup>43</sup>

In 1810 during the period between 5 February and 8 August, a severe drought engulfed Shantung (now Shandong province) on the east coast of *China* at An-ch'iu.<sup>153</sup>

In 1810, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 3 May and 1 June, floods struck Hsin-lin [uncertain name and province] and Hupeh (now Hubei province) in central *China* at I-ch'êng.

— During the period 2-30 July, floods struck Shantung (now Shandong province) on the east coast of *China* at Tsinan.

— During the period between 31 July and 29 August, floods struck Shantung province at P'ing-tu; Hopei (now Hebei province) in northern *China* at Nan-kung; and Szechwan (now Sichuan province) in southwest *China* at Kuang-yüan and Yen-yüan.

— During the period between 28 October and 26 November, floods struck Hupeh province at I-ch'êng.

*Also refer to the section 1809 A.D. – 1811 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1810 / 1811 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1810 occurred on 2 November. Had a severe snowstorm; great quantities of corn, apples, etc., were still outdoors; severe winter weather.<sup>116</sup>

The Meuse River froze. For several days, individuals crossed the ice on foot on the Saône River at Lyon, *France*.<sup>62</sup>

The winter of 1811 maltreated many olive trees. The cold rigor also slew the orange gardens of Hyères in *France*. The cold weather occurred mainly during the month of January. On the 1<sup>st</sup> of December the thermometer at Avignon sank to 23° F (-5° C). On the 3<sup>rd</sup> at sunrise the temperature read 16.3° F (-8.7° C) and at six o'clock in the evening 15.3° F (-9.3° C). The thaw came the next day by a very light southwest wind. The cold returned on the 27<sup>th</sup> with a reading of 18.5° F (-7.5° C). At Montpellier, the temperature dropped to 18.5° F (-7.5° C) on January 6<sup>th</sup> and at Marseille it dropped down to 25.3° F (-3.7° C). The northern regions of *France* suffered less than the southern regions. In Paris, for example, the thermometer did not exceed 13.5° F (-10.3° C) on January 2<sup>nd</sup>.<sup>79</sup>

The winter of 1810-11 was pretty harsh. In the *Baltic Sea*, the shipping was interrupted by the ice. The *Sound* was almost frozen over. The Meuse River was covered with ice from the middle of December to the middle of January. The Waal and Leck rivers froze. Ice flows formed on the Seine and Loire rivers. But the cold weather in *Provence* was moderate. The lowest temperatures observed during the winter were:<sup>62</sup>

Maastricht, <i>the Netherlands</i>	( 5.5° F, -14.7° C) on 7 January
Brussels, <i>Belgium</i>	( 5.5° F, -14.7° C) on 3 and 7 January
Moens, <i>France</i>	( 10.6° F, -11.9° C) on 3 January
Avignon, <i>France</i>	( 12.4° F, -10.9° C) on 3 January
Paris, <i>France</i>	( 13.5° F, -10.3° C) on 7 January
Hyères, <i>France</i>	( 24.1° F, -4.4° C) on 1 January

On 8 January 1811, the River Thames in *England* froze over.<sup>128</sup>

---

**1811 A.D.** In Pesth (Budapest, *Hungary*) in April, there was an overflow of the Danube River, by which twenty-four villages and their inhabitants were swept away.<sup>43, 47, 92</sup> [Pesth is the eastern, mostly flat part of Budapest, *Hungary*, comprising about two thirds of the city's territory. It is divided from Buda, the other part of Budapest, by the Danube River.]

In April 1811, at Pesth [Budapest], near Presburg, in *Hungary*, the overflow of the Danube River caused

24 villages and their inhabitants to be swept away.<sup>90</sup>

In 1811, ninety-four communities in northern *France* were ravaged by storms in April, May and June.<sup>79</sup>

In Shropshire, *England* in May, there was a cloudburst near Salop; many persons and cattle drowned.<sup>47, 92</sup>

On 4 May 1811, a monsoon at Madras [now Chennai, *India*] caused all the ships in the road to either be driven on shore or foundered at anchor.<sup>128</sup>

There was an inundation on 27 May 1811, in the vicinity of Salop [Shropshire, *England*] by the bursting of a cloud, during a storm, by which many persons and much stock perished.<sup>43, 90</sup>

On 28 May 1811 at Worcester, *England* was struck by a storm, which raised the River Severn 20 feet in 24 hours.<sup>43</sup>

On 28 May 1811 in *England*, there was a hailstorm in the neighborhood of Worcester. The storm began in the afternoon, lasting about half an hour. Hailstones of enormous bulk fell. These destroyed vegetation, and perforating the windows like bullets. The storm passed westward with equal fury. A great flood followed.<sup>93</sup>

On 4 June 1811 at Plymouth, *England*, the tide suddenly fell, leaving the ships in the port dry, and in about half an hour returned with great violence, set the ships afloat and rushed out again in a different location.<sup>128</sup> [Plymouth is in Devon on the south coast *England*.]

On 5 June 1811 in *England*, there was a hailstorm in Yorkshire and in Suffolk.<sup>93</sup>

On 8 June 1811 in *England*, there was a hailstorm in Worcestershire.<sup>93</sup>

On 3 August 1811 in Leitrim, *Ireland*, there was a great storm of rain and hail, which destroyed the crops.<sup>93</sup>

The summer of 1811 [in *Europe*] was, for various reasons, one of the strangest that have ever occurred. Here is a table of the highest temperatures:<sup>62</sup>

Augsburg, <i>Germany</i>	( 99.5° F, 37.5° C) on 30 July
Vienna, <i>Austria</i>	( 96.3° F, 35.7° C) on 6 July
Milan, <i>Italy</i>	( 95.0° F, 35.0° C) on 27 July
Avignon, <i>France</i>	( 95.0° F, 35.0° C) on 27 July
Riga, <i>Latvia</i>	( 95.0° F, 35.0° C) on 27 June
Altona, <i>Germany</i>	( 95.0° F, 35.0° C) on 20 July
Hamburg, <i>Germany</i>	( 94.6° F, 34.8° C) on 19 July
Naples, <i>Italy</i>	( 94.3° F, 34.6° C) on 20 July
Copenhagen, <i>Sweden</i>	( 92.8° F, 33.8° C) in July
Liège, <i>Belgium</i>	( 92.7° F, 33.7° C)
Maastricht, <i>the Netherlands</i>	( 92.1° F, 33.4° C) on 19 July
Strasbourg, <i>France</i>	( 91.4° F, 33.0° C)
St. Petersburg, <i>Russia</i>	( 88.0° F, 31.1° C) on 27 June
Paris, <i>France</i>	( 87.8° F, 31.0° C) on 19 July
Moens, <i>France</i>	( 86.0° F, 30.0° C) on 19 and 29 July
London, <i>England</i>	( 72.9° F, 22.7° C) on 28 & 29 July

In *Hungary*, the spring was already very hot; something that normally occurs during the dog days of summer. In *Russia*, on the *Danish islands* and in *Jutland* the heat was very strong since June, and by late

June the heat was excessive. In Berlin, *Germany*, the heat in the middle of May was some of the highest in the century. Nature languished due to the heat and the drought. During the solstice rain swept in and freshen the air, and repaid the earth with a little moisture. Devastating storms swept over *Germany*. In *Austria*, the harvest was over by the 6<sup>th</sup> of July. The grain was rich and quite excellent. In *Poland*, the harvest was a month earlier than usual. In *Denmark*, the rye harvest took place on 27 July. This is very early for the region. In Elberfeld, *Germany* on the Feast of St. John's [25 July], people enjoyed a lunch of bread and wine from the harvest of that year. In certain districts, the rye was harvested before the hay.<sup>62</sup> [Elberfeld is now in Wuppertal in west-central *Germany*.]

In *Italy* and throughout the *East*, the summer was early and warm. The harvest was already over by 20 June. In *Languedoc*, the spring in April and May was warm and dry, although there were some abundant rains. The summer produced strong atmospheric alternations. The grain crops in the south were very mediocre. The agricultural food that was harvested reached very high prices and the food was scarce. The grain harvest in *France* was rather low. In Burgundy, the grape harvest began on 14 September. On 11 April, a frost suddenly occurred which compromised two thirds of the harvest. The grapes produced very little but the wine earned very excellent ratings, which later became known under the name - comet wine.<sup>62</sup>

The summer of 1811 in *France* produced heat that was everywhere early, intense and prolonged. This excess heat burst suddenly from the month of February. The heat was maintained almost without interruption, or rather increasing month-by-month during the months of March, April and May. But the heat declined during the three summer months. The heat returned during the next four months, especially during the month October, when the temperatures were 2° to 5° F (1° to 3° C) above normal.<sup>79</sup>

In Nancy, *France* the heat began 15 March 1811, and persisted obstinately until August 6. On that day and two days following heavy rains momentarily cooled the earth. But right after the heat rose anew and continued to the end of October. During the months of May, June and July, the thermometer usually reached in the countryside 77° to 86° F (25° to 30° C). The temperature even on three occasions reached 91.4° and 93.2° F (33° and 34° C). October 18, the temperatures each day were at 68° F (20° C). This was the same temperature observed during the last half of August. The sky remained almost constantly serene. The atmosphere was very dry. The prevailing winds were southwesterly or northwesterly winds. The barometer was several millimeters above the norm. This dry heat was responsible for drying up a large number of streams early in the year that nobody had ever seen dry up before. It compromised meadows and spring seeding, but advanced all the crops and produced very abundant grain and grapes harvest. The grapevine bloomed on May 24, instead of the normal June 24. The grain harvest took place from July 10<sup>th</sup> to 20<sup>th</sup>, and the grape harvest began on September 8<sup>th</sup>. In the South, there were warm southerly winds that produced humid and stuffy weather. Special summer days in Provence lasted until the end of this year. In both southern and northern *France*, heat and drought exhausted most sources, parched streams and rivers, precipitated the mature fruit, consumed the plant foragers, and favored, in general the harvests of wine.<sup>79</sup>

In 1811, the hot temperatures generally occurred with the extraordinary rainfall. For example compare the rainfall in Paris, Viviers, Joyeuse and Montpellier, *France*. Paris had 23.5 inches (597 millimeters) of rainfall compared to the average annual rainfall of 19 inches (482 millimeters). Viviers had 40 inches (1,015 millimeters) rainfall compared to the nominal 35.8 inches (910 millimeters). Montpellier had 44.8 inches (1,139 millimeters) of rainfall instead of typical 30.1 inches (764 millimeters). Joyeuse had 68 inches (1,728 millimeters) of rainfall instead of the typical 50.4 inches (1,281 millimeters). The rainfall in Paris was proportionally less than in the provinces. The largest amount in relation to the average occurred in Montpellier and Joyeuse. At precisely the same time that the rain ravaged the Languedoc and Vivarais, the regions of Roussillon and Lorraine complained of unusual droughts lasting several months.<sup>79</sup>

On September 8, a terrible tornado struck Charleston, South Carolina in the *United States*. Many lives were lost and there was great destruction.<sup>1</sup>

On 10 September 1811, a hurricane struck South Carolina in the *United States*. Many were killed.<sup>141</sup>

In Lüneburg, *Germany* in October, the village of Wurgen was swept away by overflowing of the River Elbe.<sup>43, 47</sup> [Lüneburg is near Hamburg in northern *Germany*.]

On 1 November 1811, the greatest quantity of rain fell this night in *Scotland* than was ever known, and an immense quantity of land was overflowed.<sup>128</sup>

There was an inundation on 29 November 1811 caused by the bursting of the Driggle reservoir, nine miles west of Huddersfield in west Yorkshire in northern *England*, by which a cottage was swept away, and four children with their father and mother perished in the flood.<sup>43</sup>

In 1811, there was a famine in Marwar and Guzerat [now Gujarat], *India* caused by locusts.<sup>179</sup>

The four famines of 1810, 1811, 1846, and 1849 in *China* are said to have taken a toll of not less than 45,000,000 lives.<sup>84</sup>

In 1811, a drought engulfed several regions of *China* including:<sup>153</sup>

- During the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Huang.
- During the period between 22 May and 20 June, a drought engulfed Hopei (now Hebei province) in northern *China* at Peiping, Lin-yü and Fu-ning [possible misprint, “Fu-hsüan”].
- During the period between 21 June and 19 July, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Wên-chou, Li-shui, Chin-yün and Ch’êng; Hupeh (now Hubei province) in central *China* at Chung-hsiang, Fang, Chiang-ling and I-tu; and Hopei province at Ching.
- During the period between 20 July and 18 August, a drought engulfed Hopei province at Ch’ü-yang and Shantung province at P’êng-lai, Chao-yüan, Mou-p’ing, Wên-têng and Chi-mo.
- During the period between 8 August and 8 November, a drought engulfed Shantung province at Lin-ch’ü and Kuan-ch’êng.

In 1811, several regions of *China* experienced flooding including:<sup>153</sup>

- During the period between 22 May and 20 June, floods struck Honan (now Henan province) in central *China* at Hsin-an [uncertain name]; and Hopei (now Hebei province) in northern *China* at Ta-ch’êng, Pao-ting, Wên-an, Yung-ch’ing, An-tz’ü, Wan-p’ing, Liang-hsiang, Hsiung, An-hsin, Jên-ch’iu, Ku-an and Cho.
- During the period between 8 August and 8 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Fei-ch’êng, Chi-mo, P’ing-tu and Mou-p’ing.

*Also refer to the section 1809 A.D. – 1811 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1811 / 1812 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1811 occurred on 20 November. Snowed most of the day; storm very tedious.<sup>116</sup>

---

**1812 A.D. – 1814 A.D. India and Pakistan. Famine**

In *India* during 1812-13, there was a famine in parts of Sind [Sindh province, now *Pakistan*] and other neighboring districts, attributed to failure of rains. “In Kach and Pahlunpore [Palanpur] the loss was aggravated by locusts; and in Kattywar it was followed by a plague of rats. Guzerat [Gujarat] suffered most from scarcity caused by the export of grain to the famine districts; and Ahmerdabad [Ahmedabad]

was overrun by starving immigrants. In Mahee Kanta the distress was caused by internal disturbances; whilst in Broach [Bharuch] there was no failure of rain, but the crops, before they were reaped, were entirely devoured by locusts, which came in very large numbers and spread all over the country.”<sup>57</sup> [Palanpur and Ahmedabad are in the state of Gujarat in western *India*. Mahee Kanta is in the Gujarat Division of the then Bombay Presidency. Bharuch is located in west-central *India*.]

In 1812, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

In *India* during 1812-14, there was a scarcity in Madras Presidency, following unfavorable season of 1811; “but no serious distress appears to have been generally experienced throughout the presidency on this occasion, although the district of Madras [Chennai] suffered considerably.”<sup>57</sup>

In 1812, there was a famine in Cutch [Kutch district in western *India*] caused by locusts. There was also a minor famine in southern India.<sup>179</sup>

In 1812, a plague of rats visited Kathiawar [a peninsula in western *India*] and caused considerable damage to all vegetation and even scarcity to some extent.<sup>179</sup>

In 1812-13, there was a famine in Guzerat [now Gujarat], a region of northwestern Bombay state [now Mumbai, *India*]. Locusts first appeared from the eastward in the Bengal provinces [today this is *Bangladesh* and the state of West Bengal in *India*] about the beginning of the year 1810. From there they took a northerly direction passing through Hindoostan [Hindustan, the Gangetic Plain of North India, between the mountains of the Himalayas and the Vindhya]. Fifteen months later, they arrived at Marwar skirting the large western deserts of *India*. In 1811, the annual rainfall failed in Marwar, and when all vegetation was destroyed, the locusts made their way into the northwest district of Guzerat called Puttur and from there scoured Kattiwar [now Kathiawar] and appearing as far south as the city of Baroach [now Bharuch] on the Nurbadda River. Because of the agricultural destruction by the locusts and the drought, the inhabitants of Marwar fled to Guzerat [now Gujarat]. But in 1812, Guzerat experienced a failure of rain. The immigrants suffered the most during the famine. Captain James Rivett Carnac, relates what he witnessed: “I have seen a few Marwarees sitting in a cluster, denying a little water to sustain her drooping spirits to a woman stretched beside them with a dead infant reposing on her breast. In a few hours this woman had also expired.” “I have seen a child, not quite dead, torn away by a pack of dogs from its mother, who was unable to speak or move.” “Bramin [Brahmin - a term for a scholar class in the traditional Hindu societies of India and Nepal] sold his wife, his child, sister and connexions [family connections], for a trifle of two or three rupees.” “The number of Marwarees who died in a single day at Baroda [now Vadodara] could scarcely be counted, and the return of burials in twenty-four hours often exceeded five hundred bodies.” When relief aid was given, “children were often crushed to death, when attending for their pittance of food, under the feet of their own parents.” The starvation was compounded with an epidemic of small pox. The mortality at Ahmedabad was computed at a hundred thousand souls, about ½ of its population. The demand for wood to cremate the Hindu required the destruction of the houses. Of the Marwar refugees, “I would be inclined to estimate, that not more than one in a hundred of these poor creatures ever returned to their native country.”<sup>189</sup>

During 1812-1814, Madura [now Madurai district of *India*] suffered considerably from scarcity. The distress extended into the Canara [now Kanara or Coastal Karnataka] district in 1812.<sup>188</sup>

In 1813, there was a minor famine in Guzerat [now Gujarat], Cutch [Kutch district in western *India*], Rajpootana [Rājputāna now the state of Rājasthān in central *India*] and part of the North-Western Provinces of *India*.<sup>179</sup>

In 1813, there was a famine in the Northwest Provinces and Rajputana [now Rajasthan state] in *India*.<sup>156</sup>

— The famine prevailed in and around Agra, and apparently the western states of Rajputana were affected. Bundelcund, to the south, was also in strained circumstances. The late rains of 1813 were the immediate cause of this scarcity.

In northern *India* during 1813-14, there was a partial famine in many parts of the Agra district. This is because the autumn crop of 1812 failed, and the harvest of the following spring was indifferent. In 1813 the rains set in late, and were then only partial.<sup>57</sup>

In Goojerat, Hindostan [now Gujarat in western *India*] in 1813-14, the province suffered from severe famine.<sup>91</sup>

---

**1812 A.D.** On 10 January 1812, the fog was so dense in London, *England* that every house was lighted with candles or lamps; and it was so dark in the streets at mid-day, that a person could scarcely be discerned at a distance of eight or ten feet (2.4-3.0 meters).<sup>1</sup>

Another dense fog occurred in London, *England* on 10 January 1812 similar to the one of 1 January 1729.<sup>2</sup>

On 10 January 1812, there was a remarkable fog in London, *England*.<sup>128</sup>

On 18 January 1812 there was a severe hailstorm 10 miles from Sydney, *Australia*. Some of the hailstones, literally flakes of ice, were 8 inches in circumference.<sup>103</sup>

The summer of 1812 in the north of *France* and *Burgundy* was cold and rainy. The grape harvest began on 8 October. The yield was abundant, but the wine was of a very mediocre quality. During the summer in Languedoc and Provence, there was a great drought. Autumn was cold and rainy. The maximum temperature in Paris was 91.0° F (32.8° C) on 14 June. The harvest of cereals was very inadequate.<sup>62</sup>

The drought of 1812 struck Languedoc and Provence, *France*. Annual rainfall totals dropped below the average by 8.3 inches (211 millimeters) at Toulouse, and 13.4 inches (340 millimeters) at Marseille. Some northern countries, particularly in Paris, experienced this drought but to a lesser degree. The drought in southern *France* lasted two years.<sup>79</sup>

In 1812 in the *United Kingdom*, there was great scarcity in *England* and *Ireland*.<sup>57, 91</sup>

On 19 August 1812, a hurricane struck Louisiana in the *United States* causing 45 deaths.<sup>141</sup>

In 1812, a hurricane struck the Cayman Islands in the *Caribbean Sea*. The women of the east end were left widowed, when their husbands were lost at sea.<sup>141</sup>

On 12 October 1812, a hurricane struck *Jamaica*.<sup>124</sup>

On 14 October 1812, a hurricane struck *Cuba*. In Trinidad, *Cuba*, 500 houses were almost destroyed by the hurricane. Many vessels, which were at anchor in the harbor of Casilda, were driven on shore and others sank. The convent of the Pope, and the hospitals Francisco de Paula and Santa Anna were damaged.<sup>146</sup>

On 21 October 1812, there was a flood caused by the rising of the water in the River Thames, which overflowed the houses in Palace-yard, and filled Westminster Hall in London, *England*.<sup>43</sup>

On 21 October 1812, the River Thames rose so high in London, *England*, as to overflow Palace Yard and many of the low streets in or near the river.<sup>128</sup>

In 1812 during the period between 5 February and 6 May, floods struck Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang and Ch'ing-chiang. During the same time, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tung-a, T'êng and Kao-t'ang. Then during the period between 9 June and 8 July, floods struck Hupeh (now Hubei province) in central *China* at Chu-ch'i. During the period between 9 July and 6 August, floods struck Hupeh province at Fang and Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui.<sup>153</sup>

*Also refer to the section 1812 A.D. – 1814 A.D. for information on the famine in India and Pakistan during that timeframe.*

---

**Winter of 1812 / 1813 A.D.** In 1812, the frost in *Russia* was very severe.<sup>47, 90, 93</sup>

The Meuse River was frozen from 13 December 1812 until 6 January 1813. The Seine River in *France* was ice bound on 14 December and frozen over on the 17<sup>th</sup> and 18<sup>th</sup>.<sup>62</sup>

On 20- 27 December 1812, there were remarkable thick fogs in London, *England*.<sup>128</sup>

When the cold is intense, individuals exposed can experience lethargic sleep which can lead to death. (*Hypothermia*) This happened to many of the French and Italian soldiers in the fatal expedition to Moscow, *Russia* in 1812.<sup>58, 80</sup>

The winter of 1812-13 was one of the hardest ever known in *Europe*. The River Thames in *England* froze from the source to the sea; the Seine River in *France*, the Rhine River in *Germany*, the Danube River, the Po River in *Italy* and the Gaudalquiver River in southern *Spain* were all covered with ice. The *Baltic Sea* froze for many miles from land, and the Ikagerack and the Cattegat were both frozen over. The *Adriatic Sea* at Venice, *Italy* was frozen, so was the Sea of Marmora, while the Hellespont and Dardanelles were blocked with ice and the archipelago was impassable. The Tiber River in *Italy* was lightly coated, and the Straits of Massina at the eastern tip of Sicily were covered with ice. Snow fell all over *North Africa* and drift ice appeared in the Nile, in *Egypt*. This was the winter Napoleon's retreat from Moscow, *Russia*, when 400,000 men perished, mostly of cold and hunger. The men froze to death in battalions, and no horses were left either for the artillery or cavalry. Quicksilver [Mercury] froze that winter.<sup>63</sup> [The mercury in mercury thermometers solidifies (freezes) at -37.89 °F (-38.83 °C).] [Ikagerack or the Skagerrak Sea is a strait running between *Norway* and the southwest coast of *Sweden* and the Jutland peninsula of *Denmark*. Cattega or the Kattegat Sea is a strait between north *Denmark* and *Sweden*.]

This winter of 1812-13 will be forever memorable by the terrible disaster, which suffered after the French army captured Moscow, after the city was burned, and the running French retreats during one of Russia's harshest winters. Winter took its grip over all of *Europe* at an early stage with severe cold. The first snow fell on Moscow, *Russia*, on 13 October. The French army began to retreat on 18 October and completely evacuated the city by 23 October. Under continuous snowfall the French army retreated to Smolensk, *Russia*. From 7 November onwards, extreme severe cold gripped the area. On 9 November, the thermometer dropped to -12° R. (5° F, -15° C). Larrey [Dominique Jean Larrey, a French surgeon in Napoleon's army] carried a [Reaumur] thermometer [which used diluted alcohol] in the buttonhole of his tunic. [He kept a temperature record during the French retreat.] The French army stayed at Smolensk from 14 to 17 November. As they left Smolensk, Larrey observed the temperature had dropped to -21° R. (-15.3° F, -26.3° C). The brave French Corps of Marshal Ney [that held the rear guard during the retreat] escaped [after being cut off by the Russian army] because on the night of 18/19 November, they crossed the frozen Dnieper River. The night before a Russian army corps went with his artillery on the ice of the

Dvina (Daugava) River. On 24 November as Napoleon's troops approached the Berezina (Beresina) River the weather had turned warmer; the river began to thaw, and was impassable because of numerous ice floes [and bridges destroyed during the conflict]. This left the French army without a way to retreat, just as the Russian army was closing in. On 26-29 November, the French hastily constructed temporary bridges and moved their troops across to the other side of the Berezina River. Immediately after, the cold began again with renewed intensity, the thermometer fell to  $-20^{\circ}$  R. ( $-13^{\circ}$  F,  $-25^{\circ}$  C). On 30 November it continued to decline to  $-24^{\circ}$  R. ( $-22^{\circ}$  F,  $-30^{\circ}$  C). On 3 and 6 December at Molodechno (now Maladzyechna, *Belarus*) the temperature read  $-30^{\circ}$  R. ( $-35.5^{\circ}$  F,  $-37.5^{\circ}$  C). As this intense cold continued, the army continued its withdrawal to Vilna (now Vilnius, *Lithuania*). On 11 and 12 December the French army crossed the ice of the Niemen River at Kovno (now Kaunas, *Lithuania*), and brought the few remnants across the Vistula River and the Oder River to safety. Toward the end of December, the weather became milder, and the remaining portion of this winter showed no further unusual meteorological phenomena.<sup>62, 70</sup>

The severe frost was very destructive to the French army in its retreat from Moscow, *Russia*. Napoleon commence his retreat on the 9<sup>th</sup> of November 1812. The men perished in battalions, and the horses fell by hundreds on the roads. France lost the campaign of this year more than 400,000 men.<sup>90</sup>

In the rest of *Europe* during December 1812, the weather was extremely severe. In Paris, *France*, the lowest observed temperatures fell to  $12.9^{\circ}$  F ( $-10.6^{\circ}$  C) on 9 December 1812, and  $19.4^{\circ}$  F ( $-7^{\circ}$  C) on 21 January 1813. The lowest temperatures observed at different locations were as follows:<sup>62</sup>

Liège, <i>Belgium</i>	( $0.5^{\circ}$ F, $-17.5^{\circ}$ C)
Maastricht, <i>the Netherlands</i>	( $2.1^{\circ}$ F, $-16.6^{\circ}$ C) on 14 December 1812
<i>Ibid.</i>	( $16.0^{\circ}$ F, $-8.9^{\circ}$ C) on 25 January 1813
Strasbourg, <i>France</i>	( $3.9^{\circ}$ F, $-15.6^{\circ}$ C)
Moens, <i>France</i>	( $5.0^{\circ}$ F, $-15.0^{\circ}$ C) on 14 December 1812
Poitiers, <i>France</i>	( $9.7^{\circ}$ F, $-12.4^{\circ}$ C) on 26 January 1813
Paris, <i>France</i>	( $12.9^{\circ}$ F, $-10.6^{\circ}$ C) on 9 December 1812
Avignon, <i>France</i>	( $23.0^{\circ}$ F, $-5.0^{\circ}$ C) on 25 January 1813
London, <i>England</i>	( $25.0^{\circ}$ F, $-3.9^{\circ}$ C) on 9 December 1812 and 29 January 1813
Hyères, <i>France</i>	( $32.0^{\circ}$ F, $0.0^{\circ}$ C) on 15 January 1813

In the region of Toulouse, *France*, this winter was cold and fairly dry. In the last third of January and the first third of February there were strong frosts. The weather of the year was irregular with regard to the seasons, and unfavorable for the crop.<sup>62</sup>

During the winter of 1812-13, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 83 days.<sup>202</sup>

On 14 March 1813, hailstones fell at Caitro in Calabria, *Italy* during a storm of red snow. The same occurred in Tuscany and near Bologna, accompanied by a hail of red color.<sup>128</sup>

On 14 March 1813, red dust and red snow fell in Calabria, Tuscany and Friuli, *Italy*. At the same time, there was a great noise and a falling of stones at Cutro. Several specimens of the dust were collected and analyzed and found to be of the same composition as that of aerolites [meteorites].<sup>205</sup>

### 1813 A.D. – 1815 A.D. Australia. Drought

There was a severe drought in *Australia*. The wheat yield dropped by two-thirds. A bushel of wheat cost £2. The loss of livestock was extensive. The drought was so severe that settlers sought new pastures on the other side of the Blue Mountain Range after early explorers Gregory Blaxland, William Lawson and William Wentworth found a way across the mountain range.<sup>101</sup>

In New South Wales, *Australia*, the drought was prevalent in 1812 and 1813; so severe that Wentworth and party were led to cross the Dividing Range.<sup>103</sup>

In 1814 in New South Wales, *Australia*, there was a drought.<sup>103</sup>

On 18 December 1813, the thermometer stood at 90° F (32.2° C) in the shade and 146° F (63.3° C) in the sun at Parramatta in New South Wales, *Australia*.<sup>103</sup>

---

**1813 A.D.** In *Austria, Hungary, and Poland*, there were great floods from rain during the summer. The floods produced a famine in Poland; and caused the loss of 4,000 lives.<sup>47, 92</sup>

In 1813, there was a dreadful inundation in *Hungary, Austria, Silesia, and Poland* in the summer.<sup>43, 90</sup>

Major storms reigned in *France* in 1813.<sup>79</sup>

On 17 May 1813 in *England*, there was a great hailstorm in Cheshire.<sup>93</sup>

On 9 June 1813 in *Wales*, there was a great hailstorm in Glamorganshire.<sup>93</sup>

In *Silesia, Prussia (now Poland)*, the floods caused the death of about 6,000 inhabitants; and the ruin of the French army under Macdonald was accelerated by the same cause.<sup>47, 92</sup> These floods occurred in June and July.<sup>43</sup>

The rivers in *Silesia* swelled by the heavy rains during three days and nights became torrents. They swept away houses, cattle, and the standing crops. Nothing escaped. Of the inhabitants, over 6,000 perished. “Even the operations of the contending armies were impeded; but it will be some consolation to every patriotic German to learn, that the ruin of the French under Macdonald was accelerated by these floods: that they at once arrested his progress, and cut off his retreat; and that by presenting the alternative of death or imprisonment to his best troops, they paved the way to the entire liberation of Prussian *Silesia* from the cruelties and exactions of the enemy.”<sup>74</sup>

In 1813 in *Silesia*, floods caused 6,000 inhabitants to perish. The floods also accelerated the ruin of the French army under Macdonald. In *Poland*, 4,000 lives were lost due to floods.<sup>90</sup>

During June/July 1813, the Mississippi River in the *United States* overflowed its banks and flooded the country on the west side inundating it to the distance of 65 miles, by which 22,000 head of cattle were destroyed.<sup>43</sup>

[In *France*] the summer of 1813 was disastrous for many crops; the exception being the cereal crops. In Burgundy, the year was rainy. The grape harvest produced only a mediocre crop of poor quality wine. In the south, the products of the soil were very mediocre. In Paris, *France*, the peak temperature only reached 85.5° F (29.7° C).<sup>62</sup>

*Poland* in 1813 suffered from a famine caused by an inundation.<sup>57, 91</sup> Drontheim, *Norway* suffered from a famine as a result of the interception of supplies by the Sweden.<sup>57, 90</sup> This caused 5,000 to perish.<sup>57</sup> [Drontheim or Trondheim is a port in central *Norway*, on Trondheim Fjord.]

“The travelers who have arrived from *Poland*, declare that the hopes of the husbandmen [farmers] have, in particular districts, been blasted [damaged], by the Vistula River rising ten feet. Houses and cattle have likewise been destroyed; and 4,000 lives lost.” Up until the flood, the harvest in *Poland* had promised to be very abundant and of good quality.<sup>74</sup>

On 20 July 1813, it was reported that a hurricane at *Bermuda* destroyed one third of the houses.<sup>128</sup>

On 22-23 July 1813, a hurricane struck Barbados in the *Lesser Antilles*. There were at least 18 dead and 8 missing.<sup>141</sup>

On 26 July 1813 in *England*, there was a storm that struck Bielby, Yorkshire near Pocklington. Several persons making hay were knocked down, and a young woman killed.<sup>43</sup>

On 31 July - 1 August 1813, a hurricane struck *Jamaica* and many lives were lost.<sup>141</sup>

In 1813, on the island of Dominica in the *Lesser Antilles*, two hurricanes, which succeeded each other within a short time, caused considerable destruction. Several houses were blown down.<sup>146</sup>

On 19 August 1813, a very destructive hurricane struck the Gulf coast in the *United States*.<sup>117</sup>

On 27 August 1813, Charleston, South Carolina in the *United States* was struck by a fearful hurricane, doing great damage; the water rose 18 inches higher than in the corresponding gale of 1804.<sup>124</sup>

In August 1813, a hurricane struck the *Caribbean* island of Martinique causing more than 3,000 deaths.<sup>107, 141</sup>

On 28 August 1813, a hurricane struck *Jamaica*.<sup>124</sup>

In August 1813, there was an inundation by the overflowing of the Drave [Drava] River, near Orsatch, six villages and the suburbs of a town were swept away, and a congregation of 240 persons were buried beneath the ruins of a church.<sup>43</sup>

“In the middle of August, the Drave [Drava] River [located in *southcentral Europe*] flooded the country in the neighbourhood of Orsatch. By the conjoint influence of the rains and high winds, the waters of the river were raised to a tremendous height. They swept away six villages and the suburbs of a town. In the latter, a minister of the church, while intent upon celebrating divine service, was, with his congregation of about 240 persons, buried beneath the ruins of the building.”<sup>74</sup> [Orsatch is possibly Osijek, *Croatia*, located on the right bank of the river Drava, 25 kilometers (16 miles) upstream of its confluence with the Danube River.]

A division of British Infantry were, in August 1813, while descending the *Pyrenees Mountains*, overtaken by a hailstorm. The hailstones varied in size from a bean to an egg.<sup>43</sup>

In August 1813, it was reported that a caravan of 2,000 persons from Maschah to Aleppo, *Syria* in crossing the desert were overwhelmed by sand, and not more than twenty escaped.<sup>128</sup>

The River Waag [now the River Váh], which runs through *Slovakia*, was in the beginning of September raised six feet above its usual height by the great rains, which had fallen over several days. The banks of the river suddenly gave way and the lands around Trentschin [Trenčín] were inundated. A high mountain, which was undermined by the flood, suddenly fell into the channel of the river, and gave it an impetus, which nothing could resist. From Zailina [Žilina] to Szered [Sereď], upwards of sixty villages, with all their houses, flocks, and standing crops, were washed away. The calamity having occurred during the day, many of the inhabitants had time to save themselves; but, nevertheless, more than twelve hundred persons perished, besides many thousand cattle, sheep and horses. All the bridges upon the Waag were destroyed; so that in particular situations, five days elapsed before assistance could be given to the

survivors of this dreadful calamity. All the towns in the neighborhood of the Waag have been damaged. At Neustadt [now Nové Mesto nad Váhom], *Slovakia* about thirty houses were overturned. One half of the extensive district of Trentschin was laid waste.<sup>74</sup>

In Widdin, *Bulgaria* there was a flood on the Danube River on September 14. An island near, on which were 2,000 Turkish troops, suddenly flooded; all drowned.<sup>47, 92</sup> [Widdin or Vidin is a port town on the southern bank of the Danube River in northwestern Bulgaria.]

On 14 September 1813, there was an overflow of the Danube River, where a Turkish corp. of 2,000 men on a small island, near Widden, *Bulgaria* were surprised and met with instant death, and the island itself sunk and disappeared.<sup>43, 90</sup>

“Letters from Belgrade mention that there had been an inundation of the Danube in the neighbourhood of Widden, during the night of the 14<sup>th</sup> of September. A small Turkish corps of 2,000 men had occupied one of the islands, and thrown up fortifications thereon. They formed part of the force, which was blockading the Serviau fortress. In the middle of the night, while buried in a profound sleep, they were surprised by the waters, and met with instant death. Not one person escaped. Even the island itself sunk and disappeared.”<sup>74</sup>

On 28 September 1813, accounts were received of dreadful inundations in *Hungary, Austria, Silesia* and *Poland*.<sup>128</sup>

On 28 September 1813, two thousand Turks encamped on a small island near Viddin [Vidin, *Bulgaria*] drowned by the overflowing of the Danube River.<sup>128</sup>

On 28 September 1813, six villages destroyed by the overflowing of the Drava River in south central *Europe*.<sup>128</sup>

In October in *England*, there was a great storm of hail in Bedfordshire.<sup>93</sup>

On 28 October 1813, reports were received that the Mississippi River in the *United States* overflowed its banks, and did incredible damage by the destruction of cattle and livestock.<sup>128</sup>

In the *United States*, there was a great overflow of the Mississippi River; immense damage.<sup>47</sup>

In Bedfordshire, *England* in October, there was a great storm of thunder, lightning and hail, with fireball [lightning strikes], which set fire to buildings.<sup>57</sup>

In 1813, a drought engulfed several regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tung-p’ing, Tung-a, Ts’ao and Chi-ning.

— During the period between 6 May and 8 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Pao-k’ang.

— During the period between 26 August and 23 September, a drought engulfed Hupeh province at Yün, Ma-ch’êng, Chung-hsiang, Hsiang-yang and Tsao-yang.

— During the period between 24 September and 23 October, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Yüeh-ch’ing and Hopei (now Hebei province) in northern *China* at Ning-ching, Nan-yüeh, Pao-ting, Hsing-t’ai, Kuang-tsung, Ching-ching, Ch’ing-fêng, Wu-i, T’ang-shan, Wang-tu and Nan-kung.

Also refer to the section **1812 A.D. – 1814 A.D.** for information on the famine in India and Pakistan during that timeframe.

Also refer to the section **1813 A.D. – 1815 A.D.** for information on the drought in Australia during that timeframe.

---

**Winter of 1813 / 1814 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1813 occurred on 15 November. Snowed steadily all day; snow more than a foot deep; sleighs move considerably.<sup>116</sup>

On 27 December 1813, a fog similar to the one of 19 January 1812 occurred in *England*, which continued for four days, and several persons missed their way and fell into canals and rivers.<sup>1</sup>

Another dense fog occurred in London, *England* from December 20-27, 1813 similar to the fog of 1 January 1729.<sup>2</sup>

On 27 December 1813, there was a remarkable fog, which extended fifty miles round London, *England* and continued eight days; accompanied by a severe frost, which lasted six weeks.<sup>128</sup>

On 10 January 1814, seven boys drowned in the River Trent in *England* by the breaking of the ice.<sup>128</sup>

On 10 January 1814, in a sudden storm and swell near Belfast, *Ireland*, many fishing boats lost and above one hundred people perished.<sup>128</sup>

On 14 January 1814, the snow fell so deep in the West so as to impede travelling, and the severity of the frost was noticed in every part of *England*. The thermometer exposed to a northeastern aspect stood 19 degrees below the freezing point [13° F, -10.6° C]. In Ireland, the winter was nearly as severe.<sup>128</sup>

“The severest and most remarkable frost in *England* of late years, commenced in December 1813, and generally called "the Great Frost in 1814", was preceded by a great fog, which came on with the evening of the 27th of December, 1813. It is described as a darkness that might be felt. After the fogs, there were heavier falls of snow than had been within the memory of man. With only short intervals, it snowed incessantly for forty-eight hours, and this after the ground was covered with ice, the result of nearly four weeks continued frost. During this long period, the wind blew almost continually from the north and north-east, and the cold was intense.”<sup>29</sup>

“In London, *England* on 2 February after over a month of large snow accumulations and frost, the River Thames again became the site of a frost fair. The Thames this day presented a complete frost fair. The grand mall or walk extended from Blackfriars to London Bridge. This was named the city road, and was lined on each side by persons of all descriptions. Eight or ten printing presses were erected, and numerous pieces commemorative of the 'great frost' were printed on the ice. By 3 February, the number of adventurers increased. Swings, book-stalls, dancing in a barge, suttlings-booths, playing at skittles, and almost every appendage of a fair on land appeared on the Thames. Thousands flocked to the spectacle. The ice presented a most picturesque appearance. The view of St. Paul's and of the city, with the white foreground, had a very singular effect; in many parts mountains of ice upheaved, resembled the rude interior of a stone quarry.”<sup>29</sup>

The winter in *England* was very severe in January 1814, when booths were erected on the various parts of the River Thames, and the antiquarian society of Newcastle recorded, that the rapid river Tyne was frozen to the depth of 20 inches (51 centimeters).<sup>2, 42, 43</sup>

“When [exiled King of France] Louis XVIII was King, at Hartwell, his bill for coals on one Sunday when the Thames was frozen over in 1814 was 94l. 18s. 6d. at 5s. per cwt.” There was also “a power of beer

and spirits” for the coalheavers.<sup>47,93</sup> [Hartwell is Hatwell House in Buckinghamshire where the king stayed in exile.]

In January 1814, there was a great fall of snow in every part of *England*.<sup>43</sup>

In *England*, there were fairs on the frozen River Thames during the winter of 1813-14.<sup>90</sup>

During the winter of 1813-14, booths were erected on the ice on the River Thames in London, *England*. The winter was very severe in *Ireland*.<sup>90</sup>

In 1814 in *Ireland*, the winter was very severe.<sup>47,93</sup>

On 27 January 1814, a thaw commenced [in *England*]. On 22 February, because of the recent thaw, there were great inundations occasioned on the low land in most places.<sup>128</sup>

On 18 August 1814, it was reported that the season broke so late that the River Dwina [Dvina] in *Russia*, was not open on the 24<sup>th</sup> of May.<sup>128</sup>

---

**1814 A.D.** In *Ireland*, the River Shannon overflowed and did great damage.<sup>47,92</sup>

Scarcity of food severely felt by the *Irish* poor in 1814, 1816, 1822, 1831 and 1846 in consequence of the failure of the potato crop. Grants by parliament to relieve the suffering of the people, were made in the sessions of 1847. The whole amounting to ten million sterling.<sup>90</sup>

In Bengal [Bengal today is West Bengal in *India* and East Bengal in *Bangladesh*], there was a great overflow of the Narbudda River [Narmada River in central *India*], sweeping away villages, inhabitants, and cattle.<sup>47</sup>

On 12 February 1814, there was an flood caused by the overflowing of the Narbudda River, in the provinces of Bengal [*India* and *Bangladesh*], which swept away 15 villages, with the houses, inhabitants, and cattle.<sup>43</sup>

In May 1814, a flood struck Maine in the *United States*. Beginning on the night of 13 May, it rained in torrents for 4 days and nights. The Mousam River swept away the bridge in Kennebunk and damaged the dam and mills. The Saco River became a roaring flood of water. At Conway, New Hampshire, the dam for the iron works was carried off. At Fryeburg, Maine, a bridge was destroyed. The freshet took out all the bridges in Brownfield. At Hiram, the flood took out the bridge over the Saco River. The part of the bridge across the Great Ossipee River was lifted and set adrift. The mill, several dwelling houses, an immense number of logs and all the bridges between Buxton and the mouth of the Saco River, including two bridges in Saco were carried away into the ocean. The damage on the Androscoggin River was equal to that on the Saco River. Eight sawmills, an aqueduct, and part of the bridge between Topsham and Brunswick were carried off. A hundred thousand dollars of logs and other valuable property floated out to the sea. [In present currency, that would be equivalent to \$1.1 million in losses based on the Consumer Price Index (CPI) inflation rates.] The dam and five gristmills and sawmills were carried away in Waterford. The bridge between Long pond and Brandy pond floated upstream and the next day the current changed direction and the bridge floated back to near its original position and was salvaged.<sup>199</sup>

On 21 May 1814, a tornado struck New Hampshire in the *United States*. It passed over Litchfield, Merrimac, Londonderry, North Chester, and Chester. It traveled a distance of 17 miles [27 kilometers] and was from fifty to a hundred rods wide [825-1650 feet, 252-503 meters]. A considerable number of houses, barns and other buildings, trees of all kinds, and fences were destroyed. The area was also struck

by a hailstorm. The hailstones were extremely large. Some weighed more than a half a pound [0.23 kilograms] and measured 11 inches [28 centimeters] in circumference.<sup>199</sup>

On 28 July 1814 in *England*, there was a violent hailstorm at Stamford and parts of Leicestershire. The hailstones were as big as hens' eggs. Windows and window frames were beaten in and grain and fruit crops destroyed.<sup>93</sup>

On 24 August 1814, the British invaded the *United States*, attacked the Capital in Washington D.C. and towards the evening set it aflame. The public buildings were all burned including [the White House], the U.S. Capital, the Library of Congress, [and the U.S. Treasury]. The next day, a tornado struck the city causing so much havoc that the invaders were driven off.<sup>147, 148</sup>

— On Tuesday, 23 August 1814, Washington D.C. was in chaos. The British were coming. The enemy was in a full march towards the city. The original Declaration of Independence, the Articles of the Confederation, the Federal Constitution, many treaties and laws as enrolled, along with George Washington's Commission as Commander-in-Chief of the Army of the Revolution were placed in coarse linen bags and spirited away first to a mill over the Potomac River, about 3 miles from Georgetown and then to Leesburg, a small town in Virginia about 35 miles from Washington D.C.

— The loss of these documents to the British would have deeply blackened our disgrace. If they had been captured and deposited in the Tower of London, it would illustrate the British triumph.

— On the 24<sup>th</sup>, Dolley Madison was in the White House, which was almost deserted. She was trying to save what could be saved. The enemy was closing in. Two messengers covered in dust came to bid her fly. She wouldn't leave until a large portrait of George Washington was secured. This was not going to be a trophy for the captors. Mrs. Madison, with a carving knife in her hand, stood by while French John and others strove to detach the picture uninjured from its heavy external gilt frame and preserve it whole on the inner wooden work, by which it was kept distended and screwed to the wall. When it was safe, she fled. She spent the night 2½ miles from Georgetown on the Virginia side of the Potomac River.

— During the evening Mrs. Madison sitting at an open window gazing on the lurid flames and listening to the hoarse murmurs of the smoldering city, while several hundred disorderly militia around the house aggravated the din and begrimed the gloomy scene. The whole region was filled with panic struck people, terrified scouts roaming about and spreading alarm that the enemy were coming from Washington and Alexandria and that there was safety nowhere.

— At Leesburg, that fateful night was followed by next day's tornado, which at Leesburg, as at Washington, D.C. uprooted trees, unroofed tenements, and everywhere around superadded tempestuous to belligerent destruction and alarm.

— On the 25<sup>th</sup>, Dolley Madison traveled to a tavern 16-miles from Georgetown, where she was to meet up with her husband, President James Madison. About noon, the air was charged with the two-fold electricity of panic and of a storm. The horizon was overcast, the heavens portentously black, thunder muttered, forked lightning flashed, hurricane blasts announced the tornado which soon broke forth with tropical fury, desolating many miles round. The tavern, which Mrs. Madison was seeking shelter stood in the midst of an apple orchard, heavily laden with ripe fruit. The apples were torn by the tempest from the trees and dashed with noisy force against the windows and doors of the house.

— Terror was the order of the day and incubus of the night for both the Americans and the British. The storm drove the enemy from the capital. And the heavy rains helped to put the fire out.

On 1 September 1814 in *England*, there was a hailstorm in Warwickshire.<sup>93</sup>

On 19 October 1814, it was reported that the vintage [wine] on the Rhine River in *Western Europe* failed.<sup>128</sup>

On 1 November 1814, it was reported that the Nerbudda River, East Indies [Narmada River in central *India*], overflowed its banks and drowned fifteen villages and 3,000 people.<sup>128</sup>

On 16-17 December 1814, there was a great hurricane at Greenock, *Scotland* and that neighborhood which caused great damage. This hurricane likewise struck *Ireland*.<sup>128</sup>

On 16-17 December 1814, a tremendous storm throughout *Great Britain* and *Ireland* did immense damage and caused many ships to wreck.<sup>57, 90</sup>

The drought of 1814 in Paris, *France*, produced 5 inches (128 millimeters) less rainfall than a typical year, and twenty-eight rainy days less than in than normal.<sup>79</sup>

In 1814 heavy rains struck Roussillon, Toulouse, Marseille, Joyeuse and Viviers, in southern *France*. Toulouse received 7.9 inches (201 millimeters) rainfall above the yearly average. Viviers received 5.3 inches (135 millimeters) of rainfall above the average. There were 4 more rainy days at Toulouse, fifteen more rainy days at Joyeuse, and twelve more rainy days at Viviers than the average.<sup>79</sup>

In 1814, a hailstorm visited Sydney, *Australia*. It was one of the severest ever experienced in the colony. It began about 2 p.m., and in length of 12 minutes, it demolished nearly all the glass windows in the town and destroyed the gardens.<sup>103</sup>

In 1814, a drought engulfed many regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, a drought engulfed Hupeh (now Hubei province) in central *China* at Yün, Ying-ch'êng, Ch'i-shui and Lo-t'ien.

— During the period between 6 May and 8 August, a severe drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chia-hsing, Hsin-têng, Hu-chou and Ch'ung-tê; Hupeh province at Chung-hsiang; Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin, Nan-t'ung and T'ai; Shantung (now Shandong province) on the east coast of *China* at Lin-ch'ü; and Shensi (now Shaanxi province) in central *China* at Chên-pa. This drought was severe and all the rivers dried up.

— During the period between 15 August and 13 September, a drought engulfed Kiangsu province at Ch'ing-p'u, Soochow and Kao-ch'un.

*Also refer to the section 1812 A.D. – 1814 A.D. for information on the famine in India and Pakistan during that timeframe.*

*Also refer to the section 1813 A.D. – 1815 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1814 / 1815 A.D.** The hard winter of 1814-15 produced heavy snowfalls in Bradford County, Pennsylvania in the *United States*. Wolves were driven down from the mountains in search of food. They killed many sheep. They could be heard howling all during the night. The inhabitants were terrified by the danger posed by the wolves and many refused to travel between Milltown to Athens; even in the daytime. There was no travelling after dark, so great was the fear and danger. The sheep were often called into the dooryard and lights were kept burning for their protection. Bears and panthers were sometimes seen between the rivers. Bounties were offered for killing these animals and those that were not killed, later returned to the mountains.<sup>178</sup>

It was reported that the season was so backward this year in *Canada* that snow fell on the 20<sup>th</sup> of May 1815 and the trees were not in leaf before the 4<sup>th</sup> of June.<sup>128</sup>

**1815 A.D.** The summer of 1815 in the interior of *France* and especially in Burgundy and Bordeaux was unusual. The grape harvest began on 21 September. The wine was not very abundant, but the quality was very good. The grain harvest was very poor. Here is a table of the highest temperatures:<sup>62</sup>

Avignon, <i>France</i>	( 88.7° F, 31.5° C) on 31 July
Liège, <i>Belgium</i>	( 88.3° F, 31.3° C)
Paris, <i>France</i>	( 86.0° F, 30.0° C) on 5 August
Moens, <i>France</i>	( 82.9° F, 28.3° C) on 29 May
Mücheln, <i>Germany</i>	( 82.6° F, 28.1° C) in August
London, <i>England</i>	( 72.0° F, 22.2° C) on 14 July

On 6 June 1815, it was reported that a fleet of boats were overtaken by a storm on the Ganges River [*India*] and over sixty boats were lost.<sup>128</sup>

In July 1815, the most fearful windstorm ever known in the eastern part of Bradford County, Pennsylvania in the *United States*, swept eastward across Orwell, tearing up trees and leaving a wake of destruction nearly half a mile [0.8 km] wide. Timber on thousands of acres was blown down. The house of Luther Chaffee was carried from its foundation, thrown completely over and left standing on the roof. The schoolhouse at North Orwell, built of hewed logs, was blown to pieces and some of the roof found nearly four miles [6.4 km] away. An eyewitness to the storm wrote: "The scene was one of awful grandeur. The air for a great distance was full of limbs and tree tops, whirling in every direction, something like the flakes of snow in a March snow squall."<sup>178</sup>

On 6 August 1815 in *England*, there was a great hailstorm in Berkshire.<sup>93</sup>

A severe frost occurred in Quebec, *Canada* in 7 August 1815.<sup>2, 42, 43, 47</sup>

On 31 August – 1 September 1815, the *West Indies* islands were visited by a hurricane. About thirty sail were driven on shore at St. Bartholomew's [St. Barts]; fourteen were totally lost. The gale did not reach Barbados.<sup>146</sup>

On 3-4 September 1815, a hurricane struck North Carolina in the *United States*. The storm caused great damage and loss of life in Onslow County. There were 4 deaths in one storm surge incident.<sup>141</sup>

On 16 September 1815, it was reported that there was a drought so great in *Portugal* that ponds dried up, grass was destroyed, and the quantity of cattle lost was immense. Water was sold in Lisbon at a very high price.<sup>128</sup>

On 20 September 1815, a second hurricane unroofed and blew down about half the houses on *Turk's Island*, and destroyed about 400,000 bushels of salt. Several vessels were wrecked. One American vessel lost twenty-two of her crew and passengers.<sup>146</sup>

On 23 September 1815, a hurricane struck New England in the *United States*. The loss of life was so heavy that the newspapers did not have space enough to give all the details of the marine disasters. It was "impossible to estimate loss of live in Providence [Rhode Island]...but it was extremely heavy." There about twenty persons were drowned or killed.<sup>141</sup>

In September 1815, "The Great September Gale," the worst storm to hit New England in almost 200 years, devastated parts of Connecticut, Rhode Island and Massachusetts in the *United States*.<sup>19</sup>

On 23 September 1815, a great September gale, the only authentic West Indian hurricane up to that time in New England in the *United States*; passed between Providence and New London and, via Worcester and Connecticut River Valley, to the St. Lawrence River west of Montreal. [From "Our First Century" by R.M. Devens, C.A. Nichols & Co., Springfield, Massachusetts; A.H. Walker, Columbus, Ohio, 1877.]<sup>138</sup>

The summer of 1815 was remarkable for exceptionally violent and destructive storms all along the Atlantic coast of the *United States*. Newspaper columns were filled with accounts of great destruction of life and property both on land and at sea. The gale of 23 September 1815, however, exceeded them all in violence, and caused greater damage than any that preceded it, not that year only but since the settlement of the country. A detailed list of the damage from this storm is provided below.<sup>199</sup>

— During the storm, the winds blew with such force that buildings, fences, trees, and vessels along the

coast were swept away before it. The winds at Providence, Rhode Island blew with the force of a hurricane. During the heaviest part of the gale, fires could not exist in the houses; being blown out as fast as they were lit. Because the air was very oppressive and almost suffocating, respiration was laborious and difficult. The gale appeared to be centered in Narragansett Bay in Rhode Island. The gale was felt as far south as Delaware and inland to a considerable distance to the west of the New England states.

— The gale swept away buildings of all sizes and varieties from churches to shed and it unroofed a great number of other buildings. Great quantities of forest had their trees uprooted or broken down. The loss in timber trees was exceedingly great. It essentially brought an end to the shipbuilding industry. In order to salvage as much of the destroyed timber as possible, the trees were cut up for lumber. This lumber after seasoning was used in a major building boom of 1817-1818 in the construction of new homes, barns and other buildings.

— The winds destroyed the crops and the stored hay. Many people were killed by falling houses or trees, and others were drowned from the wrecks of vessels along the coast. A large number of animals were also killed.

— During the storm, the fierce winds drove in the water along the coast and the tide rose to a great height, deluging wharves, streets and cellars. The winds carried the salt water from the ocean inland more than 40 miles [64 kilometers] into the country. This destroyed the foliage of the trees, crisping and curling the leaves of plants, and giving to all vegetation, with which it came in contact with, the appearance of having suffered from a severe frost. The brooks and small rivers became brackish, and the rainwater that fell as far inland as Worcester and Sterling, Massachusetts, 40 miles [64 kilometers] from the sea, had a strong briny taste.

— Many ocean seabirds were driven 20 miles [32 kilometers] inland from the storm. Flocks of seagulls were seen in the meadows of Grafton and Worcester in Massachusetts. Several sea-swallows (petrels) were also seen quite a distance inland.

— At Providence, Rhode Island, the winds brought in the tide 10 to 12 feet [3.0-3.7 meters] above the height of the usual spring tides, and 7½ feet [2.3 meters] higher than ever known before. The tides overflowed and inundated the streets and wharves. The great bridge connecting the two parts of the town was swept away. All vessels were driven ashore or totally destroyed. Four ships, nine brigs, seven schooners and fifteen sloops were wrecked in the cove. On the west side of the river, the water rose nearly to the tops of the lower windows of the houses. People had to be evacuated by boats or scows from their dangerous situation. On the east side of the river, the water 3 feet [0.9 meters] deep flowed with a swift current down Weybosset Street, the main thoroughfare. On Westminster Street, the water was from 6 to 8 feet [1.8-2.4 meters] above the pavement. Many buildings were destroyed. The ship *Ganges* ran into the third story of the Washington Insurance Building. India Bridge and Mill Bridge at the foot of Constitution Hill were swept from their foundation. Five hundred buildings were destroyed by this gale and flood. The losses at Providence amounted to \$1.5 million. [In present currency, that would be equivalent to \$18.5 million in damages based on the Consumer Price Index (CPI) inflation rates.] Many people died but the exact count was unknown. After the storm many ships were found high and dry, 5 to 6 feet [1.5-1.8 meters] above the high water mark, in the streets and gardens of the town. Along the highest parts of the land were heaped together lumber, wrecks of buildings and vessels of every description, carriages, and bales of cotton, mingled with furniture, coffee, soap, candles, grain, flour, and other kinds of merchandise.

— At Bristol, Rhode Island, all the vessels were driven a great distance in on the land, and considerably damaged. The tide rose 7 feet [2.1 meters] higher than it was ever known to rise before, and the wharves were swept away. The post office and several houses and stores were swept away. A great many trees were blown down. The gristmill at Glenrock and the lighthouse at Point Judith were destroyed.

— In Pawtucket, Rhode Island, several houses were carried away and one person drowned. At Newport, all the stores on Long Wharf were washed away and 5 perished.

— The country around Buzzard's Bay in Massachusetts suffered significant damage from this storm. The tide was 8 feet [2.4 meters] higher than usual and the salt water was driven in on the land. Wells and springs that provide fresh water were ruined. Trees and buildings were blown down by the terrific winds

and vessels were driven ashore.

— At New Bedford, Massachusetts, all the vessels in port, except for two, were driven ashore, and several of them smashed to pieces. Five people perished. All the warehouses on the lower wharves were swept away. Many houses were destroyed.

— At Hyannis, Massachusetts, a brig was driven ashore. At Sandwich, a vessel was dashed against the wharf and a passenger drowned. Hundreds of vessels were lost in the storm. The newspapers did not have sufficient space to record all the marine disasters.

— In Plymouth County, Massachusetts, several barns were blown over and a number of houses damaged and one man was killed at Hingham. At Abington, several barns were blown completely down, 20 houses and barns were unroofed. The roofs were taken off entirely whole and carried a distance of 20 to 30 rods [330-500 feet, 100-150 meters] and broken to pieces. Boards and shingles flew miles away. In Norfolk County, the church at Needham was blown down and several persons were killed.

— In the neighborhood of Boston, Massachusetts, substantial damage was done. At Dorchester, 17 houses and 40 barns were unroofed, sixty chimneys were blown down, and more than 5,000 fruit and other trees were torn up by the roots. The South Church and the North Church were badly damaged. At Charlestown, the upper story of a large brick building was blown in, the Universalist Church was unroofed and the steeple of Dr. Morse's Church was blown away.

— In Massachusetts, other cities that were damaged included Reading, Newburyport, Newton, Chelsea, Boxford, Wenham, Danvers, and Saugus.

— At Newfane, Vermont, the storm destroyed two gristmills, an oil mill, a sawmill and a clothing works.

— In New Hampshire the following cities received damage: Amherst, Concord, Sanbornton and Portsmouth.

— In Maine, trees were blown down as far east as Wells, where one man was killed by a falling tree while he traveled along the highway.

— The storm was very severe at the eastern end of the Connecticut coast. At Stonington, the tide rose 17 feet [5.2 meters] higher than usual and swept entirely across the town. Twenty vessels in the harbor were either driven ashore or sunk. This included the schooners *Expert* and *Washington*, and a sloop carrying the governor of Rhode Island. At a minimum 4 people in town perished.

— In New London, Connecticut, almost every vessel in the harbor was driven on shore and stove to pieces. A new brig was upset and sunk. A gunboat drifted on the rocks and was smashed to pieces. On Main Street, the water was three feet [0.9 meters] deep. The wharves were almost totally demolished. Many buildings were carried off.

— At Groton, Connecticut, the storm destroyed three wharves, some tan works, two dwelling houses, three barns and other buildings.

— At Norwich, Connecticut, the water rose so high that it swept away several stores and damaged several warehouses. The water rose 5 to 6 feet [1.5-1.8 meters] above the Wharf Bridge. The water carried away the market house and adjoining store. The brig *Mary* and several schooners and sloops were driven ashore, in some cases knocking in the sides of the stores and ending up in the streets of the town.

— In Connecticut, two churches were blown down at Plainfield. The West Bridge on the Milford turnpike at New Haven was rendered impassable by the destruction of the causeway on either side. Long Wharf was entirely inundated and everything on it was swept away. The water in some stores was two feet [0.6 meters] deep.

— In Boston harbor in Massachusetts, around sixty vessels were damaged by the storm. This included the schooners *Nancy* and *Three Brothers*, the ship *Aridne*, and the new brig *Washington*. In town, many houses and church steeples were damaged.

— At Cambridgeport, Massachusetts, a schooner was carried up into Main Street, two houses were blown down and 40 other buildings were unroofed or damaged.

— At Marblehead, Massachusetts, fourteen vessels went ashore.

— At Salem, Massachusetts, several buildings were destroyed.

— At Gloucester, Massachusetts, 77 gunboats, 2 schooners, *New Packet* and *Washington* and a sloop were all driven ashore. Several buildings and stores were blown down or damaged.

— [Probably the question that should be asked – Was there a causal relationship between this great storm and the great volcanic eruption that occurred on 10 April 1815, called the Tambora eruption?]

On 17-18 October 1815, a hurricane struck *Jamaica* causing more than 100 deaths. [This total is based on *The London Times* report that "many seamen and white people drowned, with some hundreds of negroes." Alexander (1902), Garriott (1900), and Evans (1848) have 28 October as date.]<sup>141</sup>

In October 1815, a hurricane struck *Jamaica*. In a letter from Kingston, dated October the 28<sup>th</sup>, the following details of the hurricane are provided:<sup>146</sup>

— "On Thursday morning the weather put on a very threatening aspect, and the whole day it continued drizzling, with occasionally smart showers of rain. About one o'clock on Wednesday morning, the wind began to blow with great strength from the north, but changed in about an hour to the S.E., from which quarter it continued to blow during the remainder of that day with great violence, accompanied by heavy rain, which continued without intermission the whole of Wednesday night and until Thursday at noon, when it somewhat abated, the wind having again shifted to the north on Wednesday night, where it continued steady until the end of the storm early yesterday morning. In strength and continuation this was one of the severest storms we ever witnessed, and, we are sorry to say, had done very considerable mischief to the barrack wall, and other buildings, in this town. The roads and pastures in the vicinity are covered with branches of trees which have been torn off, and many large trees have also been torn up by the roots. Several vessels were lost, and their crews, and several other vessels were damaged."

A most tremendous hurricane struck *Jamaica* on October 18, 1815. "The whole island was deluged, many vessels wrecked, many houses washed away, and many seamen and white people drowned, with some hundreds of Negroes."<sup>42, 43</sup>

On 18-19 October 1815, a hurricane struck *Jamaica*.<sup>124</sup>

In 1815 during the period between 9 May and 6 June, floods struck Shantung (now Shandong province) on the east coast of *China* at Tsinan and Ch'ang-ch'ing. Then during the period between 7 July and 4 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chia-hsing. During the period between 5 August and 2 September, a drought engulfed Hopei (now Hebei province) in northern *China* at Luan.<sup>153</sup>

*Also refer to the section 1813 A.D. – 1815 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1815 / 1816 A.D.** The winter of 1815-16 was very dry in Bradford County, Pennsylvania in the *United States*. The ground was dry and dusty until March when the weather turned suddenly cold and boisterous. The succeeding months were cold and frosty and the period long remembered as "The Year Without a Summer."

In London, *England*, [readings taken at Tottenham in North London] the coldest day within the years 1807-1816 occurred on 9/10 February 1816 when the temperature fell to -5° F (-21° C). [The thermometer stood a whole night 5 below zero.] At noon on the day before [9 February] the temperature had only reached 20° F (-7° C). The temperature in Paris, *France*, fell to 12.65° F (-11° C) on 11 February 1816.<sup>175</sup>

---

**1816 A.D.** The Tambora eruption occurred on 10 April 1815 on Sumbawa Island in *Indonesia*. It was rated as a 7 on the Volcanic Explosivity Index (VEI).<sup>20</sup> The volcanic eruptions of this size are very rare events typically occurring on a millennium scale. Analysis of Peirce's temperature data shows that the eruption did not begin to affect Philadelphia, Pennsylvania's weather in the *United States* until 11 months later in March 1816.<sup>1</sup> Then temperatures were depressed for nine months before recovering. At its greatest extent, temperatures were 7.7° F (4.3° C) colder than average Dalton Minimum monthly averages. This year was known as the "Year Without Summer". But that does not really begin to describe the event for the people of Philadelphia, the Northeast *United States* and *Canada*. It was the year when a hard killer frost occurred in every month of the year.

This chart shows for Philadelphia, Pennsylvania the observed monthly temperatures difference between the year 1816 and the average monthly temperatures during the rest of the Dalton Minimum (years 1798-1815 and 1817-1823).

[Paris *France* experienced a very similar temperature anomaly.] The summer of 1816 was the coldest in the first half of the 19th century. The average temperature in Paris during the summer was only 59.5° F (15.3° C); that was 5.4° F (3° C) less than the average summer temperature. There were only six hot days; this is 26 less hot days than normal. The maximum temperature of 82.4° F (28.0° C) occurred on 20 July. This was a disastrous year in Paris. The average temperature during the period of vegetation:<sup>62</sup>

	Average Summer Temperature for 1816	Long Term Summer Average Temperature	Monthly Temperature Anomaly
April	(49.8° F, 9.9° C)	(49.66° F, 9.81° C)	(+0.14° F, +0.09° C)
May	(54.9° F, 12.7° C)	(58.15° F, 14.53° C)	(-3.25° F, -1.83° C)
June	(58.6° F, 14.8° C)	(63.21° F, 17.34° C)	(-4.61° F, -2.54° C)
July	(60.1° F, 15.6° C)	(66.27° F, 19.04° C)	(-6.17° F, -3.44° C)
August	(59.9° F, 15.5° C)	(65.21° F, 18.45° C)	(-5.31° F, -2.95° C)
September	(57.2° F, 14.0° C)	(59.85° F, 15.47° C)	(-2.65° F, -1.47° C)
October	(52.9° F, 11.6° C)	(51.75° F, 10.97° C)	(+1.15° F, +0.63° C)

This extreme cold year also ravaged *Europe*, *Africa*, the *West Indies* and Northern *China*. The volcanic eruption also affected the rain patterns in 1816. The cooler temperatures delayed India's summer monsoon. It brought late torrential rains to India that spawned cholera epidemics. The monsoon in *China* caused massive floods in the Yangtze Valley.<sup>1, 21</sup>

In London, *England*, the wettest year in 23 years [1797-1819] occurred in 1816 with a rainfall of 32.37 inches. The driest years were 1807 [18.01 inches of rainfall] and 1802 [18.43 inches of rainfall]. In 1816 the middle of *Europe* was suffering from excessive rains, at the same time that of the North, or the parts east of the Baltic at least, about Dantzig [now Gdańsk, *Poland*] and Riga [*Latvia*], were suffering from a drought.<sup>175</sup>

In 1816, there was the coldest summer known in New England in the *United States*. Because many of the crops failed and as a result many farmers suffered great distress, the year was generally known as the “poverty year”. There was a frost and snow in all the summer months. For this reason, the year was also known as “eighteen hundred and froze to death”. Many of the farmers in New Hampshire could not afford the high cost of corn to feed their hogs and pig and instead substituted Mackerel in place of the corn. As a result the year was also called “the mackerel year”. At the same time there was a severe drought in the northwest region of New England and this added to the disastrous effect for the season.

— For the most part, April was a dry month. On 12 April, snow fell in Warren, Maine and stayed on the ground for nearly a week providing good sleighing. Danby, Vermont saw rain for most of April. In general the weather in New England was dry, warm and fine.<sup>199</sup>

— In May, the weather was exceedingly dry in Vermont. In Rhode Island, Connecticut and the southern portion of Bristol County, Massachusetts, the ground became so dry that forest fires of great extent raged in many places. These forest fires raged at Dartmouth, Massachusetts; at Providence, Rhode Island, and at Oxford, North Haven, Bristol, Derby, and New Milford, Connecticut. The month was not only dry but also unseasonably cold and uncomfortable. At Chester, New Hampshire, on 15 May, a recently plowed field froze so hard that it bore the weight of a man. In the vicinity of Weare, New Hampshire, blossoms appeared on the fruit trees on 20 May but four days later the area was hit by freezing rain. On 22 May, it snowed in Ohio. On 30 May, there was frost as far south as Virginia.

— June had a few exceedingly hot days but also many cold ones. On 6 June, ice formed to a thickness of an eighth of an inch [3 millimeters] on bodies of standing water. The weather was cold and squally, and snow fell in Maine, New Hampshire and Vermont, and in Cheshire, Peru, Windsor and other mountain towns in Massachusetts. In Maine, the frost and cold killed the martins and other birds, froze the ground, destroyed the corn and potatoes and forced workmen to put on great coats and mittens in order to keep warm. On 7 June, 4 inches [10 centimeters] of snow fell at Newton, Massachusetts and Hopkinton, New Hampshire. Snow also fell in Hallowell, Maine. Many cities experienced snow on 8 June. Snow was at a considerable depth in Waterbury, Vermont. In Williamstown, Vermont, it was 12 inches [30 centimeters] deep and in Cabot, Vermont, it was 18 inches [46 centimeters]. On the morning of the 8<sup>th</sup>, there were drifts of snow on many hills in and around Montpelier, Vermont and on the mountains it was more than a foot [30 centimeters] deep. Many sheep perished in the cold and many birds were found dead in the fields. On 9 June in Salem, Massachusetts, ice was drawn from a well at the tollhouse on the turnpike. On 10 June, there was a frost in Salem, and the frost was so severe at Montpelier, that it killed the foliage of the trees. At Hallowell, Maine, the earth was frozen a half-inch deep [1 centimeter]. The ice on some mud puddles was a quarter-inch [6 millimeters] thick and was strong enough to bear the weight of a man. A great variety of birds including hummingbirds, yellow birds, martins, and scarlet sparrows were so numbed by the cold that they allowed themselves to be picked up by hand. A great number died in the cold. On 22 June, there was ice in the tan yard at Chester, New Hampshire. It was so cold at Gilmanston, New Hampshire, that the men who worked the field resorted to wearing overcoats and mittens. Beginning on 23 June at Salem, Massachusetts there were 3 very hot days. The hottest was 101° F [38° C].

— There were frosts in northern New England in July and snow fell in Amherst, New Hampshire. On 8 July, the frost was so severe at Franconia, New Hampshire that it destroyed the beans. At Warren, Maine, the frost destroyed the corn [grain]. On 10 July, there was frost in the lowland at Chester, New Hampshire. On 17 July, there was abundant rain in New Hampshire, Vermont and the northwestern part of Massachusetts, and the crops began to recover. July was a warm month in Massachusetts. In Vermont, the drought continued.

— In August, there was frost, and at Amherst, New Hampshire snow fell. Most of August was warm, but on 20 August, there was snow in the mountains at Goffstown, New Hampshire. On 21 August, there was a severe frost at Keene and Chester, New Hampshire that killed most of the corn, potatoes, beans and vines, and also injured many crops in Maine. It was felt as far south as Boston and the Middlesex County in eastern Massachusetts, and in the western portions of the state as far as Stockbridge. The mountains of Vermont were now covered with snow and it was very cold. By the 29<sup>th</sup>, the frost extended down to Berkshire County, Massachusetts, where it killed the Indian corn.

— On 11 September, Springfield, Massachusetts received 2 to 3 inches [5-8 centimeters] of snow. The Vermont mountains were covered with snow. On 20 September, frost killed the corn and injured the potatoes at Hallowell, Maine. In New Hampshire, there occurred four of the greatest frosts ever known. On 26 September, the temperature fell to 23° F [-5° C]; on the 27<sup>th</sup> and 28<sup>th</sup> to 20° F [-7° C]; and on the 29<sup>th</sup> to 25° F [-4° C]. The frosts were very heavy in central Massachusetts. Before the end of the month, snow fell at Boston, Massachusetts and Wiscasset, Maine.

— The drought in Vermont continued during September. The area was without rain for 120 days. Devastating fires swept through the woods of Vermont, New Hampshire and Maine. In New Hampshire, the towns of Gilmanton, Guilford, Alton, Barnstead, Grafton and Rochester suffered from these forest fires. In Maine, the fires occurred along the Kennebec River, and as far east as Frenchman's Bay. In some places the smoke was so thick that it blotted out the sun.

— On 17 October, snow fell to a depth of 12 inches [30 centimeters] at Haverhill, New Hampshire.

— There was great destitution among the people the next winter and spring. The farmers in some instances were reduced to the last extremity, and many cattle died. The poorer men could not buy corn at the exorbitant prices for which it sold. In autumn, livestock sold at extremely low prices on account of the lack of hay and corn. A pair of four-year-old cattle was sold for \$39 in Chester, New Hampshire.

The year 1816 was called "The Year Without A Summer". It was given this name because in Bradford County, Pennsylvania in the *United States* in the year 1816, in every month there was a sharp or killing frost. January was mild as was February with the exception of a few days. The greater part of March was cold and boisterous. April opened warm but grew colder as it advanced, ending with snow and ice and winter cold. In May, ice formed half an inch thick [1 cm], buds and flowers were frozen and corn killed. Frost, ice and snow were common in June. Almost every green thing was killed and the fruit was nearly all destroyed. July was accompanied with frost and ice. In August, ice formed half an inch thick [1 cm]. A cold northwest wind prevailed all summer. Corn was so frozen that much of it was cut down and dried for fodder. The first two weeks of September were mild and the balance of the month cold with frost, ice forming to the thickness of half an inch [1 cm]. October was colder more than usual with frost and ice. November was cold and blustering with snow enough for good sleighing. December was quite mild and comfortable. The destruction of crops was so general that a famine almost resulted. Early settlers referred to this unfruitful year as "eighteen hundred and starve to death." <sup>178</sup>

Charles Pierce provided the following record of the weather in 1816 in Philadelphia, Pennsylvania in the *United States*: <sup>1</sup>

— The medium temperature of January was 32° F, and from the 1<sup>st</sup> to the 16<sup>th</sup>, the weather was mild, foggy and wet. On the evening of the 16<sup>th</sup> a reaction took place, and there was a deep snow, and the bridge at the falls of the Schuylkill fell. The weather afterwards cleared mild, and the remainder of the month was pleasant winter weather, neither severely cold, nor so mild as not to need a good fire. On two or three days some light snow fell.

— The medium temperature of February was 28° F. There were a few intensely cold days; but excepting these, the weather was tolerably mild during the month. There was snow, hail and rain, but neither fell in great abundance. During some cold days, the Delaware River froze over, but soon opened again opposite and below the city. The ice above the city, at Burlington, Bristol, Trenton, etc. did not clear out until the first of March.

— The medium temperature of March was 36° F, and there was a great deal of cold, windy, boisterous, and stormy weather, until past the middle of the month; but, notwithstanding the month came in like a lion, and continued very ferocious for more than two weeks, yet it went out as mild and gentle as a lamb. A great fresh [freshet] in the Ohio and Kentucky rivers caused a rise of more than fifty feet, and produced great destruction of property.

— The medium temperature of April was 47° F. It commenced mild, but did not maintain its credit; as Jack Frost came along mounted upon a cold, boisterous northwester, and made every thing tremble and shiver before him. The blustering snow squalls, which followed, would have been more suitable for January than April. After the wind lulled, ice formed on several nights, half an inch thick, which destroyed all the buds, and almost every green thing.

— The medium temperature of May was 57° F, and she was really a frosty jade. Her frowns were many, and her smiles few. Northerly winds, with cold frosty nights prevailed, until every green thing was either killed or withered. A melancholy hue appeared to seal the fate of all vegetable life. Buds and small fruit froze upon the trees. On some mornings there was ice from a quarter to half an inch thick, in exposed situations. Corn was replanted two or three times, and very little ever came to perfection. Westerly and southwest winds prevailed but seven days during the whole month. There were two northeast rainstorms.

— The medium temperature of June was only 64° F, and it was the coldest month of June we ever remember; there were not only severe frosts on several mornings, but on one morning there was said to be ice. Every green herb was killed, and vegetables of every description very much injured. All kinds of fruit had been previously destroyed, as not a month had passed without producing ice. From six to ten inches of snow fell in various parts of Vermont; three inches in the interior of New York; and several inches in the interior of New Hampshire and Maine.

— The medium or average temperature of July was only 68° F, and it was a month of melancholy forebodings, as during every previous month since the year commenced, there were not only heavy frosts, but ice, so that very few vegetables came to perfection. It seemed as if the sun had lost its warm and cheering influences. One frosty night was succeeded by another, and thin ice formed in many exposed situations in the country. On the morning of the 5<sup>th</sup> there was ice as thick as window-glass in Pennsylvania, New York, and through New England. Indian corn was chilled and withered, and the grass was so much killed by repeated frosts, that grazing cattle would scarcely eat it. Northerly winds prevailed a great part of the month; and when the wind changed to the west, and produced a pleasant day, it was a subject of congratulation by all. Very little rain fell during the month.

— The medium temperature of August was only 66° F! and such a cheerless, desponding, melancholy summer month, the oldest inhabitant never, perhaps, experienced. This poor month entered upon its duties so perfectly chilled, as to be unable to raise one warm, foggy morning, or cheerful sunny day. It commenced with a cold northeast rainstorm, and when it cleared the atmosphere was so chilled as to produce ice in many places half an inch thick. It froze the Indian corn, which was in the milk, so hard, that it rotted up on the stock, and farmers mowed it down and dried it for cattle-fodder. Every green thing was destroyed, not only in this country but also in Europe. Newspapers received from England said, "It will ever be remembered by the present generation, that the year 1816 was a year in which there was no summer." Indian corn, raised in Pennsylvania in 1815, sold (for seed to plant in the spring of 1817) for four dollars per bushel in many places.

— The medium temperature of September was 62° F, and it produced more than two weeks of the mildest and pleasantest weather there had been during the whole season, for such a length of time; but on the 17<sup>th</sup>, after some rain fell, the wind changed to northwest, and a chilly, frosty atmosphere ensued; and the 23<sup>rd</sup> brought a cold north-east wind and a violent equinoctial rain storm, which continued for two days. After which it cleared with a brisk northwest wind, and for several succeeding nights water froze a quarter of an inch thick in shallow ponds. About five inches of rain fell during the month.

— The medium temperature of October was 52° F, and it produced more than its usual quantity of cool days and very frosty nights. On several mornings ice was a quarter of an inch thick. There was, however, one week of very mild and pleasant weather with a balmy southwest wind. About two and a half inches of rain fell during the month.

— The medium temperature of November was 41° F. This was indeed a cold blustering month, and there was rainstorms and snowstorms; cold northwest and northeast winds, with a few balmy westerly breezes, and mild days. About six inches of rain and four inches of snow fell, which made some sleighing in the country, but very little in the city. It froze very hard several nights, and some days were cold enough to sit by a good fire.

— The medium temperature of December was 32° F, and there were fourteen mild and pleasant days in the month. During the other seventeen days the weather was very variable. About six inches of snow and three inches of rain fell. The temperature of the whole year was only 49° F; it being the coldest year we have on our record. Although there was no uncommonly cold weather during the three winter months, yet there was ice during every month in the year, not excepting June, July and August. There was scarcely a vegetable came to perfection north and east of the Potomac River. The cold weather during the summer, not only extended through America, but throughout Europe. One of the most celebrated meteorologists in England, on reviewing the weather of the year, said, "it would ever be remembered that 1816 was a year in which there was no summer, and the temperature of the year (as a whole) was the lowest ever known." It was also the coldest summer ever known in the West Indies and in Africa. The medium temperature of the whole year in Philadelphia was only 49° F.

James Winchester of Vermont in the *United States* described the remarkable summer of 1816. “It is said that in June of that year snow fell to the depth of three inches in New York, Pennsylvania, and New Jersey on the 17<sup>th</sup>; five inches in all the New England States, except three inches in Vermont. There was snow and ice in every month of this year. The storm of June 17 was as severe as any that ever occurred in the depth of winter; it began about noon, increasing in fury until night, by which time the roads were impassable by reason of the snow drifts; many were bewildered in the blinding storm and frozen to death. During June, July, and August the wind was continuously from the north, fierce and cold; July was colder than June, and August colder than July; there was a heavy snowstorm August 30<sup>th</sup>. The first two weeks in September brought the first warm weather of the year, but on the 16<sup>th</sup> of that month the cold weather suddenly returned and continued increasing until winter. The year 1816 had neither spring, summer, nor autumn. The only crop of corn raised in that part of Vermont that summer was saved by keeping bonfires burning around the cornfield night and day. The crop of 1817 was raised from the seed of 1815. The summer of 1817 was one of the hottest and driest known in that region.”<sup>115</sup>

In northern *France* in 1816, the weather was unusually cold, with strong winds, cloudy skies, barometric changes and excessive moisture, without intermission.<sup>79</sup>

In Burgundy, *France*, the grape harvest began on 15 October. This was the latest harvest date since 1809. The yield was exceptionally small and the wine was of poor quality. It rained in Burgundy almost continuously from May to December. The cereal harvest was generally inadequate, and the median price of a hectoliter of grain rose to 35 francs. In the countryside of Toulouse, *France*, spring and summer were cold, wet, and rainy. The months of September and October only were dry and a little warm. The year was exceptionally cold and wet, and very strange. The summer in *France*, *Switzerland*, and *Germany* were remarkable because of the rain. In *Denmark*, *Sweden* and *Russia* the weather was very nice. To complete the description of this large climate anomaly, a drought occurred in the lower *Languedoc* the caused the failure of crops. In Sorèze in southern *France*, the harvest was late. The greater part of the grain had been stored due to the rain. The maize was sown very late and with great difficulty. When harvested, the maize earned very little. There were no grapes, no fruit, the food was alone was sufficient but spoiled. In July, corn in the south sold for 36 and 40 francs per hectoliter and the grain sold for 48 to 50 francs per hectoliter.<sup>62</sup>

Almost continual rainfall, cold and misfortune plagued northern *France* in 1816. The damp, cold weather delayed the harvests. It rained in the spring, especially in summer, then in the fall. Rain prevented the harvest in much of northern regions. Paris had its share with one hundred sixty-seven rainy days and 21.5 inches (546 millimeters) of annual rainfall. The month of July alone produced twenty-six days rainy days. The Seine River burst its banks and on December 22 was at 18 feet (5.48 meters) above low water mark of 1719. The rainfall of 1816 was observed in several localities of the southern *France*, including Toulouse, Joyeuse, and Viviers; but was incomparably weaker and less general. Marseille, in particular, received only 11.7 inches (298 millimeters) of rainfall compared to its normal 21.3 inches (540 millimeters). Montpellier received only 17.9 inches (455 millimeters) of rainfall compared to its normal annual figure of 30.1 inches (764 millimeters); with sixty-four rainy days instead of eighty-two.<sup>79</sup>

On 2 January 1816 at Strabane, *Ireland*, there was an inundation caused by the melting of the snow on the surrounding mountains. As a result, most destructive floods were occasioned.<sup>47, 90, 92</sup>

On 12 January 1816, there was an inundation at Strabane, in *Ireland*, by the melting of the snow on the surrounding mountains, the most destructive flood that had been witnessed for 20 years.<sup>43, 128</sup>

In *England* in February, great floods occurred in Northumberland and Durham.<sup>47</sup> This was the greatest flood ever remembered for this location.<sup>43</sup>

On 12 February 1816, the greatest flood ever remembered occurred in Northumberland and Durham, *England*.<sup>128</sup>

On 27 February 1816, considerable damage was done at Birmingham, Liverpool, Manchester, and other northern towns in *England*, by tremendous gales of wind.<sup>128</sup>

In March 1816, fifty-three villages in the great Werder in eastern *Germany*; forty-nine villages in the districts of Siegenhoff [Siegenhof, *Germany*]; and seventeen Elbing [Elbląg, *Poland*] villages were under water.<sup>43</sup>

On 21 March 1816 in *Germany* [now part of *Poland*], the Vistula River overflowed; many villages were laid under water, and great loss of life and property was sustained.<sup>47, 90, 92</sup>

In *Ireland* on April 21/22, there were great floods at Londonderry.<sup>47, 92</sup>

In June 1816, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 45.5 feet (13.88 meters) above the water mark at Windsor.<sup>99, 109</sup>

On 10 June 1816 in *Bavaria*, there was a hailstorm. All the crops and produce on the banks of the Danube River, near Munich, *Germany* were destroyed for a circle of 10 leagues (30 miles, 48.3 kilometers).<sup>93</sup>

On 28 June 1816 in *Germany*, there was a dreadful hurricane near Vibbel (10 miles outside Frankfurt). The storm tore down trees and buildings. "The hail lay 2 feet (0.6 meters) deep in the streets and fields. It was so dark that it was necessary to use candles."<sup>93</sup>

A rare June snowstorms struck Vermont in the *United States* dumping six to ten inches (15-25 centimeters) of snow; the interior of New York state received three inches (8 centimeters); and several inches fell in New Hampshire and Maine.<sup>1</sup>

On 2 July 1816, a dreadful storm fell upon the town of Worschetz, in the county of Timeswar and of 2,600 buildings in the town, none escaped without damage.<sup>43</sup> [There appears to be an unresolved conflict in this passage. It is believed that the town of Worschetz is now Vršac, *Serbia*. It is also believed that the county of Timeswar now is the region around the town of Timișoara in *Romania*.]

On 11 July 1816 in *Hungary*, there was a dreadful hailstorm at the town of Worschetz. Of the 2,600 buildings of which the town was composed, a great many were seriously injured.<sup>93</sup> [Again there appears to be an unresolved conflict in the location of Worschetz.]

In *Germany* during June and July, the harvest greatly endangered from continued rains.<sup>47</sup>

On 21 July 1816 in *England*, there was a great hailstorm in Cumberland, Staffordshire, and Lancashire. The storm caused great destruction of crops, trees, and glass.<sup>93</sup>

In June and July 1816, at Thiel, Arnheim [Arnhem, *the Netherlands*], Zutphen [*the Netherlands*], and numerous other places on the continent, the harvest was nearly destroyed by inundations from continued rain.<sup>43</sup>

In Cumberland and Westmoreland, *England* in August, there was a great storm of wind and hail which desolated these counties.<sup>57</sup> Some of the pieces of ice were an inch in diameter.<sup>43</sup>

In August 1816 in *England*, there were severe hailstorms in the counties of Cumberland and Westmoreland.<sup>93</sup>

In August 1816 in *England*, there were great quantities of rain that fell. The harvest was much delayed. This also occurred on the European Continent.<sup>92</sup>

In *England* on the 31<sup>st</sup> of August, there was an awful gale, by which a great number of vessels were lost, and much damage done on the coasts.<sup>57</sup> And much damage was done to the shipping in general on the English coast.<sup>43,90</sup>

On 31 August 1816, many vessels were lost and much damage done to the shipping in general on the *English coast*, by tremendous gales of wind.<sup>128</sup>

In *England*, there was a considerable fall of snow in the counties of Cambridge and Huntingdon, by which much damage was done to the gardens on 2 September 1816.<sup>43</sup>

On 15 September 1816, it was reported that considerable damage was done at *Dominica*, on shore and among the shipping, by a gale of wind.<sup>128</sup>

In 1816, a hurricane struck *Puerto Rico*. The storm caused two deaths on land and part of the crew from 3 ships perished.<sup>141</sup>

In 1816 red snow fell on the mountains of *Italy*.<sup>128</sup>

*Ireland* suffered the effects of famine in 1816, 1822 and 1831.<sup>188</sup>

A drought struck New England in the *United States* in 1816. This summer, which was known as the cold one, was also a very dry one in many regions. In Vermont, no rain fell during May and very little in Connecticut. During June intense heats were followed by freezing weather, with snow squalls in several of the New England States. The snowfall on the 8<sup>th</sup> of June in Vermont amounted in some places to 12 and 18 inches. In July, there was abundant rain in northwestern Massachusetts and New Hampshire; from that time a drought continued until October 22, having prevailed for one hundred and twenty days in Vermont. Owing to the cold and the drought the crops were almost a complete failure.<sup>138</sup>

In 1816 during the period between 21 October and 18 November, a severe drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui.<sup>153</sup>

---

**Winter of 1815 / 1816 A.D.** The winter of 1816/1817 was one of the severest in *Iceland*. From the beginning of February 1817 to the end of March, the weather produced changeable winds and heavy snow. From the beginning of April until the 1<sup>st</sup> of May, there was fine and mild weather with thaw; but on May 2 a storm from the north with much snow; and from that day until July 7 there was northerly winds with frost and cold weather. The Greenland drifting ice, which had left the northern lands in the beginning of April, returned again in the first days of May, and surrounded the whole of the western, northern and eastern land. From about July 7 the weather has been very dry and often pretty warm.<sup>175</sup>

On 18 and 19 January, the Potomac River froze completely over at Alexandria, Virginia, in the *United States*. From 20-22 February, snow fell to the depth of 3 feet (0.9 meters) on a level in Boston Massachusetts and in many parts of New England.<sup>1</sup>

On 21 January 1817, there was a dreadful storm at Plymouth, *England*. Damage done to the new Breakwater to a great amount.<sup>128</sup>

On 29 January 1817, a mist prevailed at Naples, *Italy*, so dense as to produce darkness for several hours.<sup>175</sup>

John Pintard, a resident of New York City in the *United States*, wrote to his daughter in February 1817 that with the bitter cold he was "obliged to hold my pen to the fire to thaw the ink." "Indeed my ideas are almost congealed."<sup>18</sup>

During the winter of 1816-17, Mrs. Clement Paine from Athens, Pennsylvania in the *United States* wrote in her diary: "February 15, 1817, the cold is very intense. Mr. Smith says it is the most severe winter we have had for 38 years. There are many sufferers on account of it. The extreme distress it brings is such as I have never known. Yesterday the cold really terrifying. The streams being frozen, a famine almost prevails and I am under serious apprehension that some will actually perish from want. We have baked our last bread, but it is not for myself that I fear. It is for those who have no bread nor other comfort, and many such there are around us. March 2<sup>nd</sup>, cold, famine and pestilence seem every day to increase and threaten desolation. The oldest persons of our acquaintance remembers no such time. A mother thinly clad came 3 miles [4.8 km] through the storm to beg a trifle for her children to eat. I have partially relieved three families to-day. The one best provided for had nothing save some frozen potatoes and milk—a family of nine children. March 5<sup>th</sup>, the very great and extreme severity of the weather has abated. It has been remarked by elderly people that such a severe winter has not been known since 1780."<sup>178</sup>

---

**1817 A.D.** During the nights of 26 and 27 February 1817, there was a hurricane at Glasgow, *Scotland*, accompanied with rain, hail, thunder and lightning. The wind was extremely violent; the thunder awfully loud, and the deep red flashes of lightning cast a glare during the whole night. The hailstones broke the windows in all directions. This storm struck Dublin, *Ireland* on 27 February and Amsterdam, *the Netherlands* on the night of the 25<sup>th</sup>.<sup>175</sup>

On 27 February 1817, a tremendous gale of wind, which did considerable damage at Birmingham, Liverpool, Manchester, and other northern towns in *England*.<sup>43</sup>

On 27 February 1817 in *Ireland*, there was a hurricane with heavy hail.<sup>93</sup>

In February 1817, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 46 feet (14.03 meters) above the water mark at Windsor.<sup>99, 109</sup>

On 7 March 1817 in *Germany* for some days past, the waters rose in a terrible manner on both sides of the Rhine River, and that the river had reached uncommon heights. It was about the same as it was at the end of the year 1800. The Kinzig and the Schuler Rivers were not quite so destructive as they had been two months earlier. The alarm bell was frequently sounded in the communes about Kehl, *Germany*, in order to collect people to strengthen the Rhine dikes. As a result the danger was averted; the bridge of boats at Kehl was still standing, and the communications between the two banks open. But on the left bank the accounts were melancholy. The rivers there had everywhere overflowed their banks. Great ravages have been caused about Strasburg [*Strasbourg, France*] by the Ill and Breusch Rivers. All the fields and gardens around Strasburg formed one great lake. All the streets near the river were underwater and communications were kept up by boats. The Ill has done still greater damage around Schlettstadt, *Germany*. Several persons and a quantity of cattle perished.<sup>175</sup>

On 20 March 1817, the floods were so great round Oxford, *England*, that the city appeared like an island.<sup>128</sup>

In 1817, during the spring equinox [around 20/21 March], a disastrous hurricane mixed with thunder, rain and hail, attacked Paris, *France* for nearly twenty-four hours.<sup>79</sup>

In France there was a flood. In March 1817, the Seine River in Paris, *France*, at the bridge “Pont de la Tournelle” reached a height of 6.3 meters (20.7 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

On 26 May 1817, the rains began to fall in torrents in Stutgard [Stuttgart], *Germany*. The rains continued for three days and nights. All the rivers overflowed and it produced an inundation far surpassing anything ever recollected in that country. The lower part of the small town of Constatt [Cannstatt], a league from Stutgard, was under water, and the inhabitants evacuated the suburbs. Several individuals and many animals were drowned at Constatt. The rains ceased on the evening of the 28<sup>th</sup>.<sup>175</sup>

On 21 June 1817 in *England*, there was a great hailstorm in Gloucestershire and Wiltshire.<sup>93</sup>

On 21 June 1817, the temperature reached 103° F in the shade at Gloucester, *England*. The intense heat produced thunderstorms in many parts of the country. In the vicinity of Gloucester and Tewkesbury, individuals experienced considerable loss by hail, which broke many windows. At Lyneham, near Chippenham, a waterspout inundated a considerable quantity of land, which caused a rapid rise of the River Avon. Salisbury and its neighborhood experienced the brunt of the storm. Forty sheep, of a flock belonging to Mr. Swayne of Langford were struck down by lightning, and six sheep and six lambs were killed. Several large trees were blown down by the storm at Durnford and West Harnham.<sup>175</sup>

On 23 June 1817 in *England*, there was a hailstorm in Somersetshire.<sup>93</sup>

On 23 June 1817, a violent storm struck in the vicinity of London, *England*. The rain fell in such torrents that the sewers were soon choked and the lower apartments of many houses were flooded. Almost every hot-house, green-house and skylight sustained glass damage from hailstones, many of which were two inches in circumference.<sup>175</sup>

On 25-27 June 1817, storms of rain, hail, thunder and lightning caused severe damage in *the Netherlands*.<sup>175</sup>

On 27 June 1817, several waterspouts were observed to the north of London, *England*. These waterspouts darted in and out of dark clouds.<sup>175</sup>

On 1 July 1817, a tempest with a terrible hailstorm almost entirely laid waste the fields of Horst and Viechhof in Lauenburg, *Germany*. So many windows were broken, that there was not enough glass in town to repair them. The hail was jagged, and many pieces were greater than 1-inch long.<sup>175</sup>

All the accounts from the eastern part of *Switzerland* announced the terror and damage caused by the late inundations. The storms carried desolation into the lower parts of the Canton of Glaris. The Linth River broke its dikes in three places. The bridge of Glaris and Helstal fell down. The bridge at Miolis was threatened with ruin. Gessau, Rutti, Fleriscue, and Hagelschauer in Teggenburg, felt the whole violence of the storms on 4 and 5 July 1817. All the torrents overflowed. The bridge at Aberglatt was ruined. At Basle, the Rhine River rose so much on the 6<sup>th</sup>, as to inundate the city as far as the fish markets. The citizens were forced to cross the street in boats. The Rhine River continually brought down trees, parts of buildings and drowned animals. These numerous wrecks indicated how this storm ravaged the lands upstream. At Lake Constance, the lake was much higher on the 6<sup>th</sup> than in 1666, and even some inches higher than in 1560. In spite of unremitting exertions, the bridge of Lindau was carried away. On the banks of the lake many communes were underwater. Because the vents by which the waters must run off

when the lake falls, being too small, a flood condition continued for a long time. In the Lower Rhinthal, the surface of the waters which covers the fields and the roads, and upon which one could navigate between half ruined houses, was 3 leagues [10 miles] in circumference. At Horn, and all along the lake, a great many buildings were abandoned; the waters threatened the foundations of the most solid edifices. In the Oberland, many bridges were carried away. The fields, the meadows, the plantations were entirely submerged, and pieces of the soil were seen floating about, torn up by the fury of the waters, covered with potatoes, vegetables, and hay. On the 9<sup>th</sup>, during a violent tempest, the lightning struck the village of Deterswell, and burnt a house. Near Neutingen, many cattle were killed by lightning.<sup>175</sup>

On 8 July 1817, it was reported that there were great inundations in *Switzerland*.<sup>128</sup>

On 11 July 1817, a tornado passed near Derby, *England*. It tore up a fine ash tree by the roots but passed over the city without doing harm.<sup>175</sup>

On 11 July 1817, a waterspout (tornado) entirely overturned 16 or 17 houses and caused considerable damage to several others in the village of Wattenbeck [Wattenbek], *Germany* near New Munser.<sup>175</sup>

On 11 July 1817, a dreadful hailstorm struck Pforzheim, Ispringen and Eukingen, *Germany*. The hailstones were all triangular and as large as pigeons' eggs. Many persons were severely wounded in the hand and head. A great number of windows were broken. The fine cornfields were almost entirely laid to waste in a quarter of a hour.<sup>175</sup>

On 28 July 1817 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 28 July 1817 at around 6 o'clock in the evening, a dreadful hailstorm from the west struck London, *England*. The storm lasted 7 minutes and most hailstones were the size of hazel nuts. Innumerable panes of glass in houses having a western aspect were damaged.<sup>175</sup>

*Germany* and *France* suffered famines in 1817.<sup>96</sup>

In 1817, parts of *Germany* were in a state of famine.<sup>155</sup>

A very pronounced drought ruled *France* in 1817. The amount of rainfall at Viviers in 1817 dropped from the yearly average of 35.8 inches (909 millimeters) down to 30.5 inches (774 millimeters). At Toulouse, it dropped from 23.8 inches (604 millimeters) down to 19.5 inches (496 millimeters). At Montpellier, it dropped from 30.1 inches (765 millimeters) down to 21.6 inches (548 millimeters). At Marseille, it dropped from 20.8 inches (528 millimeters) down to 9.1 inches (230 millimeters). At Joyeuse, it dropped from 50.4 inches (1,281 millimeters) down to 37.3 inches (947 millimeters). Paris suffered less than the province during the drought of 1817. The amount of rainfall in Paris dropped from the yearly average of (540 millimeters) down to (505 millimeters) in 1817. The level of the Seine River in Paris on September 22, at the bridge Pont de la Tournelle fell close to the zero water mark of 1719.<sup>79</sup>

Beginning in the early part of 1817, southern *Europe* was almost desolated by a severe drought. In June, the lake of Ouveillan in southern *France* dried up. The drought drained up many fountains and wells at the mouths of the Rhône & the Var rivers, and the Lower Alps. In July, such was its intensity in the department of the Eastern Pyrénées that it converted into salt a great part of the waters of the lakes of Saint Nazaire and Villeneuve in *France*. At Marseilles and Montpellier, *France* the greatest inconvenience was also felt for the want of water.<sup>190</sup>

The year 1817 was also remembered for unusual heat. On 7 June, the thermometer at Paris, *France* rose to 26° C [79° F], where it remained the whole day. On the 18<sup>th</sup> it was at 28° C [82° F], and on the 20<sup>th</sup> it

was at 30° C [86° F]. In some parts of *Great Britain* it rose even higher. At London, *England* on the 28<sup>th</sup>, between three and five o'clock in the afternoon, it was 39° C [102° F] being 10° C above the greatest heats of ordinary summers. In the north of Asia, on the contrary, there was scarcely any summer at all this year, the cold continuing until the 21<sup>st</sup> of June, the time at which the fine season in the northern parts of *Siberia* usually terminates. In the hyperborean regions of Europe, again, the heat was so intense that the coast of *Greenland*, which had been covered for ages with enormous masses of ice, were completely liberated, and the sea was laid open as far as the mountains of Spitsbergen [archipelago in the north most part of *Norway*], and even as high as the 84° of Latitude. Enormous masses of ice descended into the Atlantic Ocean as far as the 40° of Latitude without melting. The months of June, July, August and September were of a stifling heat, especially at Rome, at Naples, and at Trieste, *Italy*, where it was impossible to go outside until the evening. The warmest day at Perpignan, *France* was on the 4<sup>th</sup> of July; at Marseilles, *France* on the 17<sup>th</sup> of August, when the temperature, exposed to the sun, remained stationary at 44° C [111° F]. In Cayenne, *French Guiana* (in South America), last winter, which normally is the rainy season in that country, was unknown. It ordinarily lasts for a total of 6 months, but last year, there were only sixty-two days of rain, and that rain was slight and intermittent.<sup>190</sup>

A series of storms stung *Europe* in 1817.<sup>190</sup>

- On 19 May, a storm struck Rheims [Reims, *France*]. After 2 hours of heavy rain, a large black cloud gathered over the city and burst upon it with a horrible crash releasing a great hailstorm. For five minutes the hail fell in torrents. Whole roofs were broken; the trees of gardens were chopped to pieces; and many small animals were killed.
- Also on 19 May, a hailstorm struck many communes along the Upper Garonne River, in southwestern *France* with equal severity.
- On 20 May, Semur in the Côte-d'Or department of *France* and the rich vineyards in its neighborhood were visited by a frightful storm. The rain and hail fell for a whole hour in a continuous flood.
- On 7 June, part of the communes of Courçon, Beaugas, Moulinet, and the Parisian suburb of Bondi, *France* was entirely laid to waste by a severe hailstorm. Not a stalk of corn [grain] was seen standing, nor a leaf remained on the vine. But the immense rainstorm that fell during the night caused even more harm. It caused the earth to become unsettled which then covered all the meadows with sand [landslides].
- Also on 7 June, a violent storm struck the canton of Zurich in *Switzerland*, the city of Pau (Lower Pyrenees) in *France*, and surrounding communities. Some hailstones fell the roofs of houses and killed animals.
- On 8 June, fourteen communes situated in the valley of Loire, *France* were nearly inundated by heavy rain and large hail.
- On 9 June, twenty-seven communes situated in the arrondissement of Ambert in central *France* were nearly inundated by heavy rain and large hail.
- On 10 June, a severe storm swept over the canton of Saint Gall [St. Gallen], in *Switzerland*. The storm threw down a great number of houses at Wittenbach, Berg, Horn, and Ober-Steinbach.
- On 12 June, a storm struck in the neighborhood of Casan [Kazan], *Russia*. The storm was concentrated in the village of Oura, inhabited by Tartars living in a state of ease and famous for their fabrics of red colored cotton. A rivulet which crossed the village grew into an immense torrent, carrying along with it men, trees and homes to the distance of 20 versts [13 miles, 21 kilometers].
- On 14 June, a storm left horrible devastation in *Belgium*. The storm was so violent that it tore up a number of large trees, overturned many granaries and some houses. It shook all the houses for the distance of a league [3 miles, 4.8 kilometers].
- On 15 June, a hailstorm struck Lierre in the Low Countries [Lier, *Belgium*]. The hailstones were the size of pigeon's eggs.
- Violent storms also struck *Europe* on 22, 26, 27 and 29 June causing great havoc.
- In June, the heat was very excessive in *England* and produced storms, which did everywhere a great deal of damage. At Tewkesbury, they were accompanied with large hail. Salisbury was struck by a storm with torrents of rain and large pieces of ice that ravaged the area. Trees were shattered, men and beasts

wounded and houses overturned.

- On 3 July, a violent storm struck the town of Agen and many communes of the department of Tarn in southwestern *France*. Another storm carried devastation into the valley between two mountains of Lure and Lemeron (the mouths of the Rhône River) over a space of more than fifteen leagues [45 miles, 72 kilometers].
- On 4 July, hail the size of filberts fell at Munich, *Germany* and Lons-le-Saunier, *France*.
- On 10 July, many leagues in the departments of Yonne and Ain, *France* were in less than an hour laid entirely to waste by hailstones the size of pigeon's eggs.
- On 11 July, a storm of great fury struck Pforzheim in southwest *Germany*. The hailstones were the size of hen's eggs. Several men and beasts were killed and the hopes of a fine harvest wholly destroyed.
- During the night of 11 July, a storm struck the cantons of Châteauneuf and Eymoutier in the department of Upper Vienne, *France*. The hail struck with such great force that even the chestnut trees were destroyed. Two days after the storm, heaps of hail still lay on the ground in abundance.
- On 31 July, hail fell at Manchester, *England* and its neighborhood. The hail was of such extraordinary size that two persons were killed by it at Pendleton, and many others were grievously wounded.
- On 16 August, in the departments of Aisne and Ardennes in northern *France*, the reapers were collecting one of the finest harvests known in a long time, when the sky became suddenly obscured by thick heavy clouds. A hailstorm struck with such impetuous force, that in ten minutes the crops and fruits of every description in the territory of four villages were torn to shreds. Some of the hailstones were three pounds in weight.
- On 22 August, after two months of excessive dryness, a dreadful tempest struck Rome, *Italy*. More than thirty of the largest trees of the villa [Pamphili?] were torn up by the roots.
- On 26 August, there was a hurricane [tornado] at the estate of Gourgivaux near Épernay in northern *France*. It only lasted 3 minutes but in that time it tore up and destroyed a number of trees, carried off several roofs, knocked the barn of the farm topsy-turvy, and scattered to the winds 300 sheaves.
- On 27 August, in the valley of Pia near Genoa, *Italy*, there was another hurricane [tornado] of a longer duration. Vines, trees of every kind, even garden walls were destroyed.
- On 3 September at Liverpool, *England*; on 11 September at Paris, *France*; on 12 September at Antwerp & Brussels, *Belgium* and several other places in the *Low Countries* [Belgium, the Netherlands, and Luxembourg]; on 22 September at Schaffhausen, *Switzerland*; and on 28 September at Memel [now Klaipėda in *Lithuania*] there were violent and destructive storms, in which in most cases the size and quantity of hail was remarkable.
- On 1 October, a remarkable storm struck the communes of Mehun-sur-Yèvre, Vasselay and others in the department of Cher in central *France*.
- On 3 October, a severe storm struck the neighborhood of Cahors in southwestern *France*.
- On 4 October, the old town of Nocera, *Italy* at the foot of the Apennine mountain range was struck by a tremendous hailstorm. This was the third time in 5 months that the area was struck. This storm destroyed all that was spared by previous tempest. Its superb olives, its fruit trees, and its [grape] vines were completely destroyed. A number of cattle were killed. This might be due to the shape of the hailstones, which were very angular in shape. The largest hailstones weighed six ounces.
- Also on 4 October, a severe storm struck Foligno, Assisi and Perugia in *Italy*.
- On 13 October, a severe storm struck Alicant [Alicante, *Spain*]. In a quarter of an hour, this town and its neighborhood, which produced a great abundance of exquisite fruit and an excellent wine, became a great wreck.

In 1817, inundations of rivers and lakes desolated almost all the countries of Europe, particularly *Switzerland*, the west of *Germany*, the *Low Countries* [*Belgium*, *the Netherlands*, and *Luxembourg*], *Holland* [now *the Netherlands*], the north of *Spain* and in the *United States* (Kentucky and New York). In the first days of June, the Rhone River tumultuously burst its banks, at the same moment that the waters of the Rhine and the Aar Rivers attained a prodigious height. The lakes and rivers and the torrents of *Switzerland*, Lake Constance, the Necker, the Mein, the Meuse, the Wahl, etc. overflowed upon all points.

The detail of the disasters, which they caused, was fearful. During the three months their waters covered whole countries, menaced the foundations of the most solid edifices, and covered the roofs of houses, while they kept constantly sweeping away trees and flocks, and a vast wreck of things of all sorts. Fields cultivated with the greatest care were converted into morasses [swamps]. Large tracts were turned into deserts of mire. The finest harvests were everywhere destroyed. On 26-28 August, a south wind, which prevailed for more than a month was followed by a hot rain, which melted the glaciers in such a manner that the Rhine River rose anew beyond all former examples, and presented, until 23 September, the appearance of a vast lake. The torrents of the Tyrol [in *Austria*] were swollen higher than their greatest height in 1789. The Sill River, which falls into the Inn at Inspruck, burst its banks and carried away several bridges, with a vast quantity of trees, houses, cattle, etc. On 9 November, a very violent storm burst upon the department of Ardèche in south-central *France*. The waters rose to a prodigious height and committed great destruction in the arrondissements of Tournon, Privas, and Argentière.<sup>190</sup>

After long intervals of heat, of abundant rain, and dreadful storms, Paris, *France* was visited on 23 August with squalls of cold rain, and weather that was truly autumnal. The equinoctial winds raged with violence. In Paris, the winds tore up the stoutest trees by the roots. On 23 September, the weather was mild, and warm. But the next day a strong wind from the northeast dried up the earth and gave all the chill of winter. On 10 October, Parisians felt as if they were in the middle of January. This unseasonable cold was also felt in the south. After more than ten months without rain, and great summer heat, on 15 October, the temperature had become suddenly icy cold and the Parisians had to start fires in order to keep warm. The damage occasioned by this unseasonable cold in the nights of 22 & 24 August to the standing crops of all descriptions, was very great in the northern provinces of *Sweden*, particularly Helsingland [Hälsingland] and the regions of [Gefle] Gävle in *Sweden* and Franconia and Wirtemberg in *Germany*. During the beginning of October, a great quantity of snow fell in *Scotland*, principally in the counties of Rose and Aberdeen, where it lay two feet deep. On 4 October, there was snow on the fertile plains of Bayreuth, *Germany* to a depth of three inches. On 9 October, it covered the mountains of Urach in *Germany*, Vosges in eastern *France* and Brisgau [Breisgau] in *Germany*. On 12 October, there was snow on the elevated plain of Woivre, in the department of Meuse, *France*. On 16 October, there was snow on the mountains of Lozère and the neighborhood of Mende in *France*. It was feared that the upcoming winter would be very severe but the months of November and December produced spring-like weather in Paris.<sup>190</sup>

On 21 October 1817, a tremendous hurricane struck the *West Indies*. The storm was particularly severe at the island of *St. Lucia*. All the vessels in the port were entirely lost. The Government-House was blown down, and all within its walls, comprising the governor, his lady, and child, his staff, secretaries, and servants, amounting to about thirty persons, were buried in its ruins. Not one survived the dreadful storm. The barracks of the officers and soldiers were demolished, and all within them (about two hundred persons) died. All the estates on the island were reduced to a heap of ashes. At the island of *Dominica*, nearly the whole town was inundated, with an immense destruction of property.<sup>191</sup>

On 21 October 1817, a hurricane struck *St. Lucia*, *Dominica* and *Barbados*. One account cites more than 252 deaths, while another cites more than 200 deaths.<sup>141</sup>

On 21 October 1817, it was reported that a dreadful hurricane struck the *West Indies*. On 23 October, it was reported that a hurricane at Barbados and *St. Lucia*. Much shipping was destroyed. The hurricane also struck Martinico, *Dominican Republic*.<sup>128</sup>

On 21 October 1817, a hurricane struck the *West Indies* and was thought to be the most destructive since 1780. The ravages appeared to have been extended in breadth at least from the 12<sup>th</sup> to the 18<sup>th</sup> degree of North Latitude, but to have affected principally the islands of *Dominica*, *Martinique*, *St. Lucia* and *St. Vincent*; and to a lesser degree *Barbadoes*, which lay to leeward with regard to the storm. The wind was

stated to have set in at daybreak from the northwest and to have raged with tremendous violence, with occasional falls of rain, until three in the afternoon, when becoming southerly it abated, but did not immediately cease. At St. Lucia, the government house and barracks were blown down and their inmates buried in the ruins. The crops and forests, in short the whole face of the island was desolate and every vessel in the port lost.<sup>175</sup>

A letter dated 23 October 1817 from L.R. Baines, the Colonial Secretary of *St. Lucia* to the Governor of Barbadoes reported the hurricane caused the following damage:<sup>175</sup>

“Scarcely a dwelling or a Negro house is left standing; the mills and outbuildings either unroofed or razed to the ground; nearly the whole crop of cane torn up by the roots, and the face of the island, which was luxuriant on the 20<sup>th</sup>, now bears the appearance of an European winter.”

“The town of Castrees [Castries] is nearly in ruins, and the vessels, about 12 sail, are on shore, not one of which is expected to be saved. The whole of the buildings of Morne Fortunée [Morne Fortune] and Pigeon Island were blown down, with the exception of the magazine and tanks.”

“His Excellency and family were taken from under the ruins of his residence (the Commandant’s quarters), where he remained in the hope that it would have resisted the gale; but he has, unfortunately, suffered for his imprudence.”

A letter dated 10 November 1817 from St. Pierre, *Martinique* reported:<sup>175</sup>

“On the 21<sup>st</sup> of October, this Colony was visited by the most furious hurricane ever witnessed here; the details of this sad disaster would be equally long, as painful. The loss of nearly 1800 lives, 25,000 hhds. [hogsheads] of sugar of the present and next crop, incalculable losses in buildings, animals, and the necessaries of life, have occasioned a general desolation, independently of the great anxiety caused by nine-tenths of the shipping, which were in different ports of this island, being either wrecked, damaged, or missing. *St. Lucia* and *Dominica* have equally suffered; the tempest reached also *St. Vincent’s* and *Grenada*. Its ravages also extended to Guadeloupe [*Guadeloupe*], as well as Porto Rico [*Puerto Rico*] and its neighbourhood, though in a less degree. The loss experienced by Martinique alone, may be very moderately calculated at 25,000,000 of francs, exclusive of the shipping. The works and buildings of entire parishes were razed to the ground; it lasted 26 hours, 12 of which with such inconceivable fury as to produce all these disasters, and to destroy buildings which had withstood all former hurricanes. – It will require many years before the colony can recover itself from this heavy calamity.”

A letter dated 12 November 1817 from an Officer on board His Majesty’s ship *Antelope* at St. Kitt’s reported:<sup>175</sup>

“We were lying at *St. Lucie* quietly at anchor, only the day before the hurricane came on, and got under sail for Barbadoes [*Barbados*] (as was our intention) about seven in the morning of the 20<sup>th</sup> [of October], it being fine weather. At twelve o’clock the night following the officer of the watch hailed the master, and said the wind had come round to the northwest, which was very unusual in this country, where easterly winds prevail all the year through, and that the weather appeared to be coming on bad; the Admiral and Captain were immediately upon deck; we took in all our sails except the fore sail, which was reefed; got the top-gallant-masts upon deck, and prepared for the worse. At three in the morning of the 21<sup>st</sup> instant, it blew very hard at west, with tremendous heavy rain; at four still harder: took in our fore-sail, and brought her to under a try-sail double-reefed; at seven yet harder, when a sea came and washed away one of our boats from the stern. When ten o’clock came it blew a perfect hurricane beyond what any of us had ever witnessed; however, the ship lay very quiet and behaved very well, but from the heaviness and quantity of rain, with the immense force of wind, all our cabins were full of water. At noon the weather abated, and at three in the afternoon it became quite moderate, when we set our sails again. – We visited *St. Lucie* sixteen days afterwards, and the scene was such as my pen cannot describe: many of the inhabitants lost their clothes, and those who are sick, are lying on the ground with no other covering than the sky, exposed to sun and rain.”

A letter dated 30 November 1817 from an Officer on board one of His Majesty’s ships at Barbados reported:<sup>175</sup>

" On our first making the Island (*St. Lucie*) we were struck with astonishment at the total change in the whole face of the country. We left it the day before the hurricane [20 October] a beautiful rich green, and every thing in a most flourishing state. It has now the appearance of a severe European winter. We went on shore on the 7th of November; the scene of destruction which then presented itself is far beyond my power of description. On Pigeon Island, three houses only are left standing out of nearly 250, the rest, with the church, are almost totally demolished; one of the three is shifted 15 feet off its foundation, without going to pieces. The two large tamarind trees, under which the Negroes always met to dance on Saturday and Sunday evenings, were torn up by the roots, which by their spread in this rather sandy soil, nearly equal the branches in circumference. The woods with which this island particularly abounds are more or less scattered, according to their exposure to the gale; many of the trees which are left standing, have only a few of the ragged stout branches remaining. In the deep ravines the wind appears to have acted in a whirl; for immense trees are completely thrown down and twisted up in heaps in a most astonishing manner. The inhabitants tell us the great hurricane in 1780 was not equal to this."

At Bombay, *India*, on 20 October 1817, the *India Gazette* reported that — Until yesterday the rain has continued, during the last week, to come down almost without intermission: the quantity which has fallen in this monsoon is uncommonly great, the accounts taken by different rain gauges give upwards of 95 inches since the 2<sup>nd</sup> of June, being above a fourth more than the average fall of former years. The weather has now cleared up, with every appearance of continuing fair and hot.<sup>175</sup>

On 21 October 1817, an immense avalanche fell from the mountain of Kasbeck [Kazbek] in *Georgia* and covered an extent of three wersts [versts] in length [2 miles], to the height of 50 fathoms [300 feet]. It completely dammed up the rapid river of Tereck [Terek]; which, however, on the third day, worked a passage for itself underneath the mass of snow. This accident for some time interrupted the communication with *Georgia*. Fortunately, there were no travelers passing when it happened. Nine years have elapsed since the last avalanche occurred: though, according to the reports of the inhabitants, they generally take place once in seven years, and in the summer.<sup>175</sup>

In the night between the 7<sup>th</sup> and 8<sup>th</sup> of December 1817, a storm raged along the coast of *France*. It destroyed 20 vessels in the Channel from the coast of Brest to Saint Malo.<sup>175</sup>

On 9-11 December 1817, a dreadful storm struck the Bay of Biscay. A vessel was wrecked on the bar of Bayonne, *France*. The plains of the Adour and the Nive Rivers were inundated. At St. Jean de Luz, the dike, which defended the town from the ocean, was seriously damaged and the inhabitants were alarmed.<sup>175</sup>

The fog of 31 December 1817 was confined to the Metropolis of London, *England* and the immediate vicinity. No further to the northward than the back of Euston-square, the weather was clear and even bright. A gentleman, who came to town from Enfield, saw no fog till he approached London. Southward of London, it extended as far as Clapham, and it was rather thicker in some of the environs, than in the Metropolis itself. Upon the average, ten feet was the distance, at which objects became visible, out of doors. Within doors it was impossible to read without a candle. Another report shows that the fog was just as thick in Dublin, *Ireland* as it was in London, *England* on the same day. The oldest person living had no recollection of a fog so thick as enveloped Dublin last evening during the hours of six and nine. It was denser in some streets than in others, and where this was the case it was impossible to pass with convenience without the aid of opened lanterns.<sup>175</sup>

In 1817 during the period between 16 May and 14 June, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ü-yang. During the period between 8 August and 8 November, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Ch'ang-ch'ing, Kuan-ch'êng and Po-hsing; Kiangsu (now Jiangsu province) on the east coast of *China* at Soochow; Hopei province at

Ting, Ku-an, Wu-ch'iang, Pao-ting, Wu-chi, Kuang-tsung and Cho; and Chu-wan [uncertain name and province].<sup>153</sup>

In 1817 during the period between 13 August and 10 September, floods struck Hupeh (now Hubei province) in central *China* at I-ch'êng and Ku-ch'êng; and Ying-wu [uncertain name and uncertain province].<sup>153</sup>

**Winter of 1817 / 1818 A.D.** Miss Ellen D. Larned described the New England winter of 1817-18 at Thompson, Connecticut in the *United States* — No snow of any perceptible amount until 21 December 1817; violent northerly snowstorm, but not much snow; very cold. On 10 January 1818 - first sleighing of the winter; about 4 inches of snow fell; very good sleighing for so little snow; snowed sharp for a few hours; sleighing continued until March 2. March 28<sup>th</sup> - much of a snowstorm: good sleighing for several days.<sup>116</sup>

During the winter of 1817-18, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 108 days. This winter was long and intensely cold. On 3 March 1818, the ice moved in a body downstream for some distance and then was blocked. The river was not completely clear until March 25<sup>th</sup>.<sup>202</sup>

**1818 A.D.** On the night of 12 January 1818, a most severe gale struck Edinburgh, *Scotland*. It began to blow about 10 o'clock from the southwest, accompanied by heavy rain, and continued to increase during the night until it became a perfect hurricane.<sup>175</sup>

On 15 January 1818 the barometer fell 8/10<sup>th</sup> of an inch in Edinburgh, *Scotland*. It then blew very hard, and during the whole course of the day slates and chimney pots were flying about in all directions. In the evening the gale increased, and about 5 o'clock it blew a perfect hurricane. In houses fronting the west a good deal of mischief was done in breaking the panes of glass, stripping the lead from the roof, dashing the cupola windows from their frames, and shivering them to atoms. In the course of the forenoon, two of the small minarets on the top of St. John's Chapel, at the west end of Prince's Street, gave way, and fell without doing any material damage to that beautiful building. Not so, however, the effects of the evening—the violence of the wind carried off the whole of the minarets, large and small, leaving the summit of the tower a perfect ruin. Such was the force of the wind, that the masses of masonry were carried 30 feet beyond the base of the tower, penetrating not only the roof of the church, but also the floor, and breaking through the vaults to the foundation. One of the solid bars or bats of copper by which one of the pinnacles was bound to the top of the tower, was above an inch broad, and 5/6<sup>th</sup> of an inch thick; and though the pinnacle to which it belongs was only six feet high, with a medium breadth of about eight inches, so as to expose a surface of merely four square feet, yet such was the power of the wind, that it tore the copper bar from its place, and twisted one of its arms, which was eight inches long, through an arch of 90 degrees, as if it had been a slender piece of lead. This effect resembles more that which is sometimes produced by lightning than by any other agent.<sup>175</sup>

On 15 January 1818, a violent storm struck Hamburg, *Germany*, accompanied by hail and rain. The Elbe River rose so high, that all the lower parts of the town were inundated, and the streets could only be passed in boats. Much damage was sustained, and melancholy accounts were expected from sea. About this timeframe, another account indicated the storms struck the northern parts of the Continent [Europe]. At Adensee, Stettin [now Szczecin, *Poland*], Königsberg [Königsberg, Bavaria, *Germany*], etc. much damage was sustained. About this timeframe, another report stated the Eden, Petterill and Caldew rivers in *England* were much swollen by mountain torrents.<sup>175</sup>

A hurricane struck the island of *Mauritius* in the Indian Ocean from 28 February to 1 March 1818. Every ship in Port Louis, Mauritius was cast ashore on the island except for the ship *Jason*.<sup>198</sup>

On 1 March 1818, a severe hurricane struck Marseilles, *France*; upwards of forty sail of ships driven onshore, and the fruits of the earth were destroyed.<sup>128</sup>

On 4 March 1818, a destructive hurricane took place in London and throughout *England*. Scarcely a county escaped considerable damage, and numerous vessels wrecked or sunk round the coasts. The wind blew from the south to the southwest and ravages continued from eight in the evening till after midnight, accompanied by much lightning. The tempest also extended to various parts of *Europe*.<sup>128</sup>

On 4 March 1818, a tremendous hurricane throughout *England*, which did considerable damage to the shipping at the ports.<sup>43</sup>

On 4 March 1818, a storm was felt over the whole of South Britain, and caused much damage and loss of lives both at sea and land. The storm caused considerable damage in various parts of London, *England*. It caused considerable damage to the shipping at Great Yarmouth. Deal reported that several vessels in the Downs suffered. It caused the highest spring tides at Portsmouth ever remembered. The greater part of the pier and several houses were demolished by the storm at Ryde. Much damage was sustained in Leicester. The storm was also felt in Plymouth, Hull, Milford, Penzance, Dartmouth, and Exmouth.<sup>175</sup>

On 7 April 1818, there was a storm in *Sweden*, which threw down several churches, many houses and greatly injured the forests.<sup>128</sup>

On 26 April 1818 in *England*, there was a great hailstorm in Bedfordshire and Middlesex.<sup>93</sup>

On 26 April 1818, a tornado struck in the county of Middlesex, *England*. It uprooted trees, unroofed houses, threw down walls, and in short removed everything that impeded its progress. Another report stated that a tremendous storm of hail and rain accompanied by thunder and lightning struck Hampstead. The effects were severely felt at Hendon and the adjacent villages. Upwards of twelve large trees were blown down at Hendon. Then the storm struck Dunstable, Redburn and Market-street, where hailstones were so large as to break the church windows.<sup>175</sup>

About the end of April 1818, parties were still making their way to Stockholm, *Sweden* in sledges [a carriage mounted upon runners instead of wheels, and generally used for travelling over snow or ice]. In St. Petersburg, *Russia*, the people were walking and driving carriages on the ice over the Neva River. Then a few days later, they were complaining of the heat at Vienna, *Austria*.<sup>175</sup>

On 8 May 1818, there was a dense rain, which continued for 24 hours that flooded all the lower parts of the kingdom [*Great Britain*].<sup>128</sup>

A dreadful hailstorm struck *France* sometime prior to 16 May 1818. It ravaged Saone and Loire. The hailstones were as large as pullet's eggs. The game was everywhere found dead in the fields; and several persons were severely wounded by the hail. In one vineyard alone, between Orleans and Beaugency, the damage done by the storm was estimated at 4,000 pipes [420,000 gallons] of wine.<sup>175</sup>

From February to June of 1818, a number of ships travelling between New York City and England in the *Atlantic Ocean* reported many icebergs. Some of these islands of ice were up to 400 feet high and some were  $\frac{3}{4}$  miles in length. These icebergs traveled as far south as the West Indies; a very extensive one was observed in the neighborhood of the Bahamas.<sup>175</sup>

In *Ireland*, there were great floods; waterspout in Clare.<sup>47, 92</sup>

On 19 July 1818 in *England*, there was a great hailstorm in Cumberland.<sup>93</sup>

The summer of 1818 in *Russia* was more remarkable than in the regions of *Central and Southern Europe*. In Odessa, Ukraine, people were swimming on 18 May. A botanist wrote to the Library in Geneva that it was an extraordinary natural phenomenon that brown and green tea bloomed in the garden of the Empress Dowager of *Russia* in Pawlowsk [Pavlovsk Palace in the now district of Pavlovsk in St. Petersburg]. In *Sweden, England, Germany* and *Belgium* a very large and annoying heat wave struck for several days. In *Denmark*, rye was harvested on 27 July. In all of *Germany* there was a very abundant grain harvest.<sup>62</sup>

On 27 July 1818 in *England*, there was a hailstorm in Norfolk.<sup>93</sup>

In *France*, up until May was a wet year but then suddenly turned into a drought. From north to south, the summer of 1818 became one of the driest that had been experienced. In Paris, on 7 September the Seine River was 5 centimeters (2 inches) above the lowest water level of 1719. The small rivers and the cisterns were almost all dry.<sup>62</sup>

The year 1818 remained moist and temperate until May 15. Dry heat and bright skies appeared immediately after, with a serene sky almost always during the remainder of spring, the three summer months and the first half of autumn. We had not seen in living memory, a longer series of beautiful days. In Paris, *France*, the peak temperature of 94.1° F (34.5° C) was observed on 24 July.<sup>79</sup>

In 1818 after cold and rainy winter, which caused general misery and had driven the cost of food to the utmost, so that a hectoliter of grain cost 36 francs; *France* received magnificent weather. These blessings of the seasons spread throughout all of *Europe*. The summer in Paris, *France* was characterized by:

Hot days	37 days
Very hot days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Mechelen, <i>Belgium</i>	( 99.5° F, 37.5° C) in July
Marseille, <i>France</i>	( 98.4° F, 36.9° C) on 7 July
Alais, <i>France</i>	( 97.7° F, 36.5° C) in August
Maastricht, <i>the Netherlands</i>	( 96.8° F, 36.0° C) on 25 July
Paris, <i>France</i>	( 94.1° F, 34.5° C) on 24 July
Avignon, <i>France</i>	( 93.2° F, 34.0° C) on 27 July
Strasbourg, <i>France</i>	( 92.8° F, 33.8° C)
Liège, <i>Belgium</i>	( 90.5° F, 32.5° C)
Moens, <i>France</i>	( 88.3° F, 31.3° C) on 24 July
London, <i>England</i>	( 80.1° F, 26.7° C) on 16 July

In 1818, in many parts of *England* and *France*, the trees blossomed twice or three times, and at Paris, the thermometer rose to 98° F.<sup>128</sup>

In *England* in August, great quantities of rain fell; harvest much delayed. Also on the continent.<sup>47</sup>

During the week before 8 August 1818, a tornado passed over the village of Howell, in Lincolnshire, *England*. It appeared like a body of smoke, was preceded by a small black cloud, passed very near the earth, and completely unroofed a low building, and tore the boughs from the trees as it passed, and carried them a considerable way. Coming in contact with a large ash tree, it split a piece from the trunk 12 feet long, and as thick as a man's body, carrying it at least 100 yards.<sup>175</sup>

On 3 September 1818, on this day the weather broke up after 108 hot and clear days, during which the thermometer averaged 65° F [in *England*].<sup>128</sup>

In September 1818, a hurricane struck Galveston, Texas in the *United States*. Women died from drowning, not killed by the roof cannon falling on them from the Red House of Jean Laffite [Lafitte].<sup>141</sup> [Jean Lafitte was a pirate that captured the largely uninhabited Galveston Island (Campeche) turning it into his base of operations. A hurricane in September covered almost all the island in water, killing several people and destroying four ships and most buildings. Only six homes were habitable afterwards. Around 1821 he was run out the city but only after burning the entire settlement to the ground. All that remains of Maison Rouge is the foundation, located at 1417 Avenue A near the Galveston wharf.]

In Burgundy, *France*, the grape harvest began on 24 September, 9 days earlier than average. But the drought affected the grapes in some regions. The wine was very abundant in Burgundy and of fairly good quality. But the Bordeaux wine was not good. The grain harvest was satisfactory.<sup>62</sup>

On 24 October 1818, a violent hurricane struck Madras [now Chennai, *India*]. The *Queen Charlotte* East Indiaman was lost and all her crew and the *Lady Castlereagh* and *Cornwall*, so much injured as to be condemned.<sup>128</sup>

In Stockholm, *Sweden*, it was reported in November 1818, that the uncommonly serene and mild autumnal weather still continues, and now supplies us in abundance of garden produce, of which we were deprived during the summer by the great drought. To be without fire in the stoves [for heating], and to have the meadows covered with verdure instead of snow, is a strange phenomenon here in the month of November.<sup>175</sup>

On 8-12 November 1818, a hurricane struck *Jamaica*. There were heavy loss of life on the ships and some loss of life on the island.<sup>141</sup>

On 18-20 November 1818, a hurricane struck *Jamaica*.<sup>124</sup>

In *England*, the autumn/early winter weather of 1818 was unusually warm. It was reported on 28 September that a single tree in the orchard at Newton, near Carlisle produced ten thousand apples. At Kensington, it was reported on November 12, an apple tree had produced a second full crop of apples that year. In Shugborough, it was reported on 1 December, that a thorn tree was in full blossom, and the whole tree presented a May-like appearance. In Berwickshire, it was reported on 2 December, a tulip tree was in full blossom, which is but the second time it was ever known to be in that state. The last time this tree was in blossom was in the year 1720, being 98 years ago. In Clapham Common, it was reported on 18 December, that green peas of full growth and flavor were gathered a day or two ago, and the haulm still remains in full bloom.<sup>175</sup>

In 1818, there was a hailstorm in Azamgarh in the state of Uttar Pradesh, *India*, which almost caused a general famine.<sup>181</sup>

---

**Winter of 1818 / 1819 A.D.** The Meuse River was frozen in December 1818.<sup>62</sup>

On 28 December 1818, for two or three days, the metropolis [London, *England*], as well as the country round was enveloped in a thick impenetrable fog, which obstructed all traveling, and caused a number of fatal accidents.<sup>128</sup>

The winter of 1818-19 was cold primarily in the month of December, with some violent days. In Madrid, *Spain*, the cold was very severe. In the northern countries of *Europe*, the winter was not unusual. The

Meuse River froze on 17 December, after which the frost only lasted six days. The coldest temperatures during the winter were:<sup>62</sup>

Maastricht, <i>the Netherlands</i>	( 13.5° F, -10.3° C) on 18 December 1818
<i>Ibid.</i>	( 14.0° F, -10.0° C) on 8 February 1819
Brussels, <i>Belgium</i>	( 13.8° F, -10.1° C)
Moens, <i>France</i>	( 16.2° F, -8.8° C) on 18 December 1818
Paris, <i>France</i>	( 20.5° F, -6.4° C) on 27 December 1818
<i>Ibid.</i>	( 20.7° F, -6.3° C) on 1 & 31 January 1819
Orange, <i>France</i>	( 23.9° F, -4.5° C) on 28 & 29 December 1818
London, <i>England</i>	( 24.1° F, -4.4° C) on 17 December 1818
Avignon, <i>France</i>	( 29.7° F, -1.3° C) on 7 January 1819
Hyères, <i>France</i>	( 32.0° F, 0.0° C) on 14 December 1818

St. Petersburg, *Russia* reported on 5 January 1819, that the weather there was most extraordinary for that climate. Currently they were experiencing a thaw, a circumstance not remembered in that region for that date by any person living. Great quantities of frozen meat were brought from the interior and were spoiling in the warm weather.<sup>175</sup>

During the winter of 1818-19, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 110 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1818-19 at Thompson, Connecticut in the *United States* — On 18 November 1818, snowed large and moist; no sleighing over most of the winter, save a few days after a violent storm of sleet and rain. On 25 February 1819, there was a succession of moderate snows. Snow on March 6, 8, and 9 made good sleighing. On March 16<sup>th</sup> - severe storm, coldest day of winter, excellent sleighing for a week.<sup>116</sup>

---

**1819 A.D.** In *Ireland*, great floods in the north.<sup>47, 92</sup>

In February and again in June 1819, there were major floods at Hawkesbury/Nepean Valley in New South Wales, *Australia*. Each time the water level was recorded at 46 feet (14.03 meters) above the water mark at Windsor.<sup>99, 109</sup>

On 28 March 1819, it was reported that the Isle of France [*Mauritius*] was laid waste by a severe hurricane, being the third within 13 months.<sup>128</sup>

In *England* in June, large tracts of land flooded in the Fen Country.<sup>47, 92</sup>

In June 1819 in *England*, an inundation caused 5,000 acres to be deluged in the Fen countries [Lincolnshire].<sup>90</sup>

On 4 July 1819 in *England*, there was a hailstorm in Yorkshire and Norfolk.<sup>93</sup>

On 7 July 1819 in central *France*, there was a terrific hailstorm in the arrondissement of Montargis. The storm destroyed all fruit and grain crops within 20 leagues [60 miles, 97 kilometers]. Two days afterwards hailstones were found which were the size of a fowl's egg. The damage was estimated at over 4 millions francs (£170,000). Other parts of France also experienced very destructive storms.<sup>93</sup>

On 10 July 1819, during a violent storm at Châteauneuf, *France*; the church was struck by lightning, by which the curate and nine persons were killed, and forty wounded.<sup>128</sup> [Châteauneuf is the Châteauneuf-du-Faou in Brittany in northwestern *France*.]

On 11 July 1819, lightning struck a church of Chateaufort-de-Moustiers [Châteaufort-lès-Moustiers, France] killing 9 persons and wounding 82.<sup>271</sup>

On 13 July 1819 in *England*, there was a severe hailstorm in the town of Dereham, in Norfolk. The storm struck between 2 and 4 P.M. There was great damage to crops, trees, gardens, and glass.<sup>93</sup>

In July 1819, the heat of the weather was so great at Vienna, *Austria*; Bagdad, *Iraq* and other places that several persons dropped down dead in the streets.<sup>128</sup>

On 24 July 1819, there were great thunderstorms in the northern counties of *England* and in *Scotland* as far as Glasgow. Several persons killed by lightning and many bridges destroyed.<sup>128</sup>

On 24 July 1819 in *England*, there was a hailstorm in Lincolnshire.<sup>93</sup>

On 26 July 1819 a powerful rainstorm struck Catskill, New York in the *United States*. During the height of the storm, approximately 12 inches of rain fell in 30 minutes. The section of country in which the rain descended with peculiar violence is estimated at 80 square miles. On a considerable part of this tract, there is reason to believe, that the total rainfall quantity exceeded eighteen inches during the storm. From the banks of a brook which crosses the turnpike road, about one quarter mile above the north end of Main street and empties into the creek, some thousands of tons of earth and stone and rocks in solid mass were washed out and deposited on the flats. Houses, blacksmith shop, a large distillery, a plaster mill, a bridge, a grist mill were destroyed by the raging creeks and streams. The water uprooted trees, formed deep ravines, created landslides. On the west side of Kaaterskill, a small creek became a raging river that eroded over a hundred thousand tons of earth and stone, leaving behind a deep ravine. Some of the rocks washed out weighed six to ten tons each. The damage done in the township exceeded fifty thousand dollars. [In present currency, that would be equivalent to \$740,000 in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>191</sup>

On 27-28 July 1819, a hurricane struck Louisiana, Mississippi and Alabama in the *United States* causing 43 deaths.<sup>141</sup>

On 17 August 1819, a whirlwind at Aldborough, Suffolk, *England*, carried up a quantity of barley from a field to a great height.<sup>128</sup>

On 25-28 August 1819, a great destructive hurricane struck Louisiana and Alabama in the *United States*.<sup>117</sup>

In September 1819 in *Ireland*, there were great thunder and hailstorm in County Kilkenny. There was extensive injury to potatoes and corn.<sup>93</sup>

On 21 and 22 September 1819, there was a destructive hurricane in the *West Indies*, which did considerable damage in the Leeward Islands.<sup>128</sup>

On 21-22 September 1819, a hurricane struck the Virgin Islands in the *Lesser Antilles*. Many, many lives were lost.<sup>141</sup>

From 20-22 September 1819, a dreadful hurricane ravaged the Leeward Islands [in the Lesser Antilles in the *West Indies*]. At the island of St. Thomas alone, 104 vessels were lost.<sup>57, 90</sup> [St. Thomas is in the Virgin Islands.]

In *India* in 1819, there was a great scarcity in the Allahabad and neighboring districts, under the following circumstances: “The rains set in late, but when they did come they appeared to have fallen in abundance. The land which had hitherto been so dried up by the heat that sowing had to be undertaken twice without any effect, became so drenched that a third sowing was not possible till the middle of September. In Bundelkhand [central India], the kharif [autumn harvest] of 1819 failed extensively, and frost nipped the spring crops in the beginning of 1820.”<sup>57</sup>

In 1819, there was a famine in the Northwest Provinces in *India* and Bundelcund [now the states of Uttar Pradesh and Madhya Pradesh].<sup>156</sup>

In 1819, there was a minor famine in Bundelkhand [now the states of Uttar Pradesh and Madhya Pradesh in central *India*], Nagpore [now Nagpur in central *India*] and the North-Western Provinces of *India*.<sup>179</sup>

In 1819, there was a famine in Kandeish [now Khandesh, *India*].<sup>182</sup>

The summer of 1819 produced heat greater than 98.6° F (37° C) in Provence, *France*. The duration of the heat was sustained and extended into autumn.<sup>79</sup>

The year 1819 produced heavy rainfalls and a greater number of rainy days in southern *France*.<sup>79</sup>

In 1819, three rainbows were seen distinctly in Boston, in the *United States*.<sup>128</sup>

In 1819, a shower of red and rose colored snow fell in Carniola [now Kranjska, *Slovenia*], and the neighboring counties. The red matter consisted of silex [pure form of silica or silicate], alumina, and oxide of iron.<sup>128</sup>

In 1819 during the period between 24 April and 25 May, floods struck Shantung (now Shandong province) on the east coast of *China* at Huang and Hopei (now Hebei province) in northern *China* at Luan and T'ang-shan. At Huang, the houses were damaged by the floodwaters and many people drowned. Then during the period between 22 July and 20 August, a drought engulfed Kweichow (now Guizhou province) in southwestern *China* at Kweiyang and Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou and Ch'ung-tê. During the period between 19 September and 18 October, a drought engulfed Hupeh (now Hubei province) in central *China* at Ying-shan and Ma-ch'êng. During the period between 19 October and 17 November, a drought engulfed Hupeh province at Huang-p'o.<sup>153</sup>

---

**Winter of 1819 / 1820 A.D.** In November 1819, a black rain and snow fell at Montreal, *Canada* and the northern part of the *United States*. This fall was accompanied by an extraordinary darkening of the sky, shocks similar to those felt during an earthquake, detonations, and very powerful flashes of lightning. It was thought that the origin was a meteor bolide impact.<sup>205</sup>

At Thompson, Connecticut in the *United States*, the first significant snowstorm of the season in 1819 occurred on 29 November. Last night we had considerable snow.<sup>116</sup>

During the winter of 1819-20, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 102 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1819-20 at Thompson, Connecticut in the *United States* — On 25 October 1819 - snowed all night. November 28<sup>th</sup> - snowed all night and the next day, but no sleighing. December 30<sup>th</sup> - a cold, tedious snowstorm, wind very high. December 31<sup>st</sup> - high cold wind, snow blew violently, poor sleighing. On 11 January 1820 - a violent snowstorm. January 17<sup>th</sup> - most violent snowstorm with very high winds. January 22<sup>nd</sup> - snowed in the morning, which improved

sleighting. February 9<sup>th</sup> - most violent storm all day; no stirring about; greatest fall of snow this winter, roads all blocked up. February 10<sup>th</sup> - heavy fall of snow in the night. February 11<sup>th</sup> - snows in the morning; blows hard; roads all filled up. February 12<sup>th</sup> - all hands breaking roads: a thaw follows, but not sufficient to mar the sleighting. March 4<sup>th</sup> - pretty good sleighting. March 8<sup>th</sup> - snow, hail, and rain violent all day. March 9<sup>th</sup> - rain continues. March 10<sup>th</sup> - trees very heavily laden, snow slips off without much damage. March 12<sup>th</sup> - cold and clear, roads were frozen, and crust was thick enough to bear the weight of horses, sleighs, and teams. March 16<sup>th</sup> - good sleighting. March 17<sup>th</sup> - snows prettily. March 19<sup>th</sup> - snow falls, almost all gone.<sup>116</sup>

The Seine River in Paris, *France* froze from 12 to 19 January 1820 in all its breadth. Only the small arm of the river at Hôtel-Dieu was not frozen. On 13 January, individuals traveled on foot on the ice. Several rivers, among others, the Garonne, the Gard and the Rhône also iced in the south. In *Denmark*, individuals traveled on the ice from Aarøe to Funen Island, and from Thorseng in Svendborg and Langeland island.<sup>62</sup>

The winter of 1820 was nowhere in *France* neither long nor supported. An unusual heat and drought preceded this winter. The winter began with small frost, followed suddenly with a very violent cold from January 7 to 9. The coldest days occurred from 11 to 12 January. The observed low temperature in Paris was 6.3° F (-14.3° C); in Toulouse 7.2° F (-13.8° C); in Viviers 10.4° F (-12° C); in Alais 10° F (-12.2° C); in Montpellier 11.8° F (-11.2° C); in Joyeuse -5° F (-15° C); in Bordeaux 16.2° F (-8.8° C). The cold was more intense in the southern and northern *France*. But mainly the winter displayed its rigor in Provence where the thermometer went down to 3.9° F (-15.6° C), and Marseille in particular, where it dropped down to 0.5° F (-17.5° C). This harsh frost lasted little more than eight or ten days. A real thaw has generally underway by January 18<sup>th</sup>. The cold winter killed all the orange [trees] and damaged the vineyards and olive groves.<sup>79</sup>

The winter of 1819-20 in Europe was cold and extremely violent. But the extreme severity did not last long. In Paris, *France*, there were 47 frost days; including 19 consecutive from 30 December 1819 to 17 January 1820. The lowest temperature in Paris occurred on 11 January at ( 6.3° F, -14.3° C). From 12 to 19 January, the Seine River was frozen. The Saône, the Rhône, the Rhine, the Danube, the Garonne, and the Thames rivers, and the lagoons of Venice, and the Sound were frozen to the thickness that individuals could cross them on the ice. The lowest temperatures observed in different cities were:<sup>62, 70</sup>

St. Petersburg, <i>Russia</i>	(-25.6° F, -32.0° C) on 18 January
Berlin, <i>Germany</i>	(-11.9° F, -24.4° C) on 10 January
Maastricht, <i>the Netherlands</i>	( 11.1° F, -11.6° C) on 8 December
<i>Ibid.</i>	( -2.7° F, -19.3° C) on 10 January
Strasbourg, <i>France</i>	( -1.8° F, -18.8° C) on 15 January
Commercy, <i>France</i>	( -1.8° F, -18.8° C) on 12 January
Mechelen, <i>Belgium</i>	( -0.6° F, -18.1° C) in January
La Chapelle, <i>France</i>	( 0.1° F, -17.7° C) on 15 January
Marseille, <i>France</i>	( 0.5° F, -17.5° C) on 12 January
Metz, <i>France</i>	( 2.7° F, -16.3° C) on 10 January
Moens, <i>France</i>	( 3.9° F, -15.6° C) on 11 and 15 January
Riez, <i>France</i>	( 5.0° F, -15.0° C) on 12 January
Joyeuse, <i>France</i>	( 5.0° F, -15.0° C) on 11 January
Paris, <i>France</i>	( 6.3° F, -14.3° C) on 11 January
Toulouse, <i>France</i>	( 7.2° F, -13.8° C) on 11 January
Orange, <i>France</i>	( 8.6° F, -13.0° C) on 11 January
Alais, <i>France</i>	( 9.9° F, -12.3° C) on 12 January
Piemont, <i>Italy</i>	(10.4° F, -12.0° C)
Hyères, <i>France</i>	(10.6° F, -11.9° C) on 11 January
Vence, <i>France</i>	(11.7° F, -11.3° C) on 11 January
Avignon, <i>France</i>	(11.7° F, -11.3° C) on 11 January

Montpellier, <i>France</i>	( 12.2° F, -11.0° C ) on 12 January
London, <i>England</i>	( 18.0° F, -7.8° C ) on 11 December 1819
<i>Ibid.</i>	( 19.0° F, -7.2° C ) on 5 January 1820

The effects of cold [in *Europe*] were terrible, partly due to the intensity of the cold, partly because of the spring thaw, which brought large masses of ice and accumulated snow melts that happened too quickly.<sup>62</sup>

In *Sweden* they rarely experienced a more severe cold and had never seen this amount of considerable snowfall. In *Denmark*, the sea was frozen completely around the island of Funen in such a way that one could travel from Arrøe to Funen, and from Svendborg, *Denmark* to Thorseng in Funen and to Langeland island on the ice. A woman with her babies was found frozen on the way from Randers to Aarhus in *Denmark*. Since the *Sound* was frozen between the coasts of *Sweden* and *Denmark*, the area became a very vibrant marketplace to those with sleds. At St. Petersburg, *Russia* it was reported that in one night, a large number of sentries, they say 170, were found frozen to death. In several districts of this city, wolves driven by hunger entered.<sup>62</sup>

In *Germany*, the cold was also severe. In Berlin, several sentries were found frozen to death along with many travelers on the road. The ice of the Danube River in the area around Vienna, *Austria* caused great devastation. Wolves broke into the city Bucharest, *Romania*.<sup>62</sup>

In Holland [now *the Netherlands*], the melting ice of the Meuse, the Rhine, and the Waal rivers overflowed their banks and produced large floods. In *Belgium*, at the entrance of the Scheldt River, the river during spring thaw for two days carried drifting debris of all kinds, including animals and human corpses.<sup>62</sup>

In *England*, the intensity of the cold was so great that any communication with Deptford, Woolwich and at other stations of the River Thames and vessels at anchor became almost impossible. Only with great effort and work was it possible to resupply the ships at anchor. But when the ice thickness had reached nearly two meters (6.6 feet) the river at Deptford and in other places became a marketplace. The effects of the cold above the bridges of London, Lambeth and further upstream one could see pieces of ice 4 meters (13 feet) thick. Below the bridge of the River Thames with Kew, the ice thickness reached 0.5 meters (1.6 feet). The ice caused major accidents and more than 400 ships were damaged and swept downstream.<sup>62</sup> [Deptford and Woolwich are now part of London.]

In *France*, the severe winter cold was first announced by the arrival of a great many of the northernmost birds, swans and wild ducks of various plumage off the coast at the Strait of Calais. The severity of the cold caused several people to freeze to death: a man at the Pas-de-Calais; a gamekeeper at Nogent; a woman and a man in Cote d'Or; two travelers on the road from Breuil; a woman and a child on the road from Etain to Verdun; six people near Château-Salins; two little Savoyards on the road from Clermont to Chalons-sur-Saone. At the artillery school at Metz, several soldiers suffered frozen hands or ears. The wine froze in many basements. The Gardon River was frozen to the thickness that mules traveled over the river on the ice. The ice conditions of the Seine caused serious accidents. In Paris between the bridges Pont d'Austerlitz and the Pont d'Iéna, 25 vessels were destroyed. The Promenade de la Grève and Onnes were flooded. A dike was breached on the Robec River and carried away a bridge pillar to Rouen. The ice conditions of the Saône River destroyed many vessels and put the suburb Borstadt Vaise at Lyons underwater.<sup>62, 70</sup> [Cote d'Or is located in eastern *France*. Etain and Verdun are both located in northeastern *France*. Château-Salins is in northeastern *France*. Clermont is in central *France*. Chalons-sur-Saone is in southeastern *France*. Metz is located in northeastern *France*. The Gardon River is in southern *France*. The Robec River is in Normandy in northern *France*.]

*Italy* was struck by the cold winter to the same degree of frost and ice. Venice was trapped by the ice for several days. The sea froze so thick that individuals could travel across the ice from the city to the mainland. Rome was covered with snow for three days. The Arno River was partly frozen. When the Tiber River thawed, it overflowed its banks.<sup>62</sup>

In Provence, a large portion of the olive trees was damaged. All the orange trees of Hyeres and Nice, *France*, had to be cut to the ground, and since the year 1787 they had not suffered so much damage.<sup>62</sup>

The strong frosts in Gard in southern *France* had the following effect: "The holly oak trees were scorched, and the fig trees, we had held collectively for dead, drifted back with more than half of the main branches, and some suggested the root. Many laurels, myrtles, all of our gardens, and several other shrubs were destroyed. On 10 January, a large number of mulberry trees burst from the strain and crashed to its full length. We noticed that 4 to 10 millimeter (0.16 to 0.40 inches) wide cracks were all on the south side, no doubt because the wood was loose and the sap was more abundant than on the north side; and when the sap froze the fibers tore. The youngest trees had probably more elasticity, and the old trees more strength. The trees most affected by the frost were 10 to 30 years old. The cracks remained open until the thaw and then completely closed again. The scarred bark and the trees lived on. The biggest disaster that the severe cold induced in January was the loss of our olive trees. However, it appears that the greater part of the old trees will again turn out, but more than half of young trees, and in some places all that have been planted since the past one or two years are dead." The [grape] vines were damaged in the neighborhood of Manosque in southeastern *France*, and on the banks of the Durance River and around Bordeaux.<sup>62</sup>

On 5 January 1820, there was a hurricane in Newfoundland, *Canada*.<sup>128</sup>

On 6 January 1820, there was an intense frost at Glasgow, *Scotland*.<sup>128</sup>

On 14 January 1820, the thermometer fell to 14° F (18° F below the freezing point) in London, *England*. Then on 15 January, the thermometer fell to 9° F (-12.8° C). On 17 January, shipping damaged by ice on the River Thames. The tides were very high and flowed an hour beyond stated times.<sup>128</sup>

---

**1820 A.D.** In *India* during 1820-22, there was a famine in Upper Sind [Sindh, now *Pakistan*] and neighboring provinces, cause only partially by drought. "In 1819 there was a failure of crops in Ahmedabad, caused by unseasonable weather after the monsoon; whilst in Sawunt Warru it was occasioned by a sudden and unusual fall of rain, accompanied by a terrific storm – the former destroying the ground crops, and the latter the bagayut [orchard] produce."<sup>57</sup>

In 1820-22, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

In 1820, there was a famine in southern *India*.<sup>182</sup>

During the famine in *India* in 1820, frost caused considerable damage in Bundelkhand [now the states of Uttar Pradesh and Madhya Pradesh in central *India*].<sup>179</sup>

On 7 July 1820 a powerful storm struck *France*, when ten communes in Montargis were laid desolate, and everything destroyed for the space of 20 leagues (60 miles, 97 kilometers). The damage was estimated at 170,000*l.* sterling.<sup>43</sup>

On 30 July 1820 in *England*, there was a great hailstorm in Essex.<sup>93</sup>

On 31 July 1820 in *England*, there was a hailstorm in Norfolk, Suffolk, Shropshire, and Sussex.<sup>93</sup>

On 20 September 1820, a destructive gale was reported in the *West Indies*.<sup>128</sup>

In 1820, the Hunter River in New South Wales, *Australia*, flooded and the river reached a height of 37 feet above the high water mark.<sup>103</sup>

In 1820, a drought engulfed many regions of *China* including:<sup>153</sup>

- During the period between 14 March and 6 September, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hsin-têng [uncertain name, “Hsin-ch’êng”].
- During the period between 11 June and 9 July, a severe drought engulfed Hupeh (now Hubei province) in central *China* at Huang-mei.
- During the period between 7 September and 6 October, a drought engulfed Chekiang province at Ch’êng, Li-shui, Chin-yün, Chin-hua and Ch’ang-shan; Kiangsi (now Jiangxi province) in southern *China* at Nan-ch’ang, Yung-hsiu, Ch’ing-chiang, Kan and I-ch’un; Hupeh province at Ao-ch’êng, Hsien-ning and Ch’ung-yang.

In 1820, several regions of *China* experienced flooding including:<sup>153</sup>

- Chahar province (now eastern *Inner Mongolia*) at Hsüan-hua, Wan-ch’üan, Huai-an, Yang-yüan, Huai-lai and Cho-lu.
- Hopei (now Hebei province) in northern *China* at Ning-chin, Ning-ho, Pao-ti, Wên-an, An-tz’ü, Cho, Kao-yang, An-hsin, Ching-hai, Ts’ang, Ta-ming, Nan-yüeh, Ch’ang-yüan, Hsin-ho and Fêng-jun.
- Pu-shan. [uncertain name and uncertain province]
- During the period between 10 July and 8 August, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui.

**Winter of 1820 / 1821 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1820 occurred on 12 November. Snowed in the night and all day; a right winter-cold snowstorm about 8 inches on the level and very solid; hard sleighing; good sledding for a week.<sup>116</sup>

Miss Ellen D. Larned described the New England winter of 1820-21 at Thompson, Connecticut in the *United States* — On Sunday 12 November 1820 - snows in the night and all day; a right wintry, cold storm; no meeting; snow about 8 inches or more on the level. November 13<sup>th</sup> - very cold, snowy morning, some rain or sleet, cleared off at noon, hard sleighing. November 14<sup>th</sup> - break into the woods with sled and haul two loads of wood; sleighing and sledding continued through the week. This November snowstorm of 1820 was handed down to posterity as exceeding in severity anything ever before experienced by the oldest inhabitant so early in the season, and it is believed that the record in this vicinity, at least, remains unbroken. On 7 January 1821 - a terrible, cold snowstorm; first sleighing of the new year. January 14<sup>th</sup> - very high, rough storm of snow. January 22<sup>nd</sup> - snows about 4 inches in the night. February 6<sup>th</sup> - sleighing gone. February 15<sup>th</sup> - snows again; pretty good sleighing, continuing some days.<sup>116</sup>

During the winter of 1820-21, the Hudson River between New York and Powles’ Hook [now called Paulus Hook, Jersey City, New Jersey] in the *United States* was frozen and was crossed on the ice. [Manhattan, New York is located 1 mile across the Hudson River from Powles’ Hook. “Crossed on the ice” generally means the ice was sufficiently thick to allow foot and wagon traffic.] [This is only one of four winters when the Hudson River was completely frozen over during the century from 1740-1840. The other winters were 1740-41, 1764-65, and 1779-80.] During this winter, the Hudson River at Albany, New York was closed to river traffic because it was frozen or obstructed by ice for 123 days.<sup>202</sup>

January 1821 was one of the coldest in the *United States*. On nine mornings at sunrise, the mercury was below 0° F (-18° C) in Philadelphia and vicinity (the coldest temperature on two mornings was -10° F (-23° C)). The following are the lowest temperatures observed in different cities: <sup>1</sup>

Brunswick, Maine	( -39° F, -39° C)
<i>Canada</i>	( -38° F, -39° C)
Concord, New Hampshire	( -37° F, -38° C)
Bangor, Maine	( -34° F, -37° C)
Gardner, Maine	( -33° F, -36° C)
Exeter, New Hampshire	( -32° F, -36° C)
Lowell, Massachusetts	( -29° F, -34° C)
Vermont	( -23° F, -31° C)
Salem, Massachusetts	( -20° F, -29° C)
Newburyport, Massachusetts	( -20° F, -29° C)
Boston, Massachusetts	( -17° F, -27° C)
Buffalo, New York	( -16° F, -27° C)
New Haven, Connecticut	( -15° F, -26° C)
Hartford, Connecticut	( -15° F, -26° C)
Saratoga, New York	( -15° F, -26° C)
Albany, New York	( -14° F, -26° C)
Long Island, New York	( -13° F, -25° C)
New York City, New York	( -7° F, -22° C)

In the *United States* at Brunswick, the mercury became stiff in the bulb. The North river, leading from New York to Albany, was so firmly frozen, as to be passable on the ice from one city to the other, 160 miles, and for several days the Hudson was crossed from New York to Jersey City on the ice, by numerous persons. But three other instances of this kind have occurred during the last century – in 1741, 1765 and 1780. The sleighing was said to be good from Buffalo to the extreme part of the State of Maine; and from St. John's, New Brunswick, through Canada to Michigan, and from Michigan, a thousand miles to the west. Every harbor was ice-bound from Alexandria, Virginia to Eastport, Maine, except for the harbor of Portsmouth, New Hampshire.<sup>1</sup>

In the *United States* in Virginia, on 26 January 1821, the river from Norfolk to Portsmouth, and down to the bite of Craney Island was completely frozen.<sup>38</sup>

In the *United States*, a Great January Coastal Storm brought rain and sleet to Charleston, South Carolina on 6-7 January 1821, which became snow over eastern Virginia. Washington D.C. received 12-18 inches (30-46 centimeters) of snow. Snow piled up to 18 inches (46 centimeters) in Philadelphia, Pennsylvania.<sup>27</sup>

During the winter of 1820-21, the Seine River in Paris, *France* was frozen beginning on 31 December 1820. On 7 January 1821, the ice conditions were met. The Rhine River in *Germany* was also frozen and on the 3<sup>rd</sup> of January, wagons rode on the ice.<sup>62</sup>

The winter of 1820-21 was only severe in northern *France* and in *Germany*. Paris, *France*, experienced 54 frost days, including 15 that were consecutive. The Seine River froze beginning 31 December 1820. The Rhine River also froze, and on 3 January near *Düsseldorf*, Germany a coach crossed the river on the ice. The coldest temperatures this winter occurred during the period from 31 December to 3 January. The coldest temperatures observed were: <sup>62</sup>

Mechelen, <i>Belgium</i>	( 5.0° F, -15.0° C) in January
La Chapelle (near Dieppe), <i>France</i>	( 7.2° F, -13.8° C) on 1 January
Paris, <i>France</i>	( 8.6° F, -13.0° C) on 31 December
Maastricht, <i>the Netherlands</i>	( 10.4° F, -12.0° C) on 1 January
Moens, <i>France</i>	( 16.2° F, -8.8° C) on 1 & 2 January

Orange, *France*

( 23.0° F, -5.0° C) on 2 January

**1821 A.D.** In *England*, disastrous rains and floods.<sup>47, 92</sup>

The year 1821 was a dry year in southern *France*. In Toulouse, for example, there were 5.7 inches (144 millimeters) less rainfall and 16 less rainy days than in the average year.<sup>79</sup>

On 30 June 1821, there was a great whirlwind [tornado] at Northfield, Massachusetts in the *United States*. Also on 9 September 1821, other tornadoes struck in New Hampshire and Massachusetts. [From Perley "Historic Storms of New England", Salem, 1891]<sup>138</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Maskat, <i>Oman</i>	(122.0° F, 50.0° C) in June
Honolulu, <i>Hawaii</i>	( 87.1° F, 30.6° C) in September

In *Ireland* during August and September, there were serious floods and rains throughout the west; not only was hay and grain washed away, but also the potatoes were swept up out of the ground. During October, there were heavy rains and floods. And in November, incessant rains and floods; River Shannon rose greatly. Also floods in Dublin.<sup>47, 92</sup>

On 1-3 September 1821, a hurricane struck Guadeloupe in the *Lesser Antilles* and the northeast coast of the *United States* causing more than 200 deaths.<sup>141</sup>

A small but extremely violent hurricane was first encountered off *Turk's Island* in 1 September 1821. It traveled to the north of *the Bahamas* on the 2<sup>nd</sup>, to the coast of the Carolinas in the *United States* early in the morning of the 3<sup>rd</sup>; and then during the course of the day, along the sea coast to New York and Long Island; and then continued its course across the states of Connecticut, Massachusetts, New Hampshire, and Maine. It traveled approximately 1,800 miles in 60 hours.<sup>228</sup>

On 9 September 1821, a hurricane struck St. Kitts in the *West Indies*.<sup>144</sup>

On 9 September 1821, several tornados struck the *United States*. One strong tornado struck New Hampshire and the other struck Massachusetts. It was thought that these tornados originated at Lake Champlain. There was also a tornado spotted at Berlin, Vermont. One tornado entered New Hampshire at Cornish. It then passed east of the Grantham Mountain in Croydon, then over Sunapee, Sunapee Lake, New London, Sutton, the west branch of the Kearsarge Mountain, Warner, Salisbury, and Boscawen. In places this tornado was a half-mile [0.8 kilometers] wide. At New London, the tornado split a large rock in two. The rock was 100 feet long, 50 feet wide, and 20 feet high [30 by 15 by 6 meters]. At Sutton, trees were stripped of their bark and limbs. The second tornado crossed the Connecticut River where Vermont, New Hampshire and Massachusetts meet, and then in Massachusetts over the towns of Northfield, Warwick, Orange, Royalston, Winchendon, Ashburnham and Fitchburg. This tornado was up to 120 rods [3/8 mile, 0.6 kilometer] wide in places. At least 5 people were killed outright in New Hampshire and at least 3 in Massachusetts and many injured including at least one mortally. The tornado destroyed houses, barns, buildings, a tavern, a blacksmith shop, forests and orchards, crops and a bridge and killed many domestic animals.<sup>199</sup>

On 15 September 1821, a hurricane struck Mississippi in the *United States* causing 35 deaths.<sup>141</sup>

On 17 September 1821, a powerful tornado struck New Hampshire in the *United States*. Most of the damage extended from Croydon, Wendell, New London, Sutton and Warner. The violent storm killed or injured many people, destroyed houses, barns, trees and fences. The wind was able to overturn stones

buried in the earth. It moved a 500-pound stone several feet. A 60-foot hemlock log which was half buried in the earth was carried 6 rods [99 feet, 30 meters] forward while a knot from the same log was carried 15 paces back and driven with great force two feet under the turf. Trees were stripped of bark.<sup>191</sup>

In New South Wales, *Australia*, there was a drought from September 1821 to February 1822.<sup>103</sup>

On November 1821 a great storm struck along the coast from Durham to Cornwall in *England*. Many vessels were lost.<sup>57, 90</sup>

In 1821, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 2 April and 1 May, floods struck Hopei (now Hebei province) in northern *China* at Ning-chin.

— During the period between 31 May and 28 June, floods struck Hupeh (now Hubei province) in central *China* at Pao-k'ang and Sui; and Shantung (now Shandong province) on the east coast of *China* at Chi-mo and Po-hsing

— During the period between 8 August and 8 November, floods struck Shantung province at Hui-min, Tsinan, Shang-ho and Chan-hua; and Hupeh province at Ch'ien-chiang and Pao-k'ang [possible misprint, Jên-k'ang].

In 1821 during the period between 8 August and 8 November, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Huang-yen and Lung-ch'üan.<sup>153</sup>

---

**Winter of 1821 / 1822 A.D.** The winter of 1822 was mild throughout *Europe*. In St. Petersburg, *Russia*, the winters usually last for four consecutive months and are very severe, and to a lesser degree for two additional months. So generally the winters last at least six months. But this winter was comprised of only a month and a few days. The first accumulating snows fell on Christmas day, and generally disappeared in the first days of February. Since then the temperatures were very mild. The overcast sky was often rainy; it snowed from time to time a little; and some cheerful days were interspersed with violent storms from the southwest. The rain-swollen rivers brought the water levels up in the channels; and threatened the deeper parts of the city with the greatest danger from flooding. In Siberia, where winter is generally very severe, this year was weak. And from Tobolsk in west-central *Russia* and points further north; warm winds prevailed. There was an absence of snow everywhere. From Berezov (Beryozovo) in north-central *Russia* to one of the northernmost towns in our areas, it was raining heavily on 8 December; the elderly residents had never seen anything like it.<sup>62</sup>

In different parts of the *Russian Empire*, the temperature was anomalous. At the end of November 1821 new violets were picked from the ground in Riga, *Latvia*. By 10 December, the cold still had not been felt in *Poland*, *Central Russia* and Moscow. But the continuous rains made the roads impassable because of the bottomless mud. The winter did not begin in St. Petersburg until 4 December. On that day the thermometer fell to 9.5° F (-12.5° C). Towards the end of the month, the temperatures were 39.2° to 46.4° F (4.0° to 8.0° C).<sup>62</sup>

In *England*, violets and primroses were sold in the streets of London in mid-December. There followed a long period of rain, but on Christmas the weather was wonderful. In *Ireland*, the potato crop was damaged by the abundant rainfall this winter.<sup>62</sup>

Major storms reigned in *France* in 1821. On the night of December 21, 1821 was marked in the Alps to the Pyrenees and from the Mediterranean Sea to the Atlantic Ocean by storms, torrents of rain, hail, lightning and thunder. All meteorological instruments documented the disruption. The barometer was down tremendously especially in Paris, Dieppe, Toulouse, Montpellier.<sup>79</sup>

On the night of 21 December 1821 there was a great atmospheric disturbance. In Toulouse, *France* the barometer fell to 719 millimeters and in Montpellier it fell to 721 millimeters.<sup>79</sup>

In the south of *France*, *Italy* and *Spain*, the temperature was very mild with only one occurrence of cold weather combined with strong winds at the beginning of the season. A hurricane struck on 5 November and then the winter weather disappeared. As a result, several trees were in bloom and others produced new fruits. By the end of December, the water level had raised in the lagoons by over 1 meter (3.3 feet).<sup>62</sup>

Southern *France* experienced a very harsh winter in 1821-22. The winter destroyed a large quantity of olives trees.<sup>79</sup>

In Paris, *France* there wasn't a single day of cold to the end of 1821. In December, the mean temperature for the month was 45.5° F (+7.5° C). The highest 55.4° F (+13.0° C) occurred on 3 December, and the coldest 35.2° F (+1.8° C) on 7 December. In January there were five days of frost. The mean temperature for the month of January was 39.9° F (+4.4° C). The highest temperature 48.9° F (+9.4° C) occurred on 25 January and the lowest 25.7° F (-3.5° C) on 7 January. In January, the sky was generally overcast. In February there were three days of frost. The mean temperature for February was 43.0° F (+6.1° C). The highest temperature of 53.6° F (+12.0° C) occurred on 8 February and the lowest 25.2° F (-3.8° C) on 1 February. In February the sky was overcast, but less than in January. In March there was only one day of frost. The mean temperature for March was 49.8° F (+9.9° C). The highest temperature of 71.2° F (+21.8° C) occurred on 28 March and the lowest 29.3° F (-1.5° C) on 1 March. The mean temperature for the month of April was 52.0° F (+11.1° C). The highest temperature was 73.9° F (+23.3° C) on 15 April and the lowest 34.3° F (+1.3° C) on 3 April.<sup>62</sup>

On 25 January 1822, M. de Thielau who was going to Freyberg [Freyburg, *Germany*?] during a great downfall of snow observed that the ends of the branches of all the trees had slightly colored blue lights emanating from the tips [St. Elmo's Fire].<sup>271</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1821 occurred on 30 November. Snowed all day and night.<sup>116</sup>

During the winter of 1821-22, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 92 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1821-22 at Thompson, Connecticut in the *United States* — On 30 November 1821 - snowed all day, light; high wind. December 14<sup>th</sup> - first sleighing, pretty good but rough, duration doubtful. Good sleighing reported early in February in 1822. February 18<sup>th</sup> - snowed all day. February 21<sup>st</sup> - very rainy, high freshet.<sup>116</sup>

In the winter of 1821-22 in Bradford County, Pennsylvania in the *United States* the snow, which fell in the beginning of November, continued through the rest of the winter.<sup>178</sup>

Towards the end of 1821, the winter climate in *Canada* was severe cold. The Lawrence River was frozen from Montreal.<sup>62</sup>

In February 1822, the cold was so intense in West Florida in the *United States* that all the fruit trees were killed to the ground; but this season was comparatively mild in East Florida.<sup>139</sup>

Mercury can become a solid in extreme cold, although it is not very malleable in this state. Mercury begins to freeze within a hundredth of a degree of (-39.5° C, -39.1° F). In Melville Island [*Canada*], mercury, exposed to free air froze during the course of five months during the year. The same material

was frozen in the Island of Ingloolik [Ingloolik Island, *Canada*] in December, January, February and March 1822.<sup>80</sup>

**1822 A.D.** In *Great Britain* in January, there were great storms and floods through the British Islands generally.<sup>47, 92</sup>

In Geneva, *Switzerland*, there were great floods; serious damage.<sup>47, 92</sup>

*Russia* suffered from a major famine in 1822.<sup>96</sup>

In 1822, the Brazos River in Texas in the *United States* flooded. Very little is known of the flood of 1822, except that it was the greatest that had occurred for several years prior to that time. "The Brazos River had not been out of its banks for over thirty years until 1822, when there was a great overflow."<sup>123</sup>

On 7 May 1822 in west-central *Germany*, there was a hailstorm at Bonn. The hailstones weighed from 12 to 13 ounces (340 to 369 grams).<sup>93</sup>

On 25 May 1822 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 30 May 1822 in *England*, there was a hailstorm in Worcestershire.<sup>93</sup>

On 6 June 1822, a great cyclone struck Bombay [now Mumbai], *India*. As many as 100,000 of the inhabitants destroyed by the tidal wave (storm surge), and probably an equal number of cattle.<sup>47, 57</sup>

In 1822, a powerful cyclone struck Barisal in southern *Bangladesh* causing 50,000 deaths.<sup>98</sup>

In 1822, a terrible cyclone, followed by strong tidal waves, burst upon the seaboard of Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and caused not only the destruction of all crops but also a large number of human lives and heads of cattle.<sup>179</sup>

The summer of 1822 in Paris, *France* was characterized by:

Hot days	55 days
Very hot days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Mechelen, <i>Belgium</i>	(101.8° F, 38.8° C) in July
Joyeuse, <i>France</i>	( 99.1° F, 37.3° C) on 23 June
Alais, <i>France</i>	( 97.7° F, 36.5° C) on 14 and 23 June
Liège, <i>Belgium</i>	( 95.0° F, 35.0° C)
Maastricht, <i>the Netherlands</i>	( 93.2° F, 34.0° C) on 11 June
Paris, <i>France</i>	( 92.8° F, 33.8° C) on 10 June
Avignon, <i>France</i>	( 91.9° F, 33.3° C) on 14 July
Strasbourg, <i>France</i>	( 90.5° F, 32.5° C)
La Chapelle, <i>France</i>	( 87.3° F, 30.7° C) on 21 August
Brussels, <i>Belgium</i>	( 84.9° F, 29.4° C) on 10 June
London, <i>England</i>	( 81.0° F, 27.2° C) on 10 June

The summer season began early over almost all of *Europe*. *Russia* enjoyed a glorious spring from the first days of May. The early onset of heat caused the fruit to reach a surprising early maturity. In *England*, the heat in early June was so great, that 11 post horses fell in one week on the road to Cheltenham. In Barcelona, *Spain* the temperature reached 86° F (30° C) on 1 June. In *Italy*, the heat and

drought of the summer was considered outrageous. And the grapes reached maturity 40 days earlier than normal.<sup>62</sup>

The drought during the hot season in *France* was very great. From 21 August to 26 September 1822, the water level on the Seine River at the bridge "Pont de la Tournelle" remained almost constantly below zero [the low water mark of the year 1719]. The drought was so severe that beginning in March in southern *France*, farmers drove mules great distances to bring back water for their cattle. The spring temperatures were similar to the temperature normally observed in August. The harvest ended before 23 June in Languedoc. There were few sheaves, but very good ears. In Burgundy, the year produced unusual beauty in the sky. The grape harvest began on 2 September (although it could as easily started in 15 August). In the neighborhood of Vesoul, the grape harvest started on 19 August. The yield was fairly abundant and the wine of a very excellent quality. The cereal harvest was generally less abundant than in previous years.<sup>62</sup>

In Joyeuse, *France*, in June, the mercury rose to 90.5° F (32.5° C) eight times, to over 95.0° F (35.0° C) three times, and once on June 23 to 99.1° F (37.3° C). The mean of the maxima for the month of June was 90.0° F (32.2° C). In all parts of *France*, especially in the south, the heat during the month of June was excessive. When the mean temperature of June was compared to the mean temperatures for the same month for the 10 preceding years; the June of 1822 was 9.0° F (5.0° C) warmer. The extremely high temperature coincided with a very prominent electrical state in the atmosphere. Although no rain fell, storms produced significant lightning and sometimes hail. These storms inflicted much damage to the vineyards on the northern and eastern shore of the lake [Lake Geneva] and a number of municipalities in the canton of Vaud in southwestern *Switzerland*.<sup>62</sup>

The year 1822 in Bradford County, Pennsylvania in the *United States* was remembered as the "summer of drought and deaths." On 31 August 1822, the newspaper "The Settler" reported from Towanda: "It has been our unpleasant task to record more deaths within a few months than any other period of time of the same length for years. This is undoubtedly owing to the peculiarity of the season—the extreme drought and heat, which have so long prevailed. A parallel to it is not in the recollection of the oldest inhabitant in the county. Week after week has passed away and not a drop of rain has reached us. The earth parched, meadows and pastures dried up, streams and springs, never before known to fail, now dry, cold chilling nights, a continuous gloomy and sultry heat during the day, has been the peculiar character of the whole season. For 40 days there has not been a cloud in the horizon."<sup>178</sup>

In 1822 during the first half of spring, the heat abruptly came to an end with violent gusts of snow and rain. Some thunderstorms followed by rain interrupted the transient heat. The harvest was advanced over a month. The wheat harvest took place on June 25. The maximum temperature arrived in Paris, *France* on June 10, with a reading of 92.8° F (33.8° C).<sup>79</sup>

Major storms reigned in *France* in 1822.<sup>79</sup>

In Havana, *Cuba*, there was a great deluge.<sup>47, 92</sup>

The great gale of 1822, caused the loss of 200 lives in Georgetown County, South Carolina in the *United States*.<sup>118</sup>

On 27 September 1822, Charleston, South Carolina in the *United States* was struck by a destructive hurricane.<sup>124</sup>

On 27 and 28 September 1822, a strong gale [hurricane] struck South Carolina in the *United States*. The loss of life was very great for those early days; forty were drowned at North Inlet; twenty on Murphy

Island, and probably in all 200 at various points along the coast. The storm began about 10 p.m. on the 27<sup>th</sup> and was all over by daylight of the 28<sup>th</sup>. After that gale several planters built, storm towers of brick for their slaves to take refuge in.<sup>117</sup>

On 27-28 September 1822, a hurricane struck South Carolina in the *United States*. Most accounts cite 200 deaths but one-account claims 300.<sup>141</sup>

On 20-22 October 1822, a hurricane struck offshore of Virginia in the *United States*. A schooner foundered off Richmond, Virginia.<sup>141</sup>

In *Ireland* in 1822, there was a dreadful famine caused by the failure of the potato crop. “While, however, the agriculturists of the continent were suffering from an abundance, a grievous famine arose in *Ireland*, showing the anomalies of her situation, resulting either from the staple food of her population differing from that of surrounding nations, or the limitation of her commercial exchanges with her neighbors. Her distresses from scarcity were aggravated by the agrarian outrages, originating in the pressure of tithes and rack-rents on the peasantry and small farmers. Several of the ringleaders of these disorders were apprehended by the civil and military power, and great numbers executed or transported.”<sup>57</sup>

*Ireland* suffered the effects of famine in 1816, 1822 and 1831.<sup>188</sup>

In 1822 in *Ireland*, there was a dreadful famine, produced by failure of the potato crop.<sup>91</sup>

In *Ireland*, there were great storms and inundations at Wexford and Cork.<sup>47, 92</sup>

In *Ireland* on the 12<sup>th</sup> of December, there was a great storm and considerable destruction of property, particularly in the neighborhood of Dublin.<sup>57</sup>

On 12 December 1822, a storm struck *Ireland*, particularly in the vicinity of Dublin, many houses were thrown down, and vast numbers unroofed.<sup>90</sup>

On 12 December 1822, a hurricane struck Dublin, *Ireland* and its vicinity. From forty to fifty lives were lost and \$1,000,000 of property destroyed.<sup>197</sup>

In 1822, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 23 January and 21 February, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang and Ch’ien-chiang. At Chung-hsiang, the dikes were damaged.

— During the period between 19 June and 17 July, floods struck Hupeh province at Kuang-hua, Chu-shan and Yün.

— During the period between 18 July and 16 August, floods struck Shantung (now Shandong province) on the east coast of *China* at Wu-ch’êng and Hopei (now Hebei province) in northern *China* at Li, Wu-ch’iang, Pao-ting, T’ang-shan, Jên-ch’iu and Ch’ü-yang.

— During the period between 17 August and 14 September, floods struck Shensi (now Shaanxi province) in central *China* at Chên-pa and Hupeh province at Ying-ch’êng.

— During the period between 15 September and 14 October, floods struck Shantung province at Ho-tsê, Chan-hua, Liao-ch’êng, Ch’ang-ch’ing, Jih-chao, Kuan-ch’êng and Chü-yeh. At Liao-ch’êng, the fields were damaged.

In 1822 during the period between 5 February and 6 May, a drought engulfed Hupeh (now Hubei province) in central *China* at I-tu and Shantung (now Shandong province) on the east coast of *China* at Jih-chao. During the period between 6 May and 8 August, a drought engulfed Chekiang (now Zhejiang

province) on the east coast of *China* at Chia-hsing and Hu-chou.<sup>153</sup>

**Winter of 1822 / 1823 A.D.** The Seine River in *France* froze from 30 December 1822 until 8 January 1823 and froze a second time from 15 to 29 January. The Meuse River froze from 17 December 1822 until the 30<sup>th</sup> of January 1823.<sup>62</sup>

The winter of 1822-23 was severe in *France* and *Belgium*. In Paris, *France*, there were 53 frost days, including 21 consecutive. The frost began on 8 December 1822, and held until 2 January 1823 with a break of two days (11 and 12 December); the frost then occurred between 9 and 25 January. The Seine River was frozen twice. The first time was from 30 December to 8 January and the second time from 15 to 29 January. In southwest *Germany*, the Neckar River also froze twice and carriage crossed the river on the ice; just as it was with the Rhine River that experienced a moderate freeze under temperatures of 10° to 12° F (-11° to -12° C). The Meuse River froze. The Scheldt River experienced very large ice floes. In Holland [now *the Netherlands*] wagons with their heaviest loads crossed on the ice on the River Leck. In the interior of *France* the river ice was not very strong, and the newspapers reported numerous cases of skaters falling through the ice at Rouen and Moens, *France*. In the Alps, in Piemont in northwest *Italy* and the Roman States [the Papal States in northern *Italy*] there was much snow. At Domo d'Ossola (Domodossolain) in northern *Italy*, the snow fell for 48 hours without interruption and in such quantity that avalanches blocked roads and several persons were buried with a large number of animals under the snow. The lowest observed temperatures at different locations are:<sup>62</sup>

St. Petersburg, <i>Russia</i>	(-22.7° F, -30.4° C) on 7 February 1823
Mechelen, <i>Belgium</i>	(-11.9° F, -24.4° C) in January 1823
Maastricht, <i>the Netherlands</i>	( -9.2° F, -22.9° C) on 23 January 1823
Brussels, <i>Belgium</i>	( 24.1° F, -4.4° C) on 16 December 1822
<i>Ibid.</i>	( 0.5° F, -17.5° C) on 25 January 1823
Paris, <i>France</i>	( 16.2° F, -8.8° C) on 27 December 1822
<i>Ibid.</i>	( 5.7° F, -14.6° C) on 14 January 1823
La Chapelle (near Dieppe), <i>France</i>	( 14.2° F, -9.9° C) on 30 December 1822
<i>Ibid.</i>	( 12.0° F, -11.1° C) on 22 January 1823
Orange, <i>France</i>	( 24.8° F, -4.0° C) on 2 December 1822
<i>Ibid.</i>	( 20.0° F, -6.7° C) on 13 January 1823
Avignon, <i>France</i>	( 20.8° F, -6.2° C) on 14 January 1823
London, <i>England</i>	( 25.0° F, -3.9° C) on 30 December 1822
<i>Ibid.</i>	( 21.9° F, -5.6° C) on 22 January 1823
Rome, <i>Italy</i>	( 24.8° F, -4.0° C) on 29 and 30 December 1822
Hyères, <i>France</i>	( 29.8° F, -1.2° C) on 13 January 1823

In the *United States* during the winter of 1822-23, the temperature at Fort Howard (Green Bay, Wisconsin) fell to -38° F in February.<sup>113</sup>

Miss Ellen D. Larned described the New England winter of 1822-23 at Thompson, Connecticut in the *United States* — On 3 December 1822 - snowed hard in the night; folks began to sleigh, but could not keep it up. On 1 January 1823 - violent blowing storm; resumed sledding. January 5<sup>th</sup> - violent storm of snow and hail. January 19<sup>th</sup> - snow wastes away fast; violent rain. February 3<sup>rd</sup> - more snow and sleighing. February 12<sup>th</sup> - deep snow and very level. February 14<sup>th</sup> & 15<sup>th</sup> - very great snowstorm; a man perished on the meadow. February 24<sup>th</sup> - a violent snowstorm all day; roads terribly blocked up; all hands out to shovel. March 2<sup>nd</sup> - threatens to thaw. March 3<sup>rd</sup> - cold as Greenland and grows colder all day. March 6<sup>th</sup> - violent rain and snow. March 20<sup>th</sup> - snow; good sleighing.<sup>116</sup>

In the winter of 1822-23 in Bradford County, Pennsylvania in the *United States*, on 23 March 1823 according to the pioneers there was "a great snow storm."<sup>178</sup>

During the winter of 1822-23, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 90 days.<sup>202</sup>

In March 1823, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 1<sup>st</sup> (24° F); 4<sup>th</sup> (28° F). There was frost on the March 9<sup>th</sup> and 26<sup>th</sup>. It snowed on the March 2<sup>nd</sup>.<sup>116</sup>

---

**1823 A.D.** On 17 February 1823, there was a terrific hailstorm in New South Wales, *Australia*.<sup>103</sup>

On 6 March 1823, there was a disastrous flood in Rhode Island and Connecticut in the *United States*. Very deep snow covered the ground in southern New England during the end of February. On 5 March, it rained heavily for 24 hours. This caused the freshet. The bridge at Natick, Rhode Island was carried away whole by the floodwaters. The bridge on the old road, commonly called the Natick Bridge, and a bridge in Olneyville in Rhode Island were also destroyed. The bridge at the Arkwright factory and a bridge at the Hope factory were severely damaged. In Connecticut, the six bridges that span the Yantic River were all carried away. The oil mill at Bean Hill was swept away. The oil mill and a machine shop near the falls at Norwich were seriously damaged.<sup>199</sup>

The maximum temperature during the summer in Ambikūl [Ambikol in northern *Sudan*] was 116.4° F (46.9° C) on 31 May.<sup>62</sup>

Grain prices rose suddenly in the autumn of 1823 at Injeram, *India* due to a failure of the rains. By December, a famine was taking hold in Madras [now Chennai]. There were several deaths due to starvation. Many children were abandoned in despair by their parents. A serious grain riot took place in the town, rendering it necessary to call out the military. The failure of the periodic rains affected the Carnatic and western districts of India and caused grain prices to double. In September at Vizagapatam [now Visakhapatnam on the southeast coast of *India*], starving parents became so desperate that they began selling their infant children.<sup>188</sup>

On 5 June 1823 in *England*, there was a great hailstorm in Buckinghamshire.<sup>93</sup>

In 1823, many regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 11 April and 10 May, floods struck Hupeh (now Hubei province) in central *China* at Shih-shou and Chiang-ling; and Hopei (now Hebei province) in northern *China* at P'ing-hsiang, Ku-an, Wu-ch'ing, P'ing-ku, Pao-ting, Li, Jên-ch'iu, Ch'ing, Ch'ü-yang, Yü-t'ien and Pa. At Chiang-ling, the dikes were damaged.

— During the period between 8 July and 5 August, floods struck Shantung (now Shandong province) on the east coast of *China* at Wu-ch'êng, Chü-yeh and Liao-ch'êng; Hopei province at T'ung; Chekiang (now Zhejiang province) on the east coast of *China* at Chiang-shan; and Hupeh province at Huang-mei.

— During the period between 6 August and 4 September, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at Soochow, Kao-ch'un and T'ai Lake. At T'ai Lake, the crops were damaged by the floodwaters.

In 1823 during the period between 6 May and 8 August, a severe drought engulfed Shantung (now Shandong province) on the east coast of *China* at T'êng.<sup>153</sup>

---

**Winter of 1823 / 1824 A.D.** The winter of 1823-24 was mild in *Northern Europe*. In January in *Russia*, there were green vegetables in the markets. On 4 February in *Russia* the temperature fell to 9.5° F (-12.5° C). During the winter, there were violent storms and much snow fell. The navigation of the straits remained open. In Stockholm, *Sweden*, the mean temperature of January was 34.7° F (+1.5° C). The thermometer fell during that month only one time to 20.3° F (-6.5° C) and increased to 44.6° F

(+7.0° C).<sup>62</sup>

In *France*, the winter was mild. There were only 31 days of frost, with 5 consecutive. The minimum temperature was 23.4° F (-4.8° C) on 14 January.<sup>62</sup>

In *Spain* in January, the almond trees were in full bloom, but then violent storms caused the flower to fall off. In *Italy*, it was much colder, and the mountains in the vicinity of Rome were covered with snow. On 5 February, the thermometer fell to 28.6° F (-1.9° C).<sup>62</sup>

A fall of snow occurred in *Jamaica* at Annotobay on 15 December 1823.<sup>43</sup>

During the winter of 1823-24, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 78 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1823-24 at Thompson, Connecticut in the *United States* — For these six years (1823-1829) there was no record of the winter. It was during this interval that the editor of the National Weather Bureau was inclined to place a snowless term of years referred to in family reminiscences as the time when snowstorms were supposed to have permanently gone out of fashion and people talked of selling their sleighs.<sup>116</sup>

The winter of 1823-24 in Bradford County, Pennsylvania in the *United States* was very mild with only a few biting cold days. On 30 & 31 March 1824, there was a snowfall of over 24 inches [0.6 m].<sup>178</sup>

---

**1824 A.D.** On 14 January 1824 at Gothen [Gothenburg, *Sweden*], Mr. Maxadorf observed the fires of St. Elmo. The phenomena occurred at the close of a storm. There was a wagon loaded with straw in the middle of the field over which hung a large black cloud. Every stalk stood out straight and seemed on fire. Even the whip of the driver threw off a vivid light. The phenomena lasted 10 minutes until the winds blew the cloud away.<sup>205</sup>

On 23 February 1824, a hurricane struck the island of *Mauritius* in the Indian Ocean. It caused great loss to the shipping in the harbor. Thirty sails were driven ashore during the storm.<sup>198</sup>

In *India*, there was a severe drought in the Delhi, and some other districts.<sup>47</sup>

In *India* during 1824-25, there was a famine in several districts. In Delhi and neighboring provinces, it was due to a severe drought. In the Madras Presidency, and more particularly in the Carnatic and Western districts, the cause was a failure of rains at the usual seasons. In Hindustan, the same.<sup>57</sup> [The Delhi is located in northern *India*. Madras Presidency is in southeastern *India*. Carnatic is in southern *India*. Hindustan is in northern *India*.]

In 1824, there was a minor famine in Delhi and the neighborhood and in the North-Western Provinces of *India*.<sup>179</sup>

In 1824, there was a famine in Kandeish [now Khandesh, *India*] and southern *India*.<sup>182</sup>

In 1824 in *Australia*, due to a severe drought, the crops failed in New South Wales.<sup>101</sup>

In *Ireland*, there were great floods at Belfast.<sup>47, 92</sup>

On 22 May 1824 in *England*, there was a hailstorm in Somersetshire.<sup>93</sup>

In St. Petersburg, *Russia* on November 19, the city was flooded from an overflow of the Neva River. The river rose to the first story of the houses in this city. Carriages and horses were swept away, and a regiment of Carabineers, who had climbed to the roof of their barracks, were drowned. At Cronstadt, a 100-gun ship of the line was left in the middle of the marketplace. In the two places more than 10,000 lives were lost, and property to the amount of many millions of rubles was destroyed. The Neva River had overflowed in 1728, 1729, 1735, 1740, 1742, and 1777; but none of these occasions was equal to that of 1824.<sup>47, 92</sup> [The carabineers are the mounted Karabinary regiments of the Russian Imperial army. Cronstadt or Kronstadt is the port of St Petersburg at the mouth of the Neva River in northern *Russia*.]

On 23 November 1824, a tremendous hurricane throughout *England*.<sup>43</sup>

In New South Wales, *Australia*, turnips failed through the extreme drought of 1824.<sup>103</sup>

In 1824, there was a great storm that passed over the district of Prospect and the Pennant Hills in New South Wales, *Australia*. It was accompanied by thunder, lightning, and hail; and so great was the fall of hailstones that they were 10 feet deep in some parts of the low grounds. Four days later, a piece of ice [hailstone] was found still 12 inches in circumference.<sup>103</sup>

In 1824, a drought engulfed Hupeh (now Hubei province) in central *China* at Fang and Ma-ch'êng; and Shantung (now Shandong province) on the east coast of *China* at Ts'ao. Then during the period 1-29 March, floods struck Hopei (now Hebei province) in northern *China* at Ta-hsing and Wan-p'ing. Then during the period between 29 April and 25 July, a drought engulfed Hupeh province at I-ch'êng. During the period between 8 August and 8 November, a drought engulfed Shantung province at Chang-ch'iu and Jung-ch'êng.<sup>153</sup>

---

**Winter of 1824 / 1825 A.D.** Miss Ellen D. Larned described the New England winter of 1824-25 at Thompson, Connecticut in the *United States* — For these six years (1823-1829) there was no record of the winter. It was during this interval that the editor of the National Weather Bureau was inclined to place a snowless term of years referred to in family reminiscences as the time when snowstorms were supposed to have permanently gone out of fashion and people talked of selling their sleighs.<sup>116</sup>

During the winter of 1824-25, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 60 days.<sup>202</sup>

---

**1825 A.D.** In *Denmark*, during a violent storm the sea broke through the isthmus between the North Sea and Lymfjord, thereby making the north part of Jutland an island.<sup>47, 92</sup>

In Rotterdam, Holland [now *the Netherlands*], the Meuse River overflowed, doing considerable damage.<sup>47, 92</sup>

In *India* during 1825-26, there was a famine in the northwest provinces, caused by a failure of rains. There was scarcity in Sangor and Nerbada territories caused by blight and a succession of heavy thunderstorms.<sup>57</sup> [The Saugor and Nerbudda Territories was a region of British India, located in central part of present-day Madhya Pradesh state in central *India*.]

In 1825-27, there was a famine in the Northwest Provinces in *India*. During this period the famine sometimes also affected Bundelcund to the south, Rajputana to the west and Punjab to the north. But to the east at Oudh and Rohilcund, the area enjoyed relative immunity from this disaster.<sup>156</sup>

In 1825, the scarcity in the North-Western Provinces and some parts of the central provinces in *India* was caused by a thunderstorm.<sup>179</sup>

A correspondent in *Jameson's Journal* mentions a hailstorm, which occurred in *India* in May 1825, in which hailstones varied in size from a filbert to that of a pigeon's egg.<sup>43</sup>

On 4 June 1825, a storm struck New York in the *United States*. The schooner *Hornet* foundered during the storm with loss of her entire crew.<sup>141</sup>

On 10 July 1825 in *Ireland*, there was a dreadful hailstorm in Londonderry.<sup>93</sup>

The Brussels, *Belgium* newspapers dated 23 July 1825 say: The heat is so excessive that men and a woman died [from heatstroke] in the country while they were harvesting wheat.<sup>80</sup>

On 25 July 1825, a hurricane struck *Guadeloupe* in the Leeward Islands, in the Lesser Antilles. "The wind at the moment of its greatest intensity seemed luminous; a silvery flame streamed through the chinks in the walls, the key-holes, and other openings, and made one think, in the darkness inside the houses, that the heavens were on fire."<sup>205</sup>

On 26 July 1825, a great Atlantic hurricane struck the islands of *Guadeloupe* and *Puerto Rico* causing approximately 1,300 deaths.<sup>107</sup>

On 26 July 1825, a hurricane struck *Guadeloupe* in the *Leeward Islands* and *Puerto Rico*. [Various accounts list the number of deaths as >1300, >500, 374, and 372.]<sup>141</sup>

The great drought of 1825 in *France* began in November 1824 and lasted, without interruption, until October 1825. The drought was reported from south to north and from east to west, notably in Paris, Metz, Rouen, Strasbourg, Nantes, Berzé-la-Ville, Tarbes, Joyeuse, Orange, and Marseille. The number of rainy days and amount of rainfall were everywhere lower than average. The effect of the drought was greater in Paris, in Chalons, in Bordeaux, in Nevers, and in Arles. The low level of the water in the river reached or fell below the zero water mark.<sup>79</sup>

Intense heat, long and sustained, also marked the year 1825. Spring, summer and fall produced almost anywhere in *France* a high temperature. The peak temperatures occurred generally from 18 to 23 July, and reached 93.9° F (34.4° C).<sup>79</sup>

The heat of the summer of 1825 extended over *France, Italy, Spain* and even the *United States*. The drought was unfortunately excessive in *France*. The Seine River in Paris at the bridge "Pont de la Tournelle" remained below zero [the low water mark of the year 1719] from 26 July to 17 August and from 28 September to 21 October. The summer of 1825 in Paris, *France* was characterized by:

Hot days	37 days
Very hot days	7 days
Extremely hot days	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Paris, <i>France</i>	( 97.3° F, 36.3° C) on 19 July
Maastricht, <i>the Netherlands</i>	( 96.3° F, 35.7° C) on 19 July
Vire, <i>France</i>	( 95.0° F, 35.0° C) in July
Avignon, <i>France</i>	( 95.0° F, 35.0° C) on 21 July
Strasbourg, <i>France</i>	( 93.9° F, 34.4° C)
Pont de Souillac, <i>France</i>	( 93.9° F, 34.4° C) on 19 July
Metz, <i>France</i>	( 93.2° F, 34.0° C) on 18 & 19 July
La Chapelle, <i>France</i>	( 92.3° F, 33.5° C) on 18 July

Saint George Del Mina, <i>Ghana</i>	( 90.0° F, 32.2° C) on 26 March
Brussels, <i>Belgium</i>	( 88.3° F, 31.3° C) on 19 July
London, <i>England</i>	( 87.1° F, 30.6° C) on 19 July
Marseille, <i>France</i>	( 86.0° F, 30.0° C)

In Burgundy, *France*, the summer was hot, and punctuated by small rainstorms. Unfortunately, a hailstorm caused widespread devastation between Dijon to Chalons. The grape harvest began on 20 September. The crop was poor but the wine was of very excellent quality. In the vicinity of Bordeaux, the wine was very abundant, was sold at enormous prices, not for its age but its quality. In *France*, the corn harvest was satisfactory.<sup>62</sup>

On 17-18 November 1825, a storm struck the coast of North Carolina in the *United States*. The schooner *Harvest* was wrecked. Five or more persons were lost in what may have been a late season hurricane. Five of 15 people on board were lost and a rowboat carrying rescuers overturned in the surf.<sup>141</sup>

In 1825 during the period between 16 July and 13 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Ying-shan. During the period between 14 August and 11 September, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Tsinan and Huang.<sup>153</sup>

---

**Winter of 1825 / 1826 A.D.** In the *United States* during the winter of 1825-26, the temperature at Portland, Maine fell to -24° F in February.<sup>113</sup>

During the winter of 1825-26, the Hudson River at Albany, New York was closed to river traffic because it was frozen or obstructed by ice for 75 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1825-26 at Thompson, Connecticut in the *United States* — For these six years (1823-1829) there was no record of the winter. It was during this interval that the editor of the National Weather Bureau was inclined to place a snowless term of years referred to in family reminiscences as the time when snowstorms were supposed to have permanently gone out of fashion and people talked of selling their sleighs.<sup>116</sup>

---

### 1826 A.D. – 1829 A.D. Australia. Drought

A severe drought struck New South Wales in *Australia*. Many crops failed. Even the aborigines began to die from lack of food. Lake George dried up. The Darling River, according to the explorer Sturt, was said to be dry.<sup>101</sup>

In 1828 in New South Wales, *Australia*, the drought was so bad that livestock had to be removed from 30,000 acres at Camden for want of water.<sup>103</sup>

On 29 November 1828 in Sydney, *Australia*, “the heat and hot winds of Saturday last excelled all that we ever experienced in the colony. On board the *Volage*, man-of-war, in the shade, the thermometer was 106° F, and on the shore it was, in some parts of the town, 100° F, and in others 104° F. To traverse the streets was truly dreadful, the dust rose in thick columns, and the N.W. wind, from which quarter our hot winds invariably proceed, was assisted in its heat by the surrounding country being all on fire, so that those who were compelled to travel felt themselves encircled with lambent flames. Sydney was more like the mouth of Vesuvius than anything else. Sunday, however, brought a change of wind, since when the weather has been somewhat more endurable.”<sup>103</sup>

In Sydney, *Australia*, in March, 1829, “we are all burnt up: it is frightful to go into the garden. Not a drop of water but what we send for from Botany Swamps. Four pence per gallon was paid for water in Sydney during 1829.”<sup>103</sup>

On March 1829, during Sturt's Expedition in *Australia*, it was written, "I saw rivers cease to flow and sheets of water disappear."<sup>103</sup>

**1826 A.D.** On 24 March 1826, a gale produced such rainfall, that the torrents seemed as if the very floodgates of heaven were opened. It caused an extensive flood in *Canada*, and in the *United States* in New York and the northern New England states.<sup>199</sup>

— In Vermont, the bridges over the West River between Brattleboro and Newfane were destroyed. At Weathersfield, the Black River rose so high that it flooded barnyards and drowned 80 merino sheep. At Bellow Falls, many buildings were destroyed including a paper mill, a sawmill, two bridges, and a dye-house. In the neighborhood of Woodstock, two bridges over the Williams' River were carried away. In Montpelier, the entire village was inundated and the turnpike between Montpelier and Royalton was washed away in so many places, that the road was impassable.

— In Maine, the flood on the Kennebec River was very devastating. Before the storm, the ice on the river was 20 inches [0.5 meters] thick. When the ice broke up, the water raged down on the wharves at Gardiner. The water covered the wharves 4 to 5 feet [1.2-1.5 meters] deep. A great body of ice then pressed down on the wharves. The warehouse at Long Wharf was swept away. At 4 p.m., a great body of ice above the city broke loose and almost destroyed the wharves but an icehouse with 4,000 tons of ice blocked the surge. Sheets of ice leaped twenty feet [6 meters] from the surface of the water and fell against the building, but it held. At Gardiner, 4 or 5 schooners were driven from their moorings. At Hallowell, an ice dam formed and flooded the town, sweeping away buildings and flooding stores on the lower rooms of stores. All the vessels on the stocks were swept away. The bridge at Waterville was destroyed, and 2 or 3 other small bridges between Waterville and Augusta were very damaged.

The year 1826 was a wet year in New England in the *United States*. During the first week of July, a great rain had dislodged a large mass of stone and gravel from one mountain, and the landslide filled up the road at Notch, New Hampshire. The month of August was wet in Massachusetts, Rhode Island and Connecticut. On 14 August, 8.7 inches [22 centimeters] of rain fell at Salem, Massachusetts. The total for the month at Salem was 14 inches [36 centimeters]. The lowlands were inundated and the milldams damaged. On 28 August, a cold heavy rain struck the White Mountains. As a result five of the bridges over the Ammonoosuc River were swept away. The Contoocook River rose higher at Henniker, New Hampshire than it was ever known before. Several bridges and mills on the Souhegan and Merrimack Rivers were swept away. The rainstorm produced a great flood in the mountain region. The Saco River at Notch was sixteen feet [5 meters] above its usual height and had spread to three times its width. And then 30 slides took place on the mountains. The turnpike at Notch was buried by earth and stone 30 feet [9 meters] deep in many areas. At least 9 people were buried at the pass at Notch by the mudslides.<sup>199</sup>

In Paris, *France*, the summer of 1826 was just as warm and dry as the previous summer. In southern *France*, there was abundant rain. The temperature was very high in the north. The summer in Paris was characterized by:

Hot days	36 days
Very hot days	7 days
Extremely hot days	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Maastricht, <i>the Netherlands</i>	(101.8° F, 38.8° C) on 2 August
Épinal, <i>France</i>	( 97.7° F, 36.5° C) on 1 July
Paris, <i>France</i>	( 97.2° F, 36.2° C) on 1 August
Metz, <i>France</i>	( 97.0° F, 36.1° C) on 3 August
Geneva, <i>Switzerland</i>	( 94.3° F, 34.6° C) on 3 August
Strasbourg, <i>France</i>	( 93.6° F, 34.2° C)

Basel, <i>Switzerland</i>	( 93.2° F, 34.0° C ) on 3 August
Warsaw, <i>Poland</i>	( 92.8° F, 33.8° C ) in July
Avignon, <i>France</i>	( 91.4° F, 33.0° C ) on 2 July
Liège, <i>Belgium</i>	( 90.5° F, 32.5° C )
Brussels, <i>Belgium</i>	( 88.3° F, 31.3° C ) on 2 August
London, <i>England</i>	( 87.4° F, 30.8° C ) on 27 June
Marseille, <i>France</i>	( 86.4° F, 30.2° C )
La Chapelle, <i>France</i>	( 86.2° F, 30.1° C ) on 2 August

The summer of 1826 was hotter than the year 1819. The hot summer was reported in Toulon, Marseille, Joyeuse, and Toulouse, *France*. Everywhere in southern *France* and in several northern countries, the heat was intense, continuous and long.<sup>79</sup>

A drought in 1826 was recorded in Paris, Rouen, Metz, and Strasbourg, *France*. The drought occurred mainly during the spring and summer. There were twenty-two fewer rainy days in the year than normal.<sup>79</sup>

On 12 June 1826 in *England*, there was a hailstorm in Sussex.<sup>93</sup>

On 18 June 1826 in *England*, there was a great hailstorm in Buckinghamshire.<sup>93</sup>

On 27 June 1826 in *England*, there was a hailstorm in Hertfordshire.<sup>93</sup>

On 28 June 1826 in *England*, there was a great hailstorm in Berkshire, Essex, Middlesex, Shropshire, and Surrey.<sup>93</sup>

In *Sweden* and *Denmark*, a long drought combined with exceptional heat has been devastating to agriculture. From Stockholm, *Sweden*, a letter of 27 June: "All hope of a harvest is gone from us. The gardens are without fruit and almost without leaves; the fields show no trace of green anymore. Scorched by the heat of the sun the ears [of grain] are rapidly deteriorating. To this comes a sad sight; for three days, spread over the horizon there is darkness from the smoke from the forest fires. One of these fires is two mile and the other fire three miles from our capital."<sup>62</sup>

On 27 August 1826, a hurricane struck western *Cuba* causing 33 deaths.<sup>141</sup>

In 1826, a hurricane struck *Cuba*. General Laborde lost his fleet in *Cuba* or the southern coast.<sup>141</sup>

In 1826, a hurricane struck the Cayman Islands in the *Caribbean Sea*. The women of the east end were left widowed when their husbands were lost at sea.<sup>141</sup>

The drought in northern *France* was also very severe. The Seine River in Paris [at the bridge "Pont de la Tournelle"] remained below zero [the low water mark of the year 1719] from 2 August to 7 September and then again for an additional 14 days beginning towards the end of September.<sup>62</sup>

In *Languedoc*, the spring was dry and cold, and later cold and wet. July and August were warm. The harvest was poor. The rain from the summer thunderstorms spoiled the sheaves. The harvest of corn was good, but the wine bad. Burgundy, *France* sustained very great heat. The grapes were scorched and partially eaten by the worms. The grapes were harvested on 2 October. The yield of the harvest was nonetheless ample; but the wine had a foul taste.<sup>62</sup>

In 1826, there was a minor famine in the Central and North-Western Provinces of *India*.<sup>179</sup>

In 1826 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Chu-ch'êng and Tung-a. During the period between 5 July and 3 August, a drought engulfed Kiangsi (now Jiangxi province) in southern *China* at Yung-fêng and Wan-an.<sup>153</sup>

Also refer to the section **1826 A.D. – 1829 A.D.** for information on the drought in Australia during that timeframe.

**Winter of 1826 / 1827 A.D.** The winter of 1826-27 had an unusual amount of rain and snow, and was remarkable during the last half of December 1826 and the first half of January 1827 in *Germany*, *France*, in *Provence*, in *Italy* and as far away as Constantinople (now Istanbul, *Turkey*). Paris, *France* experienced 51 days of frost, including 33 frost days without interruption. The cold began on 3 January 1827 and lasted till the 6th, began again on the 17th and lasted, with the exception of a single day (20 February) until the 25<sup>th</sup> of February. In the Auvergne, *France*, an extraordinary amount of snow fell. In *Belgium*, the months of January and February were very cold, and the thaw only began on 27 February and the Meuse River was completely frozen at Dinant and Maastricht. [Dinant is located in southern *Belgium*. Maastricht is in *the Netherlands*.] The lowest temperatures recorded in different cities this winter:<sup>62</sup>

Great St. Bernard Hospice, <i>Switzerland</i>	(-11.2° F, -24.0° C) on 20 January
Basel, <i>Switzerland</i>	( -5.8° F, -21.0° C) on 18 February
Metz, <i>France</i>	( -4.4° F, -20.2° C) on 18 February
Geneva, <i>Switzerland</i>	( -1.7° F, -18.7° C) on 25 January
Maastricht, <i>the Netherlands</i>	( -0.8° F, -18.2° C) on 15 February
Strasbourg, <i>France</i>	( 5.0° F, -15.0° C) on 17 February
Brussels, <i>Belgium</i>	( 6.1° F, -14.4° C) on 16 February
Lyon, <i>France</i>	( 8.6° F, -13.0° C) on 23 January
Joyeuse, <i>France</i>	( 8.6° F, -13.0° C) on 24 January
Paris, <i>France</i>	( 9.0° F, -12.8° C) on 18 February
Laon, <i>France</i>	( 10.4° F, -12.0° C) on 18 February
La Chapelle (near Dieppe), <i>France</i>	( 11.5° F, -11.4° C) on 18 February
Avignon, <i>France</i>	( 11.7° F, -11.3° C) on 21 January
Orange, <i>France</i>	( 12.9° F, -10.6° C) on 25 January
London, <i>England</i>	( 16.0° F, -8.9° C) on 3 January
Alais, <i>France</i>	( 16.2° F, -8.8° C) on 24 January
Madrid, <i>Spain</i>	( 22.1° F, -5.5° C) on 3 January
Hyères, <i>France</i>	( 25.5° F, -3.6° C) on 24 January

The cold affected plants in *Provence*: The winter did not damage the oats because it was covered with snow. The myrtles and oleanders were frozen down to the trunk. The olive trees were damaged at only certain locations. The sainfoin sown in the autumn was frozen. The winter of 1827 had been extraordinary because the snow fell in abundance, and he remained on the ground until the middle of February.<sup>62</sup>

January 1827 was extremely cold in New England in the *United States*. Lakes were frozen very thick with ice. Several persons were frozen to death and many lost their hands or feet to frostbite. Along the coast, many vessels had their cables cut by the ice and forced out to sea, or onto the rocks and beaches.<sup>199</sup>

In the *United States* in Virginia on 21 January, the river was frozen across from Norfolk to Portsmouth, and on the succeeding day from Lambert's Point to Craney Island.<sup>38</sup>

During the winter of 1826-27, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 86 days.<sup>202</sup>

On 21 January 1827, the temperature in Albany, New York in the *United States* fell to  $-23^{\circ}\text{F}$  [ $-31^{\circ}\text{C}$ ].<sup>207</sup>

Miss Ellen D. Larned described the New England winter of 1826-27 at Thompson, Connecticut in the *United States* — For these six years (1823-1829) there was no record of the winter. It was during this interval that the editor of the National Weather Bureau was inclined to place a snowless term of years referred to in family reminiscences as the time when snowstorms were supposed to have permanently gone out of fashion and people talked of selling their sleighs.<sup>116</sup>

In March 1827, at Princess Anne, Maryland in the *United States* the temperature did not fall below freezing but there was a frost on March 31<sup>st</sup>.<sup>116</sup>

---

**1827 A.D.** In Naples, *Italy*, there were a destructive inundations.<sup>47, 92</sup>

On 24 April 1827, a severe storm struck the coast of Maine and New Hampshire in the *United States*. Vessels were driven ashore at Portsmouth and Portland. In Portland harbor, many vessels collided with other vessels during the storm, sinking some and damaging others. The flooding on land was also severe. At Cape Neddock, Maine, a woolen factory, a gristmill and a bridge were swept away. Five miles [8 kilometers] upstream, four other bridges were swept away. At Kennebunk, a fulling mill and gristmill were swept away. The Saco River flooded. Fifteen families were rescued off the islands above the Spring's bridge because the water was higher than the first story windows. At Poor-House Island, three families were carried off on men's backs. At Biddeford, Maine, a bridge was swept away. The Presumpscot River was greatly flooded and mills and bridges on it were destroyed. The Winslow's Bridge at Falmouth and the Congin Bridge at Westbrook, Maine, were carried away. At Saccarappa [now Westbrook], Maine, a bridge and gristmill were swept away. A bridge between Brunswick and Topsham, Maine on the Androscoggin River along with two sawmills were swept away. Two hundred thousand dollars of logs were swept away and never recovered. [In present currency, that would be equivalent to \$4 million in lost lumber based on the Consumer Price Index (CPI) inflation rates.]<sup>199</sup>

On 1 May 1827 in *England*, there was a hailstorm in Surrey.<sup>93</sup>

In 1827, the packet-boat *New York* was struck by lightning. The lightning strike affected various parts of steel, which were used in the construction of chronometers, particularly their balance. When the vessel arrived at Liverpool, *England*, it was advanced thirty-three minutes fifty-eight seconds on the time it should have indicated if the vessel had not been struck by lightning.<sup>271</sup>

In July 1827 in *France*, there was a great hailstorm; injured vines and grain.<sup>93</sup>

The maximum temperature during the summer in Geneva, *Switzerland* was  $97.2^{\circ}\text{F}$  ( $36.2^{\circ}\text{C}$ ) on 30 July.<sup>62</sup>

On 17 August 1827 in *England*, there was a hailstorm in Suffolk.<sup>93</sup>

On 17 August 1827, a hurricane struck St. Kitts in the *West Indies*.<sup>144</sup>

A destructive hurricane swept over the Windward Islands [in the *Lesser Antilles*] on 17 August 1827. It visited *St. Martin's* and *St. Thomas'* on the 18<sup>th</sup>; passed the northeast coast of Hayti [*Haiti*] on the 19<sup>th</sup>; *Turks' Island* on the 20<sup>th</sup>; *the Bahamas* on the 21<sup>st</sup> and 22<sup>nd</sup>; was encountered off the coast of Florida and South Carolina in the *United States* on the 23<sup>rd</sup> and 24<sup>th</sup>; off Cape Hatteras [in North Carolina] on the 25<sup>th</sup>; off the Delaware coast on the 26<sup>th</sup>; off Nantucket [in Massachusetts] on the 27<sup>th</sup>; and off Sable Island [off Nova Scotia, *Canada*], and the Porpoise Bank on the 28<sup>th</sup>. The hurricane traveled 3,000 miles in about 11 days.<sup>228</sup>

On 26 August 1827, a storm struck Chesapeake Bay in the *United States*. [The Chesapeake Bay is the largest estuary in the United States. It lies off the Atlantic Ocean, surrounded by Maryland and Virginia.] The vessel *Flag* lost all hands and the passengers perished in the storm.<sup>141</sup>

The year 1827 produced heavy rainfalls and a greater number of rainy days in southern *France*. There was 3.9 inches (100 millimeters) annual rainfall above the average in Marseilles. There was 5.9 inches (150 millimeters) annual rainfall above average in Tarbes. There was 36.7 inches (933 millimeters) annual rainfall above average in Joyeuse.<sup>79</sup>

In *India* in 1827-28, there was a famine in parts of Hindustan. “The autumn of 1827 and the following spring were marked by drought across the Jumna [Yamuna River]. In Pergunnahs, Ranees, and Sirsa, the rains commenced suspiciously, but stopped abruptly early in July, and did not begin again till the 22<sup>nd</sup> September. It was then too late to reclaim the damage, which the drought had already caused; and to add to the general distress there was every chance of a failure in the wheat. This was the staple rubbee [rupee] crop in these regions, and its success was mainly dependent on the river Ganges overflowing its banks, but on this occasion the usual inundations did not occur.”<sup>57</sup> [The Jumna River is a tributary river of the Ganges (Ganga) in northern *India*. Pergunnahs is in northern *India*. Ranees (Rania) and Sirsa are in northwestern *India*.]

In 1827, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 26 May and 23 June, floods struck Hupeh (now Hubei province) in central *China* at Fang, Ch’i-ch’un and Chiang-ling. At Fang, the fields were damaged and innumerable houses were damaged by the floodwaters. At Ch’i-ch’un, the houses and fields were damaged by the floodwaters and people and cattle drowned.

— During the period between 24 July and 21 August, floods struck Hupeh province at Chih-chiang and Shantung (now Shandong province) on the east coast of *China* at Jih-chao.

— During the period between 21 September and 19 October, floods struck Hupeh province at Ch’ung-yang and Ch’ien-chiang. At Ch’ien-chiang, the dikes were damaged.

In 1827 during the period between 22 August and 20 September, a severe drought engulfed Hopei (now Hebei province) in northern *China* at Nei-ch’iu.<sup>153</sup>

*Also refer to the section 1826 A.D. – 1829 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1827 / 1828 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1827 occurred on 6 November. Severe snowstorm, about 9 inches.<sup>116</sup>

In Bradford County, Pennsylvania in the *United States*, the autumn of 1827 was one of the coldest ever remembered, but it was followed by one of the mildest winters of the past 27 years. The winter produced scarcely any snow, but instead much rain. In January the average temperature was 37° F [3° C].<sup>178</sup>

During the winter of 1827-28, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for about 50 days. The river opened and closed repeatedly during this winter.<sup>202</sup>

January 1828 was unseasonably warm in Tennessee and throughout the Atlantic and Gulf States of the *United States*.<sup>140</sup>

**1828 A.D.** In *England* on the 12<sup>th</sup> and 13<sup>th</sup> of January, there was an awful storm on the English coast; many vessels lost.<sup>57</sup>

On 13 January 1828, a powerful storm struck Plymouth, *England*, casting 13 vessels ashore.<sup>43</sup>

On 12-13 January 1828, an awful storm struck the coast of *England*. Many vessels were lost, and 13 driven ashore and wrecked at Plymouth alone.<sup>90</sup>

In *Gibraltar* on the 18<sup>th</sup> of February, there was a great storm; more than 100 vessels destroyed.<sup>57, 90</sup>

On 18 February 1828, a storm struck on the coast of *Spain*. Between 160 and 180 sail of merchantmen were lost at *Gibraltar*.<sup>43</sup>

East Florida in the *United States* suffered exceedingly from a violent frost on the 6<sup>th</sup> of April 1828; on this bitter night crops of cotton, corn, and fruits were all destroyed. The thermometer at Six Mile Creek, on the St. John's, stood at 27° F, and the ice made an inch thick. The crops of corn and cotton were cut off as far south as Tomoko [in present day Volusia County, Florida].<sup>139</sup>

On the 6 April 1828, a heavy frost was very destructive to vegetation; the temperature at Picolata, Florida in the *United States* was as low as 28° F. [In 1987, the small village of Picolata is a barely noticed community on the St. Johns' eastern shore, near flashing daybeacon #25.]<sup>115</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Maastricht, <i>the Netherlands</i>	(101.8° F, 38.8° C)	on 2 August	
Saint George Del Mina, <i>Ghana</i>	( 90.0° F, 32.2° C)	on 12 May	[now Elmina]

In northern *France* in 1828, the variable weather was troubled by alternating periods of rain, wind, heat, cold, humidity, drought, storms and calm, serene days and cloudy days. This was especially true for the months July, August and September.<sup>79</sup>

In 1828 long rains reigned in northern *France*. They were mentioned in Strasbourg, Paris, Rouen and Metz. They did not extend to the southern *France*.<sup>79</sup>

In 1828, thunderstorms and rainstorms filled southern *France*. These occurred during spring, summer and autumn. Most of these storms were accompanied by hail.<sup>79</sup>

A dry heat fills the spring and summer of 1828. The heat was localized to southern *France*.<sup>79</sup>

Southern *France* suffered a severe drought during the spring and summer of 1828. There was significantly less rainfall in Marseille, Orange, and Joyeuse. There was not any rainfall in Marseille during the month of June. Orange received only 0.2 inches (5 millimeters) of rainfall during June.<sup>79</sup>

On 12 September 1828 in *England*, there was a hailstorm in Kent.<sup>93</sup>

On 13 September 1828, a hurricane struck near *Bermuda*. Three ships were lost.<sup>141</sup>

In *Ireland*, there was a great rise of the River Shannon; Cork also flooded.<sup>47, 92</sup>

In 1828, a powerful cyclone struck Nagasaki, *Japan* causing 15,000 deaths.<sup>98</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

*Also refer to the section 1826 A.D. – 1829 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1828 / 1829 A.D.** In 1829 after the temperature fell to 1° F ( -17° C), the Seine River in *France* froze at the Bridge “Pont de la Tournelle” in Paris from 25 to 28 January 1829. The Meuse River was towards the end of January frozen at Maastricht, the *Netherlands*.<sup>62</sup>

The winter of 1828-29 was not as severe in *France* as it were in *Belgium*, *Germany* and the *Danube countries*. Paris, *France* had 60 days of frost. The cold began on 6 January 1829 and lasted 21 continuous days with a very heavy frost. The frost began anew on 31 January and held until 11 February (with a break of 3 days) but was less intense. From time to time, the frost reappeared until the end of March. In Rouen, *France*, the Seine River froze on 18 January near Caudebec; in Paris, the cold came on 25 January, and the ice on the river on the 28th. The Meuse River was frozen from mid-January to mid February completely. The Rhine River was frozen, and during spring thaw it produced a major flood in Grünthal in Bavaria in southern *Germany*. The Danube River began to freeze in November. The port of Reval (now Tallinn, *Estonia*) was blocked by ice on 8 December. There was ample snow on the banks of the Danube River, at Strasbourg, Geneva and in *Spain*.<sup>62</sup>

The lowest temperatures recorded in different cities this winter: <sup>62</sup>

Berlin, <i>Germany</i>	( -13.0° F, -25.0° C ) on 24 January
Frankfurt, <i>Germany</i>	( -6.2° F, -21.2° C ) on 23 January
Basel, <i>Switzerland</i>	( -2.4° F, -19.1° C ) on 12 February
Great St. Bernard Hospice, <i>Switzerland</i>	( -0.8° F, -18.2° C ) on 1 February
Paris, <i>France</i>	( 1.4° F, -17.0° C ) on 24 January
La Chapelle (near Dieppe), <i>France</i>	( 2.7° F, -16.3° C ) on 23 January
Metz, <i>France</i>	( 6.8° F, -14.0° C ) on 22 January
Quillebeuf, <i>France</i>	( 6.8° F, -14.0° C ) on 24 & 25 January
Geneva, <i>Switzerland</i>	( 7.0° F, -13.9° C ) on 1 February
Orange, <i>France</i>	( 10.2° F, -12.1° C ) on 26 January
Joyeuse, <i>France</i>	( 11.3° F, -11.5° C ) on 25 January
Alais, <i>France</i>	( 12.6° F, -10.8° C ) in February
Brussels, <i>Belgium</i>	( 15.1° F, -9.4° C ) on 21 December
Avignon, <i>France</i>	( 27.9° F, -2.3° C ) on 15 December
Hyères, <i>France</i>	( 30.9° F, -0.6° C ) on 13 February

At Orange, *France*, the earth was covered with snow since the 10 January, and this seems to have protected the green including standing grain from damage. The ice has done significant damage to the mulberry trees. The winter at Marseille and the coast of Provence was very mild. But there were a lot of snow and severe frosts in the region of Toulouse.<sup>62</sup>

During the winter of 1828-29, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 100 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1828-29 at Thompson, Connecticut in the *United States* — For these six years (1823-1829) there was no record of the winter. It was during this interval that the editor of the National Weather Bureau was inclined to place a snowless term of years referred to in family reminiscences as the time when snowstorms were supposed to have permanently gone out of fashion and people talked of selling their sleighs.<sup>116</sup>

---

**1829 A.D.** On 11 January 1829, there was the most violent storm of wind and hail ever known in New South Wales, *Australia*.<sup>103</sup>

In Dantzic (Gdańsk, *Poland*) on April 9<sup>th</sup>, the Vistula River broke through its dikes, by which some 4,000 houses were destroyed and many of their occupants drowned. About 10,000 head of cattle were lost.<sup>47, 92</sup>

On 9 April 1829, an inundation at Dantzig [Gdańsk, *Poland*], occasioned by the Vistula River breaking through some of its dikes, by which 10,000 head of cattle and 4,000 houses were destroyed, and numerous lives lost.<sup>90</sup>

The rains of 1829 in *France* extended from north to south and from east to west. The high rainfalls were reported in Paris, Rouen, Metz, Strasbourg, Berzé-la-Ville, near Macon, Nantes, Joyeuse, Marseille, and Arles. No part of the country escaped. The total annual rainfall surpassed almost all the normal rainfall figures. The measured annual rainfall for the year 1829 was 24.1 inches (611 millimeters) in Paris on the terrace of the Observatory; 44.2 inches (1123 millimeters) in Rouen; 28.8 inches (732 millimeters) in Metz; 30 inches (761 millimeters) in Strasbourg; 38.2 inches (970 millimeters) in Berzel City; 61.7 inches (1,567 millimeters) in Nantes; 54.5 inches (1,385 millimeters) at Joyeuse; 23.5 inches (596 millimeters) at Marseilles; and 33.5 inches (851 millimeters) in Arles. Rain fell over the entire year. But the autumn, spring and summer experienced the greatest rainfalls.<sup>79</sup>

Major storms reigned in *France* in 1829.<sup>79</sup>

In June 1829 in southern *Spain*, there was a great hailstorm in Cazorta [Cazorla]. Blocks of ice weighing nearly 5 pounds (2.3 kilograms) fell during a hailstorm.<sup>93</sup>

On 14 July 1829 in *England*, there was a hailstorm in Kent.<sup>93</sup>

On 31 July 1829 in *England*, there was a hailstorm in Lincolnshire and Sussex.<sup>93</sup>

In *Scotland* on August 9<sup>th</sup>, the “Moray Floods” caused by rainfall, when the rivers Spey and Findhorn rose in some places 50 feet (15 meters) above their ordinary level, and caused great destruction of property. Many lives were lost.<sup>47, 92</sup>

On 3, 4 and 27 August 1829, the “Moray Floods” in *Scotland* were caused by rainfall, when the Spey and Findhorn rivers rose in some places 50 feet above their ordinary level, and caused great destruction of property. Many lives were lost, and whole families who took refuge on elevated places were with difficulty rescued.<sup>90</sup>

There was an inundation in Moray, *Scotland* in 1829, when over 5,000 square miles [12,950 square kilometers] were flooded.<sup>43</sup>

In *Ireland*, there were great floods in the south.<sup>47, 92</sup>

On 26 October 1829, a hurricane struck off St. Barthélemy [St. Barts] in the *Leeward Islands*. Two vessels slipped their anchors and went to sea. One returned, and the other was never heard from again.<sup>141</sup>

In 1829 during the period between 6 May and 8 November, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou. Then during the period between 8 August and 8 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Chan-hua and Ch’ang-ch’ing. Then during the period between 29 August and 25 November, a drought engulfed Hupeh (now Hubei province) in central *China* at I-ch’êng.<sup>153</sup>

*Also refer to the section 1826 A.D. – 1829 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1829 / 1830 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1829 occurred on 27 November. Snowed considerable.<sup>116</sup>

During the winter of 1829-30, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 63 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1829-30 at Thompson, Connecticut in the *United States* — On 14 November 1829 - snow, changing to rain. November 16<sup>th</sup> - snows considerable; remarkably warm Christmas weather; twelve days all fine and warm. On 25 January 1830 - term of snow. February 3<sup>rd</sup> - sleigh ride to Woodstock. February 10<sup>th</sup> - great sleigh ride. February 22<sup>nd</sup> - sleighing done. March 23<sup>rd</sup> - snow. March 26<sup>th</sup> - violent storm of snow all day.<sup>116</sup>

The winter of 1829-30 in Bradford County, Pennsylvania in the *United States* was mild until the 23<sup>rd</sup> of January when the weather suddenly became intensely cold. On November 15, a foot [30 cm] of snow fell. This allowed continuous sleighing until February.<sup>178</sup>

In March 1830, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 10<sup>th</sup> (32° F). There was frost on March 5<sup>th</sup>, 10<sup>th</sup>, and 20<sup>th</sup>.<sup>116</sup>

The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1829-30, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

In 1829, the Seine River in *France* was entirely frozen over.<sup>38</sup>

During the winter of 1829-30, most rivers of *France* were frozen. The Seine River in *France* was frozen to its full width from 28 December 1829 to 26 January 1830. The Seine froze for a second time from 5 to 10 February. The Meuse River was frozen from 18 December 1829 to 22 January 1830 and for a second time from 30 January to 9 February. The Rhine River, the Garonne River and the Rhône River near Avignon were completely frozen.<sup>62</sup>

The winter of 1829-30 began during the first days of October. The cold alternately between extreme and light cold on three occasions. Almost all the rivers in *France* were completely frozen two or three times during the winter. They were covered with firm ice in the months of December and February; including the Seine, the Rhine and the Rhône rivers. Only in April did it stop freezing. This cold, with snow was as hard as extended. Men and animals died of cold in the countryside and in the cities. The fieldwork was suspended for three whole months. Olive trees and grapevines could not resist the violence of frosts. Fruit trees died by the hundreds. Chestnut and oak trees suffered the same fate of vines and fruit trees.<sup>79</sup>

The winter of 1829-30 is remarkable because of its early onset of winter and its long persistent. The effect of this winter wrath spread all over *Europe*. A large number of rivers froze and the thaw brought devastating floods strengthened by the breakup of large ice flows. Many people and animals were killed by these floods, and the fieldwork was long lost. The following summarizes the length of the cold frost:<sup>62</sup>

22 October 1829	Jassy, <i>Romania</i>	heavy frost
3 November	Warsaw, <i>Poland</i>	( 23.0° F, -5.0° C)
21 November	Paris, <i>France</i>	( 22.5° F, -5.3° C)
22 December	St. Petersburg, <i>Russia</i>	(-22.0° F, -30.0° C)
23 December	Berlin, <i>Germany</i>	( -5.8° F, -21.0° C)
24 December	Geneva, <i>Switzerland</i>	( -0.8° F, -18.2° C)
25 December	Berlin, <i>Germany</i>	( -5.8° F, -21.0° C)
25 December	Geneva, <i>Switzerland</i>	( 2.3° F, -16.5° C)
25 December	Orange, <i>France</i>	( 10.0° F, -12.2° C)
26 December	Maastricht, <i>the Netherlands</i>	( -0.6° F, -18.1° C)

26 December	Orange, <i>France</i>	( 10.0° F, -12.2° C)
26 December	Paris, <i>France</i>	( 10.4° F, -12.0° C)
26 December	Toulouse, <i>France</i>	( 13.5° F, -10.3° C)
26 December	Bordeaux, <i>France</i>	( 14.0° F, -10.0° C)
27 December	Aurillac, <i>France</i>	(-10.5° F, -23.6° C)
27 December	Pau, <i>France</i>	( 0.5° F, -17.5° C)
27 December	Paris, <i>France</i>	( 6.4° F, -14.2° C)
27 December	Avignon, <i>France</i>	( 8.6° F, -13.0° C)
27 December	Toulouse, <i>France</i>	( 9.5° F, -12.5° C)
27 December	Lyon, <i>France</i>	( 10.4° F, -12.0° C)
28 December	Paris, <i>France</i>	( 5.9° F, -14.5° C)
28 December	Alais, <i>France</i>	( 12.6° F, -10.8° C)
28 December	Marseille, <i>France</i>	( 13.8° F, -10.1° C)
28 December	London, <i>England</i>	( 18.3° F, -7.6° C)
28 December	Hyères, <i>France</i>	( 22.5° F, -5.3° C)
29 December	St. Petersburg, <i>Russia</i>	(-26.5° F, -32.5° C)
29 December	Metz, <i>France</i>	( 2.3° F, -16.5° C)
29 December	Joyeuse, <i>France</i>	( 3.9° F, -15.6° C)
29 December	Toulouse, <i>France</i>	( 5.0° F, -15.0° C)
29 December	Paris, <i>France</i>	( 7.7° F, -13.5° C)
30 December	Avignon, <i>France</i>	( 12.2° F, -11.0° C)
30 December	Marseille, <i>France</i>	( 16.2° F, -8.8° C)
31 December	Madrid, <i>Spain</i>	( 11.8° F, -11.2° C)
31 December	Bordeaux, <i>France</i>	( 12.9° F, -10.6° C)
1 January 1830	Paris, <i>France</i>	( 10.8° F, -11.8° C)
1 January	Rome, <i>Italy</i>	( 27.5° F, -2.5° C)
3 January	Joyeuse, <i>France</i>	( 11.3° F, -11.5° C)
5 January	Alais, <i>France</i>	( 14.4° F, -9.8° C)
8 January	Orange, <i>France</i>	( 9.5° F, -12.5° C)
10 January	Geneva, <i>Switzerland</i>	( 2.3° F, -16.5° C)
11 January	Paris, <i>France</i>	( 29.8° F, -1.2° C)
12 January	Paris, <i>France</i>	( 22.5° F, -5.3° C)
13 January	Maastricht, <i>the Netherlands</i>	( 1.8° F, -16.8° C)
13 January	Paris, <i>France</i>	( 16.7° F, -8.5° C)
14 January	Paris, <i>France</i>	( 9.9° F, -12.3° C)
15 January	Paris, <i>France</i>	( 9.7° F, -12.4° C)
16 January	Paris, <i>France</i>	( 6.8° F, -14.0° C)
17 January	Paris, <i>France</i>	( 1.0° F, -17.2° C)
18 January	Paris, <i>France</i>	( 13.1° F, -10.5° C)
19 January	Paris, <i>France</i>	( 19.9° F, -6.7° C)
31 January	Metz, <i>France</i>	( -4.9° F, -20.5° C)
31 January	Berlin, <i>Germany</i>	( -4.0° F, -20.0° C)
31 January	Maastricht, <i>the Netherlands</i>	( -1.1° F, -18.4° C)
31 January	Brussels, <i>Belgium</i>	( -1.1° F, -18.4° C)
31 January	Geneva, <i>Switzerland</i>	( 3.6° F, -15.8° C)
31 January	Paris, <i>France</i>	( 11.3° F, -11.5° C)
31 January	Rouen, <i>France</i>	( 14.9° F, -9.5° C)
1 February	Yverdon, <i>Switzerland</i>	( -5.8° F, -21.0° C)
1 February	Valence, <i>France</i>	( 10.4° F, -12.0° C)
1 February	Paris, <i>France</i>	( 14.0° F, -10.0° C)
2 February	St. Bernard Hospice, <i>Switzerland</i>	( -5.1° F, -20.6° C)
2 February	Metz, <i>France</i>	( -3.6° F, -19.8° C)
2 February	Maastricht, <i>the Netherlands</i>	( -2.7° F, -19.3° C)
2 February	Paris, <i>France</i>	( 5.2° F, -14.9° C)
2 February	Joyeuse, <i>France</i>	( 11.3° F, -11.5° C)
2 February	Avignon, <i>France</i>	( 11.3° F, -11.5° C)

2 February	Marseille, <i>France</i>	( 13.8° F, -10.1° C)
2 February	Hyères, <i>France</i>	( 22.5° F, -5.3° C)
3 February	Mulhouse, <i>France</i>	(-18.6° F, -28.1° C)
3 February	Basle, <i>Switzerland</i>	(-16.6° F, -27.0° C)
3 February	Nancy, <i>France</i>	(-15.3° F, -26.3° C)
3 February	Épinal, <i>France</i>	(-14.1° F, -25.6° C)
3 February	Strasbourg, <i>France</i>	(-10.1° F, -23.4° C)
3 February	La Chapelle, <i>France</i>	( -3.6° F, -19.8° C)
3 February	Maastricht, <i>the Netherlands</i>	( -2.7° F, -19.3° C)
3 February	Freiburg, <i>Germany</i>	( -1.3° F, -18.5° C)
3 February	Paris, <i>France</i>	( 5.0° F, -15.0° C)
4 February	Paris, <i>France</i>	( 6.3° F, -14.3° C)
5 February	Paris, <i>France</i>	( 7.7° F, -13.5° C)
6 February	Paris, <i>France</i>	( 3.9° F, -15.6° C)
6 February	London, <i>England</i>	( 15.6° F, -9.1° C)
7 February	Paris, <i>France</i>	( 13.6° F, -10.2° C)
21 February	Maastricht, <i>the Netherlands</i>	( 20.7° F, -6.3° C)
21 February	Paris, <i>France</i>	( 24.8° F, -4.0° C)
8 March	Maastricht, <i>the Netherlands</i>	( 20.7° F, -6.3° C)
8 March	Paris, <i>France</i>	( 27.9° F, -2.3° C)

The winter weather arrived in Moldova at the end of October. It arrived in *Poland* in early November. On 2 November in Warsaw, *Poland*, so much snow had already fallen that one could travel the streets of the city using a sledge. On the following day the thermometer sank to 23.0° F (-5.0° C).<sup>62</sup>

In St. Petersburg, *Russia* the cold during December was indeed severe, but not unusual. On 22 December the temperature dropped to -22.0° F (-30.0° C), and on 29 December the temperature dropped to -26.5° F (-32.5° C). In January, where in the temperate southern climates there was severe cold; the winter in *Russia* was very mild with observed temperatures of only 23° to 25° F (-4° to -5° C). A severe frost struck the shores of the *Black Sea* on 11 December.<sup>62</sup>

In December heavily laden sledges crossed the Sound, seven to eight leagues (21 to 24 miles, 34 to 39 kilometers) broad, between *Sweden* and *Denmark* because of the thickness of the ice in *the Belts*. In January, the ice in *the Belts* interrupted the shipping on only 12 days. In January, the direct transport across the ice between Elsinore and Helsingborg was interrupted by the violence of the currents. Because the severity of the cold during the month, tours on the ice became very dangerous.<sup>62</sup>

In *Prussia*, there was significant snowfall and the thermometer was during a portion of December and January below -4° F (-20° C). At the end of January in the streets of Berlin, *Germany*, the snow was 0.50 meters (1.6 feet) deep.<sup>62</sup>

In *Holland* and *the Netherlands*, the cold was very persistent and took the same course as in *Southern Europe*. The frost began at Maastricht, *the Netherlands* on 3 December, and dropped down to 17.6° to 26.6° F (-3° to -8° C) every night. From 25 December, the cold dropped into the range of -0.6° to 9.9° F (-12.3° to -18.1° C). For 3 or 4 days beginning on 7 & 8 January 1830, the weather was a bit milder. But then it began to frost again. On 13 January, the weather was particularly violent. During the night, the cold would reach down to 1.8° to 15.8° F (-9° to -16.8° C). After a break of several days, the temperature was 14.9° F (-9.5° C) on 29 January and -1.1° F (-18.4° C) on 31 January. In February, the first four nights fell to -0.9° to -2.7° F (-18.3° to -19.3° C). The temperature on 4 and 5 February was 5.0° to 10.4° F (-12.0° to -15.0° C). Later, it froze from time to time at night, but the coldest was only 20.7° F (-6.3° C) on 21 February. During the first third of March the nighttime temperatures would dip down to 26.6° to 30.2° F (-1.0° to -3.0° C).<sup>62</sup>

In Paris, *France*, the thermometer dropped below zero from 17 to 22 November, and again on 24 and 25 November. From 26 November to 5 December, it was not cold. The cold began again on 6 December, and held with great severity, without interruption until 19 January. From 20 to 27 January, the temperature was slightly above freezing. But on 28 January to 7 February the frost began anew. It was fairly warm between 8 to 10 February. There was frost on 11 days in February and four days in March. The lowest temperatures for each month were: on 21 November 1829 (22.5° F, -5.3° C); on 28 December (5.9° F, -14.5° C); on 17 January 1830 (1.0° F, -17.2° C); on 6 February (3.9° F, -15.6° C); and on 8 March (27.9° F, -2.3° C). On the whole, there were 77 frost days, including 32 days in succession.<sup>62</sup>

In the south of *France* at Alais [now Alès] on the mornings of 27 and 28 December, the temperature fell to 14° F (-10° C) and 12.7° F (-10.75° C) respectively. This was the coldest December since the year 1802. (Previous December temperatures fell to 23° F (-5° C) in 1821 and 1825.) January 1830 was a very cold month because it froze every day, without exception. In February it froze until 24 February. On 2 or 3 mornings, the temperature fell to 15.8° F (-9° C), and on several days the temperature was in the range of 17.6° to 23° F (-5° to -8° C). On 22 December, there was heavy snowfall. Snow also fell on 27 & 28 December, 16 & 18 January, and on 4, 14 & 15 February. The snow stayed on the ground for 54 days.<sup>62</sup>

The winter in Orange, *France* was severe. "The terrible temperature in January and February, the entire population has moved into inactivity. The ice had a thickness of 0.38 meters (1.3 feet); the ground was frozen to 0.64 meters (2.1 feet). The Rhône River is crossed on the ice. The lowest observed temperature was 10.0° F (-12.2° C) on 25 and 26 December 1829, and 9.5° F (-12.5° C) on 8 January 1830."<sup>62</sup>

In the region of Toulouse, *France*, the winter was severely cold, which held without interruption from 25 December until 17 January. It was renewed, but with somewhat less intensity, in the first days of February. The rest of the winter was wet.<sup>62</sup>

In *Switzerland*, the winter at high elevations was very severe. At Freiburg in southwest *Germany*, there were 115 frost days, including 69 consecutive. The coldest temperature at Freiburg was -1.3° F (-18.5° C). Polar snow from low hanging crystals falling only at very low temperatures was observed. In the valley of Chamouny, at the foot of Mont Blanc, and on St. Bernard, there was no snow. While high in the streets of Geneva, *Switzerland*, more than 30 centimeters (1 foot) fell. In *Corsica* and *Italy* on a few occasions the thermometer fell to 23° to 26.6° F (-3° to -5° C), and there were great snowfalls. In *Spain*, winter began at the end of November with abundant and persistent rains. In Madrid, *Spain* and in the provinces at the end of December, the temperature fell to 19.4° F (-7° C), 15.8° F (-9° C), and 11.78° F (-11.2° C). In Bilbao in northern *Spain*, northern swans were sighted. In some valleys [in Spain], the snow was 3 meters (9.8 feet) deep. In *Portugal*, the temperature at one point during the winter dropped down to 10.4° F (-12° C).<sup>62</sup>

The following summarizes the lowest observed temperatures in various cities during the winter of 1829-1830:<sup>62</sup>

St. Petersburg, <i>Russia</i>	(-26.5° F, -32.5° C) on 29 December 1829
Mulhouse, <i>France</i>	(-18.6° F, -28.1° C) on 3 February 1830
Basel, <i>Switzerland</i>	(-16.6° F, -27.0° C) on 3 February 1830
Nancy, <i>France</i>	(-15.3° F, -26.3° C) on 3 February 1830
Épinal, <i>France</i>	(-14.1° F, -25.6° C) on 3 February 1830
Innsbruck, <i>Austria</i>	(-13.0° F, -25.0° C) in January 1830
Aurillac, <i>France</i>	(-10.5° F, -23.6° C) on 27 December 1829
Strasbourg, <i>France</i>	(-10.1° F, -23.4° C) on 3 February 1830
Berlin, <i>Germany</i>	( -5.8° F, -21.0° C) on 25 December 1829
Yverdon, <i>Switzerland</i>	( -5.8° F, -21.0° C) on 1 February 1830
Great St. Bernard Hospice, <i>Switzerland</i>	( -5.1° F, -20.6° C) on 2 February 1830

Metz, <i>France</i>	( -4.9° F, -20.5° C ) on 31 January 1830
La Chapelle (near Dieppe), <i>France</i>	( -3.6° F, -19.8° C ) on 3 February 1830
Maastricht, <i>the Netherlands</i>	( -2.7° F, -19.3° C ) on 3 & 4 February 1830
Freiburg, <i>Germany</i>	( -1.3° F, -18.5° C )
Brussels, <i>Belgium</i>	( -1.1° F, -18.4° C ) on 31 January 1830
Colmar, <i>France</i>	( -0.4° F, -18.0° C ) in February 1830
Paris, <i>France</i>	( 1.0° F, -17.2° C ) on 17 January 1830
Geneva, <i>Switzerland</i>	( 2.3° F, -16.5° C ) on 25 December 1829
Joyeuse, <i>France</i>	( 3.9° F, -15.6° C ) on 29 December 1829
Rouen, <i>France</i>	( 5.9° F, -14.5° C ) in February 1830
Avignon, <i>France</i>	( 8.6° F, -13.0° C ) on 27 December 1829
Orange, <i>France</i>	( 9.5° F, -12.5° C ) on 8 January 1830
Toulouse, <i>France</i>	( 10.0° F, -12.2° C ) on 27 December 1829
Gibraltar	( 10.2° F, -12.1° C ) on 1 January 1830
Lyon, <i>France</i>	( 10.4° F, -12.0° C ) on 27 December 1829
Madrid, <i>Spain</i>	( 11.8° F, -11.2° C ) on 31 December 1829
Alais, <i>France</i>	( 12.6° F, -10.8° C ) on 28 December 1829
Marseille, <i>France</i>	( 13.8° F, -10.1° C ) on 2 February 1830
Bordeaux, <i>France</i>	( 14.0° F, -10.0° C ) on 26 December 1829
London, <i>England</i>	( 15.6° F, -9.1° C ) on 6 February 1830
Andalucía, <i>Spain</i>	( 16.3° F, -8.7° C )
Hyères, <i>France</i>	( 22.5° F, -5.3° C ) on 28 Dec. 1829 & 2 Feb. 1830
Valencia, <i>Spain</i>	( 23.0° F, -5.0° C )
Seville, <i>Spain</i>	( 23.0° F, -5.0° C )
Rome, <i>Italy</i>	( 27.5° F, -2.5° C ) on 1 January 1830

The Seine River froze the first time for 29 days from 28 December to 26 January. It froze again from 5 to 10 February for a total of 34 days. This is the same length of time as in the year 1763. At Havre, *France*, the Seine River first froze on 27 December; and on 18 January a market was set up on the ice at Rouen, *France*. On 25 January the ice began to thaw and break up in the rivers and started coming down through the Paris suburbs Eorbeil and Melun to the bridge at Choisy, and there the ice formed a 5 meter (16.4 foot) high wall and the pillar stood up to the crown under water and the city became a lake.<sup>70</sup> In Paris the swelling of the river became noticeable at 9 o'clock in the evening. By 10 o'clock there was a weak movement of the ice above the bridge Pont d'Austerlitz. At 3 o'clock in the morning, the ice waters broke loose and drove for a half hour. A huge pile of debris formed against the upper decks and against the pilings of the island of St. Louis. In the great port were about 60 large coal ships and a host of other vessels loaded with commercial goods. At 5:30 in the morning the ice began to move again with an indescribable violence against the newly installed posts and straps reinforced piles. They suffered a terrible blow and were pushed back 0.30 meters and the stone abutments of the wharf, on which it was anchored, gave way. It resisted as if by a miracle, and thus protects not only the many commercial vessels that filled the harbor, but also the bridges of the great arm, which had a huge pile of floating ice and debris which threatened to carry it away. For such a terrible ice conditions, there was relatively only minor losses: the bleachery la Sirene, which was demolished by the ice, several Marne-boats, some light vessels, a portion of the pole plant in Bath Vigier, the piles of the port of Grenelle, two arches of the Pont du Pecq to St. Germain, and a pillar of the Fontainebleau to Melun bridge. Due to the fact that the ice waters backed-up at Choisy-le-Roi, the flood damage downstream was weakened. The floodwaters reached to height of 6.0 meters at the bridge Pont de la Tournelle. The next day, 27 January, was the height of the water was down to 4 meters. The second flood occurred in February but caused little damage.<sup>62</sup>

Ice began to appear on the Meuse River on 8 December. It froze entirely on 28 December. The ice broke up on 22 January. The river froze for a second time between 30 January and 9 February. On 10 January, the ice broke in an instant at Schiedam in southern *Netherlands*. This happened when over 400 people

were on the river; two persons were killed. The Rhine River was frozen at several locations, especially at Breisach, *Germany* on the second of February. The ice in the Rhine River pressed against the Strasbourg Bridge and tore away a portion of it. This interrupted all traffic between Strasbourg, *France* and Kehl in southwest *Germany*. The Inn River was frozen until Hall in western *Austria*. Lake Geneva near Geneva, *Switzerland* was frozen from 3 to 8 February. The Loire, Vienne and Orne rivers in *France* froze. In the south, the Garonne, the Dordogne, the Durance rivers along with the Canal of Languedoc were covered with ice. Ice sheets on the Rhône River destroyed two of the leading arm of the great bridge of Avignon, *France* and swept away two mills at Lyon, *France*. The Saône River froze twice. In Bayonne in southwestern *France* individuals skated on the frozen Adour and the Nive rivers. In the port of Bordeaux, *France*, the ships suffered greatly from the ice. The port of Odessa, *Ukraine* on the *Black Sea* was frozen on 8 December. In *Germany*, there was ice of the Danube River and its tributaries. And when the snow and ice melted it produced a great floods that swept away bridges and devastated urban neighborhoods. On 4 March, 30 corpses were recovered from the Danube River.<sup>62</sup>

The severity of the cold in *France* during this winter was demonstrated by the following facts: In Paris, on the night of the 26 December, a soldier froze to death while standing guard. The mayors of the 7th and 10 District set up heated public shelters on 15 January. Many teamsters disappeared in the snow in Normandy when the snow reached the height of 2 meters. At Rouen, a child froze to death in February. In Alsace, soldiers were sent out against the unfortunates who plundered the forests and woods for firewood, in order to keep warm. At Guebwiller in northeastern *France*, the suppression of firewood thefts led to an uprising on 10 February. The King Charles X found himself compelled to grant amnesty on 4 March for the timber theft crimes committed during the duration of the winter. In Avignon at the end of December because of the severe weather, the workshops were closed. In Montreuil, two men were found frozen to death on 1 January. At Marseille on 12 January, five people likewise succumbed to the cold on the roadways, a coachman, military personnel, etc. Several smugglers attempting to cross the Pyrenean froze to death.<sup>62</sup>

Since the end of December all wagons and carriages were converted into sleighs in Berlin, *Germany*. The hospitals and workhouses filled with unfortunates who were overwhelmed by the misery and cold. In *Germany*, it was necessary, as in *France*, to send detachments of troops into the woods to track the timber thieves stealing firewood. In *Spain*, the transportation was disrupted; guards, shepherds and carters froze to death. The mortality in the flocks was extraordinary. In Andalusia, *Spain*, it was estimated 14,000 head of cattle perished. At Pena de Orduna [Peña de Orduña in northern *Spain*], 14 mule drivers and 35 mules perished in the cold. The wolves, which were driven from the snow of the mountains to the plains below caused cruel havoc among the flocks, and attacked a large number of people.<sup>62</sup>

In Vienna, *Austria* in February, the dwellings of 50,000 inhabitants were under water.<sup>47, 90, 92</sup>

In Coblenz, Prussia (now Koblenz, *Germany*), in the spring the waters of the Moselle River thawed before those of the Rhine River, and being stopped by the ice, did very considerable damage.<sup>47, 92</sup>

---

**1830 A.D.** One wrongly cries out about the heat in northern *France* in 1830. This memorable year was instead, rather extremely variable. The cold of the winter suddenly stopped on the first day of March. This unusual warmth was replaced for a few days with rainy cold weather until April 7. Then the warmth and serenity resumed. Soon came early waves of thunderstorms. The weather alternated between stifling heat and penetrating cold, storms and calms, rain and good weather. Cold rain replaced the normally hot months of May and June. On 25 June alone unbearable heat was momentarily interrupted by cold, rain and disturbances. A violent storm broke out on July 11, at eight o'clock at night, and rain showers continued to the consecutive night. Thinning threatened, with a sultry heat that still ruled during the day. But there was even a downpour at midday. However the atmosphere is gradually refined, the air became dry, and free heat came. The sun began to shine on July 24<sup>th</sup>. The sky seemed fine, very pure skies and

warmth, but the heat from the sun soon eclipsed history. The great heat died on the eleventh day after a terrible storm on the night of August 4. Atmospheric disturbances began again on August 5. There were other storms, accompanied by rain. On the 9<sup>th</sup> and 10<sup>th</sup> of August, the wind, rain, cold mixed with and alternating brief moments of calm, drought and heat. And finally, the year ended in early frost, excessive moisture, mist and snow.<sup>79</sup>

On 26 March 1830, a strong storm struck New England in the *United States*, causing great tides.<sup>199</sup>

— At Portland, Maine, several wharves were carried away. Many vessels were driven ashore or greatly damaged. A long storehouse at Union Wharf was swept away.

— At Portsmouth, New Hampshire, the wharves were damaged and several vessels were driven ashore.

— At Newburyport, Massachusetts, the wharves were overflowed but escaped with little damage. The schooner *Lady Howard* was driven ashore at Salisbury.

— At Gloucester, Massachusetts, 2 to 3 feet [0.6-0.9 meters] of water covered the wharves. The sloop *William Swain* was driven ashore at Sandy Bay and was a total loss.

— At Beverly, Massachusetts, the schooners *Agawam* and *Abigail* collided and were damaged.

— At Salem, Massachusetts, a store on Derby wharf and a store on Crowninshield's wharf were overthrown by the water. The waves rolled several feet above the wharves. The brig *Washington* was driven ashore at the foot of Hardy Street. At high tide, the water was four feet [1.2 meters] deep on the isthmus connecting the Neck with the town at the head of Fort Avenue.

— At Marblehead, Massachusetts, several vessels were driven ashore.

— At Lynn, Massachusetts, the schooner *Adventurer* was driven ashore on the beach at Nahant.

— The tide at Boston, Massachusetts, was 1½ inches [4 centimeters] higher than the great tide of December 1786, which was 10 inches [25 centimeters] higher than the highest that any person then living remembered. Water broke through the dam along the Roxbury canal. At Roxbury, the water rose six feet [1.8 meters] above the floors in the houses and about eighty women and children were rescued by boat and taken to higher ground. Large quantities of rice, flour and coal were either washed away or ruined. Much property was set afloat at Charlestown and Cambridgeport. The Navy Yard was overflowed, and the tide broke through the cofferdam, about three feet [0.9 meters] of water coming into the dry docks. The sloop *Globe* and the schooner *Edward* went ashore at Scituate beach.

In May 1830 in *Western Australia*, the city of Perth flooded.<sup>101</sup>

In May 1830, unexpected severe flooding caused heavy damage to the fledgling Swan River settlement in *Western Australia*.<sup>99</sup>

On 25 June 1830 in *England*, there was a hailstorm in Norfolk and Suffolk.<sup>93</sup>

In July 1830 in *Ireland*, the month was exceedingly unnatural, with hail, rain, and storm.<sup>93</sup>

There was a great freshet in Vermont and New Hampshire in the *United States* in July 1830. The summer of 1830 in Vermont had been cold and wet. But the weather changed during the middle of July. Suddenly the temperature was between 90° F and 94° F [32°-34° C]. Beginning on 24 July a five-day rainstorm struck. During that time at Burlington Vermont, over seven inches [18 centimeters] of rain fell. The rivers were swollen to a height never before known, their banks being overflowed, and much property including bridges and mills were destroyed. A person wrote from Burlington at that time that he doubted if any manufacturing establishment of a large size remained within fifty miles [80 kilometers] of Burlington, so great was this flood. In New Hampshire, the Merrimack River was very swollen by the rains causing flood damage. The flood was as disastrous to the New York side of Lake Champlain as it was in Vermont.<sup>199</sup>

— The Missisquoi and Lamoille Rivers overflowed their banks. At Milton, Vermont, the floods destroyed the bridge, a trip-hammer shop, a fulling mill, and damaged a gristmill.

— The Winooski or Onion River flooded. At Northfield, Vermont, the mills and a factory were damaged. In Berlin, Vermont on the Mad River, not a mill was left standing and on the Dog River, all the bridges were carried away. Montpelier received considerable flood damage. Two bridges were swept away along with a mill, a barber's shop and another building. One person drowned. At Middlesex, the mills, carding and cloth-dressing works and a bridge was destroyed. From Middlesex to Lake Champlain, not a bridge was left standing. At Moreton [Moretown], a number of houses and barns were swept away and one person drowned. In Bolton, barns and a house were swept away. At Hubbells Falls, a toll bridge, clothing works, carding machine, hemp machine, and sawmill were destroyed. At Colchester, a bridge, a sawmill, an oil mill and a woolen factory were swept away. At Burlington, a bridge, plaster mill, sawmill, blacksmith shop, coalhouse, crops, a dam and other buildings were destroyed.

— On the White River, all the bridges from Roxbury to Royalton, Vermont, were carried away. At Braintree, three sawmills were swept away. At West Randolph, a woolen factory and gristmill and two houses were destroyed. At Bethel, a store was demolished by the floodwaters.

— On the Middlebury River, a farmer at Cornwall, Vermont, lost a flock of a hundred sheep that were drowned. Two bridges at Cornwall were swept away. At Weybridge, a sawmill and a bridge were swept away and another farmer lost 100 sheep on the flats. The dam at Bristol and Lincoln gave way.

— At New Haven, Vermont, a flood of water cause the Middlebury River to rise 10 to 12 feet [3.0-3.7 meters] higher than it was ever known to before. Dams burst. It carried off 20 buildings at West Mills. In the southeast part of town, two houses and a sawmill were swept away. A little further downstream at Wilson mills, the floodwaters washed away a bridge, a gristmill and a clothier works. Fourteen people were drowned at that location and twenty-one buildings were carried away. At East Mills, the bridge, dam, woolen factory, gristmill, sawmill and other mills were swept away by the floodwaters.

On 15-16 August 1830, a hurricane struck Florida in the *United States*. Several ships were lost off Cape Florida [Key Biscayne].<sup>141</sup>

In August 1830, a memorable gale passed close to the Windward Islands, visited *St. Thomas'* on the 12<sup>th</sup>; was near *Turks' Island* on the 13<sup>th</sup>; at *the Bahamas* on the 14<sup>th</sup>; on the gulf and coast of Florida in the *United States* on the 15<sup>th</sup>; along the coast of Georgia and the Carolinas on the 16<sup>th</sup>; off Virginia, Maryland, New Jersey, and New York on the 17<sup>th</sup>; off George's Bank and Cape Sable [Nova Scotia, *Canada*] on the 18<sup>th</sup>; and over the Porpoise and Newfoundland Banks [in *Canada*] on the 19<sup>th</sup>. It traveled 3,000 miles in 7 days.<sup>228</sup>

On 17 August 1830 in *England*, there was a hailstorm in Suffolk.<sup>93</sup>

A violent and extensive hurricane was first encountered to the north of *Turks' Island* on 22 August 1830. It moved north of *the Bahamas* on the 23<sup>rd</sup>, and off the coast of the *United States* on the 24<sup>th</sup>, 25<sup>th</sup>, and 26<sup>th</sup>. Much damage was done on the ocean by this storm but it scarcely reached the American shores.<sup>228</sup>

In 1830 in *France*, the losses from hailstorms during the year were estimated at £1,840,000. [In today's currency, that would be the equivalent of £139,000,000 or \$226,000,000 U.S. dollars using the retail price index.]<sup>93</sup>

In Paris, *France*, in the spring, summer and autumn of 1830, thunderstorms multiplied, mingled with storms and torrents of rain causing major disruptions. The first storms broke out in early April. Gusts and showers succeeded them in the months of May and June. The months of July and August produced thunderstorms followed by rain showers. On the night of August 4, nothing was missing from the endearing spectacle of this crisis. The storm feuded with greatest storms with the majesty for the title of the worst. Storms and showers returned in their turn, leaving just a few calm days in-between.<sup>79</sup>

December 1830. A similar storm traveled the same track on the 13<sup>th</sup> to 15<sup>th</sup> of January 1831.<sup>228</sup>

During the winter of 1830-31, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 82 days.<sup>202</sup>

In the *United States*, the earth was covered with snow in Philadelphia and the Delaware River was closed with thick ice from the first week in January until the last week in February. The streets of the city and roads in the country were banked up by the snow to a great height. The newspapers from Virginia, the far western U.S., the middle, northern and eastern States said that more snow had fallen during this month, than any corresponding month since 1780 A.D. A Salem, Massachusetts' newspaper said the snow drifted into banks in that town, and through that region of the country, to the depth of fifteen feet (4.6 meters). Other newspapers from the north and east published similar accounts.<sup>1</sup>

In the *United States*, the earth was covered with snow from the first week in January to the first week in March, from Maryland to Maine. In many places the snow was blown into banks from ten to twenty feet (3-6 meters) high. Snow fell in Maryland, Virginia, the Carolinas and in Alabama.<sup>1</sup>

In the *United States*, a great snowstorm began 14 January 1831 just south of the Mason-Dixon line and moved up the East Coast. It dumped 13 inches (0.3 meters) of snow at Washington D.C. and 18 inches (0.5 meters) in Baltimore, Maryland. It was a slow moving storm that lasted until the 16<sup>th</sup>. In Pennsylvania, the depth at West Chester averaged three feet (0.9 meters); at Lewiston the depth was 3 feet (0.9 meters) and 3 ½ feet (1.1 meters) in the countryside; in the lower Susquehanna Valley the snow was 3 feet (0.9 meters) with drifts up to 12 feet high (3.7 meters); at Harrisburg the snow was 2 feet (0.6 meters) deep; Pottsville reported 3 feet (0.9 meters) of snow; in Easton the depth was about 30 inches (0.8 meters); at Milford it was about 20 inches (0.5 meters); and in Pittsburg it was 22 inches (0.6 meters).<sup>27</sup>

In Central and Southeastern Illinois in the *United States*, the winter of 1830-31 produced deep snow. During this period, this part of Illinois was sparsely settled. The roads were merely trails or bypaths; and the houses of the settlers were log cabins of a crude style, and the larder [a small cool room or area for storing food] was not well supplied with sufficient provisions to carry the settler and his family through the winter. This being the case, much suffering occurred. The "deep snow" was one of the landmarks of the early settlers. It was one of the milestones that the early settlers used to count in dating events (birth, marriage, death). The snow began falling early in autumn and continued at intervals, throughout the entire winter. The snowfalls were succeeded by heavy sleet, forming crusts of ice between the layers of snow, strong enough in many places to bear up the deer and hunter. Frequently for weeks the sun was not visible, and the cold was so intense that not a particle of snow would melt on the sides of the cabins facing south. For weeks people were blockaded within their cabins and remained so until starvation compelled them to go forth in search of food. Great suffering, hunger and untold hardships were endured by the people. Game, such as deer, prairie chickens, quails, rabbits, etc., before this winter were very abundant, but for years afterwards were very scarce; having perished in the snow. As the snow would thaw, deer were often caught and killed without the aid of firearms because the deer were unable to get through the snow or walk on top it. Later in the winter when the mass of snow or ice had become compact, fences that were staked and rided [braced] buried in the snow were driven over with heavy loaded vehicles, and, in fact, the old settlers say in places these fences couldn't even be seen. The snow in many places where it was not drifted was between three and five feet deep. In the spring, when this immense snow melted, the rivers, streams and marshes became flooded.<sup>245</sup>

In March 1831, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 18<sup>th</sup> (32° F); 21<sup>st</sup> (32° F). There was frost on March 2<sup>nd</sup>, 8<sup>th</sup>, 9<sup>th</sup>, 11<sup>th</sup>, and 22<sup>nd</sup>. There was snow on March 17<sup>th</sup>.<sup>116</sup>

A snowstorm began on 31 January 1831, continued for four days, and extended over the north of *England* and the whole of *Scotland*.<sup>43</sup>

---

**1831 A.D.** In *Ireland* in February, there were great floods in the River Liffey; and waterspouts in various parts of the country.<sup>47, 92</sup>

In *Ireland* in 1831, there was a famine. Parliament granted 40,000*l.* for relief; 74,410*l.* subscriptions in England.<sup>57, 91</sup>

*Ireland* suffered the effects of famine in 1816, 1822 and 1831.<sup>188</sup>

In *India* during 1831-32, there was scarcity in Poona and the southern Mahratta country, producing considerable distress, but hardly a famine.<sup>57</sup> [Mahratta is a Maharashtra state in western *India*.]

In 1831, a powerful cyclone struck Barisal in southern *Bangladesh* causing 22,000 deaths.<sup>98</sup>

On 8 May 1831 on the terrace of Fort Bab-Azoun in *Algeria*, there was an instance of St. Elmo's Fire. After sunset some artillery officers were walking with uncovered heads during a storm. Each one, on looking at his neighbour, remarked with astonishment that the ends of their hair stood up, with little luminous plumes. When these officers raised their hands, plumes of light formed at the ends of their fingers.<sup>205, 271</sup>

On 28 May 1831 in *England*, there was a hailstorm in Hertfordshire.<sup>93</sup>

A hurricane struck the islands of *Trinidad, Tobago and Grenada* on 23 June 1831. It then passed into the Caribbean Sea. The hurricane encountered the H.M. Schooner *Minx*, and other vessels, and its swell was thrown with great force upon the southeastern shores of *Jamaica* on the 25<sup>th</sup>. It reached the coast of Yucatan [*Mexico*] on the night of 27 June. The hurricane traveled from Trinidad to the western shore of the Bay of Honduras in a little more than one hundred hours, a distance of about 1,700 nautical miles.<sup>228</sup>

On 16 July 1831, there was a dreadful storm at the Cape of Good Hope, *South Africa*, where immense property was lost.<sup>57, 90</sup>

An extraordinary dry fog occurred in August 1831 in part of *Europe*, the north coast of *Africa* and in the *United States*. It diminished the light of day and at nighttime produced a phosphorescent radiance. [Refer to a similar event in 1783] {This may have been related to an asteroid bolide impact event}<sup>205</sup>

On 10 August 1831, a hurricane struck the Island of *Barbados*, where it raged with great violence. On the 11<sup>th</sup>, it passed over the islands of *St. Vincent*, and *St. Lucia*, extending its influence to *Martinique* and the neighboring islands on the north, and to *Grenada* on the south, but exhibiting its chief violence between 12° 30' and 14° 30' of North latitude. On the 12<sup>th</sup>, it arrived on the southern coast of the Island of *Puerto Rico*. From the 12<sup>th</sup> to the 13<sup>th</sup>, it swept over the island of *Haiti* and the *Dominican Republic*, and was felt as far south as *Jamaica*. On the 13<sup>th</sup>, it raged on the eastern side of *Cuba*, and then swept over the entire island. On the 14<sup>th</sup>, it was at Havana, *Cuba*. On the 16<sup>th</sup> and 17<sup>th</sup>, it arrived on the northern shores of the Gulf of Mexico, raging simultaneously at Pensacola, Florida; Mobile, Alabama; and New Orleans, Louisiana in the *United States*, where it raged until the 18<sup>th</sup>. At 6 o'clock in the morning of 17 August while the storm was still raging, Mobile, Alabama reported that the water of the bay was on a level with most of the wharves. Commerce Street, from Barney's new building, north and from Conti Street, south, was underwater, as was the north end of Water Street. From the coasts it moved into the adjoining Southern States where it spent itself as heavy rains.<sup>206</sup>

On 10-11 August 1831, a great Atlantic hurricane struck the island of *Barbados* causing approximately 2,500 deaths.<sup>107</sup>

On 10-11 August 1831, a hurricane struck Barbados in the *Lesser Antilles*. Different accounts provide the following estimates of the number of casualties: 1477, >1500, 1525, and 2500.<sup>141</sup>

A hurricane desolated *Barbados* on the night of 10 August 1831. It passed Porto Rico [*Puerto Rico*] on the 12<sup>th</sup>, Aux Cayes [Les Cayes, *Haiti*] and St. Jago de Cuba [*Cuba*] on the 13<sup>th</sup>, Matanzas [*Cuba*] on the 14<sup>th</sup>, was encountered off the Tortugas [*Dry Tortugas* islands in the Florida Keys] on the 15<sup>th</sup>, in the Gulf of Mexico on the 16<sup>th</sup>, and was at Mobile, Alabama; Pensacola, Florida; and New Orleans, Louisiana in the *United States* on the 17<sup>th</sup>. The hurricane covered a distance of 2,000 nautical miles in about 150 hours.<sup>228</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Tunis, <i>Tunisia</i>	(104.5° F, 40.3° C) on 15 July
Izmir (Smyrna), <i>Turkey</i>	( 95.0° F, 35.0° C) on 16 July

Hailstone of a pound weight, fell at Constantinople [now Istanbul, *Turkey*] on 5 October 1831.<sup>43</sup>

In 1831, many regions of *China* experienced flooding including:<sup>153</sup>

— Kweichow (now Guizhou province) in southwestern *China* at Hsi-fêng.

— Hupeh (now Hubei province) in central *China* at Huang-an, Huang-kang, Ma-ch'êng, Ch'i-shui, I-tu, Kung-an and Shih-shou. At Shih-shou, the dikes were damaged.

— During the period between 9 July and 7 August, floods struck Hupeh province at Yün-mêng, Fang and An-lu. At Yün-mêng, The dikes and innumerable houses and fields were damaged by the floodwaters.

— During the period between 8 August and 5 September, floods struck Shantung (now Shandong province) on the east coast of *China* at Jih-chao, Hui-min, Shang-ho and Chan-hua; Hopei (now Hebei province) in northern *China* at Pao-ting; and Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-ch'un and Wu-chin.

— During the period between 6 September and 5 October, floods struck Hupeh province at Hanyang, Chung-hsiang and Huang-p'o. At Chung-hsiang, the dikes were damaged.

— During the period between 4 December 1831 and 2 January 1832, floods struck Hupeh province at Fang, Huang-kang, Ying-shan and Ao-ch'êng; Kiangsu province at Nan-ch'ang, Nan-k'ang, Lin-ch'uan, Kao-an, P'o-yang and I-ch'un; and Hopei province at Wên-an and Pao-ting.

**Winter of 1831 / 1832 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1831 occurred on 22 November. Considerable snow, not melted till January.<sup>116</sup>

During the winter of 1831-32, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 111 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1831-32 at Thompson, Connecticut in the *United States* — On 22 November 1831 - heavy snow; good sleighing continues till January 15<sup>th</sup>. Coldest December ever known. On 5 February 1832 - snow; sleighing until March 1<sup>st</sup>. March 18<sup>th</sup> - snowed again. April very cold, with frequent snows to the 26<sup>th</sup>.<sup>116</sup>

In the *United States*, January brought intensely cold weather with several boisterous and severe snowstorms to Philadelphia. The Schuylkill and Delaware Rivers were closed with thick ice. The winter was long and severe all over the United States and very similar to January 1831. A hard frost occurred in Philadelphia during almost every night in March. There was floating ice in the Delaware River during the whole month.<sup>1</sup>

The winter of 1831-32 in Bradford County, Pennsylvania in the *United States* was very severe. It was the hardest experienced since the winter of 1779-80. Even as late as 5 June 1832, there was a snowfall of 4 inches [10 cm] all over Eastern Pennsylvania.<sup>178</sup>

In the *United States* during the winter of 1831-32, the temperature at Huntsville, Alabama fell to -9° F in January.<sup>113</sup>

In March 1832, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 15<sup>th</sup> (30° F); 16<sup>th</sup> (32° F); 18<sup>th</sup> (23°-24° F); 19<sup>th</sup> (26° F). There was frost on March 2<sup>nd</sup>, 16<sup>th</sup>, 28<sup>th</sup>, 29<sup>th</sup>, and 31<sup>st</sup>.<sup>116</sup>

---

### 1832 A.D. – 1835 A.D. India. Famine

In *India* during the years 1832-1833, there was a severe drought in some of the northwest provinces.<sup>47</sup>

In *India* during 1832-34, there was a famine in some of the northwest provinces. “It is said that not a single shower of rain fell in Ajmir [Ajmer] in 1832. In the following year the drought was most severely felt in Bundelkhand, and in the southern pergunnahs of Cawnpore [Kanpur]; but in the pergunnahs bordering on the Ganges the rubbee [rupee] was good owing to the facilities for irrigation.”<sup>57</sup> [Ajmir is in northwestern *India*. Bundelkhand is in north-central *India*. Cawnpore is in northern *India*.]

In 1832, there was a famine in the Northwest Provinces and Madras in *India*.<sup>156</sup>

In Coringa, Hindustan (now in southeastern *India*), there was a great and most destructive inundation.<sup>47, 92</sup>

In 1832 in Madras [now Chennai] in southeastern *India*, there was a famine in the district of Guntoor; about 200,000 people perished.<sup>91</sup>

In 1832, there was a famine in the Bombay [now Mumbai] territories of *India*.<sup>182</sup>

In 1833, there was a famine in the Madras [now Chennai] territories of *India*. In the Guntoor [now Guntur] district, 200,000 out of 500,000 inhabitants perished.<sup>182</sup>

In southeastern *India* in 1833, a famine occurred in the Guntoor [Guntur] and other districts in the Madras Presidency. About 200,000 people perished. This famine became known as the “Guntoor famine”.<sup>57</sup>

In *India* during the period 1833-1835, there was a famine in the Madras Presidency. “In 1834 rain fell copiously in Kach [now part of *Pakistan*]; grain was sown and came up well; but locusts appeared and destroyed all the crops and grass as well as trees. In Ahmedabad, *India*, there was excessive rain the same year, which rendered cultivation impossible, and locusts also appeared in great quantities. In Broach, *India*, the famine of 1835 was also caused by excessive rain, which destroyed the spring crops, whilst the winter crops were also burnt up by intense cold. In the other districts named, the scarcity appears to have been caused by failure of crops owing to drought.”<sup>57</sup>

In 1833, a most serious famine struck Madras [now Chennai] Presidency in *India*. It was confined to the northern districts, and to the immediate neighborhood of the Presidency town. In consequence of the fearful loss of life, which took place in the Guntoor district [now Guntur in the state of Andhra Pradesh, *India*], this scarcity was generally known as “the Guntoor Famine”, although the districts of Nellore and Masulipatam [now Machilipatnam] also suffered very severely. Groups of people were seen dying in the streets from starvation every day. By August, serious grain riots occurred in Madras. The distress was reported to be dreadful, and the horrible spectacle of a mother devouring her dead infant was seen on the

streets of the town. In Nellore, the roads were strewn with dead bodies. The scarcity came to an end with the harvest of 1834. It was estimated that in Guntoor alone, 150,000 persons perished from famine out of a population of 500,000.<sup>188</sup>

In 1834, there was a famine in the Bombay Presidency in *India*.<sup>156</sup>

In 1834, there was a famine in Cutch [Kutch district in western *India*] caused by locusts. During the same year, there was a minor famine in Bundelkhand [now the states of Uttar Pradesh and Madhya Pradesh in central *India*], Ajmir [now Ajmer, a city in Rajasthan, *India*] and the North-Western Provinces of *India*.<sup>179</sup>

---

**1832 A.D.** In January 1832, in Illawarra, *Australia*, the Tom Thumb Lagoon dried up because of the drought. This lagoon is usually 6 miles in circumference.<sup>103</sup>

In Sydney, *Australia*, on Saturday, 18 February 1832, "Saturday was one of the hottest days ever remembered. The recent rains having saturated the earth, the atmosphere was impregnated by an aqueous vapor not unlike steam issuing from a boiler, while the sun poured down all the fury of his heat. It was dreadful. Man and beast groaned beneath the oppression and numbers of working oxen dropped down dead on the public roads. In the evening we were relieved by a stiff southerly gale, wafting health and vigor on its blessed wings. On Sunday night we were visited by a tremendous storm of lightning, rain and hail. The lightning was magnificent beyond description, spreading over the whole canopy of heaven, and assuming a thousand various forms. The storm broke heaviest over Parramatta where the artillery of the skies roared and crashes in deafening peals, making the very houses totter."<sup>103</sup>

In 1832 cholera invaded *France*. Both January and February experienced strong moderating cold weather. The coldest day in Paris did not fall below 25.7° F (-3.5° C). The hottest day in the period was 54° F (12.2° C). The daily temperature varied often hour-by-hour between these two extremes. Under the influence of alternating clear sky and overcast, and winds sometimes violent and sometimes weak, produced almost constant humidity, controlled by thaws, frequent rain and thick mist. Atmospheric disturbances were interrupted on 13 or 14 February, which gave us several days of mild weather and very beautiful in the middle of the day, but cold and somewhat misty morning and evening. A rushing cold wind abruptly ended this pleasant period. However, alternating periods of cold and warm, calm and tempest, sun and rain resumed since February 29, interspersed with snow, hail and fog. These storms were intensified to the equinox and lasted until 26 or elsewhere to March 27. Then came another period of calm accompanied by clear skies, bright sunshine and warmth of June. An unusual drought replaced the dominant moisture of the prior month. The weather was disturbed again on 5 or 6 April. As the temperatures increased, they did not restore the balance. Storms made repeated charges during the summer. A deep calm with burning heat grew till it burst. Then gales with noisy rain showers bursting with explosions [lightning]. This was followed by penetrating cold with exuberant humidity. Despite these storms, summer rather bowed to heat and drought than to cold and moisture. There was a disorder of the elements to survive this hot season. In autumn, cold and heat, humidity and drought, storms and calm alternated and mingled still unabated. Only the bottom of the air was cold and there were many fog, some snow and a lot rain, which tipped the weather between wet and cold to drought and heat.<sup>79</sup>

On 16 June 1832 in *England*, there was a great hailstorm in Essex and Staffordshire.<sup>93</sup>

The summer of 1832 in Paris, *France* was characterized by:

Hot days	31 days
Very hot days	6 days
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Avignon, <i>France</i>	( 97.7° F, 36.5° C)	on 11 August
Geneva, <i>Switzerland</i>	( 95.4° F, 35.2° C)	on 22 August
Paris, <i>France</i>	( 95.0° F, 35.0° C)	on 13 August
Marseille, <i>France</i>	( 93.9° F, 34.4° C)	
Milan, <i>Italy</i>	( 93.9° F, 34.4° C)	
Maastricht, <i>the Netherlands</i>	( 90.1° F, 32.3° C)	on 14 July
Strasbourg, <i>France</i>	( 89.4° F, 31.9° C)	
Metz, <i>France</i>	( 88.7° F, 31.5° C)	on 13 August
Liège, <i>Belgium</i>	( 86.2° F, 30.1° C)	on 14 July
La Chapelle, <i>France</i>	( 81.9° F, 27.7° C)	on 9 August
London, <i>England</i>	( 81.9° F, 27.7° C)	on 10 August
Basel, <i>Switzerland</i>	( 80.8° F, 27.1° C)	on 12 July

The summer in Paris, *France* was dry. For two weeks at the end of September, the Seine River was below the zero point, the lowest water level of 1719. In Burgundy, there were significant changes in the state of the atmosphere. The grape harvest only began on 4 October. The harvest was poor and the wine of a low quality.<sup>62</sup>

On 7 August 1832, a hurricane struck *Jamaica*.<sup>124</sup>

In 1832, a hurricane struck off *Bermuda* causing 52 deaths.<sup>141</sup>

On 18 August 1832 in *Ireland*, there was heavy hail in County Londonderry that damaged crops and killed small birds.<sup>93</sup>

In 1832, a drought engulfed several regions of *China* including:<sup>153</sup>

- Hopei (now Hebei province) in northern *China* at Nei-ch'iu and Wang-tu.
- Chahar province (now eastern *Inner Mongolia*) at Huai-lai and Wan-ch'üan.
- During the period between 5 February and 26 July, a severe drought engulfed Hopei province at Ch'ang-p'ing.
- During the period between 6 May and 8 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chia-hsing, Hu-chou and Ch'êng.
- During the period between 27 July and 25 August, a drought engulfed Hopei province at Tung-kuang and Ching-hai.
- During the period between 24 October and 21 November, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Ling, Lin-i, Tsou-p'ing and Po-hsing; and Hopei province at Hsin-ch'êng [uncertain name]. [Lin-i is located at longitude 116.52° East and latitude 37.13° North.]

In 1832, several regions of *China* experienced flooding including:<sup>153</sup>

- During the period between 6 May and 8 August, floods struck Hopei (now Hebei province) in northern *China* at Yü-t'ien and Hupeh (now Hubei province) in central *China* at Sung-tzū, Wuchang, Ying-shan, Ma-ch'êng and Yün. At Sung-tzū, the dikes were damaged.
- During the period between 27 July and 25 August, floods struck Hupeh province at Chung-hsiang, Hsiang-yang, I-ch'êng and along the Tu River. At Chung-hsiang, the dikes and city walls were damaged by the floodwaters and innumerable people drowned. On the Tu River, more than 50% of the houses were damaged by the floodwaters.
- During the period between 26 August and 23 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ing-t'ien and Hupeh province at Chün and Ying-ch'êng. At Chün, innumerable houses were damaged by the floodwaters.

— During the period between 24 October and 21 November, floods struck Shantung (now Shandong province) on the east coast of *China* at Kuan-ch'êng, Chü-yeh and Wu-ch'êng.

*Also refer to the section 1832 A.D. – 1835 A.D. for information on the famine in India during that timeframe.*

---

**Winter of 1832 / 1833 A.D.** Miss Ellen D. Larned described the New England winter of 1832-33 at Thompson, Connecticut in the *United States* — On 1 & 15 December 1832 - snow. In 1833, January was warm and pleasant. January 25<sup>th</sup> - snow and sleighing. January 31<sup>st</sup> - very hard snowstorm. February 6-7<sup>th</sup> - harder storm. March 1<sup>st</sup> - very severe snowstorm; could not see across the road; no such weather ever before seen in March; coldest of the season. March 16<sup>th</sup> - very muddy.<sup>116</sup>

During the winter of 1832-33, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 83 days.<sup>202</sup>

---

**1833 A.D.** In 1833, the Brazos River in Texas in the *United States* flooded. In 1833, the creeks and lakes in this locality were dry prior to the flood; in fact there was no water in the county whatever, and all water from the floods were brought down by the rivers from up the country [from the north]. The flood of 1833 was highest in the vicinity of Duke, Texas on May 1, where the high water mark was three inches below that of the flood of 1899. This overflow commenced during the latter part of April and passed into the Gulf of Mexico early in May.<sup>123</sup>

The following extract from a letter, from Navasota, Texas, dated August 18, 1899, from Rufus Grimes, who has resided in the neighborhood of Grimes County for seventy years. The letter contains an interesting bit of flood history pertaining to the Brazos River:<sup>123</sup>

“In regard to the overflows of the Brazos River, my information comes from several men who had been repeatedly through portions of Texas previous to the introduction by S. F. Austin of his 300 families as colonists. These men told my father when I was a small boy (Mr. Grimes was born in 1819), and told me after I had attained the age of maturity, that the Brazos River had not been out of its banks for over thirty years until 1822, when there was a great overflow. The next overflow was in 1833, which came in May of that year; this overflow was considered by the early settlers the greatest overflow that had ever been known by white people in the streams west of the Mississippi River. It passed over the prairie where the present City of Navasota now stands in May 1833, and the back water was 2 to 4 feet deep all over the prairie. I cannot state positively the difference between the overflow of 1833 and that of the present year (1899), but I think the water was several feet higher at this place in 1833 than in 1899. The 1833 overflow did very little damage, as there was not exceeding 100 acres in cultivation in the present Grimes County portion of the Brazos bottom, and there was no [live] stock in the bottoms.”

In 1833 in *England*, there was a great hailstorm in Bedfordshire, Leicestershire and Lincolnshire.<sup>93</sup>

In 1833, there were tremendous gales of wind, which occasioned great loss of shipping on the coasts of *England* and *France*.<sup>43</sup>

On 2 June 1833, there was a violent hurricane in London and other parts of *England*.<sup>43</sup>

In Canton (Guangzhou) in southeastern *China* in October, there were incessant rains; about 10,000 houses were swept away and 1,000 persons drowned. The rains extended to other parts of *China*.<sup>47, 92</sup>

October 1833 at Canton, *China*, an inundation caused by incessant rains swept away 10,000 houses and about 1,000 persons perished. Equal or greater calamity was produced by the same cause in other parts of *China*.<sup>90</sup>

On 14 August 1833, there was a terrible thunderstorm at Strasburg [Strasbourg, *Austria*]. Within 15 minutes time, the tower of the cathedral was struck three times by lightning. The cathedral appeared to be in flames for several seconds [due to the electrical energy dissipated]. In many places the lead, copper and iron and even the mortar were found melted or vitrified. Fragments of metal had soldered themselves to the bells and were difficult to detach. Very large masses of stone fell in the neighboring streets.<sup>205</sup>

[In the Voyage of the Beagle, Charles] Darwin mentioned a tempest [in 1833] on the pampas of *South America*, where the icy fragments that fell were so heavy [the hailstones were as large as apples and extremely hard] as to kill large animals [including deer and ostriches].<sup>205</sup>

On 29 August 1833, ten thousand houses destroyed by flood at Canton (Guangzhou), *China*.<sup>43</sup>

In October 1833, eighteen thousand houses, carried away in the city of Chienchow (Chienchow), besides much other damage done throughout *China* by floods.<sup>43</sup> [Chienchow (Chienchow) is now Jian'ou (Jainning) in Fujian province in southeastern *China*.]

In Calcutta, *India*, a high tide in the Hooghly River committed great destruction.<sup>47, 92</sup>

In 1833, a powerful cyclone struck *India* causing 50,000 deaths.<sup>98</sup>

*Russia* suffered from a major famine in 1833.<sup>96</sup>

In 1833, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 5 February and 6 May, floods struck Hopei (now Hebei province) in northern *China* at P'ing-hsiang.

— During the period between 19 May and 17 June, floods struck Kiangsi (now Jiangxi province) in southern *China* at Kuei-ch'i; Hupeh (now Hubei province) in central *China* at Hsien-ning, Huang-p'o, Wuchang and Ao-ch'êng; and Chekiang (now Zhejiang province) on the east coast of *China* at Chiang-shan.

— During the period between 18 June and 16 July, floods struck Hupeh province at Tzū-kuei, I-tu and Kung-an.

— During the period between 17 July and 14 August, floods struck Hupeh province at Ch'i-ch'un, Huang-mei and Huang-kang.

In 1833 during the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Wu-ch'ing. During the period between 6 May and 8 August, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow and Lin-t'ao.<sup>153</sup>

*Also refer to the section 1832 A.D. – 1835 A.D. for information on the famine in India during that timeframe.*

---

**Winter of 1833 / 1834 A.D.** During the winter of 1833-34, storms caused numerous shipwrecks on the coasts of *England*, *Scotland*, and *Ireland*, as well as on both sides of the *Channel* and on the shores of the *German Ocean*, to the extent of one hundred thousand tons.<sup>43</sup>

The winter of 1833-34 was very mild and very clear in northern *France*.<sup>79</sup>

On 15 January 1834, whole villages swept away in floods along with many thousands of inhabitants, in the country around Canton (Guangzhou), *China*.<sup>43</sup>

At Thompson, Connecticut in the *United States*, the first considerable snowstorm of the season in 1833 occurred on 25 & 26 November. It was snowy.<sup>116</sup>

During the winter of 1833-34, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 73 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1833-34 at Thompson, Connecticut in the *United States* — On 30 October 1833 - coldest weather ever known in October. November 4-6<sup>th</sup> - winter like. November 25-26<sup>th</sup> - snowed considerable; some sleighing. December 17-18<sup>th</sup> - moderate snows and sleighing. On 1 January 1834 - great sleigh ride. January 18<sup>th</sup> - snow gone. February 7<sup>th</sup> - snowed all day. April 1<sup>st</sup> - snowed violently. April 11-17<sup>th</sup> - extremely warm.<sup>116</sup>

In the *United States* during the winter of 1833-34, the temperature at Fort Leavenworth, Kansas fell to -30° F in January.<sup>113</sup>

In the *United States*, the Chesapeake Bay was frozen over at the capes of Virginia in February.<sup>38</sup>

In March 1834, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 23<sup>rd</sup> (32° F). There was frost on the 14<sup>th</sup>, 17<sup>th</sup>, and 31<sup>st</sup>. There was ice on March 31<sup>st</sup>. It snowed on March 3<sup>rd</sup>.<sup>116</sup>

During the winter of 1833-34 in Bradford County, Pennsylvania in the *United States*, there was a late May snowfall. On May 14<sup>th</sup>, snow fell to a depth of 10 inches [25 cm] along with ice ½ inch [1 cm] thick.<sup>178</sup>

---

**1834 A.D.** A tremendous fall of rain was experienced in Sydney, *Australia* on 30 March 1834. [During five hours some of the streets had the appearance of swollen rivers, and to such an extent did the waters accumulate, that youths were seen swimming about in the carriage ways. The foundations of many houses were injured, and the main guardhouse in Lower George-street gave way, the roof falling in with a crash. It was estimated that £10,000 would not cover the loss occasioned by the torrent of water, which saturated dwellings and ploughed up streets during the short period of a few hours.]<sup>103</sup>

In *Gibraltar*, there were waterspout and great damage from floods.<sup>47, 92</sup>

In 1834, a major storm struck the island of *Dominica*.<sup>43</sup>

On 31 May 1834 in *England*, there was a hailstorm in Lancashire.<sup>93</sup>

On 21 June 1834 in *England*, there was a hailstorm in Sussex.<sup>93</sup>

On 5 July 1834 in *England*, there was a hailstorm in Norfolk.<sup>93</sup>

On 31 July 1834 in *England*, there was a hailstorm in Suffolk.<sup>93</sup>

On 22 August 1834 in *England*, there was a hailstorm in Cambridgeshire.<sup>93</sup>

In August 1834, pieces of ice of three foot in diameter fell at Padua in *Italy*.<sup>43</sup>

On 4 September 1834, a hurricane struck South Carolina in the *United States* causing 37 deaths.<sup>141</sup>

On 20-23 September 1834, a hurricane struck Dominica in the *Lesser Antilles* and the Dominican Republic. Most accounts cite more than 200 deaths, but one account cites more than 100.<sup>141</sup>

On 18 October 1834, a storm struck the coast of *Great Britain* caused great destruction to the shipping.<sup>43</sup>

The winter of 1833-34 was very mild and very clear in northern *France*. The winter was followed by a warm very dry spring. The heat increased in May and during June, July and August. The temperature moderated significantly to September 10. However it was still very hot in September and even October. As a result of this heat, vegetation flourished. In September, most of the chestnut trees of the Luxembourg Gardens [in Paris], especially in the driveway of the South or the Observatory bloomed a second time. Some of the lilac garden produced new flowers. The sustained temperatures were 1.8° to 5.4° F (1° to 3° C) above the 21-year average.<sup>79</sup>

The average heat of 1834 rose considerably in Rouen, Strasbourg and Nantes, *France*.<sup>79</sup>

In 1834, there were dense dry fogs in *Europe* and *Russia*. They were the result of combustion of the peat beds and from the many fires that marked that year. Towards the end of May these dry fogs were observed in the Hartz Mountains in *Germany*. At the time there were fires in the peat beds in the neighborhood of Basle [Basel, *Switzerland*] and Orleans, *France*. The peat beds of Dachau, Bavaria [now Dachau, *Germany*] burned to a depth of more than nine feet [2.7 meters], and the fire propagated beneath ditches full of water. In the neighborhood of Münster and in Hanover in *Germany*, many peat beds were consumed. In July, there were terrible conflagrations in the forests and turf-pits near Berlin, *Germany*, in Silesia [a region of central Europe composed of primarily *Poland*, and smaller parts of the *Czech Republic* and *Germany*], in *Sweden* and in *Russia*. The drought during this time favored the propagation of these fires and the drifting of the smoke.<sup>205</sup>

The drought in 1834 was severe. In Paris, *France* the drought dominated the first three months of the year. The drought was maintained during the spring, despite some interruptions, and doubled in severity during the months of summer. Torrential downpours struck on the night of August 19/20 [providing some relief]. The drought resumed almost immediately and persevered, though with less intensity until the end of November. Rouen, Metz, Strasbourg, and Nantes felt the drought. The rains of spring, summer and fall were very far below average.<sup>79</sup>

This year produced high spring and summer temperatures. The summer of 1834 in Paris, *France* was characterized by:

Hot days	43 days
Very hot days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The drought was very great in August. The Seine River sank to 3 centimeters (1.2 inches) above the low water level of 1719. The high temperatures observed during the summer were:

Avignon, <i>France</i>	( 95.0° F, 35.0° C) on 14 July
Geneva, <i>Switzerland</i>	( 94.1° F, 34.5° C) on 18 July
Liège, <i>Belgium</i>	( 92.3° F, 33.5° C)
Metz, <i>France</i>	( 91.4° F, 33.0° C) on 12 July
Strasbourg, <i>France</i>	( 91.0° F, 32.8° C)
Paris, <i>France</i>	( 90.7° F, 32.6° C) on 12 and 18 July
Marseille, <i>France</i>	( 88.5° F, 31.4° C)
Lyon, <i>France</i>	( 88.3° F, 31.3° C) in July
Brussels, <i>Belgium</i>	( 88.0° F, 31.1° C) on 19 July
La Chapelle, <i>France</i>	( 87.1° F, 30.6° C) on 21 June
London, <i>England</i>	( 86.7° F, 30.4° C) on 17 July
Basel, <i>Switzerland</i>	( 80.8° F, 27.1° C) on 18 July

In *Southern Europe*, the summer produced moderate temperature and heavy rains. In Burgundy, the year was famous for the excellent quality of the wine. The grape harvest began on 15 September. In the area of Bordeaux the weather behaved well. Throughout most of *France* rich grain harvest was good.<sup>62</sup>

The heavy rains of 1834 fell in the spring, summer and autumn in southern *France*. These rains caused almost all the rivers in the south to overflow their banks, notably the Rhône and the Gironde rivers.<sup>79</sup>

In 1834 during the period between 5 February and 6 May, a drought engulfed Shensi (now Shaanxi province) in central *China* at Tso-shui. During the period between 8 August and 8 November, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Ting-hai.<sup>153</sup>

[The original record does not have this year, but both the text and a check with the annals (Ch'ing Shih Kao, Chapter 18) suggest that this date is missing.] In 1834, several regions of *China* experienced flooding including:<sup>153</sup>

- Hopei (now Hebei province) in northern *China* at Ta-hsing, Wan-p'ing, Wang-tu and Fu-ning.
- Hupeh (now Hubei province) in central *China* at Shih-shou, Kung-an and Sung-tzū.
- During the period between 7 June and 6 July, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui and Shensi (now Shaanxi province) in central *China* at Tso-shui.
- During the period between 7 July and 4 August, floods struck Chekiang province at Chin-yün and Shensi province at Yü-lin. At Yü-lin, the crops were damaged by the floodwaters.

*Also refer to the section 1832 A.D. – 1835 A.D. for information on the famine in India during that timeframe.*

**Winter of 1834 / 1835 A.D.** A great snowstorm reached Dartmouth at Hanover, New Hampshire in the *United States* on 30 December 1834, having commenced 24 hours earlier at Washington D.C. The depth of the snow was 20 inches [51 centimeters] at Baltimore, Maryland; 15 inches [38 centimeters] at Boston, Massachusetts; and 10 inches [25 centimeters] at Dartmouth.<sup>207</sup>

As a very strong cold wave passed through the northeastern region of the *United States* on 4 and 5 January, the following low temperatures were recorded:<sup>38,207</sup>

Anson, Maine	(-42° F, -41° C)
Franconia, New Hampshire	(-40° F, -40° C)
Montpelier, Vermont	(-40° F, -40° C)
Bangor, Maine	(-39° F, -39° C)
Milburn, Maine	(-39° F, -39° C)
New Lebanon, New York	(-39° F, -39° C)
Dunstable, Massachusetts	(-38° F, -39° C)
Norridgewick, Maine	(-38° F, -39° C)
Greenfield, Connecticut	(-36° F, -38° C)
Kennebeck, Maine	(-35° F, -37° C)
Lancaster, Massachusetts	(-35° F, -37° C)
Montreal, Canada	(-35° F, -37° C)
Greenwich, Massachusetts	(-34° F, -37° C)
Utica, New York	(-34° F, -37° C)
Schenectady, New York	(-33° F, -36° C)
Poughkeepsie, New York	(-33° F, -36° C)
Newbury, Vermont	(-33° F, -36° C)
Goshen, New Jersey	(-32° F, -36° C)
Hyde Park, New York	(-32° F, -36° C)
Albany, New York	(-32° F, -36° C)
Northampton, Massachusetts	(-32° F, -36° C)
Alfred, Maine	(-32° F, -36° C)
Pine Grove, Pennsylvania	(-32° F, -36° C)

Pittsfield, Massachusetts	( -32° F, -36° C)
Hanover, New Hampshire	( -32° F, -36° C)
Norfolk, Virginia	( -30° F, -34° C)
Kinderhook, New York	( -29° F, -34° C)
Dover, New Hampshire	( -28° F, -33° C)
Catskill, New York	( -28° F, -33° C)
Saco, Maine	( -28° F, -33° C)
Concord, Massachusetts	( -27° F, -33° C)
Smithfield, Rhode Island	( -26° F, -32° C)
Hartford, Connecticut	( -25° F, -32° C)
Norwich, Connecticut	( -24° F, -31° C)
Woonsocket Falls, Rhode Island	( -24° F, -31° C)
Pottsville, Pennsylvania	( -24° F, -31° C)
New Haven, Connecticut	( -23° F, -31° C)
Lancaster, Pennsylvania	( -22° F, -30° C)
Dorchester, Massachusetts	( -22° F, -30° C)
Fitchburg, Massachusetts	( -22° F, -30° C)
Bellville, New Jersey	( -20° F, -29° C)
North Lebanon, Pennsylvania	( -20° F, -29° C)
Portsmouth, New Hampshire	( -20° F, -29° C)
Worcester, Massachusetts	( -19° F, -28° C)
Columbia, Pennsylvania	( -18° F, -28° C)
Elizabethtown, New Jersey	( -18° F, -28° C)
Salem, Massachusetts	( -17° F, -27° C)
Washington D.C.	( -16° F, -27° C)
Branford, Connecticut	( -16° F, -27° C)
Boston, Massachusetts	( -15° F, -26° C)
Charlestown, Virginia	( -14° F, -26° C)
Hagerstown, Maryland	( -12° F, -24° C)
Alexandria, Virginia	( -10° F, -23° C)
Baltimore, Maryland	( -10° F, -23° C)
Bradford, Pennsylvania	( -6° F, -21° C)
New Bedford, Massachusetts	( -6° F, -21° C)
Philadelphia, Pennsylvania	( -4° F, -20° C)
Pittsburgh, Pennsylvania	( -4° F, -20° C)

In the *United States* during the winter of 1834-35, the temperature at Gouverneur, New York fell to -38° F in January. The temperature at Saint Louis, Missouri fell to -25° F in February. The temperature at Cincinnati, Ohio fell to -17° F in February.<sup>113</sup>

In the *United States*, a New York newspaper said the temperature was -23° F (-31° C) in Albany, New York; -15° F (-26° C) in Boston, Massachusetts; -13° F (-25° C) in Newark, New Jersey at sunrise on 6 January; and -18° F (-28° C) in New York City on the morning of 7 January.<sup>1</sup>

During the winter of 1834-35, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 100 days.<sup>202</sup>

In the *United States*, a man and a boy exposed to the outdoor weather on the night of 8 January, near Four Mile Point, in the vicinity of Savannah, Georgia, were frozen to death. The thermometer at Charleston, South Carolina at daybreak on 8 February was at (0° F, -18° C)<sup>38</sup>

In the *United States*, the mercury in several thermometers in Bangor, Maine and the towns adjacent, froze on the morning of 4 January. [The mercury in mercury thermometers solidifies (freezes) at -37.89 °F (-38.83 °C).] Penobscot river and bay as low down as eight miles (12.9 kilometers) below Belfast and

across to Castine and the Fox islands in Maine, were frozen over – an event not within the recollection of the oldest inhabitants.<sup>38</sup>

In the *United States*, nearly a mile from Boston, Massachusetts and in line with the fort, there were a number of tents erected on the ice where “whisky and long nines” were dispersed in great profusion.<sup>38</sup>

In Northampton, Massachusetts in the *United States* many wells were frozen at the depth of fourteen feet (4.3 meters) from the surface.<sup>38</sup>

In the *United States*, the mercury became congealed at New Lebanon, New York on the morning of the 5 January. [The mercury in mercury thermometers solidifies (freezes) at  $-37.89^{\circ}\text{F}$  ( $-38.83^{\circ}\text{C}$ ).] It is related that professor Cleveland of Bowdoin college, Massachusetts about a quarter of a century ago, in making experiments in several glasses suspended from the boughs of trees in exposed situations, ascertained that the mercury, after sinking to  $-38^{\circ}\text{F}$ , became stationary. It is mentioned, that in Parry’s second voyage to the *North Pole*, when the alcoholic thermometers stood at  $-58^{\circ}\text{F}$  ( $-50^{\circ}\text{C}$ ), his officers amused themselves by casting quicksilver into bullet moulds and freezing it, and enjoyed great sport in firing the balls at the polar bears.<sup>38</sup>

In the *United States*, the extreme cold weather caused the Nantucket beach in Maine to produce a series of three ice walls along its entire length of 4 miles (6.4 kilometers). The one next to the sea was 8 feet (2.4 meters) high and 20 feet (6.1 meters) thick of solid ice. The next wall was set back 20 feet (6.1 meters) from the first wall and was 3 feet (0.9 meters) high. The third ice wall was set back another 20 feet (6.1 meters) further up the beach and was 2 feet (0.6 meters) high.<sup>38</sup>

In the *United States*, foot passengers passed on the ice from Staten to Long Island, New York. The N.Y. Commercial states that on 9 January, Mr. R. Hazard, in company with three other gentlemen, started in a sleigh, crossed the hills on the ice near Elizabethtown, New Jersey and drove up to Jersey city, having made the track all the way.<sup>38</sup>

In the *United States*, a couple gentlemen from New York traveled by ice skates from Jersey City, New Jersey down to Bergen point, through the kills across the bay to Newark, New Jersey in four hours time.<sup>38</sup>

In the *United States*, Joshua H. Valliant and George W. Hynson, during the month of January, skated from Baltimore to Annapolis in Maryland, a distance of thirty miles in three and a half hours. They returned to Baltimore on the same day.<sup>38</sup>

Miss Ellen D. Larned described the New England winter of 1834-35 at Thompson, Connecticut in the *United States* — On 7 October 1834 - brilliant rainbow in the northwest just after sunrise. October 26<sup>th</sup> - p.m., heavy shower. October 31<sup>st</sup> - snowed several hours. December 13<sup>th</sup> - snowed. December 14<sup>th</sup> - more violent snowing. December 15<sup>th</sup> - the thermometer said to be  $-18.5^{\circ}\text{F}$  ( $-28.1^{\circ}\text{C}$ ). December 24<sup>th</sup> and 25<sup>th</sup> - more snow and sleighing. December 29<sup>th</sup> and 30<sup>th</sup> - another violent snowstorm. On 4 January 1835 - most remarkably cold; said to be  $-20^{\circ}\text{F}$  ( $-28.9^{\circ}\text{C}$ ). January 14<sup>th</sup> - sleighing gone. February 6<sup>th</sup> - snowed. February 15-16<sup>th</sup> - tedious snowstorm; sleighing again. March 2<sup>nd</sup> - very cold. March 7-10<sup>th</sup> - violent snowstorms; sleighing. March 19<sup>th</sup> - snowed. March 22<sup>nd</sup> - snow, rain, hail, thunder, and lightning. March 23<sup>rd</sup> - sleighing continuous. March 30<sup>th</sup> - snow. April 13-15<sup>th</sup> - snowstorm. April 25<sup>th</sup> - snow.<sup>116</sup>

The great freeze occurred in Florida in the *United States* on 7 February 1835, when the temperature went as low as  $7^{\circ}\text{F}$  above zero. John Lee Williams, writing in 1837, gives the following account of the great freeze of February 1835: "A severe northwest wind blew ten days in succession, but more violently for about three days. During this period the mercury was  $7^{\circ}$  below zero." [This is undoubtedly an error, and

should read above zero instead of below zero] "The St. Johns River was frozen several rods from the shore, and afforded a spectacle as new as it was distressing. All kinds of fruit were killed to the ground. Many of them never started again, even from the roots. The wild groves suffered equally with those cultivated as far south as 28° [North latitude]." He further remarks that a couple years later in 1837, the wild orange groves south of Volusia and at New Smyrna were in full bearing, which shows that they were not as injured as he originally wrote. In 1844, the writer saw very large sweet orange trees on Drayton Island bearing fruit, which could not have been killed down in 1835. There has been some question as to the exact date of the freeze of 1835. George R. Fairbanks thinks there is no doubt that it occurred on the night of the 7<sup>th</sup> and morning of the 8<sup>th</sup> of February 1835. Paragraphs in Nile's Register, February 1835, state that the mercury was 1° F below zero at Baltimore, and 1° F above zero at Raleigh, North Carolina, on the morning of 8 February 1835. That month was excessively cold, the Chesapeake having been frozen so as to close navigation three times during that month. The mercury was reported to have been at 11° F above zero at the same period at Fort King, Florida, then an army post near the present Ocala. Dr. Baldwin of Jacksonville, an excellent authority, indicated the freeze occurred on 8 February 1835 and the mercury stood at 8° F above zero.<sup>115</sup>

The frost at Jacksonville, Florida in the *United States* covering 125 years.<sup>115</sup>

February, 3, 1766	~ 20° F ( - 6.7° C)
February 8, 1835	8° F ( - 13.3° C)
January 16, 1857	16° F ( - 8.9° C)
December 28, 1872	27° F ( - 2.8° C)
January, 19, 1873	24° F ( - 4.4° C)
December 28, 1875	28° F ( - 2.2° C)
December 3, 1876	24° F ( - 4.4° C)
December 28, 1878	27° F ( - 2.8° C)
January 7, 1879	25° F ( - 3.9° C)
December 30, 1880	19° F ( - 7.2° C)
January 6, 1884	21° F ( - 6.1° C)
January 12, 1886	15° F ( - 9.4° C)
January 12, 1886	15° F ( - 9.4° C)
December 20, 1894	14° F ( - 10.0° C)
February 8, 1895	14° F ( - 10.0° C)

According to Schott's early records, the lowest temperature observed in the *United States* were:<sup>115</sup>

Fort Barancas, Florida	10° F ( - 12.2° C)	on January 1852
Fort Brooke, Florida	26° F ( - 3.3° C)	on January 1827 & 1857
Fort Dallas, Florida	30° F ( - 1.1° C)	on January 1857
Fort Jefferson, Florida	42° F ( + 5.6° C)	on December 1868
Fort King, Florida	11° F ( - 11.7° C)	on February 1835
Fort Marion, Florida	21° F ( - 6.1° C)	on January 1831
Fort Meade, Florida	24° F ( - 4.4° C)	on January 1852
Fort Myers, Florida	31° F ( - 0.6° C)	on January 1852
Fort Pierce, Florida	29° F ( - 1.7° C)	on January & December 1851, 1857
Indian Key, Florida	47° F ( + 8.3° C)	on February 1836
Key West, Florida	44° F ( + 6.7° C)	on January 1857
Charleston, South Carolina	16° F ( - 8.9° C)	on January 1852
Fort Moultrie, South Carolina	6° F ( - 14.4° C)	on February 1835

In the *United States*, the ice in the Mississippi River, at Bowling Green, Missouri, on 8 February, was strong enough for foot passengers to cross on, and the following day horses and teams crossed in safety.<sup>38</sup>

In the *United States*, the thermometer at Charleston, South Carolina at daybreak on 8 February was at 0° F (-17.8° C).<sup>38</sup>

The winter of 1834-35 was remarkable for the extreme cold in *North America*. A severe cold wave arrived on the Atlantic coast on 5 & 6 January. The ports of Boston, Portland, Newbury, New Haven, Philadelphia, Baltimore and Washington D.C. were frozen completely. On 3 & 4 January, wagons drove across the ice on the Potomac River. In contrast, the winter in *Europe* was very mild. Paris, *France* had no more than 24 frost days. The lowest temperatures observed were:<sup>62</sup>

Geneva, <i>Switzerland</i>	( 14.9° F, -9.5° C) on 21 December
Basel, <i>Switzerland</i>	( 16.9° F, -8.4° C) on 25 December
Paris, <i>France</i>	( 19.8° F, -6.8° C) on 6 January
Brussels, <i>Belgium</i>	( 25.0° F, -3.9° C) on 15 November
Constantinople, <i>Turkey</i>	( 32.4° F, 0.2° C) on 8 January
Hyères, <i>France</i>	( 33.1° F, 0.6° C) on 26 December
Cairo, <i>Egypt</i>	( 43.2° F, 6.2° C) on 17 January

In the *United States*, a severe winter of extraordinary harshness struck the South in 1835. Snow fell in South Carolina in April 1835.<sup>123</sup>

During the winter of 1834-35 in Bradford County, Pennsylvania in the *United States*, there was a late May snowfall. On 20 & 21 May, snow fell to a depth varying between 15 and 24 inches [0.4 – 0.6 m]. Apple, peach and plum trees were in bloom at the time.<sup>178</sup>

**1835 A.D.** In January 1835, the thermometer was 109° F (42.8° C) in the shade [in Sydney, *Australia*]. In February, there was a drought in Illawarra, Argyle and Maitland, *Australia*.<sup>103</sup>

A violent storm broke out first on 6 February 1835 at Toulon, *France*. Thunderstorms and rainstorms then became widespread in the southern regions of *France*. These storms even reached central regions. Rains from these storms caused rivers in both regions to overflow their banks at the end of spring.<sup>79</sup>

On 10 June 1835 in *England*, there was a great hailstorm in Cambridgeshire and Leicestershire.<sup>93</sup>

On 10 July 1835 in *England*, there was a great hailstorm in Derbyshire.<sup>93</sup>

On 11 July 1835 in *England*, there was a great hailstorm in Essex.<sup>93</sup>

The summer of 1835 in Paris, *France* was characterized by:

Hot days	41 days
Very hot days	10 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:

Avignon, <i>France</i>	( 95.0° F, 35.0° C) on 31 July
Alost (Aaist), <i>Belgium</i>	( 95.0° F, 35.0° C) on 9 June
Paris, <i>France</i>	( 93.2° F, 34.0° C) on 23 July
Rouen, <i>France</i>	( 93.2° F, 34.0° C) on 23 & 24 July
Metz, <i>France</i>	( 91.4° F, 33.0° C) on 18 July
Geneva, <i>Switzerland</i>	( 90.5° F, 32.5° C) on 16 July
Marseille, <i>France</i>	( 89.4° F, 31.9° C)
Lyon, <i>France</i>	( 87.4° F, 30.8° C) in August
Brussels, <i>Belgium</i>	( 85.6° F, 29.8° C) on 11 June and 12 August
London, <i>England</i>	( 84.0° F, 28.9° C) on 28 August
La Chapelle, <i>France</i>	( 83.8° F, 28.8° C) on 11 August

Basel, *Switzerland* ( 78.8° F, 26.0° C) on 17 June  
Normandy experienced heat and dryness. The grape harvest began in Burgundy, *France* on 5 October. The yield was abundant but the wine was of poor quality. The cereal harvest was satisfactory.<sup>62</sup>

On 12 August 1835, a hurricane struck St. Kitts in the *West Indies*.<sup>144</sup>

On 12 August 1835, a hurricane ravaged the islands of *Antigua*, *Nevis*, and *St. Kitt's*. It then struck *St. Thomas*, *St. Croix*, and Porto Rico [*Puerto Rico*] on the 13<sup>th</sup>; Hayti [*Haiti*] and *Turks' Island* on the 14<sup>th</sup>; the vicinity of Matanzas and Havana [in *Cuba*] on the 15<sup>th</sup>. It was encountered off the *Tortugas*, in the Gulf of Mexico, on the 16<sup>th</sup>. It was at Metamora, on the coast of *Mexico* on the 18<sup>th</sup>, where it was most violent. The hurricane traveled more than 2,200 miles in six days.<sup>228</sup>

On 3 September 1835, a hurricane struck Barbados in the *Lesser Antilles* and the *Dominican Republic*. The mail boat, *Lady Lunn*, was capsized and sunk; one man saved. Two boats were driven to sea from Barbados and not heard from after 11 days. Three deaths on the ship *Matilda* near the Dominican Republic.<sup>141</sup>

In 1835, a drought engulfed many regions of *China* including:<sup>153</sup>

— During the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Yüan-shih; Shantung (now Shandong province) on the east coast of *China* at Lin-ch'ü; and Hupeh (now Hubei province) in central *China* at I-tu, Chih-chiang and I-ch'ang.

— During the period between 6 May and 8 August, a drought engulfed Hupeh province at I-ch'êng and Ku-ch'êng; and Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou, Wên-chou, Ch'êng and Li-shui.

— During the period between 27 May and 21 September, a drought engulfed Chekiang province at Huang-yen.

— During the period between 27 May and 21 October, a drought engulfed Chekiang province at Chin-yün.

— During the period between 24 August and 21 September, a drought engulfed Hupeh province at Fang, Huang-kang and An-lu.

— During the period between 8 November 1835 and 5 February 1836, a drought engulfed Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing; Kiangsi (now Jiangxi province) in southern *China* at Yü-shan; and Hupeh province at Ao-ch'êng.

In 1835 during the period between 27 May and 25 June, floods struck Shensi (now Shaanxi province) in central *China* at Mien and Hupeh (now Hubei province) in central *China* at Chung-hsiang. At Mien, houses and fields were damaged by the floodwaters. During the period between 24 August and 21 September, floods struck Hopei (now Hebei province) in northern *China* at Hsing-t'ai and Shantung (now Shandong province) on the east coast of *China* at Chan-hua and P'u-t'ai.<sup>153</sup>

*Also refer to the section 1832 A.D. – 1835 A.D. for information on the famine in India during that timeframe.*

**Winter of 1835 / 1836 A.D.** The winter of 1835-36 in *Belgium* and northern *France* was rather strict, but not exceptionally. Certain parts of *Provence* experienced very strong frosts. The nature of the cold and rainy winter and half of the spring harmed the fruit trees and a large number of them died out. The following are the lowest temperatures recorded in different cities this winter:<sup>62</sup>

Moscow, <i>Russia</i>	(-46.7° F, -43.7° C)
St. Petersburg, <i>Russia</i>	(-28.8° F, -33.8° C)
Orange, <i>France</i>	( -0.4° F, -18.0° C) on 28 December
Basel, <i>Switzerland</i>	( 8.1° F, -13.3° C) on 23 December
<i>Ibid.</i>	( 2.3° F, -16.5° C) on 2 January

Metz, <i>France</i>	( 9.5° F, -12.5° C) on 15 December
<i>Ibid.</i>	( 8.6° F, -13.0° C) on 2 January
Geneva, <i>Switzerland</i>	( 10.4° F, -12.0° C) on 11 & 12 December
Löwen, <i>Germany</i>	( 10.8° F, -11.8° C) on 2 & 3 January
Brussels, <i>Belgium</i>	( 13.3° F, -10.4° C) on 22 December
<i>Ibid.</i>	( 11.7° F, -11.3° C) on 2 January
Paris, <i>France</i>	( 14.7° F, -9.6° C) on 22 December
<i>Ibid.</i>	( 14.0° F, -10.0° C) on 2 January
Avignon, <i>France</i>	( 14.9° F, -9.5° C) on 29 December and 3 January
Alost (Aaist), <i>Belgium</i>	( 17.4° F, -8.1° C) on 22 December
<i>Ibid.</i>	( 15.4° F, -9.2° C) on 2 January
Nantes, <i>France</i>	( 17.4° F, -8.1° C) in December
London, <i>England</i>	( 20.8° F, -6.2° C) on 24 December
<i>Ibid.</i>	( 17.6° F, -8.0° C) on 2 January
Fort Vancouver, <i>Canada</i>	( 21.2° F, -6.0° C) on 7 December
Constantinople, <i>Turkey</i>	( 23.2° F, -4.9° C) on 27 December
Hyères, <i>France</i>	( 29.7° F, -1.3° C) on 2 January
Cairo, <i>Egypt</i>	( 40.5° F, 4.7° C) on 31 December
<i>Ibid.</i>	( 36.5° F, 2.5° C) on 26 January

In Paris, *France* there was 54 days of frost, but only nine in succession. But in *European Russia* and *Turkey*, there was severe cold. On 27 December a low temperature of 23.2° F (-4.9° C) was observed in Constantinople (Istanbul), *Turkey*. In Constantinople, during the first days of January, an extraordinary cold struck, and the number of people that perished from the cold exceeded the number from the year 1812. On the night of 5/6 January in St. Petersburg, *Russia*, the low temperature of -25.6° F (-32° C) was observed. This was followed by five days in succession a cold between -13° F (-25° C) and -28.8° F (-33.8° C). Then on January 9, within 24 hours the temperature suddenly rose to 42.8° F (6° C). During those cold days there was a terrible wind. “You could hear the sound of wheels on the frozen ground, and sharp cries, expression of the general public suffering. A sledge arrived at the gates of the city, but when officials approached the sledge, they found the people inside frozen to death.” The birds fell down dead in large numbers. In Petersburg, the rapid temperature change caused by heat and cold produced many diseases. In Moscow, *Russia*, the severe cold was measured as -46.7° F (-43.7° C). As a result of these freezing temperatures, nobody could make anything, and the shops closed up for three days in a row. During the snowstorms, the wind was particularly unbearable because anyone exposed to it, were essentially wrapped in a sheet of ice, which robs them of any ability to fight the effects of the cold.<sup>62</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1835 occurred on 23 November. It snowed all day; very cold.<sup>116</sup>

The winter of 1835-36 was one of the severest winters ever known in New England in the *United States*. The summer of 1835 was dry and remarkably pleasant. But the winter had many extremely cold days. All the harbors from New York to Nova Scotia were thickly frozen with ice. Massachusetts Bay was covered by ice for a long distance from the shore. The first snow fell on 23 November and from then until the end of March the area was pounded by frequent snowstorms. The ground was covered to a great depth with snow. There was excellent sleighing continuous for twenty weeks.<sup>199</sup>

— On 16 December 1835, the harbor of Salem, Massachusetts was frozen over as far as Naugus Head. A small craft with a crew of 5 capsized and all the men were drowned. It was -18° F [-28° C] at Salem, Massachusetts. At Greenfield, it was -15° F [-26° C]. Many people suffered frozen fingers, ears and noses. During that night, there were many buildings burned, probably on account of the great fires that were made to enable people to keep warm.

— During November and December, there was a winter drought. The streams were so low that the [water powered] manufacturing companies had to suspend operations. Many wells were very low or

completely dry. Water had to be hauled a distance by teams for domestic use.

— January 1836 was severely cold. There were many disasters to vessels on the coast and a number of lives were lost. The brig *Regulator* ran aground on an island in Boston harbor.

— On 21 February, the three month run of cold weather in eastern Massachusetts was finally broken. The snow was deep everywhere, in the woods and fields and highways. In most of the streets of Boston, the snow and ice had accumulated to from 3 to 4 feet [0.9-1.2 meters] in depth, and in many narrow streets even deeper.

— On 1 April, the snow was four feet [1.2 meters] deep in the New Hampshire woods and not a speck of bare ground was visible on hill or dale.

Miss Ellen D. Larned described the New England winter of 1835-36 at Thompson, Connecticut in the *United States* — On 23 November 1835 - snow and tolerable sleighing. November 30<sup>th</sup> - snowed all day; very cold month. December 12<sup>th</sup> - snowed; very cold. December 17<sup>th</sup> - more so; very, very cold; temperature -14° F (-25.6° C). December 22<sup>nd</sup> - good sleighing. On 17-18 January 1836 - snowstorm. January 25<sup>th</sup> and 31<sup>st</sup> - snowed. February 8<sup>th</sup> - tremendous storm; roads all banked up. February 17<sup>th</sup> - more snow. February 26<sup>th</sup> - snow. March 10<sup>th</sup> - hard rain; hard traveling; bridges carried off. March 22<sup>nd</sup> - snow; good sleighing until the 28<sup>th</sup>, in all about four months sleighing; many snow banks left. April 6-13<sup>th</sup> - tedious snowstorms.<sup>116</sup>

In the *United States* during the winter of 1835-36, the temperature at Huntsville, Alabama fell to -9° F in January. The temperature at Williamstown, Massachusetts fell to -30° F in January. The temperature at Saint Louis, Missouri fell to -19° F in January.<sup>113</sup>

In Illinois in the *United States*, an early settler described her recollections of a “sudden freeze” that occurred a little after noon one day in January 1836. She and her family had finished their noon day meal, and were sitting around and in front of the old fashioned large open fireplace, enjoying the generous warmth, chatting and discussing the state of the weather, as during the morning it had been snowing and raining a little. Presently the lady looked from the window of her cabin and noticed a heavy black cloud lying off to the west, which seemed to be rapidly approaching. Needing some water, she took a bucket and went to the well, at a distance of about 100 yards, lowering the bucket with a long “sweep” then used in drawing water, filled it, and started for the house. Before reaching the house, the wind and the rain struck her clothing. The cold air seemed to cut like a knife, and before she reached the house, her dress and apron were frozen stiff in a solid sheet of ice. Ponds, which a moment before was free of ice, were frozen in a few minutes. Many persons were frozen to death that happened to be caught away from home; and many others, before they could get to a place of shelter, had their faces, ears, hands and feet frozen. Immediately preceding the storm, the ground had been slightly covered with snow, which from the morning rains had become slushy. Cattle in the field were held fast by the slush, which froze about their feet, and it became necessary to cut away the ice to free them. Ducks and geese were imprisoned in the same manner. It was scarcely 10 minutes after the cold wave swept over the place, that the water and melting snow was hard enough to bear the weight of a man on horseback.<sup>245</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

During the winter of 1835-36, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 125 days.<sup>202</sup>

Seven snowstorms struck the Northeast *United States* in January. Eight to ten feet (2.4-3.0 meters) of snow fell in many places near Philadelphia. The newspapers said that the interior of Pennsylvania and New York and various parts of New England received ten to fourteen feet (3.0-4.3 meters) of snow in January.<sup>1</sup>

In the *United States*, the storm of 8-10 January 1836 dumped 15 inches (0.4 meters) of wet snow in Philadelphia; around 15 inches (0.4 meters) in New York City; 18 inches (0.5 meters) in Brooklyn; 3 to 4 feet (0.9-1.2 meters) over the highlands of northern Pennsylvania into Central New York State; 42 inches (1.1 meters) in Montrose and 5 feet (1.5 meters) at Ithaca and Rome, New York.<sup>27</sup>

An extract from a letter received from Mr. Thomas J. Beans who lived in Pennsylvania in the United States: "I was nine years old when the snow of 1836 fell. From that time throughout my residence in Pennsylvania it was always spoken of as 'the big snow.' Enquiring of many of the old people in New Jersey, they say it was called here, 'the great snow.' At my father's home I remember the sheep were covered [with snow] out of sight, and after a long search were found by holes in the snow made by their breath. The young timber was bent over in the woods so that many trees kept their bent form after they had attained size years after. A rain and freeze covered the snow with ice, so that skating over its surface was the usual way for going to school. My father hauled his hay to Philadelphia, 18 miles, on a hay body with sled runners."<sup>123</sup>

The winter of 1835-36 in Bradford County, Pennsylvania in the *United States* was remarkable for a great fall of snow and intense cold weather. On 8, 9 and 10 January 1836, snow fell without cessation and was followed by a heavy wind, which in many places, piled the snow in drifts from 15 to 20 feet [4.6 – 6.1 m] deep. Again on 24 and 25 January, more than a foot [30 cm] of snow fell, making with the previous fall a snow depth of about four feet [1.2 m] on the level. The weather continued extremely cold for five weeks and as a result, many cattle and other animals perished. There was still good sleighing on the 23<sup>rd</sup> of March. Teams crossed the Susquehanna River on the ice at Towanda on the 28<sup>th</sup>. Then there was a sudden change and the ice in the river went out on March 30, doing little damage.<sup>178</sup>

Eight snowstorms struck the Northeast *United States* in February. It is estimated that if the snow had fallen on the level and remained to the end of the last snow, the snow depth would have been 8 to 10 feet (2.4-3.0 meters). But the snow blew into banks that were in some places 20 to 25 feet (6.1-7.6 meters) high. Snow covered much of the United States. It was good sleighing during February from Virginia to the Rocky Mountains, to Upper Canada, to Eastport, Maine. This was the coldest February since 1815.<sup>1</sup>

In the *United States*, every night in March produced ice in Philadelphia except the last three days of the month.<sup>1</sup>

In March 1836, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 3<sup>rd</sup> (29°-30° F); 12<sup>th</sup> (30°-31° F); 13<sup>th</sup> (28°-29° F); 16<sup>th</sup> (32° F); 26<sup>th</sup> (32° F). There was frost on March 4<sup>th</sup>, 9<sup>th</sup>, 13<sup>th</sup>, 16<sup>th</sup>, 25<sup>th</sup>, and 27<sup>th</sup>. It snowed on March 22<sup>nd</sup>.<sup>116</sup>

---

**1836 A.D.** The River Thames went dry in London, *England* and people were able to cross the river on foot.<sup>1</sup>

Major storms reigned in *France* in 1836. The winter storms shook the Mediterranean Sea and the English Channel. Spring brought thunderstorms of hail and heavy rain. In late summer and in the fall the rainstorms and lightning storms increased in intensity.<sup>79</sup>

In France there was a flood. On 8 May 1836, the Seine River in Paris, *France*, at the bridge "Pont de la Tournelle" reached a height of 6.4 meters (21 feet) above the zero mark [the low water mark of the year 1719].<sup>71</sup>

On 28 June 1836, there was a heavy fall of snow in Sydney, *Australia* that lasted for a half hour.<sup>103</sup>

On 4 July 1836 in *England*, there was a hailstorm in Hertfordshire and Wiltshire.<sup>93</sup>

On 6 July 1836 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

The summer of 1836 was memorable because of the thunderstorms of June and the beginning of July and because of the heat in the south of *France*. In *Denmark*, *Prussia* and *Spain*, the temperature was abnormally high. The summer of 1836 in Paris, *France* was characterized by:

Hot days 30 days

Very hot days 7 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

La Rochelle, <i>France</i>	(102.2° F, 39.0° C) on 4 & 5 July
Flacq, <i>Mauritius</i>	(101.3° F, 38.5° C) in March and April
Avignon, <i>France</i>	( 97.9° F, 36.6° C) on 5 July
Toulouse, <i>France</i>	( 97.0° F, 36.1° C) on 3 July
Paris, <i>France</i>	( 93.7° F, 34.3° C) on 1 July
Rodez, <i>France</i>	( 92.8° F, 33.8° C) in July
Geneva, <i>Switzerland</i>	( 92.1° F, 33.4° C) on 12 July
Marseille, <i>France</i>	( 91.0° F, 32.8° C)
Alost (Aaist), <i>Belgium</i>	( 89.8° F, 32.1° C) on 6 July
Bordeaux, <i>France</i>	( 87.8° F, 31.0° C) on 4 July
Brussels, <i>Belgium</i>	( 86.2° F, 30.1° C) on 6 July
Metz, <i>France</i>	( 85.6° F, 29.8° C) on 24 June
London, <i>England</i>	( 84.9° F, 29.4° C) on 4 August
La Chapelle, <i>France</i>	( 84.6° F, 29.2° C) on 5 July
Löwen, <i>Germany</i>	( 83.8° F, 28.8° C) on 6 July
Basel, <i>Switzerland</i>	( 78.8° F, 26.0° C) on 12 July

Between 15 June and 3 July, the thermometer remained consistently above 86° F (30° C) in Toulouse, *France*. On the roads many horses dropped dead from the heat. In La Rochelle, *France* the heat killed many people and domestic animals. In the neighborhood of Perpignan, *France* reapers in the field choked to death from the heat, and in *Spain*, soldiers on the march dropped dead from the heat.<sup>62</sup>

The drought was very great in Paris, *France* in August. The Seine River was 30 centimeters (1 foot) below the low water level of 1719. In the south, the grape harvest provided an average quantity and the wine produced was of fairly good quality. In Burgundy, the grape harvest only began on 6 October. The grain harvest was poor.<sup>62</sup>

On 14 August 1836, a violent thunderstorm with heavy rains struck *England*. The storm did much damage to the shipping in the harbor at Liverpool. On the same day, a violent thunderstorm struck *Austria*, destroying houses, barns and causing fatalities.<sup>228</sup>

On 1836, a hurricane struck the Cayman Islands in the *Caribbean Sea*. The women of east end left widowed when their husbands were lost at sea.<sup>141</sup>

On 3 & 4 October 1836, there were violent gales on Lake Michigan in the *United States*. Several vessels and much property were destroyed.<sup>203</sup>

On 5 October 1836, a great snowstorm struck the *United States*. At Auburn, New York, 24 to 26 inches [61 to 66 centimeters] of snow fell. In Pennsylvania between Hollidaysburg and Johnstown, the snow was 20 inches [51 centimeters] deep. This storm was remarkable for the early arrival in the winter.<sup>203</sup>

On 29 November 1836, a very violent gale struck London and throughout *England*. Much damage was done to London and many vessels were wrecked along the coast.<sup>203</sup>

On 29 November 1836, a storm struck throughout *England* and on the coast of *France*, which did great damage, when the ball and cross on St. Paul's cathedral vibrated fearfully.<sup>43</sup>

On 29 November 1836, a terrible hurricane struck *England*. This storm first appeared on the 23<sup>rd</sup> on the eastern shores of North America, off St. Lawrence. A ship from Poole fell in with this storm on the 26<sup>th</sup> at latitude 47° North, longitude 32° 20' West, and was thrown on her beam-ends. The storm continued across the Atlantic Ocean, and reached Land's End, *England* about 7:45 a.m.; Plymouth 8:30 a.m.; Exeter 9:30 a.m.; Weymouth 10 a.m.; Poole 10:30 a.m.; Farnham 12 noon; London 1:30 p.m.; Suffolk coast 2:30 p.m.; and Hamburg, *Germany* at 6 p.m. This storm traveled at 50 miles per hour but had a circular motion of from 120 to 150 miles per hour. The fury of the gale was most felt on the coasts of *France* and *Belgium*. At Ostend, *Belgium* there was scarcely a house, which was not unroofed; and so great was the demand for [roof] tiles that they rose from 16 to 30 florins per 1000.<sup>228</sup>

In 1836, there was a famine in the Bombay Presidency and Madras in *India*.<sup>156</sup>

In 1836, there was a famine in Orissa [now Odisha on the east coast of *India*].<sup>182</sup>

In 1836 during the period between 5 February and 6 May, floods struck Shantung (now Shandong province) on the east coast of *China* at Mou-p'ing. The fields were damaged by the floodwaters. During the period between 12 August and 10 September, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang. The dikes were damaged.<sup>153</sup>

In 1836 during the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at P'êng-lai. During the period between 6 May and 8 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Ying-ch'êng; Kansu (now Gansu province) in northwest *China* at Lanchow and Lin-t'ao; and Shensi (now Shaanxi province) in central *China* at Tso-shui.<sup>153</sup>

---

**Winter of 1836 / 1837 A.D.** A snowfall began on 24 December 1836, which continued for some days, and blocked up the roads in most parts of the kingdom so completely, that on the 27<sup>th</sup> at 8 p.m., all the mail with the exception of two, were due [late]. Such a violent snowstorm had not occurred in *England* since 1814. At Lewes, Sussex in southern *England*, an avalanche of snow, falling from a cliff, destroyed a number of houses, and buried the inhabitants in the ruins. The storm was equally severe in Paris and in the north of *France*, but the cold was not intense. The thermometer scarcely descending more than a few degrees below freezing.<sup>43</sup>

On 24 December 1836, there was a great fall of snow in *Great Britain* and northern *France*. It blocked up the roads in most parts of *England* so that on the 27<sup>th</sup>, the mail could not be delivered at London. The storm caused great damage and loss of life. At Lewes, an avalanche from a cliff destroyed several houses and buried the inhabitants in the ruins. At Chatham Lines [railroad line in England], the snow was from 30 to 40 feet [9.1 to 12.2 meters] deep. "Never before," says a London paper, "within our recollection, was the London mail stopped for a whole night at a few miles from London; and never before have we seen the intercourse between the southern shires of England and the metropolis interrupted for two whole days".<sup>203</sup>

On Christmas day 1836, a powerful snowstorm struck London, *England*. Communications with the metropolis for one whole week was greatly retarded by land, the effects of which were seriously felt by the commercial houses. The drifted snow, in many places, measured from 12 feet to 16 feet in depth, but

the average depth as nearly as could be calculated was about 4 feet. In London, the principal streets during the whole of Christmas week, resembled ploughed lands. The snow, having become mingled with the dirt in the streets, had lost its whiteness, and had very much the appearance of black mould [mold]; so that carriages passed along the streets as silently as they would have done along a ploughed field. The gale on Christmas day did much damage to the shipping on the east coast. It is believed that this storm struck across all of *England*. There was a considerable fall of snow in *Spain*, with an unusual decrease in temperature.<sup>228</sup>

In *England*, there were floods caused by winter's thaw.<sup>47, 92</sup>

The winter of 1836-37 in Bradford County, Pennsylvania in the *United States* began early. The people of Bradford county back on the hills were very surprised upon awakening on 5 October 1836 to find the ground covered with a great body of snow which had fallen to the depth of nearly two feet [0.6 m] during the night. Fruit had not been gathered nor buckwheat, some not yet cut. Fruit trees were broken down and roads through the forests blockaded with limbs. On the 6<sup>th</sup>, the sun shone brightly and the snow soon disappeared. Of this storm the Northern Banner wrote: "This was one of the most unusual storms we have ever witnessed, and being accompanied by the keen, cutting blasts from the North, it had every appearance of real winter. The jingling of sleigh bells was heard through our streets (Towanda) on the 5<sup>th</sup> of October as merrily as in the middle of winter, and overcoats, cloaks and good fires were as indispensable as in January. . . Palmer Thompson of Smithfield township perished in the snow-storm on the night of the 5<sup>th</sup>. He had been a few miles from home to a [barn?] raising. Returning home through the woods, night coming on and it being very dark, he lost his way and lay in the woods all night where he was found dead the next morning."<sup>178</sup>

During the winter of 1836-37, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 111 days.<sup>202</sup>

At Thompson, Connecticut in the *United States*, the first significant snowstorm of the season in 1836 occurred on 17 November. Considerable snow.<sup>116</sup>

Miss Ellen D. Larned described the New England winter of 1836-37 at Thompson, Connecticut in the *United States* — On 3 November 1836 it snowed. November 17<sup>th</sup> - snowstorm. November 25<sup>th</sup> - squally and cold. On 1 January 1837 - snow and sleighing. January 18<sup>th</sup> - snow. January 21<sup>st</sup>-22<sup>nd</sup> - hard snowstorm. January 25<sup>th</sup> - very remarkable red auroras. Quiet snows and sleighing through February. March 2<sup>nd</sup> - great sleighing party. March 19<sup>th</sup> - very cold. March 22<sup>nd</sup> - cold and tedious storm; trees loaded with ice. April 1<sup>st</sup> - cold, frozen rain. April 2<sup>nd</sup> - cold. April 8<sup>th</sup> - rain and thunder all day. April 9-10<sup>th</sup> - hail. April 16<sup>th</sup> - cold rain. May 1<sup>st</sup> - ground frozen hard. May 5<sup>th</sup> - rain and thunder showers all day and evening.<sup>116</sup>

In March 1837, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 1<sup>st</sup> (31° F); 4<sup>th</sup> (22° F); 5<sup>th</sup> (27°-28° F); 6<sup>th</sup> (31° F). There was frost on March 12<sup>th</sup>, 17<sup>th</sup>, and 21<sup>st</sup>. It snowed on March 3<sup>rd</sup> and 24<sup>th</sup>.<sup>116</sup>

On 3 April 1837, a great late season snowstorm struck St. Louis, Missouri in the *United States* with snow falling to a depth of 17 inches [43 centimeters].<sup>203</sup>

On 7 April 1837, it snowed all day in St. Charles and Warren Counties, Missouri in the *United States*. On the morning of the 8<sup>th</sup>, the snow was 2½ feet deep on the level.<sup>123</sup>

On 8 April 1837, snow fell at Havre, Rouen and many other places in *France*.<sup>203</sup>

On 11 April 1837, there was a considerable snowfall in London, *England*. The newspaper *The Morning Herald* wrote, "Considering the quantity [of snow] that fell in October, we may now be said to have had seven months of winter. In fact there has not been any genial weather since the middle of August."<sup>203</sup>

---

### **1837 A.D. – 1838 A.D. India. Famine**

In *India* during the years 1837-1838, there was a severe drought in some of the northwest provinces.<sup>47</sup>

In 1837, there was a famine in the Northwest Provinces in *India*.<sup>156</sup>

In 1837, there was a famine in Agra and the North-Western Provinces of *India*. A half million people perished most miserably.<sup>182</sup>

In 1837-38, there was a famine in Marwar in western *India* in which 50,000 people perished.<sup>182</sup>

In 1837-38, there was a great famine in *India*. It affected the whole country between Allahabad and Delhi, but was most severe in the central Daub [river region], in the neighborhood of Agra and Cawnpur. Including Rajputana, the affected population included 28 million. In 1836 the rains failed, and the distress was intensified by poor harvests in the preceding years. Grain merchants closed their shops. The peasantry took to plunder. Cattle starved and died. In the part of the Mathura district west of the Jumna [river], the village thatches were torn down to feed the starving beasts. In Farrukhabad, "Brahmans, who had before rejected their cooked food if the defiled Christian came to near, were now seen by us stealing the scraps from our dogs. Mothers sold their infants to the despised foreigners, or left them a prey to the wolves; society was entirely disorganized, and horrors of every kind pervaded the land."<sup>181</sup>

In *India* during 1837-38, there was a famine in northwest provinces, resulting from a general failure of rain. This was also felt in the lower provinces: for in Calcutta it is said the [water] tanks were empty. Lord Auckland wrote in January 1838: "The fall in the usual season of the rains last year was unusually late and scanty; and an absolute drought has followed up to the present time."<sup>57</sup>

In 1837-38 in northwest *India*, there was a famine. Above 800,000 people perished.<sup>90</sup>

---

### **1837 A.D. – 1839 A.D. Australia. Drought**

From 1837-39, there was a severe drought in New South Wales, *Australia*. This was reported to be the worst drought since the region was settled. Many rivers were dry.<sup>101</sup>

In 1837 in the Hunter Region of New South Wales, *Australia*, wheat sown in May had not germinated in September.<sup>103</sup>

In 1838, there was a drought in *Western Australia*. Crops suffered in Northam and York.<sup>101</sup>

On 2 November 1838 was declared a Day of Humiliation in New South Wales, *Australia* on account of the drought.<sup>103</sup>

In 1839, there was a drought in *South Australia*. There was no permanent water anywhere. The drought was severe from Port Lincoln to the head of Spencers Gulf.<sup>101</sup>

In New South Wales, *Australia*, there was a great drought in 1839.<sup>103</sup>

In February 1839 in New South Wales, *Australia*, the Cowpasture River ceased to flow. This was the first time this ever happened since it was first discovered 48 years earlier. In March, dead cattle along the roads; no food for man or beast.<sup>103</sup>

---

**1837 A.D.** During May through September of 1837 in *South Australia*, there was intermittent flooding in Adelaide.<sup>101</sup>

On 3 June 1837, a tornado cut a path from the Hudson [River] through Dutchess County, New York into the State of Connecticut in the *United States*, causing great damage.<sup>203</sup>

On 15 June 1837, there was a great rainstorm in Baltimore, Maryland in the *United States*. The waters of Jones's Fall rose suddenly in 3 to 4 hours time, 20 feet [6.1 meters] above its usual level. About 50 dwelling houses and 200 stores were destroyed or damaged; a great amount of goods and property ruined; and between 20 and 30 lives were lost.<sup>203</sup>

On 28 June 1837, there was a great fall of snow near Sydney, *Australia*.<sup>103</sup>

On 26 July to 3 August 1837, a hurricane struck the *Caribbean* island of Martinique and the southwest *Atlantic Ocean* causing 57 deaths. [Reid (1841) reprints report that two hurricanes occurred in Santo Domingo in 1837, in some combination causing 3 drownings, plus "three Haytian vessels were also on the coast, and only one man saved."] <sup>141</sup>

On 30 July 1837 in Dublin, *Ireland*, there was a violent shower of hail, accompanied by loud thunder.<sup>93</sup>

On 2-3 August 1837, a hurricane struck near the *Caribbean island* of St. Thomas, *Puerto Rico* and the southwest *Atlantic Ocean*. This hurricane caused more than 141 deaths.<sup>141</sup>

On 2-4 August 1837, hurricanes cause great damage at *St. Thomas*, *St. Bartholomew's* and other West India Islands [West Indies Islands].<sup>203</sup>

On 18 August 1837, a hurricane struck North Carolina in the *United States*. Several vessels were lost, one of them, with the entire crew. The ship *Palambam* foundered.<sup>141</sup>

The high temperatures observed during the summer were: <sup>62</sup>

Basse-Terre, <i>Guadeloupe Island</i>	( 95.0° F, 35.0° C) on 21 August
Reykjavik, <i>Iceland</i>	( 68.9° F, 20.5° C) on 25 and 31 July

On 26-27 September 1837, a hurricane struck *Jamaica*.<sup>124</sup>

On 3-10 October 1837, a hurricane struck the coast of the *Gulf of Mexico* and North Carolina in the *United States* causing 105 deaths.<sup>141</sup>

On 20 December 1837, the brig *Schah* was blown ashore about two nautical miles east of Rame Head (east coast of Gippsland) in *Australia*. The *Schah*, a 91-ton vessel, was on its way from Hobart to Sydney, carried ten passengers and a crew of nine. The *Schah* was struck by heavy gales from the southwest, losing some of its sail. When off Rame Head the weather became foggy and a change in wind forced the vessel towards the shore. Four female passengers and a child disappeared in the raging waters, while two male passengers were trapped on the vessel as it sunk. The survivors, near naked and exhausted, managed to reach the rocks and clamber ashore. The vessel disintegrated almost immediately.<sup>99</sup>

In 1837 during the period between 5 February and 2 July, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Lin-ch'ü. During the period 3-31 July, a drought engulfed Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at

Hai-k'ang. During the period 1-30 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Yüan-shih, Fou-ch'êng and Hsing-t'ai.<sup>153</sup>

*Also refer to the section 1837 A.D. – 1838 A.D. for information on the drought in India during that timeframe.*

*Also refer to the section 1837 A.D. – 1839 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1837 / 1838 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1837 occurred on 14 November. Severe snowstorm.<sup>116</sup>

The winter of 1837-38 in Bradford County, Pennsylvania in the *United States* was remarkably mild until the end of January when winter began in earnest and the weather continued intensely cold, the greater part of the time, until the 5<sup>th</sup> of March. April was also very cold.<sup>178</sup>

During the winter of 1837-38, the Hudson River at Albany, New York in the *United States* was closed to river traffic because it was frozen or obstructed by ice for 94 days.<sup>202</sup>

Miss Ellen D. Larned described the New England winter of 1837-38 at Thompson, Connecticut in the *United States* — On 14 November 1837 - cold, blowing snowstorm all day. November 22<sup>nd</sup> - snowed all day. December 10<sup>th</sup> - snowed. December 14<sup>th</sup> - severe storm. December 25<sup>th</sup> - snowed all day. On 9 January 1838 - snowed; warm month; snows turned to rain. Sleighing in February. March 8<sup>th</sup> - heavy snowstorm. March 15<sup>th</sup> - snowstorm. March 27-29<sup>th</sup> - snowed and melted. April 14<sup>th</sup> - snowstorm; cold and snowy to 24<sup>th</sup>.<sup>116</sup>

In the *United States* during the winter of 1837-38, the temperature at Hillsborough (now Hillsboro, Ohio) fell to -22° F in February.<sup>113</sup>

In March 1838, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 1<sup>st</sup> (26° F); 3<sup>rd</sup> (30° F); 4<sup>th</sup> (31° F). There was frost on March 13<sup>th</sup> and 24<sup>th</sup>. It snowed on March 2<sup>nd</sup>.<sup>116</sup>

In the *United States* it was the coldest April in Philadelphia since 1816. There was ice on five mornings and frost on eleven other mornings. Snow fell on April 14 and 24.<sup>1</sup>

In *England* on the 7<sup>th</sup> of January, a severe frost commenced this day – one of the most severe in modern times – and continued for a month.<sup>47, 93</sup>

[In *England*] from 7 January to February 1838, there was a severe frost. The River Thames was blocked by the ice.<sup>90</sup>

The winter of 1837-38 in *England* was remarkable for the long frost of January and February 1838. It lasted eight weeks. The thermometer recorded the lowest temperature at Moseley, near Birmingham on 20 January at -5.0° F (-20.6° C). Colder temperatures were recorded in more exposed areas with readings of -8.0° to -10.0° F (-22.2 to -23.3° C). On the 13<sup>th</sup> of January, the old Royal Exchange in London was destroyed by fire. The frost was so great that when the fire brigades ceased working on one portion of the burning pile, the water in short order became icicles of such large dimensions, that the effect has been described as grand in the extreme.<sup>70</sup>

In *France*, the Seine River was frozen on 17th of January 1838 at the bridge “Pont de Bercy”, and on the 18th at the bridge “Pont d’Austerlitz” in Paris. The river was crossed on the ice until the 8<sup>th</sup> of February. The Saône and Rhône Rivers in *France* were also frozen.<sup>62</sup>

The winter of 1838 was harsh in southern *France*. The thermometer at Ain [in eastern *France*] sank down to -13° F (-25° C). The intensity of the cold killed all the mulberries bushes in the surrounding area. In areas where the cold was less rigorous, many young grapevines were lost.<sup>79</sup>

During the winter of 1837-38 the frost began early, and the Dvina (Daugava) River was by 7 November covered with ice. On 30 December severe cold struck St. Petersburg, *Russia*. During this time, spring weather prevailed in Paris, *France*. In Champagne, *France*, the honeysuckle bloomed, and the apple trees were still laden with fruit, and the thermometer showed 50.0° to 52.3° F (10° to 11.3° C). Nevertheless, there was in Paris this winter, 65 days of frost, of which 26 were consecutive. From 7 January, the temperature dropped quickly. On 11 January, ice formed on the Seine River. On 13 January, the river was frozen at Rouen, *France*. On 15 January, the small arm of the river was frozen at the hospital Hotel-Dieu in Paris. On 18 January, the river was frozen at the bridge Pont d'Austerlitz. On 19 January, the ice was thick enough to support individuals crossing the river on foot. On 16 January, the Saône River was frozen above Serin and Neuville in the harbor in eastern *France*. From 13 to 19 January, the Rhône River was frozen at Avignon above St. Clair. In *Germany*, in the middle of January, the Rhine River, as well as the Neckar River were frozen above Heidelberg. In *England*, the River Thames was so obstructed with ice, that ordinary shipping was stopped almost entirely. In Châlons-sur-Marne, *France*, three travelers were found frozen to death. The following are lowest temperatures observed during the winter:<sup>62</sup>

Geneva, <i>Switzerland</i>	(-13.5° F, -25.3° C) on 11 and 15 January
Lons-le-Saunier, <i>France</i>	(-12.1° F, -24.5° C) on 16 January
Great St. Bernard Hospice, <i>Switzerland</i>	( -7.2° F, -21.8° C) on 20 January
<i>Ibid.</i>	(-10.5° F, -23.6° C) on 13 February
Löwen, <i>Germany</i>	( -5.6° F, -20.9° C) on 2 January
Lyon, <i>France</i>	( -4.0° F, -20.0° C) on 16 January
Paris, <i>France</i>	( -2.2° F, -19.0° C) on 20 January
Reims, <i>France</i>	( -2.2° F, -19.0° C) on 20 January
Brussels, <i>Belgium</i>	( -1.8° F, -18.8° C) on 16 January
Metz, <i>France</i>	( -1.3° F, -18.5° C) on 21 January
Bernay (Eure), <i>France</i>	( -0.4° F, -18.0° C)
Alost (Aaist), <i>Belgium</i>	( 0.7° F, -17.4° C) on 20 January
Orange, <i>France</i>	( 7.3° F, -13.7° C) on 20 January
Rouen, <i>France</i>	( 8.6° F, -13.0° C)
London, <i>England</i>	( 10.6° F, -11.9° C) on 16 January
Cherbourg, <i>France</i>	( 16.7° F, -8.5° C) on 18 January
Avignon, <i>France</i>	( 18.3° F, -7.6° C) on 20 January
Hyères, <i>France</i>	( 29.7° F, -1.3° C) on 12 January
Cairo, <i>Egypt</i>	( 46.2° F, 7.9° C) on 27 December
<i>Ibid.</i>	( 45.1° F, 7.3° C) on 9 January

---

**1838 A.D.** On 18 April 1838 in *Ireland*, there was a great hurricane on the north coast, with much hail and snow.<sup>93</sup>

On 4 July 1838 in *England*, there was a hailstorm in Lancashire and Yorkshire.<sup>93</sup>

During the autumn of 1838, there were terrible storms and gales in *Europe* and great damage was sustained both on the sea and land. The chain bridge at Montrose was carried away [the South Esk chain bridge in Montrose, *Scotland*]. Immense damage to shipping was done. Another storm occurred on the night of 28 October, sweeping the whole northern and eastern coast of *England* with terrific violence, unroofing houses, blowing down chimneys, trees, etc. and doing immense damage to vessels.<sup>1</sup>

The maximum temperature during the summer in Pau in southwestern *France* was 101.8° F (38.8° C) on 4 August.<sup>62</sup>

In 1838, there was a major drought in New England area of the *United States*.<sup>113</sup>

In the *United States*, on August 11, a terrific thunderstorm passed from Virginia to the New England states. Lightning killed many people; houses and barns were burnt; vessels struck and set on fire, the wind blew a perfect hurricane. In Maryland, several houses and other buildings were demolished and many buildings lost their roofs. Several barns were struck by lightning and burnt in Pennsylvania, New Jersey and New York. The newspapers cited the names of 26 individuals who lost their lives during this storm.<sup>1</sup>

On 7 September 1838, a hurricane struck near Cape Florida [Key Biscayne] in the *United States* causing 38 deaths.<sup>141</sup>

On 28 October 1838, a hurricane visited London, *England*, and its neighborhood. The storm did great damage to the buildings, but there was no destruction of human life, though many serious accidents occurred.<sup>90</sup>

In *England* on the 28<sup>th</sup> of October, a great hurricane visited London and neighborhood; considerable destruction of property; but very little loss of life.<sup>57</sup>

On 28 October 1838; 11 July 1874; 11 April 1878, and 12 December 1883, storms struck London, *England*, which destroyed from twenty to thirty lives in each case, and from \$1 to \$3 million (U.S.) dollars in property damage. [In present currency, that would be equivalent to \$27-\$81 million dollars in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

On 1 November 1838, a hurricane struck the east coast of *Mexico*. Three United States vessels were lost, and the crews of two of these perished.<sup>141</sup>

In *India* during 1838-39, there was a great scarcity and considerable distress, caused by failure of rains in Surat and other districts in the Bombay Presidency. Large numbers of people left these provinces in search of food elsewhere.<sup>57</sup>

In 1838 during the period between 6 May and 8 August, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin; Hupeh (now Hubei province) in central *China* at Ying-shan; and Kansu (now Gansu province) in northwest *China* at Ching-yüan. During the period between 19 September and 17 October, a drought engulfed Anhwei (now Anhui province) in eastern *China* at Fou-yang. Twenty-one districts were affected by the drought.<sup>153</sup>

[Although the source gives the year as 1836, it appears to be a mistake. The actual year being 1838.] During the period between 21 July and 19 August, floods struck Hupeh (now Hubei province) in central *China* at I-tu. Many houses were damaged by the floodwaters. During the period between 20 August and 18 September, floods struck Hupeh province at Ên-shih.<sup>153</sup>

*Also refer to the section 1837 A.D. – 1838 A.D. for information on the drought in India during that timeframe. Also refer to the section 1837 A.D. – 1839 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1838 / 1839 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1838 occurred on 28 & 29 October.<sup>116</sup>

Miss Ellen D. Larned described the New England winter of 1838-39 at Thompson, Connecticut in the *United States* — On 28-29 October 1838 it snowed moderately. November 8<sup>th</sup> - hard storm; very cold. November 18<sup>th</sup> - cold snowstorm. November 24-25<sup>th</sup> - extreme cold. December milder, with slight

snows. On 4 January 1839 it snowed, but soon melted; very fine and spring like, then snow and very cold; temperature -11° F (-23.9° C). January 26<sup>th</sup> - violent southeast rainstorm; variable season. February 9<sup>th</sup> - snow. April was dry and warm early in month. April 12-18<sup>th</sup> - cold storm, rain and snow.<sup>116</sup>

During the winter of 1838-39 in Bradford County, Pennsylvania in the *United States*, there was a late May snowfall. On 25 May 1839, snow began falling, continuing during the night until it was more than a foot [30 cm] deep. The spring had been early and much farming done. The corn was up. The snow soon melted and passed away.<sup>178</sup>

---

**1839 A.D.** In *Europe* during January and February the weather was very tempestuous, both on sea and land and many distressing shipwrecks occurred. There was a great amount of damage done in Liverpool and Manchester.<sup>1</sup>

On January 6 & 7, an awful hurricane struck the West Coast of *England* and in *Ireland*. Through Cheshire, Staffordshire and Warwickshire the damage was immense. Many vessels wrecked, some of great value. In Limerick, Galway, Athlone, and other places, many houses destroyed and fires extended the destruction. Dublin suffered much.<sup>47, 57</sup>

On 6-7 January 1839, an awful hurricane struck on west coast of *England* and in *Ireland*. The storm raged through Cheshire, Staffordshire, and Warwickshire; 20 persons were killed in Liverpool, by the falling of buildings, and 100 were drowned in the neighborhood; the coasts and harbors were covered with wrecks, the value of two of the vessels lost being nearly half-a-million Sterling. In Limerick, Galway, Athlone, and other places, more than 200 houses were blown down, and as many more were burnt, the winds spreading the fires. Dublin suffered dreadfully; London and its neighborhood scarcely sustained any damage.<sup>90</sup>

On 6 & 7 January 1839, a hurricane struck Dublin, *Ireland*. The loss of life in Dublin was estimated at 100, and the city sustained \$3,000,000 in property damage. [In present currency, that would be equivalent to \$81.5 million in damages based on the Consumer Price Index (CPI) inflation rates.] This storm was felt throughout the greater part of *Ireland* and on the west coast of *England*. Several other large towns in Ireland besides Dublin were struck, including Limerick, Galway and Athlone. In Liverpool, *England*, the destruction was also great. Thirty persons were killed by falling buildings or flying debris, and 100 were drowned in the storms.<sup>197</sup>

On 18 June 1839 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 18 June 1839, a tornado ravaged the parish of Châtenay in the department of Seine and Oise in *France*. It tore down walls, chimneys and removed the roofs from the chateau and the farm. It carried trees hundreds of metres [meters] distant and took boards, rafters and [roof] tiles away 500 yards [457 meters] and more. The tornado was approximately 160 yards [146 meters] wide and traveled a distance on the ground of 4 kilometres [kilometers] (2½ miles). Fifteen hundred tree-roots had served as conductors for the incessant electrical flashes that accompanied this storm.<sup>271</sup>

On 20 June 1839 in *England*, there was a hailstorm in Lincolnshire, Northamptonshire, and Worcestershire.<sup>93</sup>

On 7 July 1839 in *England*, there was a great hailstorm in Berkshire, Surrey, and Sussex.<sup>93</sup>

In July and August 1839 in consequence of a great drought in New South Wales, *Australia*, the necessaries of life became scarce and accordingly dear. The 2 pound loaf of bread was raised to 2s. 6d. Vessels were sent to Valparaiso and China for grain provisions. A public subscription was raised, from

which funds, flour, etc. was purchased, and distributed gratuitously to the sufferers.<sup>103</sup>

In 1839 in *Germany*, there was a succession of hailstorms that nearly ruined the Hail Insurance Association Mutual and Proprietary companies. The damage from hailstorms was so great in *Germany* that but few of the mutual associations could pay their losses in full; and the loss to the Berlin Company amounted to £30,502 beyond the premiums.<sup>93</sup>

The summer of 1839 was extremely dry in the south of *France* and also distinguished by its great heat. In the north it was rainy with moderate temperatures. The summer in Paris was characterized by:

Hot days	34 days
Very hot days	5 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Toulouse, <i>France</i>	(101.3° F, 38.5° C) in June
Avignon, <i>France</i>	(100.4° F, 38.0° C) on 3 August
Pesaro, <i>Italy</i>	( 96.1° F, 35.6° C) on 28 June
Dijon, <i>France</i>	( 93.0° F, 33.9° C) in July
Geneva, <i>Switzerland</i>	( 93.0° F, 33.9° C) on 15 July
Alost (Aaist), <i>Belgium</i>	( 92.5° F, 33.6° C) on 18 June
Metz, <i>France</i>	( 92.1° F, 33.4° C) on 18 June
Gent (Ghent), <i>Belgium</i>	( 92.1° F, 33.4° C) on 18 June
Paris, <i>France</i>	( 91.9° F, 33.3° C) on 17 June
Brussels, <i>Belgium</i>	( 91.2° F, 32.9° C) on 18 June
Marseille, <i>France</i>	( 88.7° F, 31.5° C)
Löwen, <i>Germany</i>	( 88.5° F, 31.4° C) on 18 June
London, <i>England</i>	( 84.9° F, 29.4° C) on 8 and 20 June
La Chapelle, <i>France</i>	( 82.4° F, 28.0° C) on 17 June
Angers, <i>France</i>	( 81.7° F, 27.6° C) on 7 July

In Burgundy, *France*, the grape harvest only began on 30 September. Due to the frost that occurred in May, the yield of grapes was very mediocre, and the yield of wheat was not enough to meet demand.<sup>62</sup>

The year 1839 was one of the driest in the southern *France*.<sup>79</sup>

In 1839 northern *France* received frequent rains. In Paris, a very soft winter preceded a cold and rainy spring, full of thunderstorms followed by showers. Thunderstorms and rains continued during the summer and fall. During the month of June, the most rain fell. There was 4.2 inches (107 millimeters) of rainfall. But overall the annual rainfall in Paris in 1839 was only 19 inches (483 millimeters); which was less than normal.<sup>79</sup>

In 1839, a powerful cyclone struck Coringa, *India* causing 300,000 deaths.<sup>98</sup>

On 28 August 1839, ball lightning struck Paris, *France*. “In the midst of a violent storm, the black and low clouds of which almost touched the tops of the buildings, the stroke [of lightning] fell in the middle of the court of the unfinished central office of the custom-house in the city of Paris, in the course of building. This thunderbolt was in the form of a great globe of fire, and was accompanied by a train of vapour; it struck the soil, formed of fresh rubbish, and dug a hollow eighteen centimeters in diameter; here it moved furiously about, turning round, and threw up the loose earth; then it rebounded, to fall again at three metres [meters] distance, where it made another excavation nine centimeters in diameter, being continually in violent agitation. Very soon the globe of fire rebounded again from this cavity on to the wall of the enclosure, along which it followed the coping for about thirty metres. Arrived at the corner of the wall opposite the Hospital of Saint Louis, this globe, already very much diminished in volume, dashed

along the street, over the pavement wet with the rain; here it dragged itself along a long serpentine furrow, passed the entrance gate of the hospital, and disappeared in the middle of the court opposite the church. As the time went on and its contact was prolonged, you could very clearly see its mass diminish; when it arrived in the middle of the court of the Hospital of Saint Louis, it was nothing but a thin strip, with but little light, which disappeared suddenly. At the moment of the fall of this globe in the court of the custom-house, all the workmen and clerks who were at shelter under the sheds felt a smart electric shock; and they were all impressed by the strong sulphurous smell which it left behind.”<sup>271</sup>

In the *United States*, the drought was so severe in Alabama from August to November as to render good drinking water so scarce, that it was sold for one dollar per gallon.<sup>1</sup> [In present currency, that would be equivalent to \$21 per gallon based on the Consumer Price Index (CPI) inflation rates.]

On 11 & 12 September 1839, a great gale struck the *Bahamas Islands*.<sup>123</sup>

On 25 November 1839, a cyclone struck Port Essington in the Northern Territory of *Australia*. A ship, *H.M. Pelorus*, was driven aground near Port Essington and eight people drowned. The settlement at Port Essington was demolished by winds. The winds from the cyclone toppled trees on Cobourg Peninsula, which caused another four deaths. A 10.5-foot (3.2 meter) storm surge added to the damage.<sup>99</sup>

In December 1839 in Victoria, *Australia*, there was a flood on the Yarra and Saltwater Rivers.<sup>101</sup>

In 1839, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 14 February and 14 March, floods struck Shantung (now Shandong province) on the east coast of *China* at Hui-min, Chan-hua and Chi-ning.

— During the period between 14 April and 12 May, floods struck Hupeh (now Hubei province) in central *China* at Chih-chiang, Kung-an, Sung-tzū and Yün-hsi.

— During the period between 13 May and 10 June, floods struck Hupeh province at Chung-hsiang. The dikes were damaged.

— During the period between 11 July and 8 August, floods struck Hupeh province at I-tu, Kung-an, Sung-tzū, Ao-ch'êng, I-ch'ang and Chih-chiang; Shantung province at Lin-i and Ling; and Hopei (now Hebei province) in northern *China* at Yü-t'ien. At Yü-t'ien, it flooded for 5 consecutive years. [Lin-i is located at longitude 116.52° East and latitude 37.13° North.]

— During the period between 8 August and 8 November, floods struck Hopei province at Ching-hai; Shantung province at Chan-hua; and Shensi (now Shaanxi province) in central *China* at Mien. At Ching-hai, all the crops were damaged by the floodwaters.

In 1839 during the period between 5 February and 8 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Wang-tu. During the period between 14 April and 12 May, a drought engulfed Hopei province at Wu-ch'iang and Chahar province (now eastern *Inner Mongolia*) at Huai-lai. During the period between 8 August and 8 November, a severe drought engulfed Kansu (now Gansu province) in northwest *China* at Chuang-lang.<sup>153</sup>

*Also refer to the section 1837 A.D. – 1839 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1839 / 1840 A.D.** Charles Pierce describes the winter of 1839-40 in Philadelphia, Pennsylvania in the *United States*:<sup>1</sup>

— In November 1839, the weather was very variable, from mild to cool, until the 20<sup>th</sup>, when the wind changed to northwest, after which the cold increased so rapidly, that on the morning of the 21<sup>st</sup>, the mercury was 20° F; on the 22<sup>nd</sup> it was 18° F; on the 23<sup>rd</sup> it was 20° F. The 24<sup>th</sup> and 25<sup>th</sup> were mild; but the 26<sup>th</sup> was severely cold; at sunrise, the mercury rested at 15° F and it did not rise higher than 24° F at mid-day. The 27<sup>th</sup> and 28<sup>th</sup> were also cold; but the 29<sup>th</sup> and 30<sup>th</sup> were milder. Some rain fell on five days, making three and a half inches; and some snow fell on two

days, about half an inch in all. During the night of the 25<sup>th</sup>, the cold was so severe as to freeze over the Delaware River from Kensington to Trenton, which stopped the steamboats from running for a few days. This was also the case in November 1838, but they resumed their trips, and continued to run until the middle of December. On the 7<sup>th</sup>, snow fell in the interior of New York and through the New England States, and Canada, to the depth of several inches. In some places there was good sleighing.

— December 1839 was a weeping month. Some rain fell on fifteen days, making in all six and a quarter inches, and some snow fell on seven days, making in all about twelve inches, in this city; but in the country it fell to a much greater depth. There were only seven entirely clear days during the month. The newspapers from various parts of the country said, that more snow had fallen in this month, than in any December for thirty years. The snow, from Philadelphia to Baltimore, and Washington D.C., was from 18 to 20 inches (46-51 centimeters) deep, and the roads were impassable for two days, after the violent snowstorm of the 22<sup>nd</sup> and 23<sup>rd</sup>. The roads between Philadelphia and Lancaster were so blocked up, that cars and stages were stopped for three days, and no mail was received from Pittsburgh, Erie, etc., for nearly two weeks. The snow was also very deep in the interior of New York State, and in all the western, northern and eastern States. The gale and storm of the 22<sup>nd</sup> and 23<sup>rd</sup>, was awfully severe and destructive from the Chesapeake to the extreme part of the State of Maine, and many vessels and valuable lives were lost. The shipping suffered very much in the harbors of New York, Rhode Island, Boston, and to the extreme part of Maine. Out of sixty vessels which put into Gloucester, (Cape-Ann,) for a harbor, twenty-two were totally lost, with almost every one of their crews; and the remainder were all dismantled and otherwise crippled. About fifty poor sailors thus perished. Twenty of their dead bodies were found washed ashore the next morning, and several more afterwards. On the 20<sup>th</sup> and 21<sup>st</sup>, the Delaware River closed from Kensington to Trenton.

— January 1840 was a month without a thaw. Some snow fell on eight days, about eight inches in all. On eight mornings the mercury was from two to ten above zero degrees Fahrenheit. On eight more days, from ten to twenty above zero. On one morning, only, it was above the freezing point. The Schuylkill River closed on the 1<sup>st</sup>, and the Delaware River would have followed suit, but for the iceboats. But Jack Frost obtained a victory over them on the night of the 16<sup>th</sup>, and placed his broad white seal upon the Delaware River, which remained unbroken for several days. At Baltimore, Maryland and Washington D.C. the mercury sunk down to zero degrees Fahrenheit. At Gettysburg and several other towns in the interior of Pennsylvania, the mercury was -13° F (-25° C). At Albany, Saratoga, Buffalo, New York, the temperature fell to -30° F (-34° C). At Hartford and New Haven, Connecticut the temperature fell to -15° F (-26° C). At Springfield, Massachusetts the temperature fell to -30° F (-34° C). At Boston, Massachusetts the temperature fell to -14° F (-26° C), and Portsmouth, New Hampshire to -14° F (-26° C). At Portland, Augusta, Eastport, etc., in Maine, the temperature fell to -20° F to -30° F (-29° to -34° C). In Montreal and Quebec, Canada the temperature fell to -37° F to -39° F (-38° to -39° C), and the roads well blocked up with snow. There were great disasters amongst the shipping on the coast and in harbors. Two inches of rain fell in Philadelphia during January.

— In February 1840, from the 1<sup>st</sup> to the 6<sup>th</sup> it was intensely cold; the mercury ranged from 0° F to 15° F, which closed the Delaware River below Pine Street, and would have kept it closed but for the vigilance of the iceboat. On the 6<sup>th</sup>, the wind came from the south and the weather suddenly became very mild, the rain poured down, and his icy majesty soon took his flight from this vicinity, and six inches of snow, which fell on the 1<sup>st</sup>, soon ran into the Schuylkill and Delaware rivers. The remainder of the month was mild and accompanied by occasional fog and rain. Three inches of rain fell during February.

— March 1840 commenced uncommonly warm; the mercury ranged at sunrise, (during the first seven days,) from 38° F to 53° F; and during mid-day, from 56° F to 70° F. But on the night of the 7<sup>th</sup>, the wind changed from south to northwest, and the cold increased so rapidly during the night, that on the morning of the 8<sup>th</sup>, it had sunk to 22° F. It continued cold until the 15<sup>th</sup>, when a little snow and rain fell—after which it became mild, and (with the exception of a few days,) it continued so until the month closed. About three inches of snow fell during March; and two and a half inches of rain. There were many frosty nights.

— During April 1840, there was the temperature of winter, spring and summer. There was thin ice on four mornings, and frost on six. On nine days the mercury ranged from noon to three o'clock from 50° F to 60° F; on ten days from 63° F to 70° F; on five days from 70° F to 76° F; on four days from 82° F to 84° F. Seven inches of rain fell, which is the greatest quantity in April for twenty years.

Three major snowstorms struck Northeast *United States* in December 1839. The snowstorm of 14-15 December dumped 20 inches (51 centimeters) of snow at New Haven, Connecticut; and 24 inches (61 centimeters) in Westchester County, New York. The second storm struck on 22-23 December dumping 10 inches (25 centimeters) of snow on Washington D.C.; and 16 inches (41 centimeters) at Baltimore,

Maryland; 2 feet (61 centimeters) of snow at Gettysburg, Chambersburg and Easton, Pennsylvania. The third storm struck on 27-28 December caused 2 feet (61 centimeters) of snow to fall in a band from Hartford, Connecticut to Worcester, Massachusetts.<sup>27</sup>

On 15 December 1839, a strong gale swept through New England in the *United States*. Many vessels turned over and sunk with the complete loss of their crew. Some vessels dashed against the rocks and were destroyed. The whole shore of Massachusetts were strewn with wrecks and dead bodies, and the harbors of Newburyport, Salem, Marblehead, Boston, Cohasset, Plymouth and Cape Cod were filled with disabled vessels. The exact number of dead was never known, but it must have been great. On the shores of Maine and Connecticut, the storm was less severe. On land, many buildings were blown down and hundreds of chimneys were overturned. The tide rose higher than many of the highest watermarks then known. Inland as far as northwestern Massachusetts, the snow fell in great quantities, and its depth rendered travelling almost impossible. The deep embankments in many places extended to the second story of buildings and houses.<sup>199</sup>

— At Boston, Massachusetts, the tide rose higher than the old watermarks, and swept completely across the Neck. The roof of the Maverick house and the car house at East Boston were blown away. A ship and brig were sunk at their wharves. The schooner *Hesperus* broke her anchor chain and crashed into the docks and smashing her jib boom through the upper window of a four story building.

— At Nahant, the schooner *Catherine Nichols* dashed to pieces on the rocky shore.

— In the harbor at Marblehead, several vessels were damaged by the gale. The schooner *Paul Jones* was driven high upon the rocks. The schooner *Sea Flower* was driven on the beach and wholly lost.

— There were vessels in the harbor at Gloucester when the gale struck. Twenty-one vessels were driven ashore, three schooners sank and seventeen were so thoroughly dashed to pieces that in some cases no fragment larger than a plank was left. Twenty vessels still rode in the harbor, all but one with masts, they having been cut away. The pieces of twenty-two wrecks were scattered along the shore. Many of these crews perished in the storm. It was estimated that 40 perished at Gloucester.

— At Ipswich the schooner *Deposit* smashed into the sandy beach near the lighthouse. Many of the crew drowned or died from exposure. The funeral was held at the South Church. Sixteen sea captains acted as pallbearers.

— At Newburyport, the tide overflowed the wharves and many ships were damaged.

— On 22 December, a second severe snowstorm struck the region. The snowfall was so great that the railroads in Massachusetts were blocked. Great damage was done on both land and sea. Many vessels were driven ashore. The storm reached as far south as Baltimore. The brig *Pocahontas*, 271 tons, was wrecked at Plum Island. All the officers and nine hands of the mast perished. At Nantasket beach, the bark *Lloyd* went ashore. The vessel was finally dashed to pieces and all on board perished.

— On 27 December, another violent gale struck. At Portland, Maine, the tide rose so high that the sea swept over Tukey's Bridge. At Newburyport, Massachusetts, 41 vessels were damaged. At Gloucester, the brig *Richard Packet* was driven ashore and dashed to pieces. Several other vessels were lost. At Salem, a few ships and schooners were driven ashore. In Boston, the wharves were overflowed and lumber, wood, coal, etc. were swept away. The Front Street Dike broke and water covered nearly all the lowlands between Front and Washington Streets, from the Neck to Northampton Street. Water also came into Water Street and damaged dry goods in cellars. The causeway leading to Dorchester, and the lower streets of the city were submerged. The ship *Columbiana* was driven by the winds and tides into Charlestown Bridge and then the Warren Bridge and then destroyed a house. The storm was very severe at Provincetown on Cape Cod. The loss to shipping and the property on the wharves amounted to \$50,000. [In present currency, that would be equivalent to \$800,000 in damages based on the Consumer Price Index (CPI) inflation rates.] Ten or eleven stores were knocked down by vessels. Two salt mills were blown down and many salt works were carried away.

— The snows during the winter of 1839-40 were deep and severe. In the valleys in the western part of Massachusetts, snow was 2 feet [0.6 meters] deep throughout the winter and on the Berkshire hills it was 4 feet [1.2 meters] deep. Most roads were impassable and people traveled about on snowshoes. In many

places, the snow was 15 feet [4.6 meters] deep. In Chesterfield [Massachusetts], a man died and the snow was so deep that it took four days for the family to get to a neighbor's house for assistance. The disasters at sea during December 1839 included upwards of 300 vessels wrecked and more than 150 lives lost in these three storms.

In the *United States* during the winter of 1839-40, the temperature at Salem, New York fell to -40° F in January.<sup>113</sup>

During the winter of 1839-40 in Bradford County, Pennsylvania in the *United States*, temperatures dropped to the range of -15° F to -20° F [-26° C to -29° C] on January 4<sup>th</sup> and 5<sup>th</sup>.<sup>178</sup>

Miss Ellen D. Larned described the New England winter of 1839-40 at Thompson, Connecticut in the *United States* — Autumn was mild. On 15 December 1839 - tremendous snowstorm. December 16<sup>th</sup> - wind increased all day; snow very deep; fine day followed, but roads impassable. December 23<sup>rd</sup> - another violent snowstorm. December 27<sup>th</sup> - snowed again. The amount of snow falling in these incessant storms exceeded anything reported by the oldest inhabitant; business and social intercourse were virtually suspended, and the roads were so heavily packed that it seemed impossible to force a passage. A pamphlet published in Boston tells of the "awful calamities" occurring during the "dreadful hurricanes" on December 15, 21, and 27, with great loss of life and destruction of property. The year 1840 began very cold. January 11<sup>th</sup> - snowed all day. January 13<sup>th</sup> - snowed; the day made memorable by the burning of the steamer Lexington on its passage from Stonington to New York. February 4 & 5 - extremely cold. February 16<sup>th</sup> - family resumed church going; sunny and mild days followed; the snow passed off without damage. February 20<sup>th</sup> - snow nearly gone. March 4<sup>th</sup> - very warm, with thunder. March 6-16<sup>th</sup> - cold, strong winds. March 15<sup>th</sup> - snowed. March 22<sup>nd</sup> - very cold. March 24-25<sup>th</sup> - snowstorm. April 1<sup>st</sup> - snowed.<sup>116</sup>

In March 1840, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 11<sup>th</sup> (32° F); 12<sup>th</sup> (31° F); 26<sup>th</sup> (32° F). There was frost on March 6<sup>th</sup> and 26<sup>th</sup>. There was ice on March 6<sup>th</sup> and 22<sup>nd</sup>.<sup>116</sup>

---

**1840 A.D.** On 9 & 10 April 1840, a hurricane struck the island of *Mauritius* in the Indian Ocean. Trees of gigantic stature were torn up by the roots, and strewn about on the ground like mere straws. Buildings were thrown down, and all the wooden palings [fence pickets] were swept away. A group of tall filao trees (*casuarina equisetifolia*), from 60 to 100 feet [18 – 30 meters] high, very tough and not easily broken; but due to the irresistible force of the hurricane were bent down to an almost horizontal direction. After the storm passed, the rich green luxuriant vegetation of the tropics, had completely disappeared as if an arctic winter had suddenly took hold. Many vessels were thrown ashore.<sup>198</sup>

The summer in Paris, *France* was characterized by:

Hot days	44 days
Very hot days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Cairo, <i>Egypt</i>	(111.0° F, 43.9° C) on 23 May
Tours, <i>France</i>	(100.4° F, 38.0° C)
Toulouse, <i>France</i>	( 96.8° F, 36.0° C) in June
Paris, <i>France</i>	( 91.4° F, 33.0° C) on 6 August
Dijon, <i>France</i>	( 90.5° F, 32.5° C) in July
Alost (Aaist), <i>Belgium</i>	( 88.3° F, 31.3° C) on 9 June
Geneva, <i>Switzerland</i>	( 88.2° F, 31.2° C) on 22 June
Gent (Ghent), <i>Belgium</i>	( 86.0° F, 30.0° C) on 2 June

Marseille, <i>France</i>	( 85.8° F, 29.9° C)
Metz, <i>France</i>	( 85.1° F, 29.5° C) on 2 June
Angers, <i>France</i>	( 84.2° F, 29.0° C) on 15 June and 30 August
London, <i>England</i>	( 82.9° F, 28.3° C) on 1 June
Brussels, <i>Belgium</i>	( 81.5° F, 27.5° C) on 2 June
Löwen, <i>Germany</i>	( 81.1° F, 27.3° C) on 2 September
La Chapelle, <i>France</i>	( 81.0° F, 27.2° C) on 6 August

In part of the south [of *France*], the summer produced many strong thunderstorms. Several cows used for fieldwork collapsed from the heat. The grain harvest was good. The grape harvest was moderate in quantity, and the wine was quite good in quality. In Burgundy, the grape harvest began on 25 September.<sup>62</sup>

The last six months of 1840 produced an abundance of rainstorms in *France*. In Paris, this unusual rainfall began on the stormy night of May 6 and continued until November 27. Both before and after this time period, there was a persistent drought. The rain was mixed with westerly winds and sunny spells interspersed very short intervals in between, for five consecutive months. The monthly rainfall measured were: 1.3 inches (32.2 millimeters) in May; 1.0 inch (25.7 millimeters) in June; 1.3 inches (32.4 millimeters) in July; 1.1 inches (27.2 millimeters) in August; 4.5 inches (114.0 millimeters) in September; 2.0 inches (51.3 millimeters) in October; and 2.4 inches (59.9 millimeters) in November. Annual rainfall in Paris measured on the terrace of the Observatory exceeds by 1.4 inches (35.4 millimeters) the average rainfall derived from 54 years of measurements. The Seine overflowed the first days of November, and on November 20<sup>th</sup> the waters still covered half of the ports of the city.<sup>79</sup>

These storms and rains did not spare the province. They did, on the contrary, greater havoc especially in the basins of the Rhône and Saône rivers than in Paris, *France*. Eastern and southern *France* will long remember the floods of 1840. In Avignon, the Rhône River was 2.6 feet (80 centimeters) higher than the flood of 1775. In Lyon, the flood was so prodigious that the water was higher than all known levels for over a hundred years. The flooding broke out in October and was repeated in November. Many other rivers like the Seine, the Doubs, the Loire, and the Moselle hardly overflowed their banks until after the Rhône and the Saône. We know of a few regions, including the Roussillon and Lauragais [in southern *France*] where the floods didn't come owing to late rains, until the end of November or in December.<sup>79</sup>

In *France* from October 31 through November 4, the Saône River poured its waters into the Rhône River, broke through its banks, and covered 60,000 acres (24,281 hectares). Lyons was inundated. In Avignon 100 houses were swept away, still a greater number (218 houses were carried away) at La Guillotiere; and upwards of 300 (houses) at Vaise, Marseilles, and Nismes [La Guillotiere and Vaise are now part of Lyons]. Many villages almost swept away. The Saône River had not attained such a height for 238 years.<sup>47, 90, 92</sup>

*Germany, France* and *Russia* suffered famines in 1840.<sup>96</sup>

There was a famine in the Jalaun district of the Uttar Pradesh state of *India* in 1840, which caused a great loss of human life and also that of cattle.<sup>185</sup>

In 1840, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow, Lin-t'ao and Yü-chung.<sup>153</sup>

---

**Winter of 1840 / 1841 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1840 occurred on 25 October. A tedious snowstorm; snow fell a foot deep in some places and lay for several days.<sup>116</sup>

In the *United States*, a snowstorm over the period of 4-6 December 1840, dropped fifteen inches (38 centimeters) of snow on Philadelphia, Pennsylvania. The storm was very violent from Virginia to Maine and considerable damage was sustained by the shipping, in ports and on the coast. The storm was very violent on the Great Lakes and in *Canada*. Further south, the storm produced heavy rainfall. Norfolk and Richmond saw several inches of hail. Another storm hit the East Coast on December 22 and 26. Snow blew into banks six to eight feet (1.8-2.4 meters) high.<sup>1</sup>

Miss Ellen D. Larned described the New England winter of 1840-41 at Thompson, Connecticut in the *United States* — November 15<sup>th</sup>, 18<sup>th</sup> and 26<sup>th</sup> in 1840 report snowfalls. December 17, 18<sup>th</sup> - snowed; very cold; cold weather; snows and sleighing continued through the month. [Account ends at the end of December.]<sup>116</sup>

In March 1841, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 15<sup>th</sup> (30° F); 17<sup>th</sup> (28° F); 18<sup>th</sup> (28° F). There was frost on March 4<sup>th</sup> and 24<sup>th</sup>. It snowed on March 5<sup>th</sup>, 17<sup>th</sup>, and 18<sup>th</sup>.<sup>116</sup>

In the *United States*, a snowstorm struck the Philadelphia area on April 10 dumping 6 inches (15 centimeters) of snow. Another struck on the 12<sup>th</sup> dumping ten to twelve inches (25-30 centimeters) of snow. Snow extended south to Virginia, west to Ohio, north to Vermont, and east through all the New England states to the extreme part of Maine.<sup>1</sup>

The winter of 1840-41 in Bradford County, Pennsylvania in the *United States* produced an unusual March snowstorm [thundersnow]. On January 4<sup>th</sup>, temperatures fell to -21° F [-29° C]. A severe snowstorm struck Towanda on 12 March 1841, accompanied in the evening by heavy thunder and most vivid flashes of lightning. As of March 17<sup>th</sup>, the weather continued cold and stormy ever since, and snow was still falling. On 1 May 1841, a severe snowstorm struck, which continued throughout the day. At evening the snow ceased but the temperature was cold and blustery. On the morning of May 2<sup>nd</sup>, ice was found in open vessels nearly an inch [2.5 cm] in thickness and the mud was frozen sufficiently to bear the weight of a horse. On the morning of the May 14<sup>th</sup>, ice was found in open vessels, ¼ of an inch [0.6 cm] thick.<sup>178</sup>

In the *United States*, on the morning of May 3, the ice was as thick as window glass in Philadelphia. The repeated frost of April and May destroyed a great part of the fruit-buds.<sup>1</sup>

The Seine River in *France* froze from 18 December 1840 to 5 January 1841 at the bridge “Pont Notre-Dame” in Paris.<sup>62</sup>

The weather in December 1840 was so severe in *Sweden*, that it was computed that three thousand people perished.<sup>1</sup>

During the winter of 1840-41, there were 59 days of frost in Paris, *France*; of these, 27 days were in succession. The cold began on 5 December, and lasted until 10 January with a break between 1 to 3 January. A second frost began on 30 January and lasted till 10 February. The temperature in Paris on 3 February was 15.4° F (-9.2° C). On 16 December, large masses of ice on the Seine River blocked the arch of the bridge Pont-Royal. The same evening, the river froze at the bridge Pont d'Austerlitz. It froze from the bridge Pont Marie up to Charenton. On other days it was frozen at the Pont Notre-Dame. On 18 December one could cross the river on the ice between Bercy and la Gare. At several places, the ice on the river had accumulated to 2 meters (6.6 feet) thick. The cold temperature during the first phase of the frost in Paris was as follows: 12 December (30.2° F, -1.0° C); 13 December (27.5° F, -2.5° C); 14 December (19.2° F, -7.1° C); 15 December (14.7° F, -9.6° C); 16 December (11.5° F, -11.4° C); 17 December (8.2° F, -13.2° C); 18 December (10.6° F, -11.9° C); 19 December (14.0° F, -10.0° C);

20 December (27.3° F, -2.6° C). The ice on the Seine River partially thawed in January. The thaw lasted nine days and then the river froze again on January 14. The river froze at Rouen beginning on 16 December. On 20 December, nearly 40 boats in Charenton sunk in a few minutes. On 19 December, the Loire and the Maine rivers froze. On 17 December, the Saône at Lyon froze. The thaw and melting of the snow brought about major flooding in *France*.<sup>62</sup>

On 15 December 1840 in Paris, *France*, a major procession was held taking the mortal remains of Emperor Napoleon from St. Helena, by way of the Arc de Triomphe de l'Étoile [to his final resting place at the Invalides]. The thermometer the night before read 6.8° F (-14° C). A countless number of men, the legions of the National Guard of Paris and its neighboring communities, many regiments lined the Elysian Fields from morning to 2 o'clock in the afternoon. Everyone suffered terribly from the cold. National Guards and workers believed they could warm themselves by drinking brandy. But after they drank, they died almost immediately from congestion. Other people became victims of their own curiosity, in order to watch the procession; they climbed trees along the avenues. But the tree limbs were frozen by the cold; the branches broke and they fell to the ground and died.<sup>62, 70</sup>

In Alsace, *France* [near the Swiss and German borders], the thermometer fell to 5.0° F (-15° C). After 15 December, three trains were stranded on the railway line from Mulhouse near Thann in eastern *France*. This is despite the fact that on that day, six heated machines were available. However, once the locomotive left the shed and was placed on the turntable. It was so hampered by the ice; it could not turn. Once this obstacle was fixed, and the machine set in motion; all it took was one moment for the water inside the feed pumps to freeze. A train had to spend the night in the forest of Lutterbach, because it was impossible to bring any machines from the station because it was frozen completely. An auxiliary locomotive was sent to fetch them. The flasks were frozen solid in the cylinders and the tubes were cracked and let the water through, so the wheels of the locomotive froze fast to the brakes preventing it from moving on the tracks. After the auxiliary locomotive's futile efforts of freeing the train; they took the stranded passengers and brought them back to Mulhouse. The cold was so bad that one of the machinists froze their feet.<sup>62</sup>

The following are the lowest observed temperatures at different locations:<sup>62</sup>

Great St. Bernard Hospice, <i>Switzerland</i>	( -9.9° F, -23.3° C) on 22 January
Geneva, <i>Switzerland</i>	( 10.4° F, -12.0° C) on 16 and 17 December
<i>Ibid.</i>	( 6.1° F, -14.4° C) on 9 January
<i>Ibid.</i>	( 0.0° F, -17.8° C) on 10 January
Metz, <i>France</i>	( 4.5° F, -15.3° C) on 17 December
<i>Ibid.</i>	( 9.5° F, -12.5° C) on 10 January
Avignon, <i>France</i>	( 4.5° F, -15.3° C) on 17 December
<i>Ibid.</i>	( 9.5° F, -12.5° C) on 10 January
Alost (Aaist), <i>Belgium</i>	( 6.3° F, -14.3° C) on 14 December
Paris, <i>France</i>	( 8.2° F, -13.2° C) on 17 December
<i>Ibid.</i>	( 8.4° F, -13.1° C) on 8 January
Orange, <i>France</i>	( 8.4° F, -13.1° C) on 16 December
<i>Ibid.</i>	( 10.4° F, -12.0° C) on 10 January
Brussels, <i>Belgium</i>	( 8.8° F, -12.9° C) on 16 December

Marseille, <i>France</i>	( 23.9° F, -4.5° C) on 9 January
Cairo, <i>Egypt</i>	( 43.5° F, 6.4° C) on 3 December
<i>Ibid.</i>	( 41.4° F, 5.2° C) on 1 January

---

**1841 A.D.** In Middlesex, *England*, on January 16, there were great floods at Brentford and surrounding districts; many lives lost, and considerable destruction of property.<sup>47, 90, 92</sup>

In January 1841 in Queensland, *Australia*, there was a flood on the Brisbane River.<sup>101</sup>

The London, *England* newspaper of 3 February 1841 said, “The weather is awfully severe and boisterous, and numerous disasters have occurred to the shipping. The Thames steamboat from *Ireland*, was wrecked and out of sixty-five passengers, only four were saved.”<sup>1</sup>

On 28 March 1841, a great flood of the Susquehanna River struck Towanda, Pennsylvania in the *United States*. The immense body of snow, which lay in the woods combined with heavy rains that began on 23 March caused an extraordinary freshet. That portion of Towanda below the State Road bordering the river was completely inundated. The water was from two to three feet [0.6 – 0.9 m] deep on Water Street, the whole distances from the State Road to the Bridge. Every cellar was filled with water and in several instances, it rose to the first floor of buildings and the occupants were obliged to abandon their homes. Below the bridge, it was still worse. Nearly all the low ground in that vicinity was overflowed. In some instances the water was three feet [0.9 m] deep in the dwellings.<sup>178</sup>

On 28 May 1841 in *England*, there was a great hailstorm in Berkshire and in Suffolk.<sup>93</sup>

On 15 July 1841 in *England*, there was a great hailstorm in Derbyshire, Middlesex, Sussex, Surrey, and Yorkshire.<sup>93</sup>

Major storms reigned in *France* in 1841. Thunderstorms and very severe storms succeeded in quick succession in 1841. These storms struck Paris and the province on April 23<sup>rd</sup> & 30<sup>th</sup>, May 3<sup>rd</sup>, 25<sup>th</sup>, 26<sup>th</sup>, 27<sup>th</sup>, 28<sup>th</sup> & 30<sup>th</sup>, June 23<sup>rd</sup>, July 4<sup>th</sup> & 18<sup>th</sup>, August 8<sup>th</sup> & 11<sup>th</sup>. The most intense storms occurred on 30 May and 4 July. The storm of May 30 specifically ruled in southern *France*. The city of Pau, Languedoc, the Gard and Ardèche experienced massive damage. A terrible hail struck. Some hailstones were twice the size of a walnut. The hail destroyed the vines and forage. During this storm furious tornadoes ravaged the two banks of the Rhône River, in the Vaucluse region in southeastern *France*. There was the sound of an awful turnover, and the storm cast waves of hail as big as chickpeas, and some even reached the size of a hen's egg. This column storm trampled seedlings, uprooted trees, and toppled houses. It removed large branches, swirling and twisting them in a vortex. It pulled up trees by the roots and carried them over thirty paces. Some of these trees were one meter (3.3 feet) in diameter. It lifted a boat from off the Rhône River that was two and a half meters wide and seven meters long (8.2 feet wide and 23 feet long), to a height of 20 meters (66 feet) in the air. At Orange in the Vaucluse region, the tornado ripped apart a section of wall about twelve meters (39 feet) long by eight meters (26 feet) tall and thick. It discarded this construction material eight meters (26 feet) away. It demolished, and scattered new stone buildings. It broke the tiles off roofs and carried them away with such violent force that the fragments were encrusted into a tree trunk. It seized an old man, a resident of the suburb, rolled and broke his head against the wall. The violent storm of July 4 was preceded by a searing heat and thick fumes all day. In Paris, the storm began at half past seven in the evening with a strong gust of wind from the southwest. This was followed for a quarter hour with a dazzling lightning display, great thunder strikes, whirlwinds, torrents of rain and hail. Lightning, thunder, wind, rain and hail mingled well for three quarters of an hour, giving us in this horrible turmoil; a sublime and frightening image of a sort of desperate struggle between all the powers of nature. The storm abated somewhat near the end of the day. But it revived during the night with a return of winds, strong ground shaking and huge showers. Paris did not suffer alone. The storm devastated the surrounding country and spread far and wide from north to south in the departments of Seine-et-Oise, Seine-et-Marne, Loiret, Indre, in Côte-d'Or, Indre-et-Loire, Nièvre, Allier and Cher. The earth shaking was felt in the provinces after midnight, at the same time in

Paris and it was all over several oscillations in different directions, sometimes with a roll underground, sometimes without any noise.<sup>79</sup> [Seine-et-Oise is in the metropolitan area of Paris. Seine-et-Marne is east of Paris. Loiret, Indre, in Côte-d'Or are south of Paris. Indre-et-Loire and Cher are southwest of Paris. Nièvre and Allier are southeast of Paris.]

Longer and deeper weather variations upset the seasons of 1841 in *France*. The winter was very early and consisted, mainly in the north, of alternating periods of frosts and thaws. Heat broke early March, the thermometer in Paris went to 55.4° F, 64.4° F, 68° F, and 71.6° F (13° C, 18° C, 20° C, and 22° C). A brilliant sun shone almost without interruption producing this high temperature. Vegetation was excited and awoke with a burst of activity. Trees flourished in the first half of the month, and most were already covered with leaves by March 30. This heat, sun and the greenery were like the best days of May. There were gusts and some rains in April. But the cold tarnished the brightness of the sky. But on April the 26<sup>th</sup>, good weather continued and the temperature rose to 46.4° F, 50° F, 59° F, and 66.2° F (8° C, 10° C, 15° C, and 19° C). The month of May and the first seven or eight days of June were generally very fine, very dry and very hot. The thermometer in the middle of the day, almost always exceeded 68° F (20° C), it reached 78.8° F (26° C) and often 80.6° F (27° C) and this period went well. On May 25<sup>th</sup> the temperature went to 88° F (31.1° C), May 26<sup>th</sup> to 92.8° F (33.8° C), and May 27<sup>th</sup> to 92.7° F (33.7° C). Then in July, in Paris and the provinces, the extreme heat settled in. A pattern of stormy weather struck during the summer. The air cooled, the wind blew in gusts, pushing before her big dark clouds from which arose several times during the day torrents of cold rain. The storms began on June 7, and continued obstinately until 18 August. Few days passed without rain. It was from morning to evening as alternations waves of heat and cold, calm storms, rain and cloudy. If the sun shone all day, which rarely happened, her sultry and oppressive atmosphere foretold of an impending sudden storm or hurricane. Cold, gales and rain this summer assimilated to the saddest days of autumn. Things were heating up several times in the month of June, July and August. The products of the earth, which so advanced in March and May, found themselves floundering in the first days of July. Most products including grains, fruits and grapes, even then withered away or could not ripen due to a lack of heat, drought and sun.<sup>79</sup>

In *France*, the summer of 1841 was the coldest since the beginning of this century, after the year 1817. The harvest was poor. In Burgundy the grape harvest began on 27 September.<sup>62</sup>

*Italy*, however, experienced very unusual heat during the summer. Leopold Pilla described the weather in *Italy* in a letter addressed to Elie de Beaumont as follows: Last week we suffered from such stifling heat in Naples, *Italy*, since anyone can remember. It was an African heat, a Sirocco, which filled our skies with dark beautiful hazy air. This Sirocco produced very high temperatures for 2 ½ days, from 16 July to noon on 18 July. On 17 July, the thermometer located on the north side of the building in the shade at 2:30 p.m. showed a temperature of 101.8° F (38.8° C); and the same instrument set up in the sun rose to 122° F (50° C). You may think that we were suffering from the heat of Libya. Generally the air compared to the reflection of a blast furnace. There were moments when the hot air blew and we believed we were suffocating. The best means of protecting against the heat was to remain inside the house with the windows sealed tight. On the morning of the 18th of July, I went with Melloni and other friends to the sea at Cape Paustlippo to refresh a little. The sky was overcast, but Mount Vesuvius was surrounded by a misty and murky air that felt like it was especially made in the volcanic crater of Atrio del Cavallo. The effect of these winds on the vineyards located at the foot of Mount Vesuvius cause the grapes to completely dry up – so the harvest was lost. . . . The stifling temperatures lasted until noon on 18 July, then the air changed direction to a northeast wind and the weather became a little fresher. It was said that in Sicily the heat was even greater. In Palermo, Italy, the temperature reached 110.8° F (43.75° C).<sup>62</sup>

On 2 October 1841, a strong gale struck New England in the *United States*. The precipitation was primarily in the form of rain in Massachusetts and snow in New Hampshire. Six inches [15 centimeters] of snow fell in Amherst, New Hampshire and twelve inches [30 centimeters] on the hills in Hampden

County. On land, a great deal of fruit was destroyed, and chimneys and buildings were blown down. “On sea, the gale was so terrific that it tore the newest and strongest canvas into shreds and masts and spars of vessels were carried away. The ocean roared as though with unbridled madness, and its waves ran mountain high, throwing their spray far into the sky, and forming a majestic yet fearful sight. Many vessels were wrecked on the water and on the shores.” In the harbors, vessels were wrenched from their moorings and dashed against the shore or driven out to sea. The tide covered the wharves and submerged the marshes.<sup>199</sup>

— In the harbor of Portland, Maine, several vessels went ashore and were wrecked. At Portsmouth, New Hampshire, the vessel *Maine* parted her cables and was driven into Massachusetts Bay and went ashore at Scituate Beach. Eight men and women perished in the wreck.

— At Cape Ann, Massachusetts, many vessels were dashed against the rocks. At Pigeon Cove the fishing fleet of sixteen vessels lost fourteen of their ships. The fisherman not only lost their vessels but many fish houses, fish flakes, 60 barrels of mackerel, 200 hogsheads [around 13,000 gallons or 48,000 liters] of salt, and 300 empty barrels were destroyed.

— At Nantucket Island, Massachusetts, several vessels were damaged. The tide rose 2 to 3 feet [0.6-0.9 meters] above the wharves and flowed into the lower streets of the town. At Siasconset, a high bluff collapsed into the sea, taking with it a house and two barns.

— On Cape Cod, Massachusetts, the beach from Chatham to the highlands was strewn with wrecks. Around 40 to 50 vessels were driven ashore and 50 dead bodies were found along the shore after the storm. The schooner *Franklin* capsized and then was cast ashore at Hyannis Port losing two of its crewmen. The schooner *Tangent* had one of its crew fall overboard and drown. The schooner *Bride* was driven ashore and lost 8 members of its crew. The town of Dennis lost 26 of its seamen. The schooner *Forest* was lost at sea with 8 crewmembers. The schooner *Ellis* went ashore on the east side of Truro; nine were drowned. The schooner *Industry* went ashore and lost 3 of its crew. The schooner *Spitfire* was wrecked a half-mile [0.8 kilometers] below Race point; four were drowned.

— Most of the vessels from Truro, Massachusetts were disabled by the gale and driven upon the Nantucket shoals, which extend 50 to 60 miles [80 to 97 kilometers] into the ocean. These included the vessels: *Altair*, *Arrival*, *Cincinnatus*, *Dalmation*, *Garnet*, *General Harrison*, *Pomona*, and the *Prince Albert*. Truro lost 57 mariners to this gale.

On 3-4 October 1841, a hurricane struck New England in the *United States* causing between 58 and 81 deaths.<sup>141</sup>

In the *United States*, a large storm struck on 3 October 1841. More than 100 vessels were lost and damage estimates were \$2 million (\$50 million in today’s currency). Many poor mariners perished. The storm unleashed not only wind and rain but also hail and snow. It struck hard in Brunswick, New Jersey; New York City; New Haven, Cape Cod and Halifax and Quebec in *Canada*. Hail and snow storms also struck Utica, Geneva and Buffalo in New York and in the interior of Pennsylvania during October.<sup>1</sup>

On 18 October 1841 in *England*, there was a great hailstorm in Essex.<sup>93</sup>

In central *France* in November, there were great floods at Mâcon and neighborhood; immense damage done.<sup>47,92</sup>

In 1841 during the period between 6 May and 8 August, floods struck Hupeh (now Hubei province) in central *China* at Ao-ch’êng, Huang-p’o, Hanyang, Sung-tzū, Huang-kang and Chung-hsiang. Then during the period between 15 October and 12 November, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Ning-yang.<sup>153</sup>

---

**Winter of 1841 / 1842 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1841 occurred on 3 October. First snowfall; at some places people went to town meeting in

sleighs. November 8, a hard snowstorm. Between October 3 and November 22, ground covered with snow four or five times.<sup>116</sup>

In the *United States* in November 1841, ten inches (25 centimeters) of snow fell during 4 days in Philadelphia. Great quantities of snow fell during the month in Indiana, Michigan, Ohio, and the interior of Pennsylvania, New York and several New England states.<sup>1</sup>

In March 1842, the temperature at Princess Anne, Maryland in the *United States* did not fall below freezing. There were frost on March 15<sup>th</sup> and 16<sup>th</sup>.<sup>116</sup>

During the winter of 1841, the cold and snow filled the southern and central *France*. Northern *France* suffered greatly. There was a severe cold outbreak around Christmas. This was accompanied everywhere with abundant snow. At Marseille, the thermometer sank sharply to 23° F (-5° C) until the end of December. Frosts continued afterwards, and lasted almost without interruption during the first fortnight of January. Temperatures reached 17.6° to 21.2° F (-6° to -8° C). The cold also broke out suddenly, after the winter solstice, in Lunel and Toulon, and the rest of Languedoc and Provence, with torrents of snow. The cold gripped the Saône River at Lyon and the Garonne River at Bordeaux.<sup>79</sup>

But the main feature of the winter of 1841 was the great mass of snow, which fell especially in central and southern *France*. Snow fell in Paris on November 15<sup>th</sup>, 17<sup>th</sup> and 19<sup>th</sup>. Snow fell later in the central and southern provinces, where it did not seem much by the end of the year. Afterwards however, the effects of winter became much more prominent. Roads became blocked. The quantity of snow was such that letters from Paris to Marseilles wandered for forty-eight hours. The news from Paris to Alby [Albi] failed for three consecutive days to get through. In some valleys of Dauphine and Roussillon, the depth of the snow was estimated as more than 1.6 to 2.0 feet (50 to 60 centimeters). Avalanches occurred repeatedly in many places, for example in the village of Servières, Auvergne, and Barège-les-Bains, which brought ruin and desolation. The snows piled up from a series of successive snowfalls during the first three months of the year.<sup>79</sup> [Alby, Servières, Auvergne, and Barège-les-Bains are located in southern *France*. Dauphine and Roussillon are located in southeastern *France*.]

The winter of 1841-42 in *Europe* was remarkable for the severe frosts in the south of *France* and by unusually cold weather in *Spain* and *Algiers*. The weather in *France* was very mild until the end of December. But in the beginning of January, south of the Loire, there was a snow accompanied by falling temperatures. From 8 to 16 January, there was very strong frost in southern *France*. On 10 January the Saône River was frozen between the St. Vincent Bridge in Lyons and the island bar. The Garonne River at Agen [southwestern *France*] as in Bordeaux was covered with ice and on 8 January at Toulouse, individuals were skating on the Canal. In Paris, there were 52 frost days, 23 of which were successive. On 10 January, the Seine River drove strong ice. Some of the lowest temperatures recorded during the winter are as follows:<sup>62</sup>

Brussels, <i>Belgium</i>	( 9.3° F, -12.6° C) on 8 January
Pau, <i>France</i>	( 9.9° F, -12.3° C) on 8 January
Agen, <i>France</i>	( 10.4° F, -12.0° C) on 16 January
Toulouse, <i>France</i>	( 11.3° F, -11.5° C) on 8 January
Gent (Ghent), <i>Belgium</i>	( 12.4° F, -10.9° C) on 8 January
Paris, <i>France</i>	( 14.0° F, -10.0° C) on 10 January
Metz, <i>France</i>	( 14.4° F, -9.8° C) on 26 January
Orange, <i>France</i>	( 16.3° F, -8.7° C) on 13 January
Bayonne, <i>France</i>	( 21.2° F, -6.0° C) on 8 January
London, <i>England</i>	( 27.1° F, -2.7° C) on 24 January

On 15 April 1842, the ground was so frozen in Warren County, Missouri in the *United States*, that individuals were unable to set stakes in the woods as guides for a worm fence.<sup>123</sup>

---

**1842 A.D.** In *Ireland*, there were great floods at Limerick; waterspouts elsewhere.<sup>47, 92</sup>

On 3 & 4 February 1842, a great flood of the Susquehanna River struck Bradford County, Pennsylvania in the *United States*. The unusual warm weather, which prevailed during the previous two weeks, melted the existing snow in the woods and a subsequent heavy snowfall, swelling the small streams and causing the river to rise to an unusual height. Immense damage was done along the river and some of the larger creeks by the sweeping away of bridges, lumber, fences, etc. In Towanda, the water overflowed River Street and the lower part of the town nearly as much as it did in March 1841. The tollhouse of the bridge and large quantities of lumber on the bank at Towanda and at the mouths of Towanda and Sugar Creek were washed away. The new bridge across the Wysox was carried from its foundation. Several mills were carried away or destroyed.<sup>178</sup>

On 28 April 1842 in *England*, there was a great hailstorm in Hampshire.<sup>93</sup>

On 27 May 1842 in *England*, there was a hailstorm in Nottinghamshire.<sup>93</sup>

On 1 June 1842 in *England*, there was a hailstorm in Yorkshire.<sup>93</sup>

On 2 June 1842 in *England*, there was a hailstorm in Nottinghamshire.<sup>93</sup>

In June 1842, a tornado passed over the southeastern portion of Bradford County, Pennsylvania in the *United States*, which was described by an eyewitness at Wyalusing as follows: "On Sunday, June 26 about one o'clock, a dark cloud began to rise in the northeast, accompanied with low distant thunder until 25 minutes past one, when the most violent clap of thunder I ever heard, burst upon us and instantly it began to rain and the wind to blow, until the rain fell, not by drops, but by vast unbroken sheets, and the wind increased until it became terrific. The forest trees, orchards, fences and buildings gave way to the giant strength of an imperceptible power. Forests that had withstood the tempest for ages had to yield to this last and more mighty than all its predecessors. Cattle were seen running to and fro for some place of shelter, and seemingly the wind would fairly raise them clear from the ground. After raining about 15 minutes the rain came like shot from a gun, breaking windows, cutting corn, potatoes and all crops to the ground, beating down meadows, riddling the forest leaves and fairly driving the cattle mad with pain and fear. The tornado was more than three miles [4.8 km] wide and went from northwest to southeast. Two barns of Justus Gaylord were blown flat. In Browntown, houses were unroofed, barns torn down, shops upset, carriages carried some distance and dashed to pieces. People were obliged to lie down to keep from being, blown away. On the west side of the river in the Bend, the wind was still harder, hurling barns and houses from their foundations with the velocity of lightning, leveling fences, orchards, grain and everything that came in its way. Farther down the river the hail was terrible. Long after the storm had passed you could gather pailfuls anywhere on the ground. Nearly all of the glass in the northwest side of all houses was broken and dents remained in the weatherboards as if a stone had been thrown against them. It was the hardest and most violent blow ever felt in this section, and the loss is 20 times more than ever occasioned from any storm before."<sup>178</sup>

On 25 June 1842 in *Wales*, there was a great hailstorm in Glamorganshire.<sup>93</sup>

The year 1842 produced a great hot summers in *France*. The heat was more intense in the North and the South. In Paris, the heat began on June 5 and lasted through a few intermissions until September. The temperature reached its peak on August 18 when 99° F (37.2° C) was observed on the thermometer. This is one of the highest readings seen during this century. The hot weather was usually stormy and dry. Many public gardens chestnut trees that lost their leaves in July bloomed again in late August.<sup>79</sup>

The drought of 1842 in *France* began during the first days of June with the onset of heat. The drought continued, with a few temporary interruptions, until the last days of September. The drought was particularly severe in northern *France*. There were regions in the region of Meuse where a barrel of water sold in the month of August, up to three francs. In Paris, *France*, transportation on the Seine River was interrupted for four consecutive months [due to the low water level]. The water level of the Seine River was lower by several inches than the zero water mark on the bridge Pont Royal. In Paris, the rainfall measurements from the terrace in June were 1.5 inches (38.7 millimeters); in July 0.5 inches (13.3 millimeters); and in August 0.5 inches (13.3 millimeters). As a result the monthly average rainfall during these three months was 0.9 inches (21.8 millimeters) instead of the typical summer monthly average of 5.6 inches (141 millimeters).<sup>79</sup>

The summer of 1842 was the hottest since the beginning of this century, particularly in the area of Paris and northern *France*. The weather was also very dry. At the observatory, only 65 millimeters (2.6 inches) of rain fell which is 107 millimeters (4.2 inches) less than average. During several days in July, August, September and October, the water level on the Seine River at the bridge “Pont de la Tournelle” fell below zero [the low water mark of the year 1719]. The summer in Paris, *France* was characterized by:

Hot days	51 days
Very hot days	11 days
Extremely hot day	4 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Paris, <i>France</i>	( 98.0° F, 37.2° C )	on 18 August
Agen, <i>France</i>	( 98.6° F, 37.0° C )	on 4 July
Bordeaux, <i>France</i>	( 94.6° F, 34.8° C )	on 16 July
Toulouse, <i>France</i>	( 93.9° F, 34.4° C )	on 17 July
Löwen, <i>Germany</i>	( 91.0° F, 32.8° C )	on 11 June
Angers, <i>France</i>	( 91.0° F, 32.8° C )	on 17 August
Brussels, <i>Belgium</i>	( 90.7° F, 32.6° C )	on 18 August
Metz, <i>France</i>	( 90.5° F, 32.5° C )	on 19 August
La Chapelle, <i>France</i>	( 90.1° F, 32.3° C )	on 18 August
Gent (Ghent), <i>Belgium</i>	( 90.0° F, 32.2° C )	on 19 August
Geneva, <i>Switzerland</i>	( 87.6° F, 30.9° C )	on 4 July
London, <i>England</i>	( 86.0° F, 30.0° C )	on 19 August
La Havre, <i>France</i>	( 86.0° F, 30.0° C )	
Marseille, <i>France</i>	( 85.6° F, 29.8° C )	
Calais, <i>France</i>	( 80.6° F, 27.0° C )	on 19 August

Several incidents caused by the heat were recorded. The wheels of several mail wagons were inflamed. On 28 June in Badajoz in southwestern *Spain*, 3 workers perished. A lady died from suffocation in an eilwagen [stagecoach]. In Cordova (Córdoba) in southern *Spain*, several persons died from heat stroke, and several cases of insanity were also attributed to the high temperature.<sup>62</sup>

In the afternoon of 1 July a great thunderstorm struck Philadelphia, Pennsylvania in the *United States*. The peals of thunder were astonishing, and the lightning the most terrific to behold, and the rain poured down in such torrents for two and a half hours, that several streets in the eastern part of the city were under two feet (0.6 meters) of water. A total of six inches (15 centimeters) fell on that day. The lightning struck and consumed several barns in the vicinity of the city along with houses and libraries and several people were stunned. Some rain fell on twelve other days of that month making a total of twelve inches (30 centimeters) for that month.<sup>1</sup>

On 12-15 July 1842, a hurricane struck the coast of North Carolina in the *United States*. Many ships were lost and many persons drowned. Two vessels were capsized and their entire crews were lost. Seven men who went out later [for rescue?] were also drowned. The hurricane of 12 July 1842 was one of the worst in the history of coastal Carolina.<sup>141</sup>

On 14 July 1842, the lower part of the city of Baltimore, Maryland in the *United States* was completely deluged by repeated and powerful rains; and particularly by tremendous thunderstorms, during which several people were struck down by lightning. On the same day there was a most destructive storm in Virginia and North Carolina, by which the whole South was partially deluged. The newspapers from those States gave the most distressing accounts of the violent gale of wind; which accompanied the torrents of rain. The Norfolk newspaper said “the rain was followed by a three days’ hurricane, by which great damage was done, to the shipping in Hampton Roads, to railroads, canals, bridges and mills. On the east side of Oronoke, fourteen vessels were cast away, and completely wrecked. And a number of dead bodies were washed ashore. Two other vessels were stranded, and their whole crews perished.” It was indeed, a month of more violent thunderstorms all over the United States, than any month for half a century. One record of the number of buildings burnt by lightning was sixty-one and of deaths due to lightning strikes was forty-six.<sup>1</sup>

On 20 July 1842 in *England*, there was a great hailstorm in Essex.<sup>93</sup>

On 10 August 1842 in *England*, there was a hailstorm in Yorkshire.<sup>93</sup>

On 24 August 1842, a hurricane struck the coast of North Carolina in the *United States*. At least eight mariners were dead (seven from the *Congress* and 1 from the *Pioneer*) from a storm “hardly less severe” than 15 July 1842 hurricane.<sup>141</sup>

On 29 August 1842 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

On 31 August 1842 in *England*, there was a great hailstorm in Cornwall and Norfolk.<sup>93</sup>

In Burgundy, *France*, the grape harvest began on 21 September. The yield was plentiful and of very good quality. But more in the East, for example, in Doubs, the amount was lower. In Bordeaux, the quality of the wine was poor. The cereal harvest compared to an average year.<sup>62</sup>

In 1842 during the period between 9 June and 7 July, floods struck Hupeh (now Hubei province) in central *China* at Chiang-ling and Sung-tzū.<sup>153</sup>

---

**Winter of 1842 / 1843 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1842 occurred on 30 November.<sup>116</sup>

On 30 November 1842, a storm struck New England in the *United States*. At Dover, New Hampshire, 15 inches [38 centimeters] of snow fell. Travel on railroads was greatly disrupted. The storm began in Washington D.C. and Baltimore, Maryland, where significant snow fell.<sup>199</sup>

— Many vessels in Boston Harbor in Massachusetts were driven from their mooring and smashed against each other or the wharves during the storm. Above the noise of the storm, the sound of falling masts and the vessels crashing together could be heard in the city. Several ships were sunk and several sailors drowned.

— The bark *Isadore*, a 400-ton burden, was driven on the rocks near Cape Neddock, Maine. The entire crew of fifteen perished.

— The schooner *Napoleon* lost both masts and capsized and then righted itself, but was filled with water. Only the mate survived, the rest of the crew of six were drowned or froze to death.

— The schooner *James Clark*, of 60-ton burden, was driven ashore at Rye Beach and wrecked. Two adults and three children perished.

January 1843 was unseasonably warm from New Jersey to Maine in the United States but colder in the South.<sup>140</sup>

Charles Pierce describes the winter of 1842-43 in Philadelphia, Pennsylvania in the *United States*:<sup>1</sup>

— In September 1842, there were the extremes of autumnal heat and cold. From the 1<sup>st</sup> to the 14<sup>th</sup> the mercury varied from +76° F to +88° F. On the 14<sup>th</sup> the wind changed from south to northeast, and the 17<sup>th</sup> to northwest, and the cold increased daily until the 23<sup>rd</sup>, when the mercury at sunrise had sunk to +36° F in this city, and in the country to +32° F, and ice was an eighth of an inch thick in many places. On the 28<sup>th</sup>, it moderated and the mercury ran up to +76° F at midday, on the last three days in the month. A very little rain fell on ten days, making in all only one inch and a quarter. The wind was northwest either the whole or a part of fifteen days.

— In October 1842 with a very few exceptions, the weather was mild and pleasant during the whole month, in this vicinity. On five days the mercury rose to +70° F and above, at midday. On two days it rose to +74° F. On fourteen days it varied from +60° F to +68° F. There were only six frosty mornings during the month. A little rain fell on five days, making in all one and three quarter inches. While we were so highly favored in this latitude with mild and pleasant weather, violent gales and storms were experienced at South Carolina, Georgia, Florida, in the Gulf of Mexico, in the Mississippi river, at Pensacola, Galveston, etc.; great damage was done to vessels on the coast and in ports. The brig *Cuba*, from Galveston for New York, with a number of male and female passengers, was lost in a violent gale, and all on board perished, and several other vessels were lost in the same gale, as nothing was heard of them afterwards.

— In November 1842 from the 1<sup>st</sup> to the 18<sup>th</sup>, the weather was as mild and pleasant as September. But in the afternoon of the 18<sup>th</sup>, the wind changed to northwest, and the mercury sank from +50° F to +31° F by ten o'clock in the evening; and to +24° F by the next morning. The weather during the remainder of the month was more like midwinter than autumn. Some snow fell on the 24<sup>th</sup>, 27<sup>th</sup>, and 30<sup>th</sup>, making about four inches; and two inches of rain fell during the month. At the close of this month, we received accounts of the severity of the weather, from the east, west, north and south, commencing about the time it did in this city. At Baltimore, Washington D.C., and farther south, it was very severe. The Kentucky, Ohio, Michigan, Indiana, and other newspapers, stated the cold to be as great there, as any ever experienced in November. The papers from the interior of New York, Vermont, and through Canada, made similar statements, and that much snow had fallen, and sleighing was excellent. Most terrific gales were experienced on the western and northern Lakes, and many vessels wrecked, and lives lost. Accounts from Detroit, Buffalo, Erie, Chicago, Dunkirk, etc., stated, that in consequence of the wrecks of so many vessels, the shores were lined with barrels of flour, pork, corn, wheat, etc., and many dead bodies were washed ashore; and in several of those places the mercury was below zero degrees Fahrenheit.

— December 1842 commenced with the mercury at +27° F at sunrise, and continued about this temperature, (with the exception of four mornings,) until the 23<sup>rd</sup>, when the wind changed from west to northwest, and the mercury sunk from +36° F to +18° F, and on the morning of the 24<sup>th</sup> to +14° F, and it continued cold until the month closed. There was but little falling weather during the month, in this city. On the 8<sup>th</sup> there was a moderate northeast rain storm, and on the 21<sup>st</sup> another; and a very little rain fell on a few other days, making three and a half inches; and about four inches of snow fell. The cold during a part of the month was very severe in many parts of the country, and a great quantity of snow fell in the west, the north and the east. But in this vicinity, there was but very little stormy weather. By the following we see how very different the weather is in different latitudes, and sometimes even in the same latitude. For instance, in Philadelphia and vicinity we had but very little severely cold or stormy weather during the two previous months, while in many parts of the western, northern and eastern states there was excessively cold, stormy and tempestuous weather. In several places beyond the Ohio River, snow fell to the depth of two feet, and there were several weeks of excellent sleighing in November. It was precisely the same in the interior of Pennsylvania, New York, Connecticut, Massachusetts and all the New England States. In Illinois, as early as the 29<sup>th</sup> of November, the mercury sunk to -14° F (-26° C), and in Belfast, Maine to -20° F (-29° C), while in Philadelphia on the same morning at sunrise, the mercury was +18° F; being a difference of 32° F between Illinois and this city, and between Belfast and Philadelphia a difference of 38° F; i.e. it was 38 degrees colder at Belfast than in Philadelphia. And as it respects a snowstorm which commenced in this city at ten o'clock on the morning of the 30<sup>th</sup> of November, (and which was comparatively mild and moderate here) it did not commence in New York until past twelve o'clock, and in Boston not until three p.m., where it was so violent, from New York to the extreme part of Maine, that the whole coast from Boston to the Bay of Funda, was lined with wrecks of vessels.

It was during this storm that the beautiful barque *Isadore*, (which left Boston before the storm commenced) was wrecked and stove entirely to pieces on the ledge of rocks running out from the harbor of York, Maine, and every person on board perished, consisting of fifteen young men, all under thirty years of age, and belonging to Kennebec, Maine, where the vessel was owned. Part of the time the wind blew a complete hurricane. The number of lives lost on the coast and in harbors by shipwrecks from the 10<sup>th</sup> to the close of November were 578. The whole month of December 1842 was one of awful and destructive storms in different latitudes.

— In January 1843, 1½ inches of rain fell, and about the same quantity of snow, in the vicinity of Philadelphia. It was a remarkably mild and pleasant winter month. But the newspapers informed us that, while Philadelphia was so highly favored, various other places were experiencing very different weather. On the 26<sup>th</sup>, Pottsville, Pennsylvania was visited by a tremendous hurricane, which swept away almost everything before it. On the 7<sup>th</sup> and 8<sup>th</sup> of January, Danville, Pennsylvania, was visited by a very destructive storm of wind and rain, which swept away bridges, and did a great amount of other damage. On the 7<sup>th</sup>, there was a great fall of snow in Tennessee, and it was intensely cold, and the papers stated that the cold extended to Louisiana and Mississippi. It was also intensely cold at the north, and down through Canada to the bay of Funda. The Montreal and Quebec papers said the weather was so cold, that the mercury sunk to -36° F (-38°).

— In February 1843, a little snow fell on five days, making about seven inches in all. There was sleighing for three days. Two and a half inches of rain fell during the month. On the mornings of the 7<sup>th</sup>, 8<sup>th</sup>, 9<sup>th</sup>, 16<sup>th</sup>, 17<sup>th</sup>, and 18<sup>th</sup>, the mercury ranged from +10° F to +12° F, and considerable ice made in the Delaware River, but the ice boat kept the river open, so that vessels had free ingress and egress. The weather was not severely cold in this vicinity, but in the papers, we saw it stated that in New York, and in the northern and eastern States, it was intensely cold and boisterous, and that a great deal of snow had fallen. The weather was also very cold at the south. Snow fell in South Carolina to the depth of two inches (5 centimeters); and there was both snow and ice in Alabama, Florida and Louisiana.

— In March 1843, snow fell on five days, measuring in the whole about fifteen inches, and four inches of rain fell. The snowstorm of the 16<sup>th</sup> was the most severe and violent that had occurred for many long years, in the month of March; during this storm, twelve inches (30 centimeters) of snow fell in Philadelphia, and blew into banks from four to five feet (1.2-1.5 meters) high in many of the streets. It was the coldest March month we have, or can find on record. On fourteen mornings the mercury ranged from +13° F to +20° F; and there were only three mornings during the month that the mercury was above the freezing point. From the 1<sup>st</sup> of February to the 8<sup>th</sup> of April, the weather was steady cold. The New York papers said, that during the violent storm of the 16<sup>th</sup>, snow fell in that city to the depth of two feet (0.6 meters), and blew into banks six feet (1.8 meters) high; that the country roads were so banked up, that no mails arrived from the north and east for two or three days. We received similar accounts from Baltimore and Washington D.C. Also, from the west, the north, and the east as far as Massachusetts, New Hampshire, and Maine. Vessels on the coast and in harbors, received great damage, and there were several shipwrecks, and great loss of property and lives.

— In April 1843, the quantity of rain that fell was four and three quarter inches. A little snow fell on the 4<sup>th</sup>, 5<sup>th</sup> and 9<sup>th</sup>, about two inches in all. The month commenced with a wintry atmosphere; the mercury at +31° F, and ice a quarter of an inch thick, and it continued cold and frosty until the 12<sup>th</sup>, when the wind changed from north to southwest, and the weather became mild and spring-like, and so continued during the remainder of the month. On four days during the last week, the mercury ranged from +70° F to +75° F at midday.

In the *United States* at the close of the winter in 1842, a New York newspaper said, “The past winter has been the coldest since the settlement of the country, and perhaps, more snow has fallen!”<sup>1</sup>

The winter of 1842-43 in Bradford County, Pennsylvania in the *United States* was severe and bitterly cold with snow three feet [0.9 m] deep. The supply of hay and straw became exhausted and many livestock perished. This winter began in the early fall and lasted until the 6<sup>th</sup> of April. In the fall of 1842, myriads of black squirrels migrated through the wilderness. The Bradford Porter of 12 April 1843 wrote: "The past winter has been one of unusual severity and is still lingering in the lap of spring as if determined to reign over the entire season of sunshine and flowers. The month of March was one unbroken period of cold weather, deep snows and good sleighing. April thus far is but little better. The snow is still lying in our fields more than a foot [30 cm] in depth and the weather is cold and freezing. The ice went out of the Susquehanna River without any unusual rise on April 6<sup>th</sup>. April 8<sup>th</sup> was pleasant and melted the snow considerably, causing a moderate freshet at this time. From every quarter we hear great complaints of the

scarcity of fodder and the consequent suffering and loss of cattle, sheep, etc. It is said that some farmers have lost their entire stock of cattle for want of food."<sup>178</sup>

In March 1843, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 2<sup>nd</sup> (28° F); 3<sup>rd</sup> (22° F); 4<sup>th</sup> (24° F); 5<sup>th</sup> (29° F); 6<sup>th</sup> (26° F); 7<sup>th</sup> (28° F); 8<sup>th</sup> (28° F); 14<sup>th</sup> (29° F); 18<sup>th</sup> (30° F); 19<sup>th</sup> (28° F); 20<sup>th</sup> (29° F); 21<sup>st</sup> (31° F); 23<sup>rd</sup> (31° F); 24<sup>th</sup> (21° F); 25<sup>th</sup> (28° F); 26<sup>th</sup> (32° F); 27<sup>th</sup> (32° F). There was frost on March 22<sup>nd</sup> and 30<sup>th</sup>. It snowed on March 17<sup>th</sup>.<sup>116</sup>

In the *United States* in the interior of Pennsylvania, New Jersey, New York, and in all the New England states, on the morning of 1 & 2 June 1843, there was a hard killer frost. In some places the ice was as thick as window glass, which destroyed tender plants and did great damage. A snow squall struck Philadelphia on the afternoon of June 1.<sup>1</sup>

---

### 1843 A.D. – 1845 A.D. Australia. Drought

According to rainfall records 1843-45 were dry years in *South Australia*. By the year 1846, the interior and north were converted to an arid desert.<sup>101</sup>

In New South Wales, *Australia*, there was a drought from August 1842 to February 1843. The Patterson River ceased running in November.<sup>103</sup>

In 1843, there was a severe drought in Hobart, Tasmania, *Australia*.<sup>101</sup>

In Central *Australia*, the high temperature on 21 January 1845 was 131° F (55° C) in the shade. On 11 November 1845, the temperature was measured at 127° F (52.8° C) in the shade.<sup>103</sup>

---

**1843 A.D.** In the beginning of April 1843, the tail of a great hurricane passed the island of *Mauritius*. From the 12<sup>th</sup> to the 15<sup>th</sup>, the telegraph was saturated with messages of a number of disabled, almost unmanageable, and leaky vessels, covered with emblems of distress, or firing guns for help, finding it almost impossible, even in the sight of a port, to make their way in. Such a fleet of wrecks from one storm had never perhaps put into Port Louis, Mauritius before. A visit to the anchorage showed groups of shattered vessels, some without their mast, others heeling over to one side, from the shifting of their cargoes in the gale. All the ships having their upper works, boats, bulwarks, and everything, which was on the deck swept away. The hurricane struck the island of *Rodrigues* in the Indian Ocean on 4 April. Some of the ships affected by this hurricane were the *Margaret*, *Robin Gray*, *Argo*, *Rambler*, *Blanche*, *Broxbournebury*, *Sea Queen*, *Velore*, *Katherine Stewart Forbes*, *Waverley*, *Parland*, *Wellington*, *Framjee Cowajee*, *Surat Merchant* and *Gazelle*. The *Victoria* was shipwrecked on the reefs of *Rodrigues*.<sup>198</sup>

On 21 April 1843, a hurricane struck the Island of Rotty [Rote Island] in *Indonesia*. Vast numbers of trees were blown down. Great damage was caused by the blowing down of large lofty trees, where the bees breed, so that no wax could be collected for two years. A great number of houses were destroyed. Seventy-five persons lost their lives.<sup>198</sup>

On 28 May 1843 in *England*, there was a hailstorm in Middlesex.<sup>93</sup>

In 1843, the Brazos River in Texas in the *United States* flooded. In 1843, the creeks and lakes in this locality were dry prior to the flood; in fact there was no water in the county whatever, and all the water from the floods were brought down by the rivers from up the country [from the north]. The overflow occurred during the month of May. The stage of the river during its overflow was about twenty inches higher than in 1852, but was not as high as that of the flood of 1899 by about five feet in the vicinity of Duke, Texas. Perhaps the greatest damage done by this overflow was the destruction of a grist and flour mill on Beason's Creek near the present town of Courtney, constructed to run by water power.<sup>123</sup>

On 10 June 1843 in *England*, there was a hailstorm in Derbyshire.<sup>93</sup>

On 5 July 1843 in *England*, there was a hailstorm in Derbyshire and Yorkshire.<sup>93</sup>

On 6 July 1843 in *England*, there was a hailstorm in Gloucestershire.<sup>93</sup>

In the *United States* on 5 August an immense storm struck Philadelphia. The streets were flooded in every direction. Towards the end of the storm a tornado swept down the Schuylkill River damaging 40 vessels loading or waiting to be loaded with coal. One man was killed instantly and several others injured. But this disaster was minimal in comparison to the damage the storm did elsewhere. In Delaware, the storm killed 30 people and destroyed public and private property to the amount of half a million dollars (\$15 million in today's currency), consisting of mills, factories, and stock. Fifty bridges were swept away by the flood. The storm did immense damage in Norristown, Upper Merion, Wilmington, Brandywine, Newark, and Elizabethtown. During August, destructive floods struck Maryland, Virginia, North Carolina, Washington D.C., New York and Connecticut. Philadelphia received 9.25 inches (23 centimeters) of rain in that month.<sup>1</sup>

On 7 August 1843 in *England*, there was a hailstorm in Cambridgeshire.<sup>93</sup>

On 9 August 1843 in *England*, there was a great hailstorm in Bedfordshire, which extended into: Berkshire, Essex, Gloucestershire, Hertfordshire, Kent, Oxfordshire, Suffolk, and Norfolk. In Norfolk, the devastation of crops was so great that a voluntary county-rate was made in favor of the sufferers. Out of these events sprang the General Hailstorm Insurance Company. In Oxfordshire, the damage to the crops resulting from this storm was estimated at "considerably over " £30,000; and a Hailstorm Relief Fund was founded, by means of which some substantial aid was afforded to the sufferers. The only previously existing Hailstorm Insurance Company, the Farmers and Gardeners, increased its rates considerably after this storm. This is one of the most widely extended storms on record. It commenced at Cheltenham, and extended its ravages across the island. The stones were not as large as in many previous cases, 8 inches in circumference being the largest spoken of; the average being 6 inches.<sup>93</sup>

A powerful hailstorm struck the county of Oxford in south-central *England* on 9 August 1843. As the storm approached an awful extraordinary sound resembling the roar of the ocean was heard for 5-10 minutes before the storm struck. At first the hail was only of an ordinary size, but soon some stones as large as pigeons' eggs began to fall, to strike the ground with great force, and to bound up again to the height of four or five feet. Some of the hailstones measure 8 inches in circumference. Many of the hailstones weighed 2 ounces. The hailstones had the appearance of misshapen morsels of ice.<sup>196</sup>

— This hailstorm destroyed crops over 50 square miles. Some of the areas affected included the parishes of Churchhill, Chipping-Norton, Over-Norton, Heythrop, Enstone, the Tews, Sandford, the Bartons, Middle Aston, and North Aston. Two men were killed at Clanfield. The hailstones did great damage to buildings by destroying glass windows and roofs. They broke to pieces the slate roof tiles; even the strongest slates such as the Stonesfield slates. The lead roof of the church was so dented from the impact of the hailstones that it took on the appearance of a person strongly marked by small pox.

— When the hailstones descended the chimneys, as in many cases they did, their size and the force of their descent were so great as in two instances to cut through kettles boiling on the fire. The hole they made in the kettle was 1½ inches across.

— In a valley at Great Tew the flood of rain carrying with it the immense hailstones was so great that it swept down a strong wall, and the hailstones accumulated in so large a quantity, that they had not melted 14 days later. Some people used the hailstones to replenish their icehouses.

— As the storm approached, cattle displayed great fear. A man who had gone into the field to look at some young colts, found them so distressed and alarmed that they came round him, as if expecting

protection from him against the impending danger, and very plainly manifesting great fear. A gentleman, who was caught on the high road riding, in the very middle of the storm, dismounted, and crept for shelter under a hedge; his horse, a mare of much courage and blood, was so cowed, that she crept down on her knees into the ditch beside him, quaking in every limb with fear.

— The smaller animals and birds were killed in great abundance. A man saw around a dozen hares running about during the storm. One after another were struck by hailstones, leaped up as if shot, tumbled over and fell dead. A leveret [a young hare in its first year] was found completely cut in two. A great number of crows, pheasants, and partridges were killed.

The maximum temperature during the summer in Calais, *France* was 86.0° F (30.0° C) on 10 August.<sup>62</sup>

In *England*, there was a terrific hailstorm in Norfolk, causing great devastation of the crops through the county.<sup>57</sup>

In 1843, the missionary M. Hue saw a hailstorm in *Mongolia* where the hailstones weighed 6 kilograms (13 pounds). During this great storm, there fell in a field a piece of ice bigger than a millstone, which was broken with hatchets, and though it was in the hottest weather, it was three days before it was entirely melted.<sup>271</sup>

In 1843 during the period between 27 July and 24 August, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Hu-chou.<sup>153</sup>

*Also refer to the section 1843 A.D. – 1845 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1843 / 1844 A.D.** In the *United States*, on 1 November, there was ice in Georgia as thick as a window-glass. On the 10<sup>th</sup> of November, the weather was so cold in Upper *Canada*, that there was good skating on the St. Charles river. At the same time, snow fell two feet (0.6 meters) deep in Vermont and the winds drove this into 4-foot (1.2 meters) deep snow banks.<sup>1</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1843 occurred on 29 November.<sup>116</sup>

During the winter of 1843-44 in Bradford County, Pennsylvania in the *United States*, there was no snow or sleighing until the beginning of February. Spring began uncommonly early.<sup>178</sup>

In March 1844, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 5<sup>th</sup> (32° F); 6<sup>th</sup> (30° F); 19<sup>th</sup> (32° F). There was frost on March 6<sup>th</sup> and 12<sup>th</sup>. It snowed on March 31<sup>st</sup>.<sup>116</sup>

---

**1844 A.D.** On 4 & 5 January 1844, a hurricane struck the island of *Mauritius* in the Indian Ocean. Several ships were cast ashore. An Indiaman *Hugh Matthie*, 538 tons burden, and two immigrant ships, and two other vessels were completely wrecked. One of these ships was the *Amity*, 600 tons burden, with 180 immigrants onboard besides the crew.<sup>198</sup>

On 20 February 1844, a hurricane struck the island of *Rodrigues* in the Indian Ocean. It caused immense damage on the island, destroying many houses and all the crops.<sup>198</sup>

Accounts from *Africa* state that the weather was intensely hot and dry and many people had perished. Accounts from the *St. Helena* [an island in the South Atlantic Ocean] states that no rain has fallen in 15 months and great distress prevails.<sup>1</sup>

First known Gundagai flood in New South Wales, *Australia* occurred on February 1844.<sup>103</sup>

In 1844, there was a great flood on the Missouri River in Kansas and Missouri and its tributary, the Platte River, in Nebraska in the *United States*.<sup>132</sup>

During the 19<sup>th</sup> century, the greatest flood of the Mississippi River in the *United States* in the upper Mississippi basin occurred in 1844 while the greatest flood on the Mississippi River south of the mouth of the Ohio River occurred in 1897. The highest water levels recorded in the principal cities in the Mississippi basin are as follows:<sup>123</sup>

City/State	Flood Stage	Date
St. Paul, Minnesota	19.7 feet	29 April 1881
Omaha, Nebraska	23.8 feet	24 April 1881
Kansas City, Missouri	24.9 feet	21 May 1892
Kansas City, Missouri	37 feet	20 June 1844
St. Louis, Missouri	41.4 feet	27 June 1844
Cincinnati, Ohio	71.1 feet	14 February 1884
Cairo, Illinois	52.2 feet	27 February 1883
Memphis, Tennessee	37.1 feet	19-21 March 1897
Vicksburg, Mississippi	52.3 feet	16 April 1897
New Orleans, Louisiana	19.5 feet	13 May 1897

The high temperatures observed during the summer were:<sup>62</sup>

Biscara (Biskra) in northeastern <i>Algeria</i>	(111.2° F, 44.0° C) on 19 August
Nizhny Tagil (Sverdlovsk Oblast) in southern <i>Russia</i>	( 95.0° F, 35.0° C) on 9 June

On 11 May 1844, a sudden squall from the west struck Athens, Pennsylvania in the *United States* accompanied by torrents of rain, and hailstones as large as hickory nuts. Approximately 1,500 panes of glass were broken in the village and many valuable trees blown down.<sup>178</sup>

On 4-6 August 1844, a hurricane struck the Rio Grande Valley [southernmost tip of Texas] in the *United States* causing around 70 deaths.<sup>141</sup>

In September 1844 in New South Wales, *Australia*, there was a heavy flood in the Tumut and Murrumbidgee Rivers in September.<sup>103</sup>

On 4-5 October 1844, a hurricane struck *Cuba* causing approximately 100 deaths.<sup>141</sup>

In October 1844 in the *South of France*, there was a hailstorm. One of the hailstones weighed 11 pounds (5 kilograms). [It might be noted that M. Hue, the celebrated missionary, spoke of a hailstorm on the *Mongolian plateau*, wherein a hailstone fell of the size of a Millstone!]<sup>93</sup>

In *Ireland*, there were extensive floods in the east and south.<sup>47, 92</sup>

The year 1844 was a year of abundance in *Ireland*. But the condition of the peasants was one of privation and suffering. This was the result of taxation, rent-payers, and cold-hearted injustice.<sup>184</sup>

In 1844, there was the greatest flood ever known in Port Phillip in Victoria, *Australia*.<sup>103</sup>

In 1844 during the period between 14 August and 11 September, several regions of *China* experienced flooding including:<sup>153</sup>

— Chekiang (now Zhejiang province) on the east coast of *China* at Ch'êng. The dikes were damaged and over 70 persons were drowned.

- Hupeh (now Hubei province) in central *China* at Chiang-ling, Sung-tzŭ and Chih-chiang. At Chiang-ling, the city walls were damaged by the floodwaters.
- Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang, I-ch'un, P'o-yang and Nan-k'ang.
- Shantung (now Shandong province) on the east coast of *China* at Hui-min, Chan-hua and P'u-t'ai.

During the period between 8 August 1844 and 5 February 1845, a drought engulfed Hupeh (now Hubei province) in central *China* at Kuang-hua.<sup>153</sup>

*Also refer to the section 1843 A.D. – 1845 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1844 / 1845 A.D.** In the *United States*, on 29-30 September 1844, snow fell in the interior of Pennsylvania, New York and the New England states.<sup>1</sup>

During the winter of 1844-45 in Bradford County, Pennsylvania in the *United States*, there was an early September snowstorm. On 29 September 1844, a snowfall gave the surrounding county the aspect of winter. On Barclay Mountain, the snow lay on the ground to a depth of 28 inches [0.7 m]. This was an occurrence that has never happened before in the memory of the oldest inhabitants.<sup>178</sup>

At Thompson, Connecticut in the *United States*, the first measurable snowstorm of the season in 1844 occurred on 28 November. Snowed all day about 5 inches, mercury 10° F; some sleighs moved.<sup>116</sup>

Charles Pierce describes the winter of 1844-45 in Philadelphia, Pennsylvania in the *United States*:<sup>1</sup>

— In November 1844 from the 1<sup>st</sup> to the 19<sup>th</sup> the weather was remarkably mild. The mercury was not once so low as the freezing point until the morning of the 19<sup>th</sup> when it was 32° F, and on four other mornings, towards the close of the month, it was from 28° F to 30° F in this city, and we neither saw or heard of a flake of snow falling in this vicinity during November. Some rain fell on nine days, making in all three inches. There were eighteen clear days, and a great part of the month was like “Indian summer” in this vicinity. But it was far otherwise in some other parts of the *United States*, and in the British provinces. In Illinois, Indiana, Michigan and in the interior of New York, Vermont and some of the New England states, we read accounts in the newspapers of snow being from ten to twelve inches (25-30 centimeters) deep and good sleighing. In Canada, there was very severely cold weather, and in some places the snow was two feet (0.6 meters) in depth.

— In December 1844, the weather was very variable. Some rain fell on seven days, making in all three inches. A very little snow fell on the 23<sup>rd</sup> and 27<sup>th</sup>, about a quarter of an inch in all. There was much cloudy, overcast and chilly weather, but none that was severely cold or very mild in this vicinity. On the 17<sup>th</sup>, the river became so obstructed by ice from Kensington to Bordentown, that the up-river steamboats ceased to perform their regular trips. Although there was insufficient snowfall in this vicinity during December to whiten the earth, yet the whole state of New York and the New England States were bountifully supplied. On the 11<sup>th</sup> and 12<sup>th</sup> of the month there was a violent snowstorm from New York to the extreme part of Maine. On Long Island, the snow was blown into banks from ten to twelve feet (3.0-3.7 meters) high, so that the cars were stopped for several days. The papers said, the storm was the most violent for many years; in Connecticut the drifts were fifteen feet (4.6 meters) high. Beyond Rhode Island the storm was not so severe, and much less snow fell.

— Three and a half inches of rain, and about two inches of snow fell during January 1845. A milder and pleasanter winter month could scarcely be desired then was experienced in this latitude. But very few instances occurred in which the mercury sunk below the freezing point in the city; and it frequently ranged from 50° F to 60° F, from eleven to three o'clock. The Delaware River below Kensington, and the Schuylkill River below Fairmount, was as free from ice as in mid-summer.

— During February 1845, four and three quarter inches of rain, and five inches of snow fell. There was sleighing from the 8<sup>th</sup> to the 12<sup>th</sup>. From the 1<sup>st</sup> to the 10<sup>th</sup>, it was severely cold, the mercury ranging from 10° F to 20° F. From the 11<sup>th</sup> to the close of the month, the weather was mild particularly in the vicinity of Philadelphia. On the 4<sup>th</sup> and 5<sup>th</sup>, there was a very severe snowstorm in all the northern and eastern states, and through Canada; after which it cleared intensely cold. During the storm many disasters occurred to the shipping on the coast.

— In March 1845, two and a half inches of rain fell, and a very little snow, which soon melted. The weather for one week was very variable, producing the temperature of the four seasons; with the above exception, the weather was mild during the month. On four days the mercury ranged from 70° F to 74° F; and on four days from 26° F to 32° F.

— During April 1845, two and a half inches of rain fell. On the 25<sup>th</sup>, there was a heavy thundershower with very vivid lightning. On the 6<sup>th</sup> and 8<sup>th</sup>, there were snow squalls. On four mornings there was frost, and one morning ice. The month commenced and continued mild until the 8<sup>th</sup>. From the 8<sup>th</sup> to the 13<sup>th</sup>, it was quite cool and frosty. On the 13<sup>th</sup>, the wind changed from northwest to south, and the remainder of the month (with the exception of four days) was not only mild, but also summerlike, and vegetation came forward with great rapidity. Only a few sprinkles of rain fell from the 23<sup>rd</sup> of March to the 19<sup>th</sup> of April in this vicinity, when it then rained moderately for ten straight hours.

In the *United States* during the winter of 1844-45, the temperature at Savannah, Georgia fell to 18° F in January.<sup>113</sup>

The Saône River in *France* froze in December 1844.<sup>62</sup>

The winter of 1844-45 was remarkable in *Europe* because of its length and vast amount of snow that fell during several months. This abnormal winter was felt in *Sweden, England, Germany, France, Italy, and Spain* and up to Ceuta in *North Africa*. [Ceuta is an 18.5 square-kilometer (7.1 square mile) autonomous city of Spain and an exclave located on the north coast of North Africa surrounded by Morocco.] There were 65 days of frost in Paris, *France*, of which 20 were successive. The cold began on 2 December. On 8 and 11 December, the thermometer stood at 15.3° F (-9.3° C) in Paris and the cold persisted until the 16<sup>th</sup>. The cold weather came again from 22 to 27 December. In January, the temperature was fairly mild, and only freezing a little for 14 days with breaks of thaw. On 7 February intense cold weather arrived and lasted until 22 February. On the 21<sup>st</sup> of February was the cold day at 10.8° F (-11.8° C). The cold started again towards the end of February and stayed until 20 March. Some of the lowest temperatures observed during this winter were:<sup>62</sup>

Gefle (Gävle), <i>Sweden</i>	(-26.5° F, -32.5° C) on 11 February
Great St. Bernard Hospice, <i>Switzerland</i>	(-11.7° F, -24.3° C) on 8 December
Ossau, <i>France</i>	( -5.8° F, -21.0° C) in December
Metz, <i>France</i>	( -1.7° F, -18.7° C) on 21 February
Dijon, <i>France</i>	( -0.4° F, -18.0° C) on 21 February
Turin, <i>Italy</i>	( 1.4° F, -17.0° C) on 7 December
Rouen, <i>France</i>	( 8.8° F, -12.9° C) on 12 February
Brussels, <i>Belgium</i>	( 9.7° F, -12.4° C) on 12 December
<i>Ibid.</i>	( 5.0° F, -15.0° C) on 20 February
Catalonia, <i>Spain</i>	( 8.6° F, -13.0° C) in December
Le Havre, <i>France</i>	(14.0° F, -10.0° C) on 9 December
Toulouse, <i>France</i>	(14.0° F, -10.0° C) in December
Montpellier, <i>France</i>	(14.5° F, -9.7° C) on 8 December
Saint-Lô, <i>France</i>	(14.9° F, -9.5° C) on 6 December
Orange, <i>France</i>	(14.9° F, -9.5° C) on 10 December
<i>Ibid.</i>	(15.1° F, -9.4° C) on 13 February
Paris, <i>France</i>	(15.3° F, -9.3° C) on 8 and 11 December
<i>Ibid.</i>	(10.8° F, -11.8° C) on 21 February

The Seine River did not freeze this winter. But the Saône River froze in December, and the Loire River in *France* came to a halt. In *Germany*, the Neckar River froze on 13 February in some places. The Rhine River also began to drift ice. In *England*, on the banks of the River Thames, wild birds, gulls, etc., appeared as a precursor of a severe winter ahead. On 9 December, the Serpentine Lake in Hyde Park [in London] was frozen and thousands of skaters ventured out onto the 38 mm (1.5 inch) thick ice. Immense amounts of snow fell over a large part of *Europe*. The Ardennes, the Vosges, the Jura, the Alps, the Cévennes, the mountains of the Auvergne and the Pyrenees had a layer of snow cover three times as thick as ordinary winters. [The Ardennes Mountains are located in the Ardennes region in northeastern France. The Vosges Mountains are in northeastern France. The Jura Mountains are in east-central France. The Alps are in southeastern France. The Cévennes Mountains are in south-central France.] Also almost all

the roads in the south were full of snow and the transportation links were interrupted at many points. In Marseilles, *France*, 0.50 meters (1.6 feet) of snow fell in 36 hours, and in Pau 0.30 meters (1.0 feet) of snow fell. The railways at Harze, *Belgium* and in Schlesien, [now within *Poland*] and also the one from Leipzig / Magdeburg, *Germany* and the one from Dresden, *Germany* were covered with snow 7 meters (23 feet) deep. [Schlesien is the German name for Silesia.] In Upper Silesia, the houses were buried under snow along with their residents. The coast of southern *Spain*, from Estepona to Tarifa was covered with snow. The mountains in Tetuan showed the same phenomenon. [Tetuan now Tétouan is located in northern *Morocco*, a few miles south of the Strait of Gibraltar. To the south and west of the city, there are mountains.]<sup>62</sup>

Numerous accidents were reported during this winter. In Drôme in southeastern *France* in January, six men and twelve horses were buried under the snow. On the way from Le Puy after Nîmes in southern *France*, five men and twenty horses met the same fate. In Fos (Midi-Pyrénées, *France*), eight men and nine mules also came to the same fate in January. Several people died on the roads, among others, a soldier on the way from Lodève after Le Caylar in southern *France*. In Marseille, a little boy froze to death after falling asleep in a boat. In Turin, *Italy* during the night of 6/7 December, several sentries froze to death in their sentry posts. In *Sweden*, near Gefle, 11 people froze to death within eight days. The cold damaged the vines in the Upper and Lower Rhine, but in the rest of *France*, the plants were protected by snow cover.<sup>62</sup>

The winter of 1844-45 [in *England*] was remarkable for the long duration of cold weather. The whole of December was very cold, January not so severe, but still cold; February singularly cold, and the frost so severe in March that on Good Friday (March 21) the boats, which had been frost bound for weeks in the canals, were still locked tightly in ice.<sup>70</sup>

---

#### 1845 A.D. – 1851 A.D. Ireland. Famine

[There was a great famine in *Ireland* that was caused less by the weather, but by blight, and the heavy reliance on a single crop, the potato. In 1845 a pestilential blight of unexampled severity caused the whole potato crop to rot. Three-fourths of the population of the island was entirely dependent of upon this staple for food at that time. The resulting suffering can scarcely be imagined. In March and April 1847, 2,500 died weekly in the workhouses alone. Thousands of starving peasants poured into *England*, many dying of famine fever while on board of emigrant ships. The total death toll was between 200,000 and 300,000. Owing to death and emigration, the population of the island was reduced from 8,300,000 in 1845 to 6,600,000 six years later in 1851.<sup>84</sup>]

In *Ireland* in 1845 there was a famine. The government expended 850,000*l.* in relief of sufferers.<sup>57, 91</sup>

In August 1846, a large and influential meeting, at which the Mayor presided, was held in Sydney, *Australia* to take measures for collecting subscriptions to relieve the famine then prevailing in *Ireland* and *Scotland*, in consequence of the failure of the crops in those countries. Similar meetings were held in various parts of the colony of New South Wales, and large sums were subscribed for that benevolent purpose.<sup>103</sup>

In *Ireland* during 1846-47, there was a great potato famine. Parliament advanced nearly 10,000,000*l.* About 275,000 persons are supposed to have perished. The famine on the whole lasted nearly six years. The population was reduced by about 2,500,000. The immigration to America was 1,180,409. There were 1,029,552 people who died from starvation and pestilence consequent upon it. This is probably overstated. It is further said that about 25% of the immigrants died within twelve months of leaving. The Commerce and Navigation Laws were repealed.<sup>57, 91</sup>

One of the most devastating of all famines occurred in 1846-47 in *Ireland*, when in consequence of the failure of the potato crop, over one million people perished of starvation, and the epidemic which was occasioned by the famine.<sup>155</sup>

In the Irish Potato Famine of 1845-46 about one million people, that is around 12% of *Ireland's* population at the time, perished from famine.<sup>151</sup>

The great Irish famine of 1846-47 was terrible in its severity. In the summer of 1845, the symptoms of the disease in the potato crop, which formed the staple food of the people of *Ireland*, became general and alarming. The heavy rains which swamped the country, seemed to increase the blight. The real horrors of the famine did not commence until the failure of the potato crop in the autumn of 1846. Deaths caused by the famine are estimated at upwards of a half million between 1846-50.<sup>188</sup>

In 1846-49, there was a great famine in *Ireland*. There were no less than 130 poorhouses in Ireland. Some contained 1,000 to 2,000 souls. "When the famine advanced, when funds decreased, when the doors were besieged by imploring applicants, who wanted a place to die, that they might be buried in a coffin, they were little else than charnel houses, while the living, shivering skeletons that squatted upon the floors, or stood with arms folded against the wall, half-clad, with hair uncombed, hands and face unwashed, added a horror if not terror to the sight." When the potato crops failed, people relied on turnips for food. The tops had to be cooked but the bottoms were taken raw. Some relied on nettles and chickweed as miserable substitutes for food. The government handed out black bread. "But it is much to be doubted whether the government, had they been served with a loaf of that bread, would have ordered it for either man or beast." The bread was sour, black, and with the consistency of liver. It was the color of peat. "Some twenty-nine years before, the government had deposited in that region some continental material for bread, which had become damaged, and then could not be sold." This became the main ingredient of black bread.<sup>184</sup>

[Ireland was in a state of turmoil long before the Great Potato Famine struck. The wealthy landowners employed cruel agents to collect the rents on their properties. The peasant farmers were barely surviving and unable to set aside anything for a time of want. When the famine struck, and they were no longer capable of paying their rents, the agent would appear and set their home on fire or by other means destroy them. This deprived the family of both shelter and fire (Fire for warmth and to cook their meager meals). This turned the population into wandering nomads that would take shelter in a ditches along the side of the road. Being cold, starving, sick and nearly naked, there they died by the tens of thousands.]

In the second year of the famine in *Ireland*, Mrs. Nicholson passed a corpse lying against a corner of a wall. The man [an agent for the landowner] had been killed by a tenant. Her coachman said it was good. This shocked her and she asked him why. "Why lady, he was the greatest blackguard that ever walked the airth [earth]; he was agent to a gentleman, and he showed no mercy to a poor man that was toilin' [toiling] for the potato; but as soon as the famine was sore on the cratures [creatures], he drove every one into the blake staurm [black storm?] that could not give the rent, and many's the poor bein' [being] that died with starvation, without the shelter; and wouldn't ye think that such a hard-hearted villain better be dead, that to live and kill so many poor women and helpless children, as would be wanderin' [wandering] in the black mountains this winter, if he should live to drive 'em [them] there." <sup>184</sup>

---

**1845 A.D.** In *China*, there were great floods. "Along the shores of the Yellow Sea, the phenomenon took the character of a second deluge; whole provinces being submerged."<sup>47, 92</sup> [Yellow Sea is located between mainland *China* and the *Korean Peninsula*.]

In 1845 during the period between 5 July and 2 August, floods struck Shantung (now Shandong province) on the east coast of *China* at Tung-p'ing, Ch'ing and Yüeh-t'ing; Chekiang (now Zhejiang province) on

the east coast of *China* at Chin-yün, Yün-ho and Wên-ling; and Hupeh (now Hubei province) in central *China* at Kung-an. During the same time period (5 July and 2 August), a drought engulfed Chekiang province at Ch'ing-t'ien. During the period between 3 August and 1 September, a drought engulfed Chekiang province at Chin-yün and Yün-ho.<sup>153</sup>

In May 1845 in *Ireland*, there were hail showers of more than ordinary weight.

A great drought struck Northern Ohio in the *United States* in 1845. Mr. Seabury Ford describes the drought as follows:<sup>115</sup>

“The district of country which suffered the most was about 100 miles in length and 50 or 60 in width, extending nearly east and west parallel with Lake Erie, and in some places directly bordering on the shore of this great inland sea. There was no rain from the last of March or the first of April until the 10<sup>th</sup> of June, when there fell a little rain for one day, but no more until the 2<sup>nd</sup> of July, when there probably fell half an inch, as it made the roads a little muddy. From this time no more rain fell until early in September. This long-continued drought reduced the streams of water to mere rills, and many springs and wells heretofore unfailing became dry, or nearly so. The grass crop entirely failed, and through several counties the pasture grounds in places were so dry that in walking across them the dust would rise under the feet, as in the highways. So dry was the grass in meadows that fires, when accidentally kindled, would run over them as over a stubble field, and great caution was required to prevent damage from them. The crop of oats and corn was nearly destroyed. Many fields of wheat so perished that no attempt was made to harvest them. Scions set in the nursery dried up for lack of sap in the stocks, and many of the forest trees withered, and all shed their leaves much earlier than usual. The health of the inhabitants was not materially affected, although much sickness was anticipated. Grasshoppers were multiplied exceedingly in many places, and destroyed every green thing that the drought had spared, even to the thistles and elder tops by the roadside.”

“The late frosts and cold drying winds of the spring months cut off nearly all the fruit, and what few apples remained were defective at the core and decayed soon after being gathered in the fall. Many of the farmers sowed fields of turnips in August and September, hoping to raise winter food for their cattle, but the seed generally failed to vegetate for lack of moisture. So great was the scarcity of food for the domestic animals that early in autumn large droves of cattle were sent into the valley of the Sciota [Scioto], where the crops were more abundant, to pass the winter, while others were sent eastward into the borders of Pennsylvania. This region of country abounds in grasses, and one of the staple commodities is the produce of the dairy. Many stocks of dairy cows were broken up and dispersed, selling for only four or five dollars a head, as the cost of wintering would be more than their worth in the spring. Such great losses and suffering from the effects of drought have not been experienced in that portion of Ohio for many years, if at all since the settlement of the country.”

In 1845 in *France*, the losses from hailstorms for the year were estimated at £2,000,000. [In today's currency, that would be the equivalent of £161,000,000 or \$262,000,000 U.S. dollars using the retail price index.]<sup>93</sup>

On 19 August 1845, a tornado ripped through northern *France*. At Rouen it tore up 180 trees, twisting and wrenching nearly all of them and destroyed a factory-drying house. In a valley near Malaunay and Monville [Montville], it broke off the trees in a forest near ground level. It destroyed three spinning mills and the working people within them. The width of the tornado was 715 feet [218 meters] at Malaunay; 995 feet [303 meters] in the middle of the tornado path of destruction; and 195 feet [59 meters] near Clères, where the cloud disappeared.<sup>205</sup>

On 17 December 1845, there was a great flood in Ipswich in Queensland, *Australia*.<sup>103</sup>

In 1845, there was a minor famine in Bombay [now Mumbai, *India*].<sup>179</sup>

*Also refer to the section 1843 A.D. – 1845 A.D. for information on the drought in Australia during that timeframe. Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe.*

**Winter of 1845 / 1846 A.D.** A New Orleans, Louisiana newspaper of 8 December said the Mississippi River in the *United States* was frozen, the temperature was 23° F (-5° C), and individuals were skating on the river. On 8 December, the Ohio River was frozen over at Pittsburg, Pennsylvania; Cincinnati, Ohio; and Wheeling, West Virginia. As early as November 30, the Wabash River was frozen at Vincennes, Indiana. In Kentucky, the temperature was -2° F (-19° C) on 3 December 1845. At St. Louis, Missouri, the temperature was -5° F (-21° C) and snow was a foot deep. This was the case of many western states. Snow was about a foot deep in Pennsylvania, New York, Connecticut and through the New England states. In Canada, eighteen to twenty-four inches (46-61 centimeters) of snow had fallen. In many parts of *Upper Canada*, the snow was blown into banks fifteen feet (4.6 meters) high and the temperature was -13° F (-25° C). At Albany, Saratoga and Utica, New York, the temperature on 11 December was -10° F (-23° C) and the temperature at Franconia, New Hampshire was -33° F (-36° C).<sup>1</sup>

In the *United States* during the winter of 1845-46, the temperature at Washington D.C. fell to -6° F in December.<sup>126</sup>

In March 1846, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 1<sup>st</sup> (32° F); 3<sup>rd</sup> (26° F); 4<sup>th</sup> (22° F). There was frost on March 11<sup>th</sup>, 22<sup>nd</sup>, and 31<sup>st</sup>. It snowed on March 2<sup>nd</sup>.<sup>116</sup>

**1846 A.D.** On 14 & 15 March 1846, a great flood of the Susquehanna River struck Bradford County, Pennsylvania in the *United States*. The rise was very sudden. Never within the memory of the oldest inhabitants has the Susquehanna been so high at Towanda as it was on Saturday and Sunday. Most bridges on the Susquehanna were either swept away or badly damaged, including the following: Lanesboro [PA], Great Bend [PA], Binghamton [N.Y.], Burlington [PA], Smithboro [N.Y.], Catawissa [PA], Danville [PA], Northumberland [PA], Clark's Ferry [PA] and Harrisburg [PA].<sup>178</sup>

On 18 March 1846 in *Ireland*, there was a great hailstorm in Waterford.<sup>93</sup>

Towards the end of March 1846, the melting snow and ice produced a freshet [flood] in several rivers and streams in New Hampshire and Maine in the *United States*.<sup>199</sup>

— On 26 March, a dam washed away at Somersworth, New Hampshire. On the same day, the railroad bridge over the river at Saco, Maine was damaged. On the Androscoggin River, the village of Livermore Falls, Maine was almost entirely swept away. Seventeen stores and houses floated downstream. The Kennebec River flooded the lower and central parts of Hallowell, Maine. The Kennebec River rose very rapidly at Gardiner, Maine and broke up the ice which was 2 feet [0.6 meters] thick driving it into the lower streets of the town, flooding cellars and carrying away several storehouses, barns and other buildings.

— The flood of the Penobscot River caused great destruction of property, which was caused by ice dams. Below the town of Orono, Maine at a place called the Basin, a block of 17 mills was destroyed. In the northern part of Bangor, Maine, an ice jam seriously threatened 21 sawmills and a large number of clapboard-, shingle-, and lath-mills. But the ice gave way and the threat was averted.

— The Franklin Bridge over the Kenduskeag River was carried away along with parts of the Smith's Bridge, and the Kenduskeag Bridge.

— [In Bangor, Maine], the water inundated the lower part of town, including the whole of Market Square, the Broad, Wall and Exchange Streets and a large portion of Maine Street to a depth of several feet. The water rose quickly – five feet [1.5 meters] in five minutes and as a result people in the square

had to wade through water 3 feet [0.9 meters] deep to reach the safety of higher ground. A temporary ferry was set up between Hammond Street near the City Hall and State Street near Exchange Street. Smith's block, including the post office was submerged almost to the tops of doors. The same was the case for the stores on Market Square. The floodwater was nearly up to the windows in the Exchange. The water was several feet deep in front of the old Hatch Tavern. The lumber dealers suffered most of the loss. The wharves were covered with millions of feet of valuable lumber, which was worth hundred of thousands of dollars. The greater part of this lumber were carried away and lost. The ice and the lumber combined with the wrecks of 44 sawmills and shingle and lath mills, and floating storehouses rushed downstream and demolished the Penobscot Bridge. Three persons drowned in the flood. After the flood, great sheets of ice were piled in some places to a height of 25 feet [7.6 meters].

On 24 June 1846 in *Ireland*, there was a great hailstorm in the northwest districts.<sup>93</sup>

In 1846, there was a severe drought in Iowa in the *United States*. "I recollect very well the dry season of 1846, which took all the surface water of Iowa away, so far as I knew it. The surface at the time was devoid of water to such an extent that none was to be had from wells, springs or streams for cattle and other stock, except in the channels of the largest streams of the State, the Des Moines, Iowa and Cedar rivers were at that time, but I can state for the Iowa river that all the water running in its channel during that summer passed through a hole two feet square in the penstock of what was called the Company Mills, about two miles and a half above Iowa City. Not a drop of water fell during that season in our part of the country from April to November, and during all this time the weather was extremely hot. The stock of the country had to be herded along streams where water could be had for their sustenance. Plowing fields and breaking prairie had to be given up for that season, and in many cases farmers were compelled to haul water in barrels long distances, in order to sustain themselves in their homes. The drouth [drought] from which we suffered in 1846 had begun in other parts of the *United States* one or two years previously. Two years before the New England region suffered severely, and during the years before the northern part of Ohio suffered so severely that the people along and on the southern border of Lake Erie were obligated to emigrate, for it was impossible to obtain water either for domestic or stock uses throughout a very large region of the country."<sup>111</sup>

The temperature of the summer of 1846 was very remarkable. *France, Belgium and England* suffered from the extreme heat. The summer in Paris, *France* was characterized by:

Hot days	48 days
Very hot days	9 days
Extremely hot day	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Toulouse, <i>France</i>	(104.0° F, 40.0° C) on 7 July
Quimper, <i>France</i>	(100.4° F, 38.0° C) on 19 June
Rouen, <i>France</i>	( 98.2° F, 36.8° C) on 5 July
Paris, <i>France</i>	( 97.7° F, 36.5° C) on 5 July
Orange, <i>France</i>	( 97.7° F, 36.5° C) on 13 July
Angers, <i>France</i>	( 95.0° F, 35.0° C) on 29 July
Metz, <i>France</i>	( 94.6° F, 34.8° C) on 1 August
Pau, <i>France</i>	( 92.1° F, 33.4° C) on 6 July
Görsdorf, <i>Germany</i>	( 88.9° F, 31.6° C) on 1 August
Geneva, <i>Switzerland</i>	( 88.9° F, 31.6° C) on 14 July
La Chapelle, <i>France</i>	( 88.5° F, 31.4° C) on 5 July
Saint-Lô, <i>France</i>	( 87.6° F, 30.9° C) on 6 June
Brussels, <i>Belgium</i>	( 87.1° F, 30.6° C) on 27 June
Dijon, <i>France</i>	( 86.4° F, 30.2° C) on 31 June
Rodez, <i>France</i>	( 82.4° F, 28.0° C) on 21 June

Krakow, *Poland*

( 82.2° F, 27.9° C) on 10 July

In Rouen, *France*, the summer of 1846 was very warm and the thermometer rose to a height that is rarely seen in that region. In *Brittany* accidents were reported at the market in Pont de Croix where several people fainted from the heat. In Beuzec, *France*, a little girl who had been left carelessly exposed to the sun for a few minutes died from the heat. In June, the temperature in Toulouse, Toulon and Bordeaux was extremely hot. In Landes, *France* there was a second harvest of rye. In the neighborhood of Niort, *France* in early July, three workers died in the fields.<sup>62</sup> [Rouen is in northern *France*. Beuzec is in northwestern *France*. Toulouse, Toulon and Landes are in southwestern *France*. Bordeaux and Niort are in western *France*.]

In 1846, there was a fall of red dust near Lyons in east-central *France*. It was estimated that the quantity of dust that fell was equal to 7,200 quintals [1.6 million pounds, 720,000 kilograms] spread out over 400 square miles [1,036 square kilometers]. The dust was analyzed and found to be composed of sand, clay, organic substances and infusoria. The infusoria was composed of animalcula, similar to miniature worms. [Other red dust fall specimens were collected on the Atlantic Ocean, Europe, Asia Minor and Syria. The infusoria matched that observed in the Lyons fall. The soil in different parts of Africa and South America were analyzed, and the animalcula appeared to match the area near the Orinoco and Amazon Rivers.]<sup>205</sup>

On 1 August 1846, there was a great rain and hailstorm that visited various parts of *England*. Upwards of 7,000 panes of glass were broken at the Houses of Parliament; 300 at the Police Office, Scotland Yard; other buildings in the Metropolis suffered severely. The glass in the Picture Gallery at Buckingham Palace was totally destroyed, and the apartment flooded.<sup>93</sup>

On 7-8 September 1846, a hurricane struck offshore Virginia in the *United States*. Several vessels were lost.<sup>141</sup>

In Burgundy, *France*, the grape harvest began on 14 September. The grape harvest only provided half a normal crop; but the wine produced was of very excellent quality. The cereal harvest was far from that of an average year.<sup>62</sup>

On 10-11 October 1846, a hurricane struck western *Cuba*, the Florida Keys in the *United States* and Cayman Islands in the *Caribbean* causing more than 164 deaths.<sup>141</sup>

On 22 October 1846, there were overwhelming inundations in the center, west and southwest of *France*; numerous bridges, with the viaduct of the Orleans and Vierzon Railway swept away. The latter had cost 6 million francs [140,000*l.*] to build. [The viaduct of the Orleans and Vierzon Railway is located in north-central *France*.] The Loire River rose 20 feet [6.1 meters] in one night. The total destruction was estimated at 4,000,000*l.* Sterling.<sup>47, 90, 92</sup>

In 1846, parts of *Germany* were in a state of famine.<sup>155</sup>

In 1846 in *Belgium*, there was a severe famine. But the people were relieved with supplies from neighboring countries.<sup>57, 91</sup>

On 11-13 October, a strong hurricane traveled up the Gulf of Mexico. It struck Havana *Cuba* and Key West, Florida in the *United States* causing an immense amount of damage both on land and sea.<sup>1</sup>

The four famines of 1810, 1811, 1846, and 1849 in *China* are said to have taken a toll of not less than 45,000,000 lives.<sup>84</sup>

In 1846 during the period between 27 January and 25 February, the Laun River flooded in Hopei (now Hebei province) in northern *China*. During the period between 25 May and 23 June, floods struck Hupeh (now Hubei province) in central *China* at Chih-chiang and Kiangsu (now Jiangsu province) on the east coast of *China* at Ch'ing-p'u. At Ch'ing-p'u, several thousand families were flooded. During the period between 23 July and 21 August, the Wên River flooded in Shantung (now Shandong province) on the east coast of *China* and in Hopei province at Ch'ing. The floods along the Wên River damaged the dikes. Also during the period between 23 July and 21 August, a severe drought engulfed Shensi (now Shaanxi province) in central *China* at Lan-t'ien and San-yüan.<sup>153</sup>

*Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe.*

---

**Winter of 1846 / 1847 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1846 occurred on 25 November. A hard snowstorm all day.<sup>116</sup>

On the night of 26 November 1846, the steamer *Atlantic* on her passage from New London, Connecticut for New York with eighty persons on board, was overtaken by a violent storm and gale in Long Island Sound by which she was wrecked and stove to pieces on Fisher's Island, near the eastern end of Long Island, New York in the *United States*, whereby forty persons (men, women and children) perished.<sup>1</sup>

In March 1847, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 17<sup>th</sup> (30° F) (Manokin River frozen over). There was frost on March 6<sup>th</sup>, 15<sup>th</sup>, and 19<sup>th</sup>. It snowed on March 13<sup>th</sup> and 27<sup>th</sup>.<sup>116</sup>

This winter was very long in *France*, and severe in *Provence*, *Switzerland* and *Spain*. In *Poland*, the frost began to in October. In Paris, *France*, there was 60 days of frost, but only 10 were successive. The frost in Paris began on 12 November and lasted until 17 November when it began to thaw in the middle of the day. The frost began again on 2 December. On 3 December the thermometer sank to 22.3° F (-5.4° C). It thawed from 5 to 8 December. On 8 December, the frost returned and lasted until 19 December. On the 19<sup>th</sup> the temperature was 5.5° F (-14.7° C). The 19<sup>th</sup> of December was the only day this winter, when a cold was intense. The next period of thaw lasted from 19 to 24 December. The next period of frost lasted from 24 December until 3 January. The thaw this time lasted from 3 to 9 January. The next period of frost lasted from 10 to 15 January. The Seine River did not freeze but during the spring thaw the river swelled. On 27 December, at the bridge Pont de la Tournelle in central *France*, the river rose to 4.6 meters (15.1 feet) and flooded the low levels of Paris.<sup>62</sup>

Beginning on 13 December, the winter in Marseille, *France* was very severe and the violent northwest winds made walking very difficult. Throughout the South of *France* and *Spain* significant amounts of snow fell. In Victoria, *Spain*, 0.70 meters (2.3 feet) of snow was measured, and the thermometer sank to 11.7° F (-11.3° C). All roads in the east of the peninsula were full of snow. The water birds of the north appear in Barcelona, *Spain*. In Pontarlier, *France*, the temperature fell to -24.3° F (-31.3° C) and the birds of the field could be picked up with one's hands. This winter was very mild in St. Petersburg, *Russia*; where they only received an extreme amount of snow. The *United States* experienced very severe cold. The observed temperatures at different locations are:<sup>62</sup>

Pontarlier, <i>France</i>	(-24.3° F, -31.3° C) on 14 December
Le Locle, <i>Switzerland</i>	(-19.3° F, -28.5° C) on 14 December
Geneva, <i>Switzerland</i>	( -1.8° F, -18.8° C) on 14 December
Bern (Berne), <i>Switzerland</i>	( -1.8° F, -18.8° C) on 14 December
Zurich, <i>Switzerland</i>	( -1.8° F, -18.8° C) on 14 December
Rodez, <i>France</i>	( 5.0° F, -15.0° C) on 19 December
Paris, <i>France</i>	( 5.5° F, -14.7° C) on 19 December
<i>Ibid.</i>	( 17.8° F, -7.9° C) on 1 January

Wörsdorf, <i>Germany</i>	( 6.8° F, -14.0° C) on 6 December
Krakow, <i>Poland</i>	( 8.1° F, -13.3° C) on 15 December
<i>Ibid.</i>	( 7.7° F, -13.5° C) on 13 February
Dijon, <i>France</i>	( 9.7° F, -12.4° C) on 14 December
<i>Ibid.</i>	( 9.0° F, -12.8° C) on 12 February
Brussels, <i>Belgium</i>	( 9.3° F, -12.6° C) on 18 December
Victoria, <i>Spain</i>	( 11.7° F, -11.3° C) on 13 December
Metz, <i>France</i>	( 14.0° F, -10.0° C) on 1 January
Cambray (Cambrai), <i>France</i>	( 14.0° F, -10.0° C) on 1 January
Pau, <i>France</i>	( 14.0° F, -10.0° C) on 31 December
<i>Ibid.</i>	( 15.6° F, -9.1° C) on 2 January
Versailles, <i>France</i>	( 15.1° F, -9.4° C) on 31 December
Rouen, <i>France</i>	( 15.4° F, -9.2° C) on 30 December
Orange, <i>France</i>	( 16.3° F, -8.7° C) on 14 December
Saint-Lô, <i>France</i>	( 16.5° F, -8.6° C) on 31 December
La Chapelle (near Dieppe), <i>France</i>	( 17.4° F, -8.1° C) on 11 March
Toulouse, <i>France</i>	( 19.8° F, -6.8° C) on 14 February
Bordeaux, <i>France</i>	( 20.3° F, -6.5° C) on 3 December
<i>Ibid.</i>	( 19.8° F, -6.8° C) on 1 January
Draguignan, <i>France</i>	( 23.0° F, -5.0° C) in December
Cannes, <i>France</i>	( 26.6° F, -3.0° C) on 18 December
Marseille, <i>France</i>	( 26.6° F, -3.0° C) on 19 December
<i>Ibid.</i>	( 27.3° F, -2.6° C) on 12 March

#### 1847 A.D. – 1860 A.D. Australia. Drought

During this period 1847-59, a series of severe droughts took place in New South Wales, *Australia*.<sup>101</sup>

From 1854-59, the Adelaide area of *Australia*, suffered a long dry period according to rainfall records.<sup>101</sup> By November 1857, there was a drought in the region of Longford and to its east in Tasmania, *Australia*. The drought caused considerable damage to fruit due to lack of moisture and also widespread bushfires. Rain when it did fall in February 1858 was too late to repair the effects of a long and oppressive drought.<sup>99</sup>

In New South Wales, *Australia*, there was a drought from July 1847 to January 1848. There was a dreadfully dry December.<sup>103</sup>

In New South Wales, *Australia* in 1850, there was a drought from August to March.<sup>103</sup>

In New South Wales, *Australia*, the winter of 1849 was dry, and nothing but light showers fell till May 1851, being the severest drought remembered, and most serious in its consequences. This drought was confined to the western slopes, and was so severe that large quantities of livestock perished from thirst.<sup>103</sup>

On 1 March 1853, there was a tremendous dust storm and hot wind at Melbourne, *Australia*.<sup>103</sup>

In New South Wales, *Australia* on 18 August 1854, a strong drought had taken hold of the area. As a consequence, people fasted on account of the drought from September to January 1855.<sup>103</sup>

In New South Wales, *Australia*, there was a drought from October 1857 to February, 1858.<sup>103</sup>

In Queensland, *Australia* in 1858, there was a very serious drought. Lake Gracemere (Rockhampton) was dry.<sup>103</sup>

On 1 November 1847 on the Paterson River in New South Wales, *Australia*, the temperature was 127° F

(52.8° C) in the sun. On 1 January 1848 on the Paterson River, the temperature was 129° F (53.9° C) in the sun and 108° F (42.2° C) in the shade. On 3 January 1848 on the Paterson River, the temperature was 109° F (42.8° C) in the shade.<sup>103</sup>

In 1856 in *Western Australia*, the drought conditions caused sheep farmers to lose half their lambs.<sup>101</sup>

In 1854 in Victoria, *Australia*, there was a severe drought in the Maryborough district. In 1857-58 in Victoria, *Australia*, the hot winds and drought caused a loss of 209,000 bushels of wheat.<sup>101</sup>

In 1858 in Queensland, *Australia*, there was a drought in Richmond and Barcoo districts.<sup>101</sup>

In 1851, there was a drought in the eastern district of *South Australia*. There was a severe scarcity of water and feed for livestock. During 1858-60 in *South Australia*, livestock almost starved because of the drought.<sup>101</sup>

In 1860 in *Western Australia*, there was a drought.<sup>101</sup>

On 6 February 1851 in *Australia*, there was a great bushfire later known as *Black Thursday*. At its peak the bushfires raged from Barwon Heads in Victoria to Mount Gambier in South Australia. The smoke and haze from this fire spread as far as Tasmania, *Australia*. At 11 A.M. the temperature measured in the shade at Melbourne was 117° F (47° C). Ten people were known to have died during this bushfire and many settlements were totally destroyed.<sup>101</sup>

After five weeks of hot northerly winds, on 6 February 1851, a bushfire, later known as *Black Thursday*, began in Victoria, *Australia*. This was most likely Victoria's most extensive bushfires. The fire apparently started in the Plenty Ranges when two bullock drivers left some logs burning which set fire to long, drought-parched grass. From an early hour in the morning a hot wind blew from the north-northwest, accompanied by 117° F (47° C) temperatures in Melbourne. There was extensive damage in Victoria's Port Phillip district.<sup>99</sup>

Huge areas of southern and northeast Victoria were burnt out. Fires burnt from Mt Gambier in South Australia to Portland in Victoria as well as the Wimmera in the north and central and southern areas including Semour, the Plenty Ranges and much of Gippsland, Westernport, Geelong, Heidelberg and east to Diamond Creek and Dandenong; where a number of settlements were destroyed. One settler lost his wife, five children, his home and 1,100 sheep. Although approximately 1,300 buildings were destroyed, only about 100 people were left homeless. However, over one million sheep and thousands of cattle were lost.<sup>99</sup>

There were 3.7 million acres (1.5 million hectares) of forest burnt out plus vast areas of scrub and grasslands. The total land area burnt was approximately 12.4 million acres (5 million hectares). Farmers at Barrabool Hills were burnt out or ruined; three men perished at Mount Macedon and wholesale destruction of the Dandenong region was caused by similar widespread razings from Gippsland to the Murray (River). Other scorched areas included Omeo, Mansfield, Dromana, Yarra Glen, Warburton and Erica.<sup>99</sup>

In 1854, there was a bushfire in Tasmania, *Australia*. The bushfires struck in the vicinity of Port Cygnet, Lymington and Huon. Three deaths were reported with about 10 people sustaining injuries. Some houses were destroyed.<sup>99</sup>

In 1851 [1854?] in *Australia*, there was a serious brushfire in Van Diemen's Land (now Tasmania).<sup>101</sup>

**1847 A.D.** The summer of 1847 was average in Paris, *France*. In the south, summer began early. The summer in *Italy* and *Spain* to *Gibraltar* and in *Ireland* was glorious. This caused the agriculture crops to produce a high yield by mid-year and as a consequence, food became very inexpensive. The summer in Paris, *France* was characterized by:

Hot days	39 days
Very hot days	1 day
Extremely hot day	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Toulouse, <i>France</i>	(100.8° F, 38.2° C)	on 16 July
Angers, <i>France</i>	(100.4° F, 38.0° C)	on 17 July
Orange, <i>France</i>	( 99.5° F, 37.5° C)	on 11 July
Břeží, <i>Czech Republic</i>	( 98.6° F, 37.0° C)	
Bordeaux, <i>France</i>	( 96.4° F, 35.8° C)	on 17 July
Versailles, <i>France</i>	( 95.9° F, 35.5° C)	on 17 July
Paris, <i>France</i>	( 95.2° F, 35.1° C)	on 17 July
Constantinople (Istanbul), <i>Turkey</i>	( 92.1° F, 33.4° C)	on 7 August
Dijon, <i>France</i>	( 91.8° F, 33.2° C)	on 18 July
Metz, <i>France</i>	( 91.8° F, 33.2° C)	on 18 July
Pau, <i>France</i>	( 91.4° F, 33.0° C)	on 16 July
Rouen, <i>France</i>	( 91.0° F, 32.8° C)	on 17 July
Geneva, <i>Switzerland</i>	( 90.3° F, 32.4° C)	on 18 July
Brussels, <i>Belgium</i>	( 89.8° F, 32.1° C)	on 17 July
Marseille, <i>France</i>	( 89.4° F, 31.9° C)	on 15 July
Görsdorf (Storkow), <i>Germany</i>	( 88.5° F, 31.4° C)	on 18 July
Rodez, <i>France</i>	( 88.3° F, 31.3° C)	on 16 July
Cambray (Cambrai), <i>France</i>	( 87.8° F, 31.0° C)	on 2 August
La Chapelle, <i>France</i>	( 84.7° F, 29.3° C)	on 23 May
Bourg, <i>France</i>	( 79.0° F, 26.1° C)	in July

In *France*, the wheat harvest produced a very high yield, an enormous number of 20,913,041 hectoliters (59,346,170 bushels) in excess of French needs [export]. In Burgundy, the grape harvest began on 4 October. The grapes were plentiful but of wine produced was of poor quality.<sup>62</sup>

On 11 October 1847, a hurricane struck the *Caribbean* island of Tobago causing 27 deaths.<sup>141</sup>

*Germany* and *France* suffered famines in 1847.<sup>96</sup>

In *France*, there was scarcity. This produced food riots. At Chateauroux in central *France*, a wealthy corn [grain] merchant who defied the mob was set upon and beaten to death.<sup>57</sup>

In 1847, floods struck Hopei (now Hebei province) in northern *China* at Yen-shan. During the period between 6 May and 8 August, a severe drought engulfed Hupeh (now Hubei province) in central *China* at I-ch'êng. During the period between 8 August and 8 November, a severe drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui.<sup>153</sup>

*Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe. Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1847 / 1848 A.D.** On 16 December 1847, a storm struck New England in the *United States*. The brig *Falconer*, 360 tons burden, was driven onto a sandy reef about ¾ mile [1.2 kilometers] from the shore and pounded continuously with tremendous waves of icy water. Seventeen of the 53 persons on

board perished, most by exposure rather than drowning. Various craft were wrecked at Cohasset, Nantucket and other places during the storm.<sup>199</sup>

In the *United States* during the winter of 1847-48, the temperature at Dartmouth College (at Hanover, New Hampshire) fell to -34° F in January.<sup>113</sup>

In March 1848, the temperature at Princess Anne, Maryland in the *United States* fell below freezing on the following dates: March 4<sup>th</sup> (31° F); 6<sup>th</sup> (26° F); 15<sup>th</sup> (26° F); 16<sup>th</sup> (22° F); 17<sup>th</sup> (30° F). There was a frost on March 25<sup>th</sup>.<sup>116</sup>

**1848 A.D.** In Inverness, *Scotland*, there was a great overflow of the River Ness, which swept away the old bridge and did other damage.<sup>47, 92</sup>

On 7 April 1848, the vessels *Georgina* and *Spy* were driven ashore near Hobart, *Australia*, during a gale. Three people were drowned.<sup>99</sup>

The maximum temperature during the summer in St. Bernard, *Switzerland* was 64.0° F (17.8° C) on 23 July.<sup>62</sup>

On 23 July 1848, a terrible storm of hail and rain struck Bradford County, Pennsylvania in the *United States*. The memory of the oldest inhabitant goes not back to anything equaling it in violence. Some of the hailstones measured 1½ inches [4 cm] in diameter. In Towanda, where it was strongest, there was a general demolition of awnings and gardens were entirely ruined (vegetables looking as if an army of worms had stripped them of their leaves). The storm was about a mile [1.6 km] in width. Fields of fine corn and oats were completely ruined.<sup>178</sup>

In 1848 during the period between 5 February and 6 May, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Wên-chou. During the period between 8 August and 8 November, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ang-p'ing.<sup>153</sup>

In 1848, many regions of *China* experienced flooding including:<sup>153</sup>

— Hupeh (now Hubei province) in central *China* at Sung-tzū, An-lu, Sui, Huang-kang and Pao-k'ang. At Pao-k'ang, houses and fields were damaged by the floodwaters.

— During the period 1-29 July, floods struck Kiangsi (now Jiangxi province) in southern *China* at Wuchang, Nan-ch'ang, I-ch'un, P'o-yang, Nan-k'ang, Yün-mêng, Hsien-ning, Huang-p'o, P'u-ch'i and Hanyang; Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-ch'un; Shantung (now Shandong province) on the east coast of *China* at Ling; and Hopei (now Hebei province) in northern *China* at Wu-ch'ing. At Yün-mêng, all the dikes were damaged.

— During the period between 26 January 1848 and 23 January 1849, floods struck Hupeh province at Sui, Ying-shan, Huang-kang, Chiang-ling and Kung-an.

*Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe.*

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1848 / 1849 A.D.** In 1849 in *Norway*, the frost was very severe.<sup>47, 93</sup>

In 1849, the cold in *Sweden*, *Norway* and *Russia* was so severe that great numbers of persons were frozen to death in all those countries.<sup>63</sup>

On 2 January 1849, the frost was so intense in parts of *Norway*, that quicksilver froze and persons exposed to the atmosphere lost their breath.<sup>90</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1848 occurred on 11 November. Snowed steadily and pretty fast all day. November 20, a very uncommon fall of snow, said to be about 18 inches deep. Sleighs were very thick.<sup>116</sup>

According to the Reporter dated 21 February 1849, the winter of 1848-49 in Bradford County, Pennsylvania in the *United States*: "While most of December was spring like without any snow, the memory the oldest inhabitant is necessary to the recollection of a winter as severe as has been the present. The past winters have been mild and given rise to the belief that old fashioned seasons of snow and ice had passed away. The present, however, knocks the theory into a cocked hat—old Boreas himself could not desire a colder season." Even as late as 18 April 1849, a snowstorm of rare violence for this season of the year struck covering the fields with snow. In some parts of the adjacent country, the snow was a foot [30 cm] deep.<sup>178</sup>

In March 1849, the temperature at Princess Anne, Maryland in the *United States* did not fall below freezing. There was a frost on March 23<sup>rd</sup>.<sup>116</sup>

---

**1849 A.D.** On April 16, 1849, at Florence, Alabama in the *United States*, "severe frosts, and vegetation supposed to be all killed."<sup>130</sup>

During the summer of 1849, southern *France* experienced very great heat. The high temperature in Orange was the highest temperature ever observed (in the shade) in *France*. The summer in Paris, *France* was characterized by:

Hot days	32 days
Very hot days	2 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The summer heat began in the south in May and June. The high temperatures observed during the summer were:

Orange, <i>France</i>	(106.5° F, 41.4° C) on 9 July
Toulouse, <i>France</i>	( 99.7° F, 37.6° C) on 23 June
Bordeaux, <i>France</i>	( 94.3° F, 34.6° C) on 7 July
Gent (Ghent), <i>Belgium</i>	( 93.9° F, 34.4° C)
Metz, <i>France</i>	( 92.5° F, 33.6° C) on 8 July
Versailles, <i>France</i>	( 91.9° F, 33.3° C) on 8 July
Dijon, <i>France</i>	( 91.6° F, 33.1° C) on 8 July
Constantinople (Istanbul), <i>Turkey</i>	( 91.4° F, 33.0° C) on 14 June
Rouen, <i>France</i>	( 91.2° F, 32.9° C) on 3 June
Brussels, <i>Belgium</i>	( 91.0° F, 32.8° C) on 9 July
Marseille, <i>France</i>	( 90.1° F, 32.3° C) on 25 June
Geneva, <i>Switzerland</i>	( 90.0° F, 32.2° C) on 12 July
Paris, <i>France</i>	( 89.6° F, 32.0° C) on 1 June
Görsdorf (Storkow), <i>Germany</i>	( 88.5° F, 31.4° C) on 9 July
Cayenne, <i>French Guiana</i>	( 87.3° F, 30.7° C) in October
Angers, <i>France</i>	( 86.9° F, 30.5° C) on 5 June
Rodez, <i>France</i>	( 86.0° F, 30.0° C) on 23 June and 8 August
Cherbourg, <i>France</i>	( 85.8° F, 29.9° C) on 7 July
Bourg, <i>France</i>	( 81.9° F, 27.7° C)

The grain harvest in *France* was much better than an average year. In Burgundy, the grape harvest began on 27 September. The wine produced was of a good quality.<sup>62</sup>

On 6 October 1849, a hurricane struck Massachusetts in the *United States*. One source identifies 143 deaths while another cites 27.<sup>141</sup>

On 7 October 1849, a gale struck New England in the *United States*. The storm did great damage along the shore. A considerable number of vessels were driven ashore or bilged. In Chelsea, Massachusetts, one of the brick walls of Universalist Society Church came crashing down. The brig *St. John* wrecked on Minot's ledge off Cohasset, Massachusetts. One hundred and forty-three men, women and children perished during this wreck.<sup>199</sup>

The four famines of 1810, 1811, 1846, and 1849 in *China* are said to have taken a toll of not less than 45,000,000 lives.<sup>84</sup>

In 1849, many regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 23 April and 21 May, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Chia-hsing and Hu-chou; Kiangsu (now Jiangsu province) on the east coast of *China* at Soochow; and Hupeh (now Hubei province) in central *China* at Ying-shan and Huang-kang. At Ying-shan, innumerable people drowned. At Hu-chou, crops were damaged by the floodwaters.

— During the period between 20 June and 19 July, floods struck Kiangsi (now Jiangxi province) in southern *China* at Hêng-fêng; and Hupeh province at Huang-p'o, Hanyang and along the Man River.

— During the period between 20 July and 17 August, floods struck Hupeh province at Kung-an, Lo-t'ien, Ma-ch'êng, Ch'i-shui, Tzŭ-kuei, I-ch'ang, P'u-ch'i, Hsien-ning, An-lu, Huang-kang and Chih-chiang.

— During the period between 18 August and 16 September, floods struck Shantung (now Shandong province) on the east coast of *China* at Jih-chao; Hupeh province at Ao-ch'êng; and Shensi (now Shaanxi province) in central *China* at San-yüan. At San-yüan, houses and fields were damaged by the floodwaters and many people drowned.

In 1849 during the period between 18 August and 16 September, a severe drought engulfed Kansu (now Gansu province) in northwest *China* at Chuang-lang.<sup>153</sup>

*Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe.*

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**1850 A.D.** Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

In *Ireland* in April, there were great floods in County Kerry; bridges destroyed.<sup>47, 92</sup>

On 16 April 1850, "disastrous frosts, which killed vegetation, and even young oak trees, from Tennessee to the Gulf [in the *United States*]." <sup>130</sup>

On 18 April 1850, Dublin, *Ireland* was visited by one of the most terrible hailstorms ever recorded, which was attended with great thunder and lightning. The hailstones were an inch in diameter. "This appears to have been a true whirlwind." A similar storm passed over Mullingar about an hour and a half previously. Property to the value of £27,000 was destroyed in Dublin.<sup>93</sup>

In *France*, the losses in 1850 from hailstorms were estimated at £480,000.<sup>93</sup> [In present currency, that would be equivalent to £43.5 million in damages based on the retail inflation price index.]

In Bradford County, Pennsylvania in the *United States*, a severe storm, which began on 18 July 1850, continued with unabated violence until the 20<sup>th</sup>. In this county the damage was widespread, immense and disastrous. The various tributaries of the Susquehanna River, particularly the Towanda and Sugar Creeks were swollen in a few hours to a greater degree than ever before known. They left along their whole course, painful and powerful evidences of the terrific ability of the element to cause mischief. The

damage was very great at Monroeton and Greenwood, where mills, factories, houses, barns and bridges were swept away and farms cut to pieces. On Sugar Creek the chief destruction was to the milldams and farms along the stream. The Susquehanna River though not as high as it has been previously was still high enough to flood the flats in many places causing the entire destruction of crops.<sup>178</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Ambon Island, <i>Indonesia</i>	( 91.4° F, 33.0° C) on 22 December
Clermont-Ferrand, <i>France</i>	( 90.3° F, 32.4° C) on 5 August
Szczecin, <i>Poland</i>	( 88.3° F, 31.3° C) on 15 August

In *Ireland* in August, there were great floods in Limerick.<sup>47, 92</sup>

On 13 August 1850 in *Ireland*, there was a violent storm with much hail and sleet in Limerick.<sup>93</sup>

On 24 August 1850, a hurricane struck North Carolina in the *United States* and a pilot boat sank.<sup>141</sup>

In *Belgium* in August, there was a calamitous flood.<sup>47, 92</sup>

A fleet of nine vessels laden with cedar & bound for Sydney, *Australia* struck a severe southeasterly squall shortly after they left the Richmond River in New South Wales, *Australia* on 28 September 1850. The *Lucy Ann*, a 36-tons wooden schooner, was lost with 14 lives. Four were rescued when they were found clinging to their overturned vessel. Of the nine schooners which started off, five turned back shortly after sailing. Only one schooner, the *Anna Maria*, reached its destination.<sup>99</sup>

In Khartoum, Egypt (now *Sudan*), “an inundation occurred.”<sup>47, 92</sup>

In 1850 during the period between 13 January and 11 February, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at T’ung-hsiang. Crops were damaged by the floodwaters. Then during the period between 6 May and 8 August, a drought engulfed Chekiang province at Ch’êng; Anhwei (now Anhui province) in eastern *China* at T’ai-p’ing; Shantung (now Shandong province) on the east coast of *China* at Ning-yang; and Kansu (now Gansu province) in northwest *China* at Lanchow. Then during the period 9 July and 7 August, floods struck Shantung province on the east coast of *China* at Tung-p’ing; and Chekiang province on the east coast of *China* at Ch’ing-t’ien. Along the Yellow River, innumerable houses and fields were damaged by the floodwaters.<sup>153</sup>

*Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe. Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

**1851 A.D.** On 14 April 1851 a severe storm of rain, hail and snow struck New England in the *United States*. It began the day before in Washington D.C. It reached New York the next morning and New England that afternoon. The storm lasted a week. Wharves were greatly damaged all along the coast of New Hampshire and Massachusetts. A large amount of property was swept into the sea and many vessels were wrecked and many lives were lost. This storm was known as the Lighthouse Storm because it carried away the most advanced lighthouse at Minot’s Ledge near Cohasset, Massachusetts.<sup>199</sup>

— Considerable damage was done inland with trees blown over, roofs torn off and chimneys and buildings blown down. A barn was demolished in Lawrence, Massachusetts. The winds were so strong that it carried a man, his horse and a load of calves into the river as he crossed the Cambridge Bridge. The Lowell bleachery dry house, which was 300 feet [91 meters] long and 3 stories high, was blown down. The railroad depot at Wilmington junction and 2 barns in Tewksbury were demolished. In Danvers, a house and many chimneys were blown down. The steeple of the Baptist Church in Charlestown was blown down killing a man below. The steeple of the Catholic Church at Pawtucket,

Rhode Island was blown down. The Episcopal Church in Boston was moved from its foundation and then blown down by the wind.

— The wind drove the tidewaters across the wharves all along the coast from one to four feet [0.3-1.2 meters] deep. At Provincetown on Cape Cod, Many wharves and salt mills were swept away.

— At Boston, Massachusetts, the water was 3 to 4 feet [0.9-1.2 meters] over the Central and Long wharves. Many houses were flooded. The lower part of Washington Street was flooded 2 feet [0.6 meters] deep. The South Boston Bridge was washed away. The Eastern Railroad Depot was underwater. The Charlestown and Chelsea Bridges were so submerged that they were impassable. The high tidewaters completely breached over Deer Island in the Boston Harbor. Several vessels went ashore on a small island called Pleasant Beach and a number of lives were lost.

— At Salem, Massachusetts, Derby wharf was greatly damaged. Many streets near the harbor and the floors of the lead mills were flooded. Many cellars were filled with water.

— At Beverly, Massachusetts, Water Street was flooded. The sea washed over Tuck's point. A store was carried away by the sea.

— A great flood took place on the Merrimac River [now Merrimack River] at Newburyport, Massachusetts. It was 22 inches [56 centimeters] higher than in December 1839. Warehouses and cellars on the lower side of Water Street were flooded. Many of the wharves were badly damaged. The engine and boiler rooms of the Essex mill were almost filled with water. Workshops and outbuildings were swept away.

— At Newcastle, New Hampshire, the sea broke through the breaches and made an island out of Jaffrey Point.

— Along the coasts, roads and railroad tracks were washed away by the storm. The water was high enough that the fires in locomotives were extinguished.

— During the storm, the sea broke completely over Plum Island, Massachusetts. The brig *Primrose* was driven by the breakers and struck a reef 600 feet [183 meters] offshore. At Rockport, several vessels were damaged. In Salem Harbor, several schooners were driven ashore. At Marblehead, seven vessels were cast ashore and several mariners lost their lives on Marshfield Beach.

In *Ireland*, there were great and destructive floods alike in spring and autumn.<sup>47, 92</sup>

In 1851, there was a severe flood in the Bega and Twofold Bay Region of New South Wales, *Australia*. It cost the lives of 20 people and caused property damage.<sup>99</sup>

In August 1851, there was a great flood in Adelaide, *Australia*. Bridges collapsed. The town of Noarlunga was completely inundated. Two people were killed.<sup>99</sup>

On 18 August 1851, a hurricane struck the *Dominican Republic*. There were many casualties.<sup>141</sup>

On 22 August 1851, a tornado tore through Massachusetts in the *United States*. The path of the tornado passed over Quinsigamond, Wayland, Waltham, West Cambridge [now Arlington], Medford, Malden, Lynn, and Rockport. At Medford, the path of destruction was up to 76 rods [1,300 feet, 380 meters] in width. Great trees were uprooted, twisted, shattered; carried long distances and tossed about like straws. These included oaks, walnuts and maples between 2 and 3 feet [0.6-0.9 meters] in diameter. A great number of houses were damaged, unroofed or completely destroyed. A heavy baggage train car was blown from its tracks and carried for 60 feet [18 meters].<sup>199</sup>

On 12 September 1851, a hurricane struck offshore Virginia in the *United States*. The schooner *Free Trade* was capsized. Nothing was ever heard from the persons on board, and it was feared that they were lost.<sup>141</sup>

The *Marie* was wrecked near Cape Bridgewater, near Portland, *Australia* in mid-September 1851 during a

heavy gale. Twenty-five members of the crew drowned. There were no survivors.<sup>99</sup>

In *France*, the losses in 1851 from hailstorms were estimated at £600,000.<sup>93</sup> [In present currency, that would be equivalent to £55.6 million in damages based on the retail inflation price index.]

In 1851 during the period between 1 February and 2 March, floods struck Shantung (now Shandong province) on the east coast of *China* at Tung-p'ing. During the period between 6 May and 8 August, floods struck Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing. During the period between 8 August and 8 November, floods struck Honan (now Henan province) in central *China* at Ch'in-yang.<sup>153</sup>

*Also refer to the section 1845 A.D. – 1851 A.D. for information on the famine in Ireland during that timeframe.*

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1851 / 1852 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1851 occurred on 27 October. A tedious snowstorm.<sup>116</sup>

The winter of 1851-52 in Bradford County, Pennsylvania in the *United States* was noted for an early November snowstorm. On 25 November 1851, the snow began falling with scarcely a warning and continued until evening, covering the ground with a fleecy mantle to the depth of nearly a foot [30 cm]. On 27 December, the temperature dropped to the range of -24° F to -26° F [-31° C to -32° C] in the county. But by noon the weather moderated and the temperature rose 60 degrees in less than 12 hours. This thaw combined with rain caused the ice in the river to break up and for the Susquehanna River to flood. Lumberman suffered from this unexpected freshet, losing lumber, which had been placed in the river.<sup>178</sup>

In the *United States* during the winter of 1851-52, the temperature at Shelbyville, Indiana fell to -28° F on December 17<sup>th</sup>, then -26° F on January 19<sup>th</sup> and then -28° F on January 20<sup>th</sup>. The temperature at Baton Rouge, Louisiana fell to 8° F in January. The temperature at New Orleans, Louisiana fell to 17° F in January. The temperature at Charleston, South Carolina fell to 16° F in January.<sup>113, 126</sup>

---

**1852 A.D.** In Holmfirth, near Huddersfield (York) in northern *England* on February 5th, the reservoir burst, consequent upon a rain flood. Between 90 and 100 persons perished; and property was destroyed of the value of 600,000*l.*, consisting of woolen mills, houses, etc. in the valley.<sup>47, 92</sup> [In present currency, that would be equivalent to £55.2 million in damages based on the retail inflation price index.]

On 4 February 1852, an inundation caused a lamentable catastrophe at Holmfirth, *England*.<sup>90</sup>

In 1852, the Brazos River in Texas in the *United States* flooded. The overflow of 1852 commenced during the latter part of February, and its crest reached the Gulf of Mexico about March 5. Because the overflow occurred early in the season, there was no material damage to crops. The high water mark of 1852 is 2 to 3 feet below that of the flood of 1899, at Allen Farm, Brazos County.<sup>123</sup>

On 19 April 1852, snow in the morning in Florence, Alabama in the *United States*.<sup>130</sup>

In [May 23] 1852, a great flood caused the Barwon River in Victoria, *Australia* to overflow its banks causing heavy damage in the floodplain in the region of Wilsons Promontory.<sup>99</sup>

Gales destroyed several small vessels off the New South Wales coast in *Australia* during June and July 1852. This included the *Highlander*, a 28-ton wooden schooner. The vessel floundered off Cronulla, in Sydney's south, during a gale on 23 June. Eleven members of the crew were lost and eleven were injured. At the same time on 22-23 June 1852, the Murrumbidgee River was at high flood levels at Cavan (near

Yass) in New South Wales.<sup>99</sup>

In 25 June 1852, there was an extreme flood on the Murrumbidgee River, which swept through most of Gundagai and the surrounding countryside in New South Wales, *Australia*. The flood destroyed 60 homes, leaving only three houses damaged but standing. Eighty-nine lives were lost. The death toll represented 36% of the town's population of 250. The entire town was later relocated to a higher and safer location.<sup>99</sup>

On 26 June 1852, there was a great flood at Gundagai in New South Wales, *Australia*. The Valley of the Murrumbidgee was converted into an inland sea; the town of Gundagai was swept away, only seven buildings remaining out of 78, and 89 persons perished out of a population of 250. The waters commenced rising on Thursday night, and did not begin to fall until Saturday morning.<sup>103</sup>

In New South Wales, *Australia*, the winter of 1852 was the wettest known, and then occurred the great flood at Gundagai on June 26, 1852.<sup>103</sup>

On 25 June 1852 in New South Wales, *Australia*, the Murrumbidgee River flooded. In Gundagai, 89 of the 250 inhabitants of the city were swept away and drowned.<sup>101</sup>

The summer of 1852 was remarkably hot in *Russia, England, Holland [now the Netherlands], Belgium* and *France*. The summer in Paris, *France* was characterized by:

Hot days	30 days
Very hot days	6 days
Extremely hot days	1 day

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

In Paris, *France* a series of unusually hot days occurred in July. The temperature readings were:

88.0° F (31.1° C) on 9 July; 92.3° F (33.5° C) on 10 July; 87.8° F (31.0° C) on 11 July; 90.5° F (32.5° C) on 12 July; 92.8° F (33.8° C) on 13 July; 93.6° F (34.2° C) on 14 July; 93.6° F (34.2° C) on 15 July; 95.2° F (35.1° C) on 16 July. The high temperatures observed in *Europe* during the summer were:<sup>62</sup>

Constantinople (Istanbul), <i>Turkey</i>	( 101.3° F, 38.5° C) on 27 July
Rouen, <i>France</i>	( 97.0° F, 36.1° C) on 5 July
Versailles, <i>France</i>	( 96.3° F, 35.7° C) on 16 July
Dunkirk, <i>France</i>	( 96.3° F, 35.7° C) on 7 July
Orange, <i>France</i>	( 95.5° F, 35.3° C) on 25 August
Paris, <i>France</i>	( 95.2° F, 35.1° C) on 16 July
Verviers, <i>Belgium</i>	( 95.2° F, 35.1° C) on 18 July
London, <i>England</i>	( 95.0° F, 35.0° C) on 12 July
Vendôme, <i>France</i>	( 95.0° F, 35.0° C) on 16 July
Oran, <i>Algeria</i>	( 95.0° F, 35.0° C) on 5 August
Saint-Etienne, <i>France</i>	( 95.0° F, 35.0° C) on 16 July
Sint-Truiden, <i>Belgium</i>	( 94.5° F, 34.7° C) on 17 July
Toulouse, <i>France</i>	( 93.4° F, 34.1° C) on 11 July
Périgueux, <i>France</i>	( 93.2° F, 34.0° C) on 16 July
Namur, <i>Belgium</i>	( 92.7° F, 33.7° C) on 17 July
Nemours, <i>France</i>	( 92.5° F, 33.6° C) on 16 July
Munich, <i>Germany</i>	( 92.3° F, 33.5° C) on 17 July
Stavelot, <i>Belgium</i>	( 91.9° F, 33.3° C) on 18 July
Bordeaux, <i>France</i>	( 91.4° F, 33.0° C) on 16 July
Gent (Ghent), <i>Belgium</i>	( 91.4° F, 33.0° C) on 10 July
Liège, <i>Belgium</i>	( 91.4° F, 33.0° C) on 17 July
Amsterdam, <i>the Netherlands</i>	( 91.4° F, 33.0° C) on 12 July

Dijon, <i>France</i>	( 91.2° F, 32.9° C ) on 17 July
Brussels, <i>Belgium</i>	( 90.9° F, 32.7° C ) on 16 July
Angers, <i>France</i>	( 90.5° F, 32.5° C ) on 12 July
Görsdorf (Storkow), <i>Germany</i>	( 90.3° F, 32.4° C ) on 17 July
Nagasaki, <i>Japan</i>	( 90.0° F, 32.2° C ) on 9 & 11 August
Château-Thierry, <i>France</i>	( 89.6° F, 32.0° C ) on 12 & 13 July
Marseille, <i>France</i>	( 89.1° F, 31.7° C ) on 17 July
Geneva, <i>Switzerland</i>	( 88.9° F, 31.6° C ) on 15 and 17 July
La Flèche, <i>France</i>	( 86.9° F, 30.5° C ) on 12 July
Oviedo, <i>Spain</i>	( 84.2° F, 29.0° C ) on 3 July
Rodez, <i>France</i>	( 83.3° F, 28.5° C ) on 11 July

In Alphen near Leyden, *the Netherlands*, two farmers were found in the fields killed by the heat. In the interior of *France*, the thermometer remained more than 10 days over 86° F (30° C). Many domestic work animals died. Madrid, *Spain* suffered much from the heat. On 11 August in Thourout, *Belgium*, a disastrous hailstorm struck. Many hailstones weighed 75 grams (2.6 ounces) and were 7 to 8 centimeters (2.8 to 3.2 inches) in diameter.<sup>62</sup>

On 17-24 July 1852, there was a flood at Launceston, Tasmania, *Australia*. The Jordan River rose to extraordinary heights. This was the highest flood since 1828. Fingal Bridge was washed away. There was a great amount of damage to the main roads. Water rose 5 feet (1.5 meters) above the parapet of the Ross Bridge. Two lives lost at Green Ponds.<sup>99</sup>

On 11 August 1852, there was a higher and more destructive flood than any previously known in Launceston, Tasmania, *Australia*. The Esk Rivers, Macquarie, Nile, and all other tributaries rose to unprecedented heights. Losses of livestock reported from drowning.<sup>99</sup>

On 23-25 August 1852, a hurricane struck the Gulf coast of the *United States* and produced the highest flood [storm surge] ever known (except for the hurricane of 1772).<sup>117</sup>

In *France*, the grain harvest took place shortly after mid-July and the yield was satisfactory. In contrast, the grape harvest began in the beginning of October. The yield was low in many vineyards and wine produced was of poor quality.<sup>62</sup>

In *England* in September through November, dreadful storms and floods in many parts of the country, more especially in the Severn valley; also in Derbyshire; in Sussex, and in *Scotland* and in Dublin.<sup>47, 92</sup>

On 5 September 1852, there was an inundation of the valleys of the Severn and Teme rivers in *Wales* after a violent thunderstorm.<sup>90</sup>

On 5 September 1852, a hurricane struck *Puerto Rico* causing more than 100 deaths. [This total may come from two storms. According to the 3 November 1852 issue of *The London Times*, "In Puerto Rico, heavy thunderstorms and hurricanes had been experienced, and over 100 lives were lost." Salivia (1970) indicates hurricanes on 5 and 22 (or 26) September and that the first occasioned many deaths.]<sup>141</sup>

On 19 September 1852 in western *Europe*, there were inundations in the basins of the Rhine and the Rhône rivers, which overflowed the country to a great extent.<sup>90</sup>

On 6-8 November 1852, a hurricane struck *Jamaica*. Many lives were lost on ships in ports.<sup>141</sup>

*Switzerland* and parts of *Belgium*, *France*, and *Germany*, suffered severely from floods.<sup>47, 92</sup>

In 1852, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Ting-hai and Ch'ang-shan. Then during the period between 17 July and 14 August, floods struck Hopei (now Hebei province) in northern *China* at Kao-yang and Yunnan province in southwest *China* at Chiang-ch'êng [uncertain name, "P'ing-ho"]. During the period between 15 August and 13 September, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang, Ku-ch'êng, Hsiang-yang, Ch'ien-chiang and Kung-an.<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1852 / 1853 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1852 occurred on 23 November. It snowed all day.<sup>116</sup>

January 1853 was unseasonably warm on the Pacific Coast of the *United States*.<sup>140</sup>

In *England* in December 1852 and January 1853, there were many storms of great severity, with much destruction of property.<sup>57, 90</sup>

In the *United States* in 1853, the Mississippi River froze solid enough to walk 200 miles from St Louis, Missouri to La Claire, Iowa.<sup>33</sup>

---

**1853 A.D.** The year 1853 in Bradford County, Pennsylvania in the *United States* was notable for many destructive summer hailstorms and a severe June drought. On 25 June 1853, it was reported, "the heat is intense, the dust multitudinous [multitudinous] and the parched and thirsty earth fairly gasps for moisture. The fields are becoming brown and the trees covered with a coating of dust."<sup>178</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Staouéli, <i>Algeria</i>	(106.7° F, 41.5° C) on 22 August
Oran, <i>Algeria</i>	( 95.5° F, 35.3° C) on 25 August
Munich, <i>Germany</i>	( 95.0° F, 35.0° C) on 9 July
Amsterdam, <i>the Netherlands</i>	( 91.4° F, 33.0° C) on 12 July
Ambon Island, <i>Indonesia</i>	( 91.4° F, 33.0° C) on 18 February

In the south of *Wales* on July 9, there were great floods caused by rain. At Brecon, the Houdda River rose to a great height, and carried away the bridge. Many houses inundated. People escaped by resorting to the upper parts of their dwellings.<sup>47, 92</sup>

On 6-7 September 1853, a hurricane struck the western *Atlantic Ocean* causing 40 deaths. [According to Snow (1952), "scores of lives were lost and seventy-five vessels were either sent to the bottom or dismantled." Also, the brig *Albermarle* was lost off Hatteras, North Carolina. This event is possibly related to "two men overboard" from *Henry Horbeck* in a hurricane at 38° N 56° W on 13 September.]<sup>141</sup>

On 2 November 1853, in Cork, *Ireland*, there was a great overflow of the River Lee. St. Patrick's bridge swept away, with many people on it.<sup>47, 92</sup>

A great rainstorm struck New England in the *United States* on 13 November 1853 causing a freshet [flood]. A railroad bridge with a 30 to 40 foot [9.1 – 12.2 meter] span between Dummerston and Putney was carried away by the floodwaters in Vermont. In Maine, the Penobscot River was greatly flooded. A boom at Veazie broke, and a great number of logs were carried away. Kenduskeag was badly flooded and a dam was carried away. The Connecticut River was greatly swollen. There was significant damage on the Housatonic, Naugatuck and Danbury and Norwalk railroads. The bridge at Mittineague, Connecticut was swept away. The railroad bridge at Seymore, Connecticut and a highway bridge at Ansonia,

Connecticut were carried off along with other bridges in the region. Several people were drowned. Many of these people were on the Ansonia Bridge when it collapsed.<sup>199</sup>

In southwestern *India* during 1853-54, there was a great scarcity in the Bellary district (Madras Presidency). “The rains which usually fall in the months of October and November, ceased at an unusually early period in the year 1853; and the showers which usually fall in June and July, had been scanty. The grain harvests were consequently almost universally deficient, and considerable distress occurred in several parts of this presidency. In Bellary district, the season had been exceptionally unfavorable; an average fall of only 9.5 inches of rain having taken place during the year, against an average of about double that quantity in previous years. The stocks of grain on hand were small: for serious damage had been occasioned by a storm in 1851 to several of the irrigation works of the district; and in 1852 the fall of rains had been unseasonable, and the crops short.”<sup>57</sup>

In 1853, there was a famine in Madras in *India*.<sup>156</sup>

In 1853, there was a great flood in *China*. The Yellow River cut a new course to the sea.<sup>142</sup>

In 1853 during the period between 8 April and 7 May, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui. During the period between 7 June and 5 July, floods struck Shensi (now Shaanxi province) in central *China* at Tso-shui; Chekiang province at Ch'êng; and Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing. During the period between 6 July and 4 August, floods struck Tso-t'ien and Ju-tê [uncertain names and uncertain provinces]. During the period between 5 August and 2 September, floods struck Hopei (now Hebei province) in northern *China* at Pao-ting and Hupeh (now Hubei province) in central *China* at I-ch'êng and Chün. At I-ch'êng, the dikes and city walls were damaged by the floodwaters.<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1853 / 1854 A.D.** The Seine River in *France* was frozen from 28 December 1853 until 6 January 1854.<sup>62</sup>

On the Continent [*Europe*], the winter of 1853-54 was not only protracted but also severe, especially towards the end of December. Several rivers were frozen over. The cold lasted from November until March with scarcely any interruptions. In *England*, the winter was less severe.<sup>70</sup>

The winter of 1853-54 was a severe winter in the temperate zones of *Europe*. It lasted from November to March, and caused many rivers to freeze. In many areas, the cold was more beneficial to agriculture than harmful. In St. Petersburg, *Russia*, towards the end of December, there was much ice. Beginning on 20 December, Kronstadt Bay was covered in ice. The cold weather in *Russia* did not seem unusual for this northern climate. In Copenhagen, *Denmark* there was just a single day, when it was cold in December at 28.4° F (-2.0° C); and the shipping in the straits remained free. In *France*, the frost began on 10 November on the coast of the Pas-de-Calais, on the Oise, and on the higher elevations in northern and central *France*. The coldest weather during this winter in *France* fell between 26 and 31 December except for Puy because that city was at a higher elevation.<sup>62</sup>

The cold, although moderate in *Belgium*, extended over *Germany, England, France, Spain* and *Lombardy*. Almost everywhere, the snow and severe cold came together during the month of December. The thick blanket of snow in *France* protected the ground until 1 March. It was unusual that despite the moderate temperatures the Seine River in Paris, *France* froze.<sup>62</sup>

The water level of the Seine River was very low which explains why the Seine froze at only moderately cold temperatures. At the bridge Pont de la Tournelle in Paris, *France*, the water level of the river on 7 January began to swell very strongly. On the 8<sup>th</sup> the water rose to the 2.5 meter (8.2 feet) level; on the 9<sup>th</sup> to 3 meters (9.8 feet); and on the 10<sup>th</sup> to 3.5 meters (11.5 feet).<sup>62</sup>

Many rivers in *Germany* were hard frozen. This included the Vistula River (now in *Poland*), in which the ice was so thick that wagons traveled across it towards the end of December. In *England*, the rivers of the royal parks were covered with ice. In *France*, the Loire River froze at various points from 26 December to 8 January. The Saône River froze between Mâcon and Chalon, *France*. The Rhine River froze on 26 December. The Garonne River froze on 28 December. The rivers and lakes in the Vosges Mountains [in east-central *France*] were covered with ice. In Barcelona, *Spain*, all the rivers and ponds were frozen. In Madrid, *Spain* the lake at the royal park of Retiro was covered in ice. In some areas of the Manzanares and Jarama rivers were frozen.<sup>62</sup>

The number of frost days during this winter:<sup>62</sup>

Le Puy, <i>France</i>	123 days of frost
Clermont, <i>France</i>	118 days of frost
Hendecourt, <i>France</i>	111 days of frost
Goersdorf, <i>France</i>	105 days of frost
Metz, <i>France</i>	99 days of frost
Bourg, <i>France</i>	97 days of frost
La Châtre, <i>France</i>	75 days of frost
Orange, <i>France</i>	65 days of frost
Vendôme, <i>France</i>	54 days of frost
Lille, <i>France</i>	52 days of frost
Toulouse, <i>France</i>	51 days of frost
Paris, <i>France</i>	47 days of frost
Marboue, <i>France</i>	44 days of frost
Régusse, <i>France</i>	39 days of frost
Beyrie, <i>France</i>	27 days of frost
Nantes, <i>France</i>	22 days of frost
Bordeaux, <i>France</i>	21 days of frost
Marseille, <i>France</i>	20 days of frost

The lowest temperature observed at different locations during the winter:<sup>62</sup>

Goersdorf, <i>France</i>	( -7.2° F, -21.8° C ) on 27 December
Les Mesneux, <i>France</i>	( -4.2° F, -20.1° C ) on 26 December
Clermont, <i>France</i>	( -4.0° F, -20.0° C ) on 26 December
Châlons-sur-Marne, <i>France</i>	( -4.0° F, -20.0° C ) on 26 December
Hendecourt, <i>France</i>	( -1.3° F, -18.5° C ) on 26 December
Lille, <i>France</i>	( -0.4° F, -18.0° C ) on 26 December
Kehl, <i>Germany</i>	( 0.3° F, -17.6° C ) on 26 December
Bourg, <i>France</i>	( 0.3° F, -17.6° C ) on 30 December
Metz, <i>France</i>	( 0.5° F, -17.5° C ) on 27 December
Le Puy, <i>France</i>	( 1.2° F, -17.1° C ) on 15 February
Brussels, <i>Belgium</i>	( 3.0° F, -16.1° C ) on 26 December
La Saulsaye (Ain), <i>France</i>	( 5.0° F, -15.0° C ) on 30 December
Toulouse, <i>France</i>	( 5.0° F, -15.0° C ) on 31 December
Lyon, <i>France</i>	( 5.7° F, -14.6° C ) on 30 December
Paris, <i>France</i>	( 6.8° F, -14.0° C ) on 30 December
Vendôme, <i>France</i>	( 6.8° F, -14.0° C ) on 30 December
La Châtre, <i>France</i>	( 9.5° F, -12.5° C ) on 30 December
Marboue, <i>France</i>	( 11.8° F, -11.2° C ) on 30 December
Beyrie, <i>France</i>	( 13.6° F, -10.2° C ) on 30 December

Bordeaux, <i>France</i>	(14.0° F, -10.0° C) on 30 December
Orange, <i>France</i>	(14.4° F, -9.8° C) on 31 December
Nantes, <i>France</i>	(14.9° F, -9.5° C) on 30 December
Marseille, <i>France</i>	(18.1° F, -7.7° C) on 30 December
Nîmes, <i>France</i>	(19.4° F, -7.0° C) on 30 December
Régusse, <i>France</i>	(21.2° F, -6.0° C) on 30 December and 14 & 15 February

The frost was severe towards the end of December in the north and east of *France*. One person froze to death in Mortefontaine and another in Vervins. And in the Pyrenees, several people were buried under the snow.<sup>62</sup> [Mortefontaine and Vervins are in northern *France*. The Pyrenees is in southwestern *France*.]

From 15 December until the end of the cold, there was an unusual amount of snow in Holland [now *the Netherlands*], *England*, *Belgium*, *Rhine Prussia*, *France*, *Spain* and *Lombardy*. In Sétif, *Algeria* in November, a considerable amount of snow fell. The heavy snowfalls blocked the trains from Strasbourg and Le Havre, *France* and on all other tracks in *Belgium* and the *Rhine Prussia* [now west-central *Germany*]. The family of the King of Belgium had to travel by sleigh from Brussels in order to put a coating on the castle walls.<sup>62</sup>

In the *United States*, a furious storm on 22 January struck the Ohio River destroying a large number of canal boats. Seventy-nine boats proved a total loss and 17 boatmen were drowned. Boston, Massachusetts and vicinity on 29 January experienced one of the coldest days of the winter season when temperatures dropped to -6° F (-21° C) at sunrise. Throughout New England the day was one of the coldest known for many years. On 4 February another very cold spell of weather struck with the thermometer falling below 0° F. The months of January and February were noted for their tempestuous weather, and for the immense damage done to shipping. Also for the extreme cold weather in the United States. On 20 February, a terrible snowstorm raged at New York, Philadelphia, Baltimore and that vicinity. Drifts four to five feet high were found in each of these cities, and more snow fell than at one time for ten years previous. The railroads were all obstructed. Another violent snowstorm raged throughout the country on 23 February. On 18 March a fearful gale prevailed in New England, the wind being very high and destructive. On 16 April a fearful storm raged on the Atlantic coast, and a large number of marine disasters occurred. During spring thaw on 1 & 2 May, floods devastated New England. A tremendous freshet occurred on the Connecticut and Farmington rivers, the water rising 15 inches higher than in the great freshet of 1801. Much damage was done all along the valley to farms, houses, bridges, railroads, etc. Destructive freshets occurred in all parts of the country. In Maine great damage was done. In Pennsylvania immense loss was sustained in the valleys of the Lehigh and the Delaware.<sup>77</sup>

The winter of 1853-54 in Bradford County, Pennsylvania in the *United States* was primarily noted for the lack of snow. One exception was the early October snowstorm on the 24<sup>th</sup>, which deposited 8 inches [20 cm] of snow. A few warm days and rain converted this to an overabundance of moisture and mud. According to the Reporter: "If the past winter was distinguished for the total absence of snow in this region, the present month of April will long be remembered for the body of snow, whose coming at this late day in such quantities is almost unexampled. On Friday, the 14<sup>th</sup> commenced a fall of snow, which continued almost without cessation until Monday night (3 days). At Towanda it is supposed that at least three feet [0.9 m] of snow must have fallen, some of it melting as it reached terra firma, but leaving a body remaining, measuring two feet [0.6 m] in depth. In the woods we are assured the snow measured three feet [0.9 m]."<sup>178</sup>

There is no doubt that the western slope of the Sierra Nevada foothill region and also that part of southern California in the *United States*, inland, of which Riverside is a fair representative, offer very favorable climatic conditions for the growth of citrus fruit. They are subject, however, although rarely, to minimum

temperatures, which have affected and which may affect citrus fruit disastrously. The winter of 1854 was probably more severe than the winter of 1888 or of 1898, when minimum temperatures fell below 20° F in some portions of these citrus regions. It appears that the region of the Santa Barbara foothills and probably of the entire foothill region of the Coastal Range southeast of Santa Barbara, wherever the foothills do not recede too far from the ocean, is never affected in such winters to a degree sufficient to injure the growth of citrus fruit. Regular observations of temperature have been taken at Santa Barbara, California since 1870. Since 1870, the two lowest temperatures observed at Santa Barbara were 28.5° F, on one January morning, 1888, and the next lowest, 30.5° F, on another morning of the same month and year.<sup>138</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

**1854 A.D.** There were floods in southern Tasmania, *Australia* from 26 February to 22 March 1854. This was caused by tremendous rainfall throughout Tasmania. A total of six people lost their lives and 15 injured. Several lives were lost due to floods in Hobart. The Jordan River was at its highest since 1828. At Richmond the Coal River rose to 11.8 feet (3.6 meters). Three bridges were destroyed between New Norfolk and Lachlan. The Clyde Bridge at Hamilton washed away. There were substantial livestock and crop losses.<sup>99</sup>

On 27 February 1854, there was a great flood at Hobart Town, *Australia*.<sup>103</sup>

The high temperatures observed during the summer were:<sup>62</sup>

Le Havre, <i>France</i>	( 89.6° F, 32.0° C) in July
Saint-Léonard, <i>France</i>	( 89.6° F, 32.0° C) on 23, 24 & 25 July

During the autumn of 1854, a drought prevailed in Bradford County, Pennsylvania in the *United States*. In September, the drought was becoming terrible in its effect upon vegetation. Corn, potatoes and buckwheat in the neighborhood of Towanda were almost a failure. The meadows and pastures were brown and withered, while the atmosphere was filled with dust and smoke from numerous [forest] fires upon the mountains. The memory of the oldest inhabitant had no recollection of the like.<sup>178</sup>

In 1854, there was an extensive drought in the *United States*. The latter part of the season of 1854 was extremely dry, followed by a mild and dry winter and a very dry spring [of 1855], so dry in fact, that one of the early settlers of Webster county drove from Muscatine to Fort Dodge [Iowa], the last of April 1855 without wetting his wagon tire. Despite the drought in Iowa and the western states, the crops turned out better than in the States east of the Mississippi River.<sup>111</sup>

In 1854, several regions of *China* experienced flooding.<sup>153</sup>

During the period of 27 May – 24 June, the following areas were affected:

- Chekiang (now Zhejiang province) on the east coast of *China* at Sung-yang experienced flooding.
- Kiangsi (now Jiangxi province) in southern *China* at Kuang-ch'ang experienced flooding. The city walls and 80% of the houses were damaged. Several tens of thousands of people were drowned.

During the period of 8 August – 8 November, the following area was affected:

- Hopei (now Hebei province) in northern *China* at Pao-ting experienced flooding.

In 1854 during the period between 27 May and 24 June, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui. During the period between 25 July and 23 August, a drought engulfed Hupeh (now Hubei province) in central *China* at Hsien-ning and Pao-k'ang.<sup>153</sup>

On 5 June 1854, a tornado cut a path through Cedar County, Iowa in the *United States*. The path of the storm was half a mile wide as it cut its way through the timber. Everything was taken clean – nothing

left. When the storm crossed Cedar River it took large stones from the bottom and carried them on land. It appears this storm reached Lake Erie.<sup>123</sup>

On 27 August 1854, a tornado struck Louisville, Kentucky in the *United States*. Twenty-five persons were killed and \$1,000,000 in property damage was sustained. [In present currency, that would be equivalent to \$27 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

On 7 September 1854, Charleston, South Carolina in the *United States* was struck by a violent gale.<sup>124</sup>

On 7-13 September 1854, a hurricane struck the mid-Atlantic coast of the *United States* causing 26 deaths.<sup>141</sup>

On 18 September 1854, a hurricane struck the eastern coast of Texas in the *United States*. Two people were killed. The steamer *Kate Ward* and crew were lost.<sup>141</sup>

On the *Black Sea* on the 13<sup>th</sup> through 16<sup>th</sup> of November, there was a great storm, causing much loss of life and destruction of shipping and stores sent for allied armies in Crimea.<sup>57, 90</sup> [The Crimea is now an autonomous republic of *Ukraine*, on the northern coast of the Black Sea, occupying a peninsula of the same name.]

In 1854, a powerful cyclone struck *India* 1854 causing 50,000 deaths.<sup>98</sup>

In 1854, there was a minor famine in Madras [now Chennai] and Hyderabad [in southern *India*].<sup>179</sup>

A scarcity struck the Madras Presidency in *India* in 1854. The rains which usually fall in the months of October and November, ceased at an unusually early period in 1853 and the showers of June and July 1854 were short. The grain harvest was deficit and grain prices rose to great heights. The Bellary district of the Karnataka state of India received only 9.5 inches of seasonal rainfall compared to an average that was double this amount in prior years. About 1/3 of the cattle perished.<sup>188</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1854 / 1855 A.D.** In *Northern Europe* on the 31<sup>st</sup> of December, there was a great storm, which caused considerable damage.<sup>57, 90</sup>

In Hamburg, *Germany* on January 1, an overflow of the Elbe River laid the greater part of the city under water.<sup>47</sup>

The weather was so cold in the spring that a great frost froze the River Thames in London, *England*.<sup>29</sup>

In *England*, the frost was very severe between the 14<sup>th</sup> of January 1855 and the 24<sup>th</sup> of February; and very cold up to the 26<sup>th</sup> of June. On 22 February, fires were made on the Serpentine in Hyde Park. There was traffic on the ice for a length of 35 miles in Lincolnshire.<sup>47, 90, 93</sup>

The winter of 1854-55 was severe. The frost commenced in the east of *France* in October and lasted till the 28<sup>th</sup> of April. The mean temperatures for January and February in *England* were 31° F and 29° F (-0.6° C and -1.7° C) respectively. This year will be remembered as that during which the British army suffered so terribly from the cold in the *Crimea*.<sup>70</sup>

The winter of 1854-55 was quite severe in *southern Russia*, in *Denmark*, *England*, *France*, *Spain* and *Italy*. The winter was unusually long. The frost began in eastern *France* in October and continued until

28 April. In Paris, there were 50 frost days, with 17 in succession. The following is a list of the number of frost day in various locations in *France*:<sup>62</sup>

Le Puy, <i>France</i>	123 days of frost
Clermont, <i>France</i>	108 days of frost
Hendecourt, <i>France</i>	102 days of frost
Goersdorf, <i>France</i>	90 days of frost
Les Mesneux, <i>France</i>	74 days of frost
Strasbourg, <i>France</i>	73 days of frost
Metz, <i>France</i>	70 days of frost
Bourg, <i>France</i>	62 days of frost
Saint-Léonard, <i>France</i>	58 days of frost
Lille, <i>France</i>	56 days of frost
Vendôme, <i>France</i>	55 days of frost
Marboue, <i>France</i>	53 days of frost
Orange, <i>France</i>	51 days of frost
Montpellier, <i>France</i>	50 days of frost
Paris, <i>France</i>	50 days of frost
Toulouse, <i>France</i>	42 days of frost
La Châtre, <i>France</i>	40 days of frost
Nantes, <i>France</i>	40 days of frost
Régusse, <i>France</i>	33 days of frost
La Chapelle-d'Angillon, <i>France</i>	28 days of frost
Bordeaux, <i>France</i>	26 days of frost
Beyrie, <i>France</i>	17 days of frost
Marseille, <i>France</i>	14 days of frost

At various places precursors were observed foretelling the coming of a severe and long winter: the early appearance of the birds from the *Polar Regions*, and the migration of the swans. In several northern, eastern and southern areas of *France* received substantial amounts of snow. Without this snow cover, the effects of frost damage would have been even more severe. In February at Strasbourg the snow was 0.30 meters (11.8 inches) deep; in Marboue 0.30 meters (11.8 inches); in Nantes 0.40 meters (15.8 inches); in Gorsdorff 0.65 meters (25.6 inches). In Lille, the frost penetrated 0.40 meters (15.8 inches) deep in the ground. The neighboring countries, *Switzerland*, *Spain* and *Lombardy* also experienced significant snowfalls. This snowfall also occurred in Sétif, (*Algeria*) in Africa.<sup>62</sup> [Marboue is in north-central *France*. Nantes is in northwestern *France*. Lille is in northern *France*.]

On 17 January, drift ice began to appear on the Loire River; and on the next day the river was frozen over. On 19 January, ice began to appear on the Seine River but it was not completely frozen. The Rhône River froze on January 20. The Saône River froze at the bridge at Serin on 20 January and by the next day the river was completely frozen. On 24 January, the Rhine River was frozen over completely at Mannheim, *Germany*. Individuals crossed the Rhine on foot.<sup>62</sup>

The lowest temperatures observed in various cities are listed below:<sup>62</sup>

Les Mesneux, <i>France</i>	( -7.6° F, -22.0° C ) on 19 January
Goersdorf, <i>France</i>	( -4.9° F, -20.5° C ) on 29 January
Vallec d'Huchigny, <i>France</i>	( -0.4° F, -18.0° C ) on 20 January
Clermont, <i>France</i>	( 1.4° F, -17.0° C ) on 21 January
Brussels, <i>Belgium</i>	( 1.9° F, -16.7° C ) on 2 February
Turin, <i>Italy</i>	( 2.3° F, -16.5° C ) on 24 January
Metz, <i>France</i>	( 3.2° F, -16.0° C ) on 29 January
Strasbourg, <i>France</i>	( 3.2° F, -16.0° C )
Montpellier, <i>France</i>	( 3.2° F, -16.0° C ) on 21 January
Le Puy, <i>France</i>	( 4.8° F, -15.1° C ) on 21 January
La Châtre, <i>France</i>	( 5.5° F, -14.7° C ) on 19 January

Hendecourt, <i>France</i>	( 6.3° F, -14.3° C) on 16 February
La Chapelle-d'Angillon, <i>France</i>	( 6.8° F, -14.0° C)
Saint-Léonard, <i>France</i>	( 6.8° F, -14.0° C) on 20 January
Lille, <i>France</i>	( 7.2° F, -13.8° C) on 2 February
Bourg, <i>France</i>	( 7.2° F, -13.8° C) on 21 January
Orange, <i>France</i>	( 8.2° F, -13.2° C) on 22 January
Vendôme, <i>France</i>	( 9.0° F, -12.8° C) on 20 January
Marboue, <i>France</i>	(10.0° F, -12.2° C) on 19 January
Paris, <i>France</i>	(11.7° F, -11.3° C) on 21 January
Toulouse, <i>France</i>	(12.7° F, -10.7° C) on 20 January
Bordeaux, <i>France</i>	(13.1° F, -10.5° C) on 19 January
Nantes, <i>France</i>	(14.0° F, -10.0° C) on 19 January
Beyrie, <i>France</i>	(15.8° F, -9.0° C) on 20 January
Régusse, <i>France</i>	(19.4° F, -7.0° C) on 22 January
Marseille, <i>France</i>	(23.5° F, -4.7° C) on 20 January
Algiers, <i>Algeria</i>	(23.9° F, -4.5° C) on 21 January and 10 April

This winter in *France* was of an unusually long duration. This can be observed by the fact that the frost continued to April. For example: <sup>62</sup>

In Hendecourt on 6 April the temperature was 26.6° F (-3.0° C) and on the 23<sup>rd</sup> it was 28.4° F (-2.0° C).

In Clermont on 6 April it was 24.8° F (-4.0° C), on the 23<sup>rd</sup> it was 28.0° F (-2.2° C), and on the 28<sup>th</sup> it was 28.4° F (-2.0° C).

In Le Puy on 9 April it was 26.1° F (-3.3° C) and on the 23<sup>rd</sup> the temperature was 26.6° F (-3.0° C).

In Montpellier on 2 April the temperature was 28.0° F (-2.2° C).

In Toulouse on 1 April the temperature was 28.4° F (-2.0° C).

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1854 occurred on 16 November. Some snow. <sup>116</sup>

January 1855 was unseasonably warm in the West and Southwest of the *United States*. <sup>140</sup>

In the *United States*, on 20 December 1854, very cold weather set in. Bangor, Maine recorded -27° F (-33° C). On 7 February 1855, the thermometer in Boston, Massachusetts for thirty-four hours, ranged from -5° to -12.5° F (-20.6° to -24.7° C). Throughout the whole of New England, and as far south as Washington, D.C., the weather was unprecedentedly cold. During the first ten days of February, a most terrific snowstorm prevailed through all parts of U.S., north of forty degrees latitude. The storms in the West were of unprecedented fury. All communications on many of the railroads were stopped for several days and great suffering occurred. Passengers in many cases narrowly escaped with their lives from the cold and starvation. <sup>77</sup>

In 1854 in Bradford County, Pennsylvania in the *United States*, the fall was warm. Farmers continued to plough their fields until December when snow fell. Snow remained on the ground until April 1855. Sleighing was good over these months. People continued to cross the Susquehanna River on sleighs at Towanda until April 6, when the ice broke up and passed out. <sup>178</sup>

In the *United States* during the winter of 1854-55, the temperature at Fort Canby (now Fort Disappointment at the mouth of the Columbia River in Washington) fell to -20° F in January. <sup>113</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**1855 A.D.** On 1 January 1855, Hamburg, *Germany* was half-flooded by the Elbe River. <sup>90</sup>

On 1 January 1855 at Hamburg, *Germany*, an overflow of the Elbe laid the greater part of the city under water.<sup>92</sup>

On 6 August 1855, a hurricane struck Tampico, *Mexico*. The loss and damage done to goods was very heavy, and the destruction of life and property was no less severe.<sup>141</sup>

On 26 August 1855, a hurricane struck the *Dominican Republic*. There were many casualties.<sup>141</sup>

The maximum temperature during the summer in Algiers, *Algeria* was 99.5° F (37.5° C) on 8 September.<sup>62</sup>

In 1855 during the period between 17 February and 17 March, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow. During the period between 6 May and 8 November, a drought engulfed Hupeh (now Hubei province) in central *China* at Ao-ch'êng. During the period between 16 May and 13 June, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ing. Then during the period between 13 August and 10 September, floods struck Hupeh province at Huang-p'ô, Ma-ch'êng, Huang-kang, Ch'i-ch'un and Kuang-chi; and Chekiang (now Zhejiang province) on the east coast of *China* at Li-shui, Yün-ho and Ching-ning. At Ching-ning, all the houses and fields were damaged by the floodwaters.<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1855 / 1856 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1855 occurred on 17 November. Snowy afternoon. November 20, snowed all day and night; good sleighing.<sup>116</sup>

On 5 January 1856, a violent snowstorm extended from Washington D.C. in the *United States* to Halifax, Nova Scotia, *Canada*. Travelling on the railroads was much obstructed for some days. On the 8<sup>th</sup> of January, the Potomac River froze from shore to shore. Many people crossed the river on foot with safety. On the 12<sup>th</sup> of January, the roof of the station house of the Richmond and Danville railroad in Richmond, Virginia, gave way and collapsed because of the great weight of the snow upon it. On the 3<sup>rd</sup> of February, in Kansas the thermometer sunk as low as -30° F (-34.4° C). The cold extended over the United States, and in some parts to a degree unknown before. On the 24<sup>th</sup> of February, owing to the breaking up of the ice in the Ohio River, six steamers and several barges were sunk, causing a great loss of property. On the 30<sup>th</sup> of May, there was a snowstorm on the Baltimore and Ohio Railroad.<sup>77</sup>

The winter of 1855-56 in Bradford County, Pennsylvania in the *United States* was long with biting cold and many snowstorms in January, February and March. The first snowstorm struck on 24 October 1855 producing a snowfall of 3 inches [8 cm]. On March 10, the temperature was -19° F [-28° C]. Ice in the Susquehanna River at Towanda passed out on 11 April.<sup>178</sup>

In the *United States* during the winter of 1855-56, the temperature at Fort Canby (now Fort Disappointment at the mouth of the Columbia River in Washington) fell to -25° F in December. The temperature at Fort Jones, California fell to -17° F in December. The temperature at Fort Union (near Watrous, New Mexico) fell to -28° F in December. The temperature dropped to -14° F at Mount Auburn, Ohio, a suburb of Cincinnati in January. The temperature at Shelbyville, Indiana fell to -30° F on February 4. The temperature at Allegheny Arsenal (near Pittsburgh, Pennsylvania) fell to -22° F in February.<sup>126</sup>

---

**1856 A.D.** In May and June 1856, inundations in south of *France* caused immense damage.<sup>90</sup>

On 1 June 1856, in the South of *France*, there were great floods, occasioning loss of agricultural produce and other property to the extent of 140 million francs (5,600,000*l.*).<sup>47, 92</sup> [In present currency, that would be equivalent to £443 million in damages based on the retail inflation price index.]

On 6 June 1856, destructive floods occurred in *France*, especially in the neighborhood of Lyons. In some places whole villages were swept away, and many lives lost. The railway station at Tours was ten feet (3 meters) under water.<sup>77</sup>

On 1 July 1856, there was a heavy gale on the coast of Labrador, *Canada* and 29 vessels out of a fleet of 30 were driven ashore and lost.<sup>77</sup>

On 10 August 1856, Last Island [now Isle Dernière, Louisiana] in the *United States*, a summer resort in the Gulf of Mexico was destroyed during a terrific storm, which raged for three days. The island was entirely submerged, and every house on the island gave way. One hundred and seventy three people are known to have perished. The effect of the storm was felt greatly at New Orleans, Louisiana.<sup>77</sup>

On 10-11 August 1856, a hurricane struck Louisiana in the *United States*. [Various accounts give differing fatality figures of 400, 320, >250, <200, and >155 deaths.]<sup>141</sup>

On 19 August 1856, a hurricane swept the coast of Louisiana in the *United States*, but was not particularly severe on the Alabama and Mississippi coasts; Lost Island [Last Island] was submerged and 300 lives lost.<sup>117</sup>

In Prome, *Burmah* (Pyay, *Burma*), a great overflow of the Irrawaddy River nearly destroyed this town.<sup>47, 92</sup>

In 1856 during the period between 8 January and 5 February, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang. During the period between 3 June and 1 July, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ch'êng, and Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing.<sup>153</sup>

In 1856, a drought engulfed many regions of *China* including:<sup>153</sup>

— During the period between 6 May and 8 November, a drought engulfed Hupeh (now Hubei province) in central *China* at I-ch'êng and An-lu. Many trees withered.

— During the period between 3 June and 1 July, a severe drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at T'ung-hsiang and Hupeh province at Hsien-ning, Huang-p'o, Chung-hsiang and Ch'ien-chiang. The rivers dried up.

— During the period between 30 June and 28 August, a severe drought engulfed Hupeh province at Sui.

— During the period 2-31 July, a drought engulfed Chekiang province at Chia-hsing and Kiangsu (now Jiangsu province) on the east coast of *China* at Soochow and Ch'ing-p'u.

— During the period 1-29 August, a drought engulfed Kiangsu province at Wu-chin and Nan-t'ung; Hupeh province at Lo-t'ien; and Shantung (now Shandong province) on the east coast of *China* at Ling and Fei-ch'êng. The rivers dried up.

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1856 / 1857 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1856 occurred on 29 November. Hard snowstorm; very high wind.<sup>116</sup>

In the *United States*, a great snowstorm struck the Northeast and Mid-Atlantic States in January 18-19, 1857. Snow accumulations in North Carolina and Virginia exceeded 12 inches (30 centimeters). Raleigh,

North Carolina reported a 24-inch (61 centimeter) snowfall; 18 to 24 inches (46-61 centimeters) of snow was reported at Washington D.C., Baltimore, Maryland, and Philadelphia, Pennsylvania with snowdrifts as high as 6-10 feet (1.8-3.0 meters).<sup>27</sup>

During the winter of 1856-57 in Bradford County, Pennsylvania in the *United States*, there was one of the severest storms ever witnessed, which swept over the country on 18 & 19 January 1857. The amount of snowfall was very great and the wind blew with great fury for nearly 24 hours blockading the railroads, stopping the mail and putting a complete embargo on travel. Snowdrifts were as high as the tops of houses. The cold of 25 January has probably not been equaled in the 19<sup>th</sup> century. In Bradford County, temperatures dropped to -30° F [-34° C]. At Watertown, New York, the mercury fell to -37° F [-38° C] and froze. On 19 & 20 April 1857, there was a snowfall varying from 12 to 24 inches [30 – 61 cm] in depth. It rained continuously from the spring ice break-up until July.<sup>178</sup>

The winter of 1856-57 was a very severe winter in New England in the *United States*. There were 32 snowstorms during the winter. The winter began earlier than usual and continued far into the spring. Snow fell to a depth of six feet and two inches [1.9 meters].<sup>199</sup>

— On 17 December 1856, a cold spell gripped the region. The temperature fell to -12° F [-24° C] in Massachusetts and -16° F [-27° C] in Maine. On 23 December there was a violent snowstorm that dropped 4 to 5 inches [10-13 centimeters] of snow on the level.

— On 3 January 1857, another snowstorm hit the region. The snow was now 12 inches [30 centimeters] deep on the level. Temperatures fell to -6° F to -8° F [-21° to -22° C] and almost unbearable due to the strong winds. On 12 January, the temperature in New Hampshire fell to -19° F [-28° C] and a very severe snowstorm struck the region. The gale caused damage to the shipping along the coast. On 17 January, the temperature at Salem, Massachusetts fell to -20° F [-29° C]. The next day, the temperature at Lowell, Massachusetts was -20° F [-29° C]. Snow fell to great depths; drifts on Essex Street in Salem were between 8 and 12 feet [2.4-3.7 meters] deep. Transportation ground to a halt. The snow in Washington D.C. was 2 feet deep [0.6 meters]. The streets of Boston were piled full of snow. Snowshoes were required for traveling. Several people were nearly smothered or frozen to death. The steeple of the church in Campello, Massachusetts was blown down. The steeples of the Episcopal and Second Congregational churches in Waterbury, Connecticut were also blown down. The spire on the Congregational Church in Fairhaven, Massachusetts was destroyed. A house in New Bedford, Massachusetts was completely demolished by the wind.

— The storm on 18 & 19 January at Provincetown, Massachusetts on Cape Cod blew with the strength of a hurricane. Seventeen of the twenty vessels in the harbor were driven ashore. A schooner Bonita anchored off Cape Ann parted her cables and was driven ashore at Provincetown about a half mile [0.8 kilometers] east of Race point. Two crewmembers perished.

— The following are the lowest temperatures observed on 19 January 1857 in New England:

Coventry, Connecticut	(-32° F, -36° C)
Hartford, Connecticut	(-32° F, -36° C)
New Haven, Connecticut	(-27° F, -33° C)
Bangor, Maine	(-44° F, -42° C)
Bath, Maine	(-52° F, -47° C)
Portland, Maine	(-29° F, -34° C)
Boston, Massachusetts	(-16° F, -27° C)
Fall River, Massachusetts	(-26° F, -32° C)
Lowell, Massachusetts	(-30° F, -34° C)
Malden, Massachusetts	(-30° F, -34° C)
New Bedford, Massachusetts	(-20° F, -29° C)
Salem, Massachusetts	(-26° F, -32° C)
Springfield, Massachusetts	(-33° F, -36° C)
Taunton, Massachusetts	(-30° F, -34° C)
Worcester, Massachusetts	(-26° F, -32° C)

Dover, New Hampshire	(-31° F, -35° C)
Franconia, New Hampshire	Mercury Froze
Keene, New Hampshire	(-24° F, -31° C)
Manchester, New Hampshire	(-35° F, -37° C)
Nashua, New Hampshire	(-28° F, -33° C)
Providence, Rhode Island	(-26° F, -32° C)
Woonsocket, Rhode Island	(-35° F, -37° C)
Montpelier, Vermont	(-50° F, -46° C)
Northfield, Vermont	(-40° F, -40° C)
St. Johnsbury, Vermont	(-50° F, -46° C)

— The 18<sup>th</sup> and 19<sup>th</sup> were the two coldest days known in New England in the past century. But the temperatures continued to remain low until the 26<sup>th</sup> of January. For example on the 23<sup>rd</sup>, the temperature fell to:

Auburn, Maine	(-22° F, -30° C)
Bangor, Maine	(-44° F, -42° C)
Lawrence, Massachusetts	(-32° F, -36° C)
Amherst, New Hampshire	(-35° F, -37° C).
Weare, New Hampshire	(-40° F, -40° C)
North Field, Vermont	(-40° F, -40° C)
White River Junction, Vermont	(-43° F, -42° C)

Then on January 24<sup>th</sup>, the temperature fell to:

Auburn, Maine	(-40° F, -40° C)
Manchester, Massachusetts	(-37° F, -38° C)
Amherst, New Hampshire	(-37° F, -38° C)
Franconia, New Hampshire	(-49° F, -45° C)

— This week [week of January 18] was one of the coldest weeks in New England. The harbor at Portsmouth, New Hampshire was frozen over. Long Island Sound was frozen the whole width for the first time as far as ever known. During the entire period between 20 December and 27 January, snow on the roofs of buildings in a greater portion of New England did not melt.

— On 27 January, a thaw set in and rain fell. There were 2 heavy rainstorms. The rainstorm of 8 February was great which caused freshets [floods] on the 9<sup>th</sup> and 10<sup>th</sup>. Vast amounts of snow were carried away. The destruction at Norwich, Connecticut was great. The Lord's and Lathrop's bridges were swept away. The waterfront was swept over by a raging flood. An ice dam formed below the city, and the water flooded the wharves and buildings on Water Street.

— The rest of the winter was very changeable. Often a cold spell would permeate the area and drive temperatures below zero. Towards the end of February, the weather was mild. On the first of March, bluebirds, blackbirds and robins appeared in Massachusetts, three weeks earlier than usual. But in the afternoon, snow began to fall and the temperatures fell below freezing. This variable weather dragged on until the middle of April.

— This was one of the coldest winters ever known in the southern as well as in the northern and western *United States*. This is the first winter known when there was a snowstorm in Mexico City, *Mexico*. This occurred on 31 January 1857.

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

In the *United States* during the winter of 1856-57, the temperature at Fort Gibson (now Muskogee and Cherokee Counties, Oklahoma) fell to -20° F in January. The temperature at Mount Auburn, Ohio, a suburb of Cincinnati dropped to -13° F in January. The temperature at Fortress Monroe (at Hampton, Virginia) dropped to 2° F in January.<sup>113, 126</sup>

In April 1857, snow lay on the ground near Fayette, Missouri in the *United States* from the 17<sup>th</sup> to the 20<sup>th</sup> to a depth of several inches.<sup>123</sup>

**1857 A.D.** The spring and early summer of 1857 was extremely rainy in Bradford County, Pennsylvania in the *United States*. There had not been a week since the spring break-up that the Susquehanna River was not swollen from one bank to the other. As of 2 July, there was a heavy freshet and the water was still rising.<sup>178</sup>

In *France*, the summer of 1857 was warmer than normal, and the months of July and August produced very warm temperatures. The heat during the summer was distributed as follows:

<u>City</u>	<u>Hot Days</u>	<u>Very Hot Days</u>	<u>Extremely Hot Days</u>
Lille, <i>France</i>	41 days	4 days	1 day
Hendecourt, <i>France</i>	38 days	2 days	0 days
Clermont, <i>France</i>	74 days	32 days	9 days
Metz, <i>France</i>	54 days	8 days	2 days
Görsdorf, <i>Germany</i>	42 days	5 days	0 days
Paris, <i>France</i>	44 days	4 days	1 day
Marboue, <i>France</i>	36 days	1 day	0 days
Vendôme, <i>France</i>	49 days	6 days	0 days
Nantes, <i>France</i>	65 days	12 days	0 days
La Châtre, <i>France</i>	54 days	8 days	1 day
Bourg, <i>France</i>	53 days	12 days	3 days
Saint-Léonard, <i>France</i>	54 days	5 days	0 days
Le Puy, <i>France</i>	44 days	6 days	0 days
Bordeaux, <i>France</i>	58 days	10 days	0 days
Orange, <i>France</i>	66 days	23 days	14 days
Beyrie, <i>France</i>	56 days	14 days	2 days
Régusse, <i>France</i>	56 days	15 days	2 days
Toulouse, <i>France</i>	62 days	12 days	6 days
Montpellier, <i>France</i>	68 days	29 days	14 days
Marseille, <i>France</i>	60 days	2 days	0 days
Algiers, <i>Algeria</i>	109 days	7 days	0 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The high temperatures observed during the summer were:<sup>62</sup>

Montpellier, <i>France</i>	(101.5° F, 38.6° C) on 29 July
Perpignan, <i>France</i>	(101.5° F, 38.6° C) on 29 July
Orange, <i>France</i>	(100.9° F, 38.3° C) on 18 July
Les Mesneux, <i>France</i>	( 98.6° F, 37.0° C) on 4 August
Toulouse, <i>France</i>	( 98.2° F, 36.8° C) on 27 July
Clermont, <i>France</i>	( 98.2° F, 36.8° C) on 14 & 15 July and 3 August
Beyrie, <i>France</i>	( 97.9° F, 36.6° C) on 15 July
Blois, <i>France</i>	( 97.7° F, 36.5° C) in August
La Chapelle d'Angillon, <i>France</i>	( 97.7° F, 36.5° C) in August
Paris, <i>France</i>	( 97.2° F, 36.2° C) on 4 August
Tours, <i>France</i>	( 96.8° F, 36.0° C) in August
Sétif, <i>Algeria</i>	( 96.4° F, 35.8° C) in July
Bourg, <i>France</i>	( 96.1° F, 35.6° C) on 4 August
Metz, <i>France</i>	( 96.1° F, 35.6° C) on 4 August
La Châtre, <i>France</i>	( 95.4° F, 35.2° C) on 4 August
Lille, <i>France</i>	( 95.0° F, 35.0° C) on 4 August
Rousson, <i>France</i>	( 95.0° F, 35.0° C) in July
Régusse, <i>France</i>	( 95.0° F, 35.0° C) on 30 & 31 July
Algiers, <i>Algeria</i>	( 94.8° F, 34.9° C) on 9 September
Görsdorf, <i>Germany</i>	( 93.9° F, 34.4° C) on 4 August
Vendôme, <i>France</i>	( 93.9° F, 34.4° C) on 3 August
Le Puy, <i>France</i>	( 93.6° F, 34.2° C) on 28 July

Nantes, <i>France</i>	( 93.2° F, 34.0° C ) on 3 August
Rodez, <i>France</i>	( 92.3° F, 33.5° C ) in July
Hendecourt, <i>France</i>	( 91.4° F, 33.0° C ) on 4 August
Saintes, <i>France</i>	( 90.5° F, 32.5° C ) on 3 August
Bordeaux, <i>France</i>	( 89.6° F, 32.0° C ) on 15 July and 3 August
Marseille, <i>France</i>	( 89.2° F, 31.8° C ) on 30 July
Saint-Léonard, <i>France</i>	( 88.7° F, 31.5° C ) on 29 July
Marboue, <i>France</i>	( 88.3° F, 31.3° C ) on 15 July and 4 August
Brussels, <i>Belgium</i>	( 86.4° F, 30.2° C ) on 1 August

In 1857 there were three distinct periods of summer heat. The first began on 27 June on the highest and most southerly resorts in *France* and by 28 June reached the northern borders. The second wave passed from 14 to 16 July to the northwest. The third and strongest heat wave spread slowly and gradually progressing from south to north during the period 27 July to 4 August.<sup>62</sup>

In *France* during the greater part of the summer, there was an extraordinary drought. Fortunately, in many places in mid-August a weak but fertile rain fell. During several days in July, August and September, the Seine River at the bridge “Pont de la Tournelle” in Paris fell below the zero water level [the low water mark of the year 1719]. In Burgundy, the grape harvest began on 16 September. The yield was reasonably in quantity and vintage quality of the wine was good. The cereals harvest produced average yields.<sup>62</sup>

In the Bolwarra - Maitland region of New South Wales, *Australia*, 26 people were killed and there was great damage from severe floods in 1857.<sup>99</sup>

The *Dunbar*, an emigrant ship (1,980 tons fully loaded, 1,321 tons register) was wrecked near South Head, Sydney, *Australia* on the night of 20 August 1857. The *Dunbar* arrived off Sydney Heads in a rising southeasterly gale and poor visibility carrying 63 passengers and 59 crew. Her master, Captain Green, anxious to terminate the voyage, posted extra lookouts and ran for the Port Jackson entrance, but shortly after midnight her port bow struck rocks just north of the signal station, midway between the lighthouse on South Head and The Gap. Immediately she struck the topmasts went overboard and the huge sea swept over her starboard carrying away people, boats, bulwarks and masts. Next morning floating wreckage showed that a ship had been wrecked and anxious relatives who had been expecting the *Dunbar* joined searchers who found only battered bodies floating in the surf. On the second day a young able seaman named Johnson was sighted on the rocks and hauled up the cliffs to safety. He was the sole survivor.<sup>99</sup>

On 11 September 1857, a hurricane struck North Carolina in the *United States* causing approximately 424 deaths.<sup>141</sup>

On 23 November 1857, there was a great storm on the northeast coast of *Scotland*; 42 fishermen lost.<sup>57, 90</sup>

In 1857 during the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch’ang-p’ing, T’ang-shan and Wang-tu. During the period between 6 May and 8 August, a drought engulfed Hopei province at Pao-ting, Yüan-shih, Wu-chi, Yung-ch’ing, Wu-i, Kuang-tsung and Pai-hsiang. Then during the same time (6 May and 8 August), floods struck Hupeh (now Hubei province) in central *China* at Sung-tzū and Chih-chiang. During the period between 20 August and 17 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Chin-yün and Pin-chou [uncertain name and province].<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1857 / 1858 A.D.** The winter was a little more severe than average. The Danube River and the Russian ports in the *Black Sea* were frozen over in January 1858.<sup>70</sup>

The winter of 1857-58 was moderately cold for the temperate zone. Beginning in mid-November, on the Atlantic coast of the *United States* great cold struck, and several ports became blocked by the ice and the Erie Canal froze. In *France* and *Germany*, during the months of November and December the temperatures were noticeably milder than normal. North of the Loire River, the winter began as a vision of springtime in the fields. The primroses, violets, anemones were in bloom. January [in *Europe*] was colder than average and in the South there was a series of frosts, which lasted 20-30 days. Fortunately, the cold was not severe, for the ground had no snow this winter in *France*, except in the high places. If the cold was worse because of the lack of snow, the damage of the frost on the defenseless and already green fields could have been very significant. The continuing drought was sad for the farmers. There was sufficient rain only along the *Mediterranean Sea* in Provence, *France*. The drought was so great that the wells dried up in almost every village, and the springs dried up; so individuals were forced to travel several leagues in order to obtain water for the cattle. In Eure in northern *France* one hectoliter (26.4 gallons) of water was sold for 2 francs 50 centimes which was normally the price paid for cider in a good year.<sup>62</sup>

There were two cold spells in *France* that drove the temperature lows. These were from 5 to 8 January and from 24 to 29 January. The lowest temperatures observed this winter in France are the following:<sup>62</sup>

Goersdorf, <i>France</i>	( 6.1° F, -14.4° C) on 28 January
Le Puy, <i>France</i>	( 6.3° F, -14.3° C) on 25 January
Clermont, <i>France</i>	( 6.8° F, -14.0° C) on 7 January
Les Mesneux, <i>France</i>	( 7.7° F, -13.5° C) on 7 January
Bourg, <i>France</i>	( 9.5° F, -12.5° C) on 29 January
Hendecourt, <i>France</i>	( 10.4° F, -12.0° C) on 8 January
Marboue, <i>France</i>	( 10.8° F, -11.8° C) on 7 January
Vendôme, <i>France</i>	( 12.2° F, -11.0° C) on 6 January
Lille, <i>France</i>	( 14.0° F, -10.0° C) on 5 & 7 January
Saint-Léonard, <i>France</i>	( 14.0° F, -10.0° C) on 7 January
La Châtre, <i>France</i>	( 14.5° F, -9.7° C) on 5 January
Metz, <i>France</i>	( 15.1° F, -9.4° C) on 29 January
Paris, <i>France</i>	( 15.8° F, -9.0° C) on 7 January
Montpellier, <i>France</i>	( 17.2° F, -8.2° C) on 6 January
Beyrie, <i>France</i>	( 17.6° F, -8.0° C) on 8 January
Toulouse, <i>France</i>	( 17.6° F, -8.0° C) on 7 January
Nantes, <i>France</i>	( 20.3° F, -6.5° C) on 7 January
Orange, <i>France</i>	( 20.8° F, -6.2° C) on 27 January
Bordeaux, <i>France</i>	( 23.0° F, -5.0° C) on 5 January
Régusse, <i>France</i>	( 23.0° F, -5.0° C) on 25 January
Marseille, <i>France</i>	( 25.0° F, -3.9° C) on 24 January
Algiers, <i>Algeria</i>	( 37.0° F, +2.8° C) on 13 March

In *France* the number of frost days were quite large; but in *Algeria* it was not cold. In Paris, the average number of frost days per winter since the end of the last century was 43 frost days. In the winter of 1857-58, there were 57 days of frost.<sup>62</sup>

Goersdorf, <i>France</i>	108 days of frost
Bourg, <i>France</i>	94 days of frost
Le Puy, <i>France</i>	91 days of frost
Les Mesneux, <i>France</i>	88 days of frost
Hendecourt, <i>France</i>	87 days of frost
Clermont, <i>France</i>	81 days of frost
Saint-Léonard, <i>France</i>	78 days of frost

Metz, <i>France</i>	77 days of frost
Marboue, <i>France</i>	65 days of frost
Lille, <i>France</i>	63 days of frost
Montpellier, <i>France</i>	63 days of frost
Vendôme, <i>France</i>	59 days of frost
Paris, <i>France</i>	57 days of frost
La Châtre, <i>France</i>	53 days of frost
Toulouse, <i>France</i>	52 days of frost
Régusse, <i>France</i>	52 days of frost
Beyrie, <i>France</i>	33 days of frost
Nantes, <i>France</i>	33 days of frost
Orange, <i>France</i>	32 days of frost
Bordeaux, <i>France</i>	21 days of frost
Marseille, <i>France</i>	8 days of frost
Algiers, <i>Algeria</i>	0 days of frost

A few frost in *France* occurred late in the season during the month of April. On 2 April it was 24.8° F (-4.0° C) in Clermont; on 14 April it was 27.5° F (-2.5° C) in Hendecourt; 28.4° F (-2.0° C) in Les Mesneux; and 29.3° F (-1.5° C) in Goersdorf.<sup>62</sup>

During this winter, several rivers froze. The Danube and the Russian ports of the *Black Sea* were frozen in January. In Lombardy [*Italy*] the Tanaro River was frozen from one shore to the other side, and powder wagons drove across the ice. Many rivers froze in *France* because of the extremely low water levels brought on by the drought, even though the temperatures were only moderately cold. Most froze in areas where the water currents were low. The Seine River froze in Paris on 5 January in small arms between the bridge *Pont de l'Archevêché* and the lock. At several other points on the river the Seine froze in the middle with ice. The Cher River in central *France* was frozen to a certain extent. The Loire River was also frozen in several places as well as the Nièvre River in central *France*. The Mayenne River in eastern *France* was frozen over in its entire width. The Rhône and Saône rivers froze twice in different places. The Dordogne River was covered with ice floes.<sup>62</sup>

The contrast between the climate of *North America* and ours was revealed in January as in November; when the cold prevailed in one part of *Europe*, the weather on the banks of the St. Lawrence River became exceptionally mild.<sup>62</sup>

The snow, which was almost completely absent in *France*, Piedmont [*Italy*], the Papal States [*Italy*], the Kingdom of the Two Sicilies. But the foreign newspapers were full of detail about major snowstorms to the east. They lasted a month on the *Bosphorus*, on the *Black Sea* and *Marmara Sea*. Several people were killed. A Greek monastery was buried in Mersina, *Turkey*. One individual wrote from Constantinople published in a journal on 3 February: "During one month we have been besieged by snow and wolves. . . . You could go into the streets only on narrow sidewalks, which were limited on each side by 1.5 to 2 meters (4.9 to 6.6 feet) high snow. The cold was one of the most intense ever experienced. The wolves advanced to the gates of the city and tore apart many unfortunate people. In the open place in a barracks, two hundred paces from Pera [now part of Istanbul], *Turkey*, the wolves strangled a horse. In Scutari [now Uskudar, a district of Istanbul], *Turkey*, a woman but a short distance from a guard post, fell prey to the wolves. In certain villages of *Bosnia*, the snow rose so high that they went through the windows in the houses. Everything was closed in the city; one could not obtain any burning materials to keep warm. The extreme lack of all the items necessary to sustain life brought the public great misery."<sup>62</sup>

In the *United States* during the winter of 1857-58, the temperature at Fort Jones, California fell to -17° F in December.<sup>126</sup>

**1858 A.D.** The summer of 1858 was marked by a severe drought and a heat wave that was more sustained than intense in *England*, *Belgium*, central and southern *France*, as well as in *Algeria*. The heat during the summer was distributed as follows:

<u>City</u>	<u>Hot Days</u>	<u>Very Hot Days</u>	<u>Extremely Hot Days</u>
Lille, <i>France</i>	28 days	9 days	1 day
Hendecourt, <i>France</i>	27 days	5 days	1 day
Clermont, <i>France</i>	69 days	13 days	3 days
Les Mesneux, <i>France</i>	29 days	17 days	4 days
Metz, <i>France</i>	44 days	17 days	1 day
Görsdorf, <i>Germany</i>	42 days	5 days	0 days
Paris, <i>France</i>	26 days	3 days	0 days
Vendôme, <i>France</i>	48 days	9 days	3 days
Nantes, <i>France</i>	64 days	6 days	0 days
La Châtre, <i>France</i>	53 days	3 days	2 day
Bourg, <i>France</i>	55 days	7 days	0 days
Le Puy, <i>France</i>	47 days	3 days	0 days
Saint-Léonard, <i>France</i>	36 days	1 day	0 days
Bordeaux, <i>France</i>	61 days	3 days	0 days
Orange, <i>France</i>	66 days	27 days	8 days
Beyrie, <i>France</i>	59 days	3 days	0 days
Régusse, <i>France</i>	76 days	5 days	0 days
Toulouse, <i>France</i>	70 days	14 days	0 days
Montpellier, <i>France</i>	81 days	47 days	21 days
Marseille, <i>France</i>	60 days	2 days	0 days
Algiers, <i>Algeria</i>	105 days	24 days	3 days

[It appears that hot days are defined as those with temperatures of 25° C and greater but less than 31° C, very hot days are those with temperatures 31° C or greater but less than 35° C, and extremely hot days are those with temperatures of 35° C or greater.]

The heat was most remarkable in *France* from 13 to 20 June. On 13 June, the heat wave hit the high-altitude stations. By 15 June, the heat wave reached from Lille to Bordeaux. From 19 and 20 June, the heat in Montpellier rose to an extraordinary height. Heat waves struck again from 14 to 10 July and from 12 to 18 August. The exceptions were Bar, the Vaucluse and the upper Garonne, which sustained their highest temperatures in July. The high temperatures observed during the summer were:<sup>62</sup>

Montpellier, <i>France</i>	(100.9° F, 38.3° C) on 20 June
Orange, <i>France</i>	(100.9° F, 38.3° C) on 19 July
Les Mesneux, <i>France</i>	( 99.5° F, 37.5° C) on 15 June
Algiers, <i>Algeria</i>	( 98.8° F, 37.1° C) on 25 July
Sétif, <i>Algeria</i>	( 98.6° F, 37.0° C) in July
La Chapelle d'Angillon, <i>France</i>	( 98.6° F, 37.0° C) in June
Vendôme, <i>France</i>	( 97.0° F, 36.1° C) on 15 June
Tours, <i>France</i>	( 96.8° F, 36.0° C) in June
Clermont, <i>France</i>	( 96.4° F, 35.8° C) on 16 June
Lille, <i>France</i>	( 95.9° F, 35.5° C) on 15 June
Metz, <i>France</i>	( 95.0° F, 35.0° C) on 15 June
Hendecourt, <i>France</i>	( 95.0° F, 35.0° C) on 15 June
London, <i>England</i>	( 94.8° F, 34.9° C) on 16 June
Gevrolles, <i>France</i>	( 94.6° F, 34.8° C) in June
Toulouse, <i>France</i>	( 94.3° F, 34.6° C) on 14 July
Rousson, <i>France</i>	( 94.1° F, 34.5° C) in July
Nantes, <i>France</i>	( 93.2° F, 34.0° C) on 15 June
Beyrie, <i>France</i>	( 93.2° F, 34.0° C) on 2 June
Bourg, <i>France</i>	( 91.9° F, 33.3° C) on 15 June
Görsdorf, <i>Germany</i>	( 90.7° F, 32.6° C) on 15 June
La Châtre, <i>France</i>	( 90.5° F, 32.5° C) on 16 June
Le Puy, <i>France</i>	( 90.1° F, 32.3° C) on 13 June
Régusse, <i>France</i>	( 89.6° F, 32.0° C) on 19 July

Paris, <i>France</i>	( 89.6° F, 32.0° C) on 3 July
Bordeaux, <i>France</i>	( 88.7° F, 31.5° C) on 15 July
Saintes, <i>France</i>	( 88.7° F, 31.5° C) in June
Marseille, <i>France</i>	( 88.5° F, 31.4° C) on 19 June
Saint-Léonard, <i>France</i>	( 87.8° F, 31.0° C) on 15 June
Rodez, <i>France</i>	( 85.1° F, 29.5° C) in June

Beginning early in the year and lasting almost for half the summer, *France* experienced a very great drought. The drought affected the livestock. During June, the sky had remarkable clarity. There was very little rain in July. But numerous thunderstorms struck in August in the north. The lack of water sterilized the meadows. The harvest in the south took place on 1 July and in the north on 1 August. The yield was mediocre but the quality was quite good. Only the early corn was a failure. Various vegetables were very abundant. In Burgundy the grape harvest took place on 18 September. The yield of grapes was remarkable and the quality of wine vintage was excellent. The temperature was mild for so long that the trees, especially the chestnuts, bloomed twice in 1858. The fruit harvest was held earlier than usual.<sup>62</sup>

On 13 August 1858, there was severe flooding at Hobart, Tasmania, *Australia*. The Jordan River flooded at Pontville. One person died in the flood. Antill Ponds road was covered by 5 feet (1.5 meters) of water.<sup>99</sup>

On 14 August 1858, hurricane force winds contributed to the loss of the *John Nussey*. The foremast and fore gaff were destroyed and the jib was torn to ribbons. Pumps were used to keep the water level down, but when the stay foresail ripped, the vessel became unmanageable, drifting broadside onto a reef at the back of Griffiths Point in Victoria, *Australia*. Five members of the crew were lost.<sup>99</sup>

In 1858 during the period between 6 May and 8 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ing.<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1858 / 1859 A.D.** In Venice, *Italy* on 5 November 1858 there was an unusual abundant snowfall. In Rome, *Italy* on 10 November, the cold was extraordinary and it snowed without regard for the season. The Journal of 11 November 1858 in Rome read “After 8 days of bad weather, wind, cold and rain continued, says in the provinces of Ancona and Piceno at five o’clock this morning the sun in all its glory reflected its rays on the earth covered with an inch of snow that fell during the night.” In the memory of man it is not remembered a time when snow fell in early November in the districts of Ancona. It was most surprising to see Rome on Saturday the snow falling in large flakes.<sup>81</sup> [Ancona is in central *Italy*. Piceno is in west-central *Italy*.]

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1858 occurred on 14 November. Heavy snow.<sup>116</sup>

During the winter of 1858-59 in Bradford County, Pennsylvania in the *United States*, temperatures dropped to -20° F [-29° C] on January 10<sup>th</sup>. Two days of disagreeable storm culminated on 23 April 1859, in a snowfall to the depth of several inches. On 9 June, there was snow on the highlands. On 4 July, there was a flurry of snow in parts of the county.<sup>178</sup>

In the *United States* during the winter of 1858-59, the temperature at Fort Crook (now Offutt Air Force Base, Nebraska) fell to -20° F in January. The temperature at Brunswick, Maine fell to -32° F in January.<sup>113</sup>

---

**1859 A.D.** On 30 January 1859, there was a lightning storm in Rio Janeiro [Rio de Janeiro, *Brazil*] that produced bifurcated lightning. “At seven o’clock some flashes of lightning appeared in the east, and at ten minutes past seven the storm had attained its full intensity. At this moment there appeared continuously, at intervals of one or two seconds, zigzag flashes of lightning, more than the third of which were bifurcated. Besides these bifurcated flashes, and those with three or four branches, which were also very frequent, not a minute passed without the appearance of what may be called arborescent flashes. These were tracks of fire which divided into many principal branches, which in their turn divided into a multitude of boughs. One of them, which I particularly remarked, and which appeared to propagate itself as it descended, divided at first into three parts, which subdivided afterwards, so as to form in all fifteen branches.”<sup>271</sup> [This phenomena is frequent in the intertropical zones but rare in Europe.]

In 1859 a heat wave struck California in the *United States*. The following maximum temperatures were observed:<sup>112</sup>

102° F, (38.9° C) at San Diego, California in June.

117° F, (47.2° C) at Fort Yuma, California in June.

133° F, (56.1° C) at San Bernardino, California.

The year 1859 was memorable in Bradford County, Pennsylvania in the *United States* as the year of the "cold summer." There was a heavy or killing frost every month in the year. There was a flurry of snow on the 4<sup>th</sup> of July, and the temperature was so cold “that persons wore overcoats at the celebrations”.<sup>178</sup>

In *England*, a dreadful storm struck on the 25<sup>th</sup> and 26<sup>th</sup> of October. The “Royal Charter,” and many other vessels lost. Another great storm occurred on the 31<sup>st</sup> of October and the 1<sup>st</sup> of November.<sup>57</sup>

On 25-26 October 1859, there was a dreadful storm that struck during the night in *Wales*. The Royal Charter was totally lost along with many other vessels. [The Royal Charter was a steam clipper, which was wrecked on the northeast coast of Anglesey, *Wales* on 26 October 1859. Although the precise number of dead is uncertain as the passenger list was lost in the wreck; around 459 lives were lost.] There was another storm on 31 October and another storm on 1 November 1859.<sup>90</sup>

In 1859 during the period between 4 January and 2 February, floods struck Hupeh (now Hubei province) in central *China* at Chiang-ling, Sung-tzū and Kung-an. During the period between 5 February and 6 May, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Chi-mo. During the period between 6 May and 8 August, a drought engulfed Shantung province at Lin-ch’ü, Pin and Huang. During the period between 30 July and 27 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Yüan-shih and Luan.<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1859 / 1860 A.D.** In the *United States* during the winter of 1859-60, the temperature at Camp Stockton (now Fort Stockton, Texas) fell to -9° F in December. The temperature at Fort Crittenden (near Fairfield, Utah) fell to -22° F in December. The temperature at Fort Ripley (near Little Falls, Minnesota) fell to -44° F in January.<sup>113</sup>

---

**1860 A.D. – 1862 A.D. India, Afghanistan and South Africa. Drought**

In *India* during the years 1860-61, there was a severe drought in parts of the Punjaub [Punjab] and northwest provinces.<sup>47</sup>

In 1860, there was a famine in the Northwest Provinces, Punjab, and Bombay in *India*.<sup>156</sup>

In *India* during 1860-61, there was a famine. “In 1859-60, the Delhi territory suffered from want of rain. The great Nujjufghur Jheel [great marsh] became entirely dry – a thing never before known within the memory of man. The rains of 1860 completely failed in the country between the Jumna [Yamuna River] and the Sutlej [River]; and except where irrigation was available, no autumn or spring crop could be sown.”<sup>57</sup> [Nujjufghur Jheel is possibly today the Okhla Bird Sanctuary, a neighbourhood around the old Okhla village in South Delhi district. The Jumna River is in northern *India*. The Sutlej River flows through the historic crossroad region of Punjab in northern *India* and *Pakistan*.]

In 1860-61 in northwest *India*, there was a famine and thousands perished.<sup>90</sup>

In 1860, there was a famine in *India*. Two scanty years were followed by a failure of the rains in 1860. The affected region lied between Delhi and Agra and encompassed approximately 5.5 million people.<sup>181</sup>

In 1860-61, there was a famine in Panjab, *Afghanistan*.<sup>187</sup>

In 1861 in *India*, there was a famine in the northwest provinces; failure of crops; thousands starved.<sup>91</sup>  
In *India* during 1861-62, there was considerable scarcity of food in Kach and various other districts of the Bombay Presidency, owing to scanty and unseasonable rains in 1861, and to short rainfall in the early part of 1862.<sup>57</sup>

During 1861-1862, *South Africa* experienced drought conditions.<sup>167</sup>

— At Genadendal in 1861, “The continued severe drought, which prevailed not only in this neighbourhood, but over the whole colony, and even beyond its boundaries, caused great distress throughout the country.”

— At Cradock “Farmers who have lived upwards of fifty years in this locality state that the drought of 1862 is the greatest ever known.”

— In North-Eastern Colony in 1862, “The drought continues unabated, Colesburg, Hanover, Hopetown, the western part of the Free State, Griquatown, and the country beyond it, are all in a pitiable state.”

**1860 A.D.** In 1860, there were floods in the Terara Nowra (Shoalhaven River Region) of New South Wales in *Australia*. A total of 16 people lost their lives in this flood. The severity of the floods caused great damage and led to the rebuilding [and relocation] of Nowra. The city was originally located in a low-lying area near the Shoalhaven River.<sup>99</sup>

In 1860, there were severe floods at Araluen and Braidwood in New South Wales, *Australia*. Twenty-four lives were lost. The flood produced significant property damage.<sup>99</sup>

In February 1860, a great flood took place in almost all parts of New South Wales, *Australia*. The country adjacent to the Shoalhaven and Araluen Rivers in the south, suffered the most from this flood. The prospects of the agriculturists and the diggers [farmers and miners] were alike blasted by the overwhelming waters. Many lives were lost, and in some instances whole families were drowned. Entire houses were overwhelmed, and cattle, crops, fences, agricultural implements, the wreck of households and farms were carried to the sea, strewing the sea coast for a distance of miles; one proprietor near Goulburn lost 2,000 sheep. At Braidwood, another proprietor lost to the extent of £5,000; the railway works lost to a great extent, embankments being washed from under the rails, culverts burst, and bridges destroyed by the combined force of the rushing waters and masses of floating timber.<sup>103</sup>

On 24 April 1860, there was a great flood at Ballarat in Victoria, *Australia*.<sup>103</sup>

In *England*, there was a great storm in the [English] Channel, causing much loss of life and property on 1 January. There was a dreadful gale on the 26<sup>th</sup>-28<sup>th</sup> of February, on the 28<sup>th</sup> of May, and on the 2<sup>nd</sup> of June.<sup>57, 90</sup>

On 11 August 1860, a hurricane struck Louisiana in the *United States* causing 47 deaths.<sup>141</sup>

On 11 August 1860, storm [hurricane] at Mobile, Alabama in the *United States*; the [storm surge] high-water mark was 18 inches lower than that of 1852 hurricane.<sup>117</sup>

On 15 September 1860, a storm [hurricane] at Mobile, Alabama in the *United States*; the [storm surge] high-water mark was 12 inches lower than that of 1852 hurricane.<sup>117</sup>

On 20 October 1860, Bradford County, Pennsylvania in the *United States* experienced a great flood. Heavy rains caused great damage by raising the creeks and rivers, overflowing the bottoms and carrying away the crops. The Susquehanna River rose extremely rapidly to a mark higher than ever known at this season. The low flats were flooded and much damage done. But damage was greatest in the creeks. Sugar Creek had not been so high for some years. Bridges, milldams and crops suffered terribly. Not a bridge is left on Bentley Creek, all having been swept away by the flood. On Towanda Creek the damage was very severe. A new bridge erected just above Franklin was swept away. A portion of Bull's milldam was carried away and a sawmill greatly damaged. The floods swept away the harvest; stouts of corn and a shower of apples were seen floating downstream.<sup>178</sup>

In 1860 during the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ing-fêng; Shantung (now Shandong province) on the east coast of *China* at P'êng-lai; and Kansu (now Gansu province) in northwest *China* at Lanchow. During the period between 18 July and 16 August, a severe drought engulfed Hopei province at Ch'ing.<sup>153</sup>

*Also refer to the section 1847 A.D. – 1860 A.D. for information on the drought in Australia during that timeframe. Also refer to the section 1860 A.D. – 1862 A.D. for information on the drought in India, Afghanistan and South Africa during that timeframe.*

**Winter of 1860 / 1861 A.D.** In *England*, there was a very severe frost from 20<sup>th</sup> December to 5<sup>th</sup> January; many of the less hardy shrubs destroyed.<sup>47, 90, 93</sup>

In *England*, the frost of December 1860 and January 1861 were remarkable. Christmas eve was extremely cold. In the valley of the Rea [in the west Midlands], the temperature dropped to -5.0° to -7.0° F (-20.6° to -21.7° C).<sup>70</sup>

The winters of 1860, 1863 and 1864 was very severe and covered southern *Europe* with snow and ice, and was very severe even in *Egypt*.<sup>205</sup>

In the *United States* during the winter of 1860-61, the temperature at Middletown, Connecticut fell to -18° F in December. The temperature at Fort Abercrombie, North Dakota, fell to -40° F in February and March. The temperature at Stratford, New Hampshire fell to -37° F in February. The temperature at Newark, New Jersey fell to -7° F in February.<sup>113,126</sup>

During the winter of 1860-61 in Bradford County, Pennsylvania in the *United States*, was noted for early snowstorms. The first snowfall occurred on 14 October 1860, which deposited 8 inches [20 cm] of snow. Snow fell each day beginning 30 November for 11 straight days. On 6 February 1861, temperatures dropped to -12° F [-24° C]. Then on 14 February, temperatures dropped to -20° F [-29° C] at Towanda and -29° F [-34° C] at Rome.<sup>178</sup>

**1861 A.D.** In Holland [now *the Netherlands*], there were great inundations. About 30,000 of the peasantry rendered destitute.<sup>47, 92</sup>

In January 1861 in Holland, an inundation submerged nearly 40,000 acres [16,187 hectares].<sup>90</sup>

In Montreal, *Canada* in January and February, there was a flood occasioned by the breaking of the ice of the St. Lawrence in the spring, laid the greater part of the city under water, and occasioned the destruction of a large amount of property.<sup>47, 92</sup>

In *England* on the 20<sup>th</sup> and 21<sup>st</sup> of February, there were great gales; part of the Crystal Palace [in London] blown down; Chichester Cathedral [in Sussex in southern *England*] steeple fell.<sup>57, 90</sup>

In May 1861, there was an inundation at Kiev, *Ukraine* and Moscow, *Russia*. 615 houses under water.<sup>97</sup>

In *Britain* on 28 May, there were great storm on the British coast – 143 shipwrecks. And then on the 13<sup>th</sup> and 14<sup>th</sup> of November there was another storm on the north coast producing another 50 shipwrecks.<sup>57, 90</sup>

On 10 July 1861, a hurricane struck the western *Atlantic Ocean*. The ship *Bowditch*, while in a tremendous hurricane, was overwhelmed by large waves, which washed all hands overboard. Only the captain survived.<sup>141</sup>

On 2 November 1861, a hurricane struck North Carolina and Massachusetts in the *United States* causing 33 deaths.<sup>141</sup>

In 1861 during the period between 5 February and 8 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ing. Then during the period between 8 July and 5 August, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang. Dikes were damaged. During the period between 6 August and 4 September, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ching-ning. Also during the period between 6 August and 4 September, a drought engulfed Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing. During the period between 5 September and 3 October, a severe drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow, T'ung-wei and Ch'in-an.<sup>153</sup>

*Also refer to the section 1860 A.D. – 1862 A.D. for information on the drought in India, Afghanistan and South Africa during that timeframe.*

---

**Winter of 1861 / 1862 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1861 occurred on 29 & 30 November. Slight snowfall.<sup>116</sup>

In the *United States* during the winter of 1861-62, the temperature at Colebrook fell to -28° F in December. The temperature at Fort Riley, Kansas fell to -29° F in January. The temperature at Fort Dalles (The Dalles, Oregon) fell to -23° F in January. The temperature at Fort Walla Walla (Walla Walla, Washington) fell to -24° F in January.<sup>113</sup>

---

**1862 A.D.** In Cape Colony [today in the southern part of *South Africa*], there was a disastrous drought.<sup>47</sup>

In April 1862, the North Branch of the Susquehanna River in Pennsylvania in the *United States* flooded for a week. There was very little rain in this region during the spring. The floodwaters came from the immense snow banks of New York State. Then in the autumn, a general drought prevailed in Bradford County, Pennsylvania.<sup>178</sup>

At St. Germain's (near King's Lynn, Norfolk, *England*) on May 4, there was a great inundation through the bursting of the Middle Level Sluice. Some 10,000 acres (4,000 hectares) of cultivated land submerged. Then on October 4, another marshland sluice burst; large tract flooded.<sup>47,92</sup>

On 4-15 May 1862, a great inundation was caused by the bursting of the outfall sluice at St. Germain's, near King's Lynn in *Great Britain*.<sup>90</sup>

In July 1862, the Swan, Murray and other rivers overflowed their banks and caused unprecedented widespread flooding of Perth, Bunbury, York and surrounding areas of *Western Australia*. The floods caused 12 deaths and destroyed many buildings.<sup>99</sup>

In *England* on the 2<sup>nd</sup> of September, there was a great hailstorm. The hailstones were 6 to 7 feet deep on the ground at Market Laverton; much damage to crops.<sup>57</sup> [There is a Market Laverton Parish Council in Wiltshire in southwestern *England*. Wiltshire borders on to Somerset.]

On 2 September 1862, a storm at Market Laverton [in *England*] caused much damage to crops by hail.<sup>90</sup>

On 2 September 1862 in *England*, there was a great hailstorm in Somersetshire. The hailstones accumulated 6 or 7 feet (1.8 or 2.1 meters) deep on the ground. The storm produced severe damage.<sup>93</sup>

On 4 October 1862, a marshland sluice [in *Great Britain*] bursts; many acres inundated.<sup>90</sup>

In *England* on the 19<sup>th</sup> and 20<sup>th</sup> of October, there was a great storm on the British coasts; many shipwrecks.<sup>57,90</sup>

On 30 October 1862, a hurricane struck off the coast of North Carolina in the *United States*. Twenty-five Federal vessels left Hampton Roads, Virginia with coal for the fleet about to attack Port Royal in South Carolina. The next day, fifty more vessels sailed. On the 30 October, off Cape Hatteras, North Carolina they were swallowed up and spewed everywhere by appalling winds and seas. Two steamers were lost.<sup>141</sup>

In 1862, a powerful cyclone struck Canton, *China* causing 37,000 deaths.<sup>98</sup> [Canton (Guangzhou) is in southeastern *China*.]

In 1862, a drought engulfed many regions of *China* including:<sup>153</sup>

— During the period 1-29 March, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ing.

— During the period between 27 June and 26 July, a drought engulfed Shensi (now Shaanxi province) in central *China* at Tso-shui and Kansu (now Gansu province) in northwest *China* at Lanchow.

— During the period between 27 July and 24 August, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Ch'i-hsia; Hupeh (now Hubei province) in central *China* at Wuchang and Hsien-ning; and Wei-hsien [uncertain name and province, possible misprint].

In 1862 during the period between 28 May and 26 June, floods struck Hupeh (now Hubei province) in central *China* at Kung-an and Shantung (now Shandong province) on the east coast of *China* at Jih-chao. During the period between 8 August and 8 November, floods struck Kiangsi (now Jiangxi province) in southern *China* at Ch'ing-chiang [uncertain name, "Lin-chiang"].<sup>153</sup>

*Also refer to the section 1860 A.D. – 1862 A.D. for information on the drought in India, Afghanistan and South Africa during that timeframe.*

**Winter of 1862 / 1863 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1862 occurred on 7 & 8 November. Violent storm; much snow.<sup>116</sup>

The winter of 1862-63 in Bradford County, Pennsylvania in the *United States* was memorable because it produced much snow but little sleighing. On 7 November, an incessant snowstorm lasted all day.<sup>178</sup>

---

**1863 A.D.** In 1863, the Murrumbidgee River flooded in New South Wales, *Australia*. At Gundagai, the river rose to 38 feet 10 inches above the high water mark. At Wagga Wagga, the river rose to 35 feet 9 inches above the high water mark.<sup>103</sup>

In 1863 in New South Wales, *Australia*, the Macleay and Darling Rivers flooded. Ten people perished in these floods. Queensland experienced flooding during most of the year. South-central Victoria rivers flooded. Also severe flood damage was reported in Hobart, Tasmania.<sup>101</sup>

On 5 January 1863, the temperature at Sydney, *Australia* reached 106.9° F (41.6° C).<sup>103</sup>

In *England* on the 19<sup>th</sup> of January, there were extensive gales, accompanied by numerous whipwrecks.<sup>57</sup>

On 19 January 1863, there were severe gales [in *Great Britain*], doing much damage, and causing much loss of life.<sup>90</sup>

In 1863, there was a prolonged drought in the Oatlands region of Tasmania, *Australia*, which caused crops to fail.<sup>99</sup>

In 1863, the Yarra River in Victoria, *Australia*, overflowed its banks and caused heavy damage in the floodplain including the city of Melbourne.<sup>99</sup>

On 16 February 1863, a cyclone struck Rockhampton in Queensland, *Australia*. The cyclone brought damaging winds and seas to the region between Rockhampton and Hervey Bay. Houses were unroofed and trees uprooted. At least one boat was lost. The storm caused severe erosion. Thirty-three feet (10 meters) of shoreline at Hervey Bay was lost and a further 20 acres (8 hectares) of forest were swept away by the sea. In February 1863, widespread flooding caused tremendous damage in Queensland, New South Wales and Victoria in *Australia*. Ten people drowned when the Macleay and Darling Rivers overflowed their banks.<sup>99</sup>

In 1863 there were heavy floods in Queensland, *Australia*.<sup>103</sup>

On 26 May 1863, a hurricane struck the northeast *Gulf of Mexico* causing 37 deaths.<sup>141</sup>

On 21 August 1863, a hurricane struck near the Outer Banks in North Carolina in the *United States* causing 80 deaths.<sup>141</sup>

On 12 September 1863 in *England*, there was a most destructive hailstorm in Berkshire. Near midnight, the hailstorm, near East Illsley (taking a northeasterly direction), caused great damage to grain crops cut, but not carted, and also to glass and fruit. The storm was accompanied with lightning; killing sheep and cattle. Rabbits, partridges, and many small birds were found killed by the hail.<sup>93</sup>

In Melbourne, *Australia* on December 14-24, there was a flood, caused by the rising waters of the Yarra Yarra River, 40 feet above their usual level, submerged the greater portion of the city and destroyed property to the value of 250,000*l*.<sup>47, 92</sup> [In present currency, that would be equivalent to £20 million in damages based on the retail inflation price index.]

In Buenos Aires, *Argentina*, a drought occurred in 1863 and 1864. “The ground is baked hard, and in some places cracked open. The surface is like burnt ground. When the winds prevail, storms of dust sweep over the plains, almost depriving the remaining animals of life. Dust storms, in which houses are unroofed, trees blown down, and thousands of sheep driven to parts unknown, have occurred in several places.” Over hundreds of miles of territory affected, losses in millions of dollars.<sup>66</sup>

From 9 - 12 December 1863, a severe northeast gale, with heavy snowstorm struck St. John’s *Newfoundland*.<sup>66</sup>

On December 13, 1863, the coast of *England* was visited with a terrible gale, which inflicted very great distress on shipping, and caused much loss of life. It was also very destructive on land as well as at sea and on the coast – chimneys, trees, roofs, barns, houses, etc. being blown down by the violence of the wind. The list of casualties extended over thirty columns of the London papers, and embraces almost every locality on the coast of the United Kingdom, and many points on the adjacent continental seaboard.<sup>66</sup>

On 14-20 December 1863, severe floods struck eastern Tasmania, *Australia*. The flooding followed a southerly gale at Hobart and in the Derwent Valley. Extensive damage occurred at New Town. Flooding also caused agricultural losses at Oatlands and Richmond. The barometer fell to 977 millibar at Hobart. On 16 December, in Launceston, floodwaters rose 16 inches (40 centimeters) above the 1929 flood level making it the most severe on record in the city's history. These record floods caused heavy livestock and crop losses in the Tooms Lake, Macquarie and South Esk areas.<sup>99</sup>

In 1863, a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Ch’êng. During the period between 5 February and 6 May, floods struck Chekiang province at Hu-chou. During the period between 16 July and 13 August, floods struck Hupeh (now Hubei province) in central *China* at Chung-hsiang, Ch’ien-chiang, Pao-k’ang and Kung-an. At Ch’ien-chiang, the dikes were damaged. At Pao-k’ang, houses and fields were damaged by the floodwaters. During the period between 8 August and 8 November, floods struck Hupeh province at Yün-hsi.<sup>153</sup>

---

**Winter of 1863 / 1864 A.D.** The meteorological condition in the northern hemisphere during December 1863 and January 1864 were remarkable. A cold polar current flowed southward dramatically dropping temperatures in the middle of the *United States* (this was confined to a narrow band), and at the same time warm equatorial currents flowed northward over contiguous spaces, and thus restoring the general equilibrium of temperature and of pressure by opposite and parallel streams. At the same time an unbroken sheet of cold air, swept down through *Eastern Europe*, on the one side, to at least the *Sandwich Islands* [now *Hawaiian Islands*] on the other, flowed southward. Everywhere in this wide band severe temperatures were experienced.<sup>66</sup>

A severe cold wave swept over the whole of *North America*. The thermometer went to -60° F (-51° C) in the northwest. The Mississippi River in the *United States* was blocked with ice in a single night, and in twelve hours froze from St. Paul, Minnesota to Cairo, Illinois.<sup>63</sup>

The *United States* experienced severe cold and extensive snowstorm in the end of December 1863 and beginning of January 1864. The deepest snow was east of the Mississippi river and north of the Ohio, and the severest cold was in the same region and further west; but the depression of temperature and the atmospheric disturbance extended over the whole country. The following is a list of cold temperatures observed in U.S. cities:<sup>66</sup>

Fort Laramie, Wyoming	(colder than -38° F / -39° C) on 5, 6 & 7 January
Forest City, Minnesota	(-38° F, -39° C) on 1 January 1864

St. Paul, Minnesota	(-35° F, -37° C)	on 1 January 1864
Tamarack, Minnesota	(-35° F, -37° C)	on 1 January 1864
Canton, Missouri	(-33° F, -36° C)	on 6 January 1864
Fort Madison, Iowa	(-33° F, -36° C)	on 1 January 1864
Milwaukee, Wisconsin	(-30° F, -34° C)	on 1 January 1864
Beloit, Wisconsin	(-29° F, -34° C)	on 1 January 1864
Debuque, Iowa	(-29° F, -34° C)	on 1 January 1864
Waterloo, Iowa	(-28° F, -33° C)	on 7 January 1864
Winnebago, Illinois	(-28° F, -33° C)	on 1 January 1864
Littleton, New Hampshire	(-28° F, -33° C)	on 19 February 1864
North Littleton, New Hampshire	(-27° F, -33° C)	on 19 February 1864
Gouverneur, New York	(-27° F, -33° C)	on 18 February 1864
Manitowoe, Wisconsin	(-26° F, -32° C)	on 1 January 1864
Muscatine, Iowa	(-26° F, -32° C)	on 2 January 1864
Sandwich, Illinois	(-26° F, -32° C)	on 1 & 7 January 1864
Augusta, Illinois	(-26° F, -32° C)	on 1 January 1864
Pleasant Plain, Iowa	(-26° F, -32° C)	on 1 January 1864
Independence, Iowa	(-26° F, -32° C)	on 2 January 1864
Ottawa, Illinois	(-25° F, -32° C)	on 1 January 1864
Stratford, New Hampshire	(-25° F, -32° C)	on 19 February 1864
Lanenburg, Vermont	(-25° F, -32° C)	on 18 & 19 February 1864
Tishkila, Illinois	(-24° F, -31° C)	on 1 January 1864
Waverley, Illinois	(-24° F, -31° C)	on 1 January 1864
Lyons, Iowa	(-24° F, -31° C)	on 1 January 1864
Mount Pleasant, Iowa	(-24° F, -31° C)	on 1 January 1864
Iowa Falls, Iowa	(-24° F, -31° C)	on 1 January 1864
Algona, Iowa	(-24° F, -31° C)	on 1 & 2 January 1864
Galesburg, Illinois	(-23° F, -31° C)	on 1 January 1864
St. Louis, Missouri	(-22° F, -30° C)	on 1 January 1864
Rockville, Indiana	(-22° F, -30° C)	on 1 January 1864
Peoria, Illinois	(-22° F, -30° C)	on 8 January 1864
Lansing, Michigan	(-22° F, -30° C)	on 1 January 1864
Harrisonville, Missouri	(-22° F, -30° C)	on 1 January 1864
Elkhorn, Nebraska	(-22° F, -30° C)	on 7 January 1864
Upper Alton, Illinois	(-21° F, -29° C)	on 1 January 1864
Brandon, Vermont	(-21° F, -29° C)	on 18 February 1864
West Waterville, Maine	(-21° F, -29° C)	on 19 February 1864
Muncie, Indiana	(-20° F, -29° C)	on 1 January 1864
Burlington, Vermont	(-20° F, -29° C)	on 7 January 1864
Pekins, Illinois	(-20° F, -29° C)	on 1 January 1864
Hoylton, Illinois	(-20° F, -29° C)	on 1 January 1864
South Bend, Indiana	(-20° F, -29° C)	on 1 January 1864
Athens, Missouri	(-19° F, -28° C)	on 6 January 1864
Newcastle, Indiana	(-19° F, -28° C)	on 1 January 1864
Spiceland, Indiana	(-19° F, -28° C)	on 1 January 1864
Laborville, Missouri	(-18° F, -28° C)	on 1 January 1864
Craftsbury, Vermont	(-18° F, -28° C)	on 7 January and 18 February 1864
Middlebury, Vermont	(-17° F, -27° C)	on 7 January 1864
Bellevue, Nebraska	(-17° F, -27° C)	on 1 January 1864
Lawrence, Kansas	(-17° F, -27° C)	on 1 January 1864
Claremont, New Hampshire	(-17° F, -27° C)	on 19 February 1864
Urbana, Ohio	(-16° F, -27° C)	on 6 January 1864
Steuben, Maine	(-16° F, -27° C)	on 19 February 1864
Baldwinsville, Massachusetts	(-16° F, -27° C)	on 19 February 1864
New Harmony, Indiana	(-15° F, -26° C)	on 1 January 1864
South Hartford, New York	(-15° F, -26° C)	on 18 February 1864

Jamestown, New York	( -14° F, -26° C ) on 2 January and 17 February 1864
Westerville, Ohio	( -14° F, -26° C ) on 6 January 1864
Welshfield, Ohio	( -13° F, -25° C ) on 2 January 1864
Manhattan, Kansas	( -13° F, -25° C ) on 6 January 1864
Austinburg, Ohio	( -12° F, -24° C ) on 2 January 1864
Fort Riley, Kansas	( -12° F, -24° C ) on 1 January 1864
Cincinnati, Ohio	( -12° F, -24° C ) on 1 January 1864
College Hill, Ohio	( -12° F, -24° C ) on 1 January 1864
New Lisbon, Ohio	( -12° F, -24° C ) on 18 February 1864
Tioga, Pennsylvania	( -12° F, -24° C ) on 19 February 1864
Kelly's Island, Ohio	( -11° F, -24° C ) on 1 January 1864
Cornishville, Maine	( -11° F, -24° C ) on 17 February 1864
Connellsville, Pennsylvania	( -10° F, -23° C ) on 7 January 1864
New Albany, Indiana	( -10° F, -23° C ) on 1 January 1864
Louisville, Kentucky	( -10° F, -23° C ) on 8 January 1864
Williamsville, Massachusetts	( -10° F, -23° C ) on 18 February 1864
Buffalo, New York	( -9° F, -23° C ) on 2 January 1864
Rutland, Vermont	( -8° F, -22° C ) on 18 February 1864
Auburn, New York	( -8° F, -22° C ) on 17 February 1864
Westfield, Massachusetts	( -7° F, -22° C ) on 11 January 1864
Fredonia, New York	( -7° F, -22° C ) on 2 January 1864
Fleming, Pennsylvania	( -7° F, -22° C ) on 19 February 1864
Oswego, New York	( -6° F, -21° C ) on 2 January 1864
Springfield, Massachusetts	( -6° F, -21° C ) on 18 February 1864
Pomfret, Connecticut	( -6° F, -21° C ) on 18 February 1864
Mendon, Massachusetts	( -6° F, -21° C ) on 18 February 1864
Topsfield, Massachusetts	( -6° F, -21° C ) on 18 February 1864
Skaneateles, New York	( -5° F, -21° C ) on 2 January and 17 February 1864
Kingston, Ohio	( -5° F, -21° C ) on 2 January 1864
Monroe City, Michigan	( -4° F, -20° C ) on 1 January 1864
Amherst, Massachusetts	( -4° F, -20° C ) on 18 February 1864
New Haven, Connecticut	( -2° F, -19° C ) on 11 January and 18 February 1864
Seneca Falls, New York	( -2° F, -19° C ) on 2 January 1864
Sandwich, Massachusetts	( -2° F, -19° C ) on 18 February 1864
Nazareth, Pennsylvania	( 0° F, -18° C ) on 2 January and 18 February 1864
Portsmouth, Ohio	( 0° F, -18° C ) on 2 January 1864
Sykesville, Maryland	( 0° F, -18° C ) on 17 & 18 February 1864
New Bedford, Massachusetts	( 0° F, -18° C ) on 18 February 1864
Mount Holly, New Jersey	( 1° F, -17° C ) on 2 January 1864
Newark, New Jersey	( 2° F, -17° C ) on 18 February 1864
White Plains, New York	( 3° F, -16° C ) on 18 February 1864
Fishkill Landing, New York	( 3° F, -16° C ) on 7 January 1864
Providence, Rhode Island	( 4° F, -16° C ) on 8 January 1864
Throg's Neck (Long Island) New York	( 5° F, -15° C ) on 18 February 1864
Philadelphia, Pennsylvania	( 5° F, -15° C ) on 17 & 18 February 1864
Chestertown, Maryland	( 5° F, -15° C ) on 18 February 1864
Washington, D.C.	( 5° F, -15° C ) on 18 February 1864
St. Mary's City, Maryland	( 7° F, -14° C ) on 18 February 1864
New York, New York	( 8° F, -13° C ) on 17 & 18 February 1864
Beaufort, South Carolina	( 18° F, -8° C ) on 2 January 1864

In the *United States* during the winter of 1863-64, the temperature at Bellefontaine, Ohio dropped to -28° F on January 1<sup>st</sup>. In January, the temperature at Milwaukee, Wisconsin fell to -30° F. Also in January, the temperature at Dubuque, Iowa fell to -29° F. The temperature in Chicago, Illinois fell to -25° F. The

temperature at Salt Lake City fell to  $-8^{\circ}$  F. The temperature at Fort Laramie, Wyoming fell to  $-40^{\circ}$  F. The temperature at Fort Ruby, Nevada fell to  $-23^{\circ}$  F.<sup>113, 126</sup>

The winter of 1863-64 in Bradford County, Pennsylvania in the *United States* produced a heavy March snowfall. On 20 March 1864, there was a snowfall of 20 inches [51 cm].<sup>178</sup>

U.S. Colonel W. O. Collins at Fort Laramie, Wyoming in the *United States* reported on 15 January “The weather has been so intensely cold, and the snow so deep, that we have not been able to keep open our communication with the different detachments posted in the mountains. In endeavoring: to do so, and in furnishing the necessary wood, stores, &c, and taking care of the stock, probably one hundred men of my command have been frost-bitten. Two or three may lose their feet, but others will recover without permanent injury.”<sup>66</sup>

*Hourly observations of thermometer at Fort Laramie, Wyoming  
from 4 p.m. January 4, to 4 p.m., January 7, 1864*

Hour	January 4, 1864	January 5, 1864	January 6, 1864	January 7, 1864

The mercury in mercury thermometers solidifies (freezes) at -37.89 °F (-38.83 °C).

Leavenworth, Kansas in the *United States* on 18 December 1863 reported, “Accounts from the plains represent great suffering among the men and stock. In consequence of a severe snowstorm, no hay or grass could be had, and the stock was dying off by hundreds of starvation, and many lives were known to be lost by the intense cold. Fourteen inches of snow has fallen here, and much of it being drifted all the roads are blocked up. No mail have been received here for three days.”<sup>66</sup>

Natchez, Mississippi in the *United States* on 31 December 1863 reported, “This morning was sultry and close; thermometer 80° F (27° C); wind south; cloudy. About 9 a.m. a remarkable change occurred, and the wind increased and became chilly, and then stinging cold, with occasional warmer gust. What was remarkable this cold wind blew strongly directly up the river [Mississippi River], or from a point south 30° west. At 12 o’clock noon the ground began to freeze, and the wind had veered round to west. At 7 p.m. the thermometer stood at 23° F (-5° C), and next morning at 10° F (-12° C), and in some localities in the country as low as 8° F (-13° C). The cold lasted till about the 10<sup>th</sup> of January.”<sup>66</sup>

Sandwich, Illinois in the *United States* described the storm, “At 3 a.m., January 1, 1864, it began to increase in violence, and continued until it became impossible for man or beast to withstand its violence; at 7 a.m., January 1, the mercury marked -26° F (-32° C), and snow falling rapidly; railroads became blocked, and the Chicago, Burlington and Quincy road was so obstructed that for one week no mail express passed this station. Many cattle perished in the cornfields; stock [livestock] in transportation on the cars perished by hundreds, and thousands of fowls froze upon their perches. The depth of snow

falling here was about two and a half feet. The extreme cold continued about eight days. Peaches are destroyed, that is, the fruit germs, and in many instances the trees are ruined. The fruit germs upon nearly all early varieties are also destroyed. Early Richmond cherries also, and probably plums. Peaches are said to be destroyed more than a hundred miles south of Memphis [Tennessee].”<sup>66</sup>

Geneva, Wisconsin in the *United States* on 1 January 1864 reported, “snow-drifts are from four to twelve feet high; roads running north and south are impassable. Large numbers of quails are found frozen in the snow.”<sup>66</sup>

Athens, Missouri in the *United States* reported, “From the 23d of December to the 23d of January the ground has been covered with snow to the depth of seventeen inches on a level, and drifted to the height of the fences. Many roads became impassable, the general depth of the drifts being six feet. We have had as deep snows before, but not so cold, nor drifted so badly. The timber was loaded down with snow, and much of it broken, especially the pin oak and black jack, which had the leaves on. Great numbers of cattle, sheep, hogs, and fowl have perished, and many persons have been frozen to death.”<sup>66</sup>

Mount Pleasant, Iowa in the *United States* described the weather on 31 December, “The wind blew a gale all day from the northwest, and the driving snow rendered the air dark, and made it almost impossible to go about out of doors. More stock [livestock] died on this night in Iowa than was ever before known in any month of time; cattle, sheep, and hogs were often buried in-snow-banks, where they perished by being smothered.”<sup>66</sup>

Pleasant Plain, Iowa in the *United States* reported that on 31 December, “a strong gale blew from the northwest all day and night, drifting the snow in such a manner as to fill roads so full as to entirely stop them, compelling everybody to take to the fields; all communication was stopped for several days.”<sup>66</sup>

New Bedford, Massachusetts in the *United States* reported that high winds on 2 January prevented the freezing of the Acushnet River and harbor. But on the 3<sup>rd</sup> a sheet of ice covered the river and harbor. On the 4<sup>th</sup> the River was passable by pedestrians and skaters above the bridge; ice broken daily below the bridge by the steam ferryboat to Fairhaven. The ice began to disappear on the 29<sup>th</sup>.<sup>66</sup>

Skaneateles, New York in the *United States* reported on January 8, the Skaneateles Lake was nearly frozen over. On the 12<sup>th</sup>, ice cutting commenced [ice for underground ice houses – early form of refrigeration]. On the 23<sup>rd</sup> it was reported that great quantities of ice taken from the lake the week past.<sup>66</sup>

Lyons (Clinton), Iowa in the *United States* reported that on 10 January the ice in the Mississippi River was from sixteen to twenty-two inches thick.<sup>66</sup>

Fishkill Landing (Beacon), New York in the *United States* on 11 January reported the Hudson River was crossed with heavy teams.<sup>66</sup>

Byberry, Pennsylvania in the *United States* on 18 January reported, “The cold spell for the greater part of this month has been something unusual in this vicinity. Ice has been housed ten inches in thickness. The Delaware River has been frozen over at Andalusia sufficiently to bear a man walking across. At Bristol, horses have been driven across on the ice.”<sup>66</sup>

Pekin, Illinois in the *United States* on 22 January reported the Illinois River frozen sufficiently to allow crossing on the ice. Muscatine, Iowa reported on 23 January that the ice on the Mississippi River was eighteen to twenty inches thick; very solid. St. Louis, Missouri on 26 January reported the Mississippi River began to break up and the ice to move after having been closed for a period of twenty-three days, and during that time crossed by heavy teams. Beverly Philipstown, Garrison's post office on 31 January

reported the Hudson River obstructed by floating ice on the 10th of December; closed on the 17th; remained closed throughout January; crossing good for teams most of the time; ice a foot in thickness. Iowa Falls, Iowa on 31 January reported the ice on the Iowa River was about twenty-eight inches thick.<sup>66</sup>

Manna Loa and Mauna Kea, the high mountain peaks on *Hawaii*, and Mount Haleakala, on Maui, were covered on their summits with beautiful white mantles of snow; the drifts in the gulches and valleys being often from twenty to thirty feet deep. The presence of snow on these mountains indicates cold weather higher up, their altitude being from ten thousand to fourteen thousand feet. There were several snowstorms on them during the several weeks in the winter. Snowstorms in the tropics are among the most beautiful sights imaginable, and the few who are privileged to see them witness some of nature's grandest exhibitions.<sup>66</sup>

The winters of 1860, 1863 and 1864 was very severe and covered southern *Europe* with snow and ice, and was very severe even in *Egypt*.<sup>205</sup>

In Shanghai in east-central *China*, during the winter, there was ice-skating [on the Yangtze River Delta] on three different occasions. The thermometer would stand at 50° F (10° C) at noon, and fall at night to 18° F (-8° C).<sup>66</sup>
