During 1864-66 in *Australia*, there was a national drought. A drought that prevailed over New South Wales caused losses in livestock and crop failure. A severe drought affected Queensland and this drought continued until 1869. The northern areas of Victoria were severely affected by the drought. But even the southern areas of Victoria saw reduced wheat harvest. In South Australia, drought conditions were particularly harsh in the north. The drought caused cattle to be reduced by a half and sheep by 330,000. Western Australia saw one of the worst seasons ever experienced in 1864, when much of the wheat crop failed. The De Gray and the Gascoyne Rivers dried up.<sup>101</sup>

In New South Wales, *Australia* in 1864, there was a drought.<sup>103</sup>

In New South Wales, *Australia* in 1865, there was a very dry summer. January 12<sup>th</sup> was declared a day of fast on account of the drought.<sup>103</sup>

In 1866 in New South Wales, *Australia* it was very dry from October to January.<sup>103</sup>

On 8 January 1866, the temperature at Lochinvar, New South Wales, *Australia* was 108° F (42.2° C) in the shade.<sup>103</sup>

---

**1864 A.D.** At Bradfield Reservoir (near Sheffield, South Yorkshire, *England*) on March 11, the embankment [the reservoir embankment of the Dale Dyke Dam] gave way at midnight; the water rushed in torrents through the neighboring villages. Great destruction of property, and 250 persons drowned.<sup>47, 92</sup>

On 11 March 1864, The Bradfield reservoir in *England* burst drowning about 250 persons.<sup>90</sup>

On 17 March 1864, a cyclone struck Brisbane in Queensland, *Australia*. There were three days of cyclonic winds from Brisbane to Gladstone. The storm damaged and unroofed houses in Brisbane, Cleveland, Toowoomba and Gladstone. The flooding at Maryborough reached the eaves of houses. The sailing ship *Panama* was driven onto a sand spit near Sandy Cape and broke in two. Eleven seamen died, only one body was found.<sup>99</sup>

On 14 May 1864, the Chemung River flooded and ran across the upper end of Athens, Pennsylvania in

the *United States* into the Susquehanna River.<sup>178</sup>

In June 1864, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 48 feet (14.64 meters) above the water mark at Windsor.<sup>99, 109</sup>

In 1864, California in the *United States* suffered from a serious drought caused by a lack of winter rains. There was a regular downpour in November 1863, and from that time until November 1864, there was no rain. Dead cattle covered the ground from Monterey to Southern California.<sup>200</sup>

On 5 October, a great cyclone struck at Calcutta, *India*. Immense damage was done on land and sea. A great part of Calcutta was laid to waste. About 200 ships were reported to be lost and about 70,000 people perished. Whole towns nearly destroyed.<sup>47, 57</sup>

On 5 October 1864, a dreadful hurricane in the Indian Ocean struck Calcutta, *India*.<sup>90</sup> [The typhoon killed 60,000 people and many more died later from sicknesses and diseases that followed.]

On 5 October 1864, a great cyclone struck Calcutta, *India*. Captain Watson, of the *Clarence*, observed the barometer falling foretelling the approaching cyclone and saved his ship by steering out of its range.<sup>90</sup>

On 5 October 1864, a great cyclone struck Calcutta, *India*. This was followed by a "bore" or spring tide in the Hooghly River. Water rose 30 feet high. Immense damage was done to shipping and houses. About 60,000 persons said to have perished.<sup>94</sup> [Calcutta is now Kolkata, capital of the northwestern Indian state of West Bengal. A "bore" or spring tide is a Hugli tidal bore. The tide runs rapidly on the Hugli, and produces a remarkable example of the fluvial phenomenon known as a "tidal bore". This consists of the head-wave of the advancing tide, hemmed in where the estuary narrows suddenly into the river, and often exceeds 7 feet (2.1 m) in height. It is felt as high up as Calcutta, and frequently destroys small boats. The Hooghly River is in West Bengal in *India*.]

In 1864, a powerful cyclone struck Calcutta, *India* causing 60,000 deaths.<sup>98</sup>

On 5 October 1864, a storm wave, 16 feet deep, caused the loss of 45,000 lives on the Ganges delta in *India* and *Bangladesh*.<sup>124</sup>

On 31 October 1864 at Arelas (Arles, *France*), the bridge of boats and much property destroyed by the sudden rising of the Rhône River.<sup>47, 92</sup>

In Lisbon, *Portugal* on the 13<sup>th</sup> of December, there was a great hurricane; much damage.<sup>57</sup>

On 13 December 1864, a hurricane struck at Lisbon, *Portugal* caused much damage. This was the worst storm in many years.<sup>90</sup>

On 13 December 1864, a gale struck Lisbon, *Portugal*. The gale destroyed 100 lives and caused \$2,000,000 in property damage. [In present currency, that would be equivalent to \$54.3 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

In 1864 during the period between 6 May and 8 August, floods struck Hupeh (now Hubei province) in central *China* at Kung-an. Also during the same period (between 6 May and 8 August), a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ang-shan. During the period between 8 August and 8 November, a drought engulfed Hupeh province at Ch'ung-yang and Hopei (now Hebei province) in northern *China* at Fu-ning. Also during the same period (between 8 August and 8 November), floods struck Hupeh province at Yün-hsi.<sup>153</sup>

Also refer to the section **1864 A.D. – 1866 A.D.** for information on the drought in Australia during that timeframe.

---

**Winter of 1864 / 1865 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1864 occurred on 13 & 14 November. It snowed enough for sleighing.<sup>116</sup>

The winter of 1864-65 in Bradford County, Pennsylvania in the *United States* was long and cold with deep snow. It was followed by a great flood on March 17<sup>th</sup>.<sup>178</sup>

The winter lasted from December to the end of March. The Seine River was frozen over at Paris, *France*, and people crossed the ice near the Pont des Arts.<sup>70</sup>

The winters of 1860, 1863 and 1864 was very severe and covered southern *Europe* with snow and ice, and was very severe even in *Egypt*.<sup>205</sup>

---

### **1865 A.D. – 1866 A.D. Bangladesh and India. Famine**

In 1865-66 in Bengal and Orissa there was a severe famine and about 1,000,000 perished.<sup>90</sup> [Orissa is in *India*. Bengal is in *Bangladesh* and *India*.]

In *India*, there was a severe drought in Orissa and parts of Madras [Chennai].<sup>47</sup>

In 1865, there was a famine at Orissa in *India* and in Bengal [Bengal today is West Bengal in *India* and East Bengal in *Bangladesh*].<sup>156</sup>

The Orissa [now Odisha on the east coast of *India*] famine in 1865-66 owed its severity to floods.<sup>179</sup>

In 1866, many crops were lost due to a hailstorm in some districts of Behar [now Bihar in northern *India*].<sup>179</sup>

A famine struck the Madras Presidency in *India* in 1866. The years 1864-65 were unfavorable to agriculture. In January 1866, the laboring classes were in dire straits and were forced to subsist on wild roots and plant leaves. Drinking water was failing in the district. In April; Vizagapatam, Bellary, Coimbatore, Salem and North Arcot were feeling the effect of the famine. In Bellary, people were subsisting on leaves, tamarind and date seeds. In June, the shortages became critical. The rains failed in many parts of the country. All agricultural operations came to a standstill. There was considerable suffering among the poorer classes in the Madras Presidency during the months of June through mid-November. The famine caused approximately 200,000 deaths throughout the Presidency.<sup>188</sup>

In *India* in 1866, there was an awful famine in the lower provinces of Bengal, Orissa, Behar, etc. It was reported that 1,500,000 persons perished.<sup>91</sup> “The total quantity of rainfall for the year [1865] was not unusually small in most of the districts of Bengal, but it fell abnormally and out of its normal time. Much rain fell early in the season, before the usual time for sowing, while the later rains, which are usually expected in the end of September and October, failed.” There was a great scarcity also in Madras Presidency, through many districts.<sup>57</sup>

After the great famine of 1769-70 in *India*, there were twenty great famine and over fifteen lesser ones that afflicted the country up to 1898. But the greatest of these was the famine of 1866, when between seven and eight million people in *India* fell victim to the famine.<sup>155</sup>

---

**1865 A.D.** In *England* on the 14<sup>th</sup> of January, there were severe gales; great damage to shipping.<sup>57</sup>

On 14 January 1865 in *Wales*, there were severe gales, doing much damage, and loss of life.<sup>90</sup>

In 1865 in Bradford County, Pennsylvania in the *United States* the year was noted for a spring flood and a remarkably mild fall. On 17 March 1865 (St. Patrick's Day), the highest water level (28 feet [8.5 m]) ever known in the Susquehanna River occurred. The warm weather and the rains melted the heavy body of snow, which caused the river to rise rapidly. By Friday morning (March 17) the water was several feet above high water mark. The floodwaters flowed over the banks at Towanda, submerging buildings and filling cellars on Water Street and in the lower part of the borough reaching Main Street. Floodwater in the lower story of the Court House was 4 feet 10 inches [1.5 m] from the floor of the jail. The rise was so rapid and unexpected that in many of the submerged dwellings and storehouses there was insufficient time to remove the furniture and goods to safety and as a result great damage was done. Much lumber piled upon the riverbank was swept away. The loss and damage to property in the northern part of the county, particularly between the Susquehanna and Chemung Rivers, was very great.<sup>178</sup>

In 1865 in *England*, there were destructive hailstorms in Cambridge, Huntingdon, Norfolk, and Oxford; and severe ones in other counties.<sup>93</sup>

On 9 May 1865 in northeastern *France*, there was a hailstorm at Catelet (Department of Aisne). In a tract of meadowland 1¼ miles in length, and about 2000 feet broad, there fell during the storm a quantity of hail, which was estimated as equal to 21,000,000 cubic feet of ice, approximating to 630,000 tons in weight.<sup>93</sup>

[On 9 May 1865] a hailstorm struck Vendhuile and Catelet in northern *France*. "A small side ditch of the canal of Saint Quentin, which serves to drain 500 hectares (1,250 acres) of land, received so much water and hail, that the flood mounted over the high embankments of the canal, swept before it a heap of 800 hectolitres (2,800 cubic feet) of coal, with which it precipitated itself into the bed of the navigable canal, which it obstructed in the most complete manner. I observed the day after the storm that this deposit of hail, extended over the length of 462 metres [500 yards], and a width of 20 metres (22 yards), presented at certain points a height exceeding 5 metres (5½ yards); it formed thus a volume of more than 40,000 cubic metres (53,000 cubic yards) so compact, that the water up the river, though raised 2 feet [0.6 meters] above the water down the river did not fall a millimeter in twenty-four hours. This deposit constituted a veritable glacier, on which we could walk without the least danger. When I succeeded in making a cutting in it to establish a current which would take it away, it became detached in considerable masses which floated in the water like icebergs."<sup>271</sup>

In 1865 during the period between 5 February and 6 May, a severe drought engulfed Hupeh (now Hubei province) in central *China* at Ch'i-shui. Then during the period between 25 April and 24 May, floods struck Hupeh province at Kung-an. During the period between 8 August and 8 November, a drought engulfed Hupeh province at Ma-ch'êng. During the period between 8 November 1865 and 8 August 1866, a drought engulfed Kao-hsing [Kaohsing].<sup>153</sup>

*Also refer to the section 1864 A.D. – 1866 A.D. for information on the drought in Australia during that timeframe. Also refer to the section 1865 A.D. – 1866 A.D. for information on the drought and famine in Bangladesh and India during that timeframe.*

---

**Winter of 1865 / 1866 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1865 occurred on 5 November. Some snow.<sup>116</sup>

The winter of 1865-66 in Bradford County, Pennsylvania in the *United States* was open with little snow, and not enough at any time for sleighing. On January 8<sup>th</sup>, temperatures dropped to -18° F [-28° C].<sup>178</sup>

In the *United States* during the winter of 1865-66, the temperature at Lewisburg, Pennsylvania fell to -23° F in December. The temperature at New York City, New York fell to -7° F on 8 January 1866. At the Brooklyn Navy Yard and on Bedford Avenue, Brooklyn, on the same day, temperatures of -12° F and -15° F, respectively, were recorded. The temperature in Providence, Rhode Island fell to -17° F in January. The temperature in Philadelphia, Pennsylvania fell to -9° F in January. The temperature at Paterson, New Jersey fell to -13° F in January. The temperature at Fort Delaware (located on Pea Patch Island in the Delaware River) fell to -5° F in January. The temperature at Spiceland, Indiana fell to -21° F in February.<sup>113, 126</sup>

---

**1866 A.D.** In *England* on the 6<sup>th</sup> through the 11<sup>th</sup> of January, there were severe gales; many vessels and lives lost.<sup>57</sup>

Severe gales; many vessels and lives lost on 6-11 January 1866, [especially off Torbay in Devon in southern *England*].<sup>90</sup>

On 28 February 1866, the high waters on the Susquehanna River in Pennsylvania in the *United States* took out a portion of the river dam at Towanda. During 12-19 July, the temperature reached 100° F [38° C] in the shade.<sup>178</sup>

On 10 May 1866, a terrific westerly gale strikes the settlement in the remote island *Tristan da Cunha*. It destroys two houses, crops, plantation and livestock.<sup>105</sup>

On 7 June 1866, a strong cloudburst struck Northfield, Massachusetts in the *United States*. [From Temple and Sheldon's History of Northfield.]<sup>138</sup>

On 12 July 1866, there was a great storm in New South Wales, *Australia*.<sup>103</sup>

On 26 September 1866, there were great inundations in *France*.<sup>47, 90</sup>

In September 1866 in *France*, there was most extensive damage from floods.<sup>92</sup>

On 30 September to 3 October 1866, a hurricane struck the *Turk Islands*, the *Bahamas* and offshore in South Carolina in the *United States*, causing more than 383 deaths.<sup>141</sup>

On 16-17 November 1866, there were great floods in the north of *England*. As a result, there was immense damage in Yorkshire, Lancashire, and Derbyshire. Farms were destroyed, mines flooded, and mills thrown down. Railways were stopped. There was much suffering at Leeds, where around 20 people drowned, and in Manchester, Preston, Wakefield, and other towns.<sup>90</sup>

In *England* in November, there were great floods in the north, especially in Yorkshire, Lancashire, and Derbyshire; farms destroyed, mills thrown down, railways stopped, and mines flooded. The towns of Leeds, Manchester, Preston, and Wakefield suffered much.<sup>47, 92</sup>

In the *Bahamas* at Nassau [on the island of] New Providence on the 1<sup>st</sup> and 2<sup>nd</sup> of October, there was a great hurricane. Above 600 houses and many churches and other buildings thrown down; between 60 and 70 persons killed, and a great many ships dismantled.<sup>57, 90</sup>

During the period between 8 November 1865 and 8 August 1866, a drought engulfed Kao-hsing [Kaohsing]. In 1866 during the period between 6 May and 8 August, floods struck Hupeh (now Hubei province) in central *China* at Ch'ung-yang, Hsien-ning and Kung-an [possible misprint, "Hsien-hsüan"] and Kiangsi (now Jiangxi province) in southern *China* at Tê-an. During the period between 6 May and 8

August, a drought engulfed Hupeh province at Wuchang and Chekiang (now Zhejiang province) on the east coast of *China* at Chiang-shan. During the period between 9 October and 6 November, floods struck Kiangsi province at Ch'ing-chiang [uncertain name, "Lin-chiang"] and Hupeh province at Wuchang. During the period between 9 October and 6 November, a drought engulfed Hupeh province at Hanyang and Ch'ung-yang.<sup>153</sup>

*Also refer to the section 1864 A.D. – 1866 A.D. for information on the drought in Australia during that timeframe. Also refer to the section 1865 A.D. – 1866 A.D. for information on the drought and famine in Bangladesh and India during that timeframe.*

---

**Winter of 1866 / 1867 A.D.** The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1866-67, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1866 occurred on 22 & 23 November. Two days' snowstorm.<sup>116</sup>

The winter of 1866-67 in Bradford County, Pennsylvania in the *United States* commenced on 16 December with a heavy snowfall. On the 16<sup>th</sup>, snow fell incessantly all day to the depth of more than a foot [30 cm]. A strong wind piled the snow in drifts, which were almost impassable. It was very cold until the middle of February. On May 8<sup>th</sup>, snow fell to the depth of several inches on the hills, and 10 inches [25 cm] deep at Barclay. During the month of May, it rained 23 days.<sup>178</sup>

In the *United States* during the winter of 1866-67, the temperature at Fort Buford (near Williston, North Dakota) fell to -40° F in March.<sup>113</sup>

On 9 May 1867, a late-in-the-season snowstorm at Idaho Springs, Colorado in the *United States* deposited snow to a depth of thirty-eight inches.<sup>113</sup>

---

**1867 A.D.** In January 1867, the temperature at Adelaide, *Australia* was 113.5° F (45.3° C) in the shade.<sup>103</sup>

On 3 March 1867, a cyclone struck Townsville and Bowen in Queensland, *Australia*. These towns were wrecked.<sup>99</sup>

On 2-3 March 1867, a cyclone struck Queensland, *Australia*. Townsville and Bowen were wrecked.<sup>101</sup>

In May 1867, there were several destructive hailstorms in various parts of *England*.<sup>93</sup>

In May 1867, after heavy rains, the Susquehanna River in Pennsylvania in the *United States* flooded. Bridges over the smaller streams were destroyed but the larger bridges were secured. All communications was suspended for two or three days. May had 23 rainy days.<sup>178</sup>

In June 1867, there was an extreme flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 63.2 feet (19.26 meters) above the water mark at Windsor. Up and down the Nepean-Hawkesbury valley were telltale signs bearing a blue line, which indicated the level reached by these legendary record floods of 1867 (the highest ever recorded in the 190 years of record keeping for this river system). This was when Sydney's northern beaches, from Long Reef to Barrenjoey, were littered with flood debris including houses, furniture, dead animals & farm produce. At least six people died in the floods.<sup>99, 109</sup>

In June 1867 in New South Wales, *Australia*, there was a flood, the highest flood in the memory of any of the white inhabitants.<sup>103</sup>

In June 1867, the Hunter River in New South Wales, *Australia*, flooded and the river reached a height of 30 feet above the high water mark.<sup>103</sup>

On 23 June 1867, there were disastrous floods in the Murrumbidgee and Murray rivers in New South Wales and Victoria, *Australia*. For the Murray River, this flood was the 4<sup>th</sup> highest at Albury and 2<sup>nd</sup> highest at Echuca ever recorded.<sup>99</sup>

On 29 July 1867, there was a terrific gale. Three pilot boats were upset and eight lives lost outside Sydney Heads, *Australia*.<sup>103</sup>

On 3 August 1867, a hurricane struck the east coast of the *United States*. There were 2 deaths [on land?] and all perished on a brig except for the captain.<sup>141</sup>

On 1-3 October 1867, a hurricane struck the east coast of Texas in the *United States*. Many lives were lost.<sup>141</sup>

On 29 October 1867, a hurricane struck St. Thomas in the *Virgin Islands* and *Puerto Rico* causing greater than 811 deaths.<sup>141</sup>

In the *West Indies* on the 29<sup>th</sup> of October, there was a dreadful hurricane off St. Thomas. The Royal mail steamers “Rhine” and “Wye” entirely wrecked. The “Conway” and “Derwent” and above fifty other vessels driven ashore and about 1,000 persons lost their lives.<sup>57</sup>

In Calcutta, *India* on the 1<sup>st</sup> of November, there was a cyclone. About 30,000 native huts swept away by the tidal wave; but only about 1,000 lives lost.<sup>57</sup>

On 1 November 1867, a cyclone struck Calcutta, *India*. About 30,000 small houses unroofed. Much small shipping was injured. The crops in the Lower Bengal [*India*] destroyed. About 90,000 persons drowned. About 75,000 died of cholera.<sup>94</sup>

In 1867, a terrible cyclone, followed by strong tidal waves, burst upon the seaboard of Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and caused not only the destruction of all crops but also a large number of human lives and heads of cattle.<sup>179</sup>

In *England* on the 2<sup>nd</sup> through the 4<sup>th</sup> of December, there was a destructive gale.<sup>57</sup>

Severe gales [in *Great Britain*]; many vessels and lives lost on 2-4 December 1867.<sup>90</sup>

In the famine years of 1867-68 in *Finland* about 8% of the population died of hunger and epidemics.<sup>151</sup>

In 1867, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 5 April and 3 May, floods struck Hupeh (now Hubei province) in central *China* at Lo-t’ien.

— During the period between 2 June and 1 July, floods struck Hupeh province at Chiang-ling and Hsing-shan.

— During the period between 29 August and 27 September, floods struck Hupeh province at I-ch’êng, Hsiang-yang, Ku-ch’êng, Chung-hsiang and Ch’ien-chiang; Kiangsi (now Jiangxi province) in southern *China* at Tê-an; and Shensi (now Shaanxi province) in central *China* at Chên-pa and Mien. At

Ch'ien-chiang, the dikes were damaged.

— During the period between 28 September and 26 October, the Yellow River flooded and floods struck Shantung (now Shandong province) on the east coast of *China* at Lin-i. [Lin-i is located at longitude 116.52° East and latitude 37.13° North.]

In 1867, a drought engulfed several regions of *China* including:<sup>153</sup>

— During the period between 6 May and 8 August, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ang-p'ing and Yü-t'ien; Shantung (now Shandong province) on the east coast of *China* at Tê; and Hupeh (now Hubei province) in central *China* at Huang-p'o and Ching-mên.

— During the period between 8 August and 8 November, a drought engulfed Chahar province (now eastern *Inner Mongolia*) at Huai-lai; Hopei province at Hsing-t'ai; and Hupeh province at Huang-kang and Wuchang.

In the years 1867-69 in *China*, droughts in the north were severely felt, though not sufficiently intense to cause famine, while the valley of the Yangtze was flooded to such a degree as to cause a local scarcity.<sup>165</sup>

**Winter of 1867 / 1868 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1867 occurred in November. It snowed 4 inches deep.<sup>116</sup>

The winter of 1867-68 in Bradford County, Pennsylvania in the *United States* was long and cold with deep snow banks. On the hills, there was continuous good sleighing from early December until the middle of April. On 12 December 1867, there was a snowstorm, one of the most extensive and violent ever known at this season of the year. It appeared to extend over the whole country. On 16 December, thermometers registered from -10° F to -30° F [-23° C to -34° C] at various localities. On 17 January 1868, there was a snowfall of 18 inches [46 cm]. On 7 February, temperatures dropped to the range of -22° F to -25° F [-30° C to -32° C]. On 7 April 1868, there was a late snowfall of several inches.<sup>178</sup>

In the *United States* during the winter of 1867-68, the temperature at Lewisburg, Pennsylvania fell to -23° F in December. The temperature at Camp Bidwell (near Chico, California) fell to -18° F in January and February. The temperature at Saint Paul, Minnesota fell to -39° F in January. The temperature at Guttenberg, Iowa fell to -37° F in February. The temperature at Brookside, Iowa fell to -35° F in February. The temperature at Randolph, Vermont fell to -31° F in February.<sup>113</sup>

### **1868 A.D. – 1870 A.D. India and Afghanistan. Famine**

In *India* during 1868-70, there was a famine and scarcity in a considerable number of northwest provinces, including Delhi, Meerut, etc. This was occasioned by failure of the harvest of 1868, following upon the inferior crop of 1867.<sup>57</sup>

In 1868-70, there was a famine in the Northwest Provinces, Punjab and Rajputana [now Rajasthan state] in *India*.<sup>156</sup>

In 1868-69 in Rajpootana [Rājasthān in northwestern *India*], there was a famine. About 1,500,000 perished.<sup>90</sup>

A famine struck Bundelkhand [now the states of Uttar Pradesh and Madhya Pradesh in central *India*] in 1868. At Chhindwara, the autumn harvest partly failed while the spring crops were poor owing to the absence of cold weather rain. Some distress was felt in Sausar Tehsil.<sup>180</sup>

The scarcity in the Panjab, *Afghanistan* during the year 1869 led to a famine. This famine began with the failure of the 1868 harvest. During the early months of 1868, so much rain fell that it affected the crops. The summer was exceedingly hot, and during July and August so little rain fell that it was of no

material benefit to the crops. The grass was burnt up and the cattle began to die in great numbers. Cattle usually fed on fodder called chari [joiodr stems]. But owing to the drought, this fodder had become hard and indigestible and produced severe inflammation of the bowels. This caused great mortality of cattle in some districts. In the districts south of the Satlej River and in the state of Rajputana, *India*; the wells and tanks dried up and water was impossible to procure. Villages were deserted and people flocked northward, driving their cattle to the banks of the Panjab Rivers, where they hoped to obtain sufficient grass to preserve their lives. By the beginning of October in the Panjab, the kharif crop had entirely failed and the grasses had withered away. The tanks dried up, and the wells became brackish and unserviceable. People abandoned their villages and joined the crowd of refugees from Rajputana to seek food and pasture elsewhere. During the last few days of January and the first ten days of February 1869, rain fell in considerable quantities in the Panjab. In March, so much rain fell in some districts that it injured the crops. In June, rain fell in the districts north of the Satlej River, but to the south, where it was urgently needed, there was little to none. The grass withered away. Locusts appeared in great numbers. Sickness caused by insufficient and bad food added to the distress. During July, rain fell but the weather was excessively hot, and the fierce winds like a blast furnace quickly dried up the moisture. The condition of the Panjab became critical in the extreme. But on 4-5 September, heavy rains fell, which literally saved the Panjab.<sup>187</sup>

---

**1868 A.D.** In *England* on the 22<sup>nd</sup> and 31<sup>st</sup> of January and the 1<sup>st</sup> of February, there were severe gales and destruction of shipping.<sup>57</sup>

Severe gales [in *Great Britain*]; many vessels and lives lost on 22 & 31 January and 1 February 1868.<sup>90</sup>

On 27 April 1868 in *England*, there was a very severe hailstorm. There were 8 other hailstorms more or less severe during the year.<sup>93</sup>

During 1-16 July 1868, the temperature in Bradford County, Pennsylvania in the *United States* ran 16 days in succession from 90° F to 103° F [32° C to 39° C]. In 1868 in Bradford County and a large section of country, black and grey squirrels swarmed the woods, wheat fields and barns. They could be found everywhere. In some places fields of grain were literally destroyed by them. Hunters would kill all they could carry in a few hours. The squirrels disappeared as strangely as they had come, and since then there have been no remarkable visitations by them. In pioneer times, plagues of squirrels struck every seven or eight years, at irregular intervals during the summer. A great army of black and grey squirrels invaded the wilderness from the northwest; a host that no man could number. They traveled east in search of food. Crows and squirrels became such a menace to the crops of the farmer that an Act was passed March 4th, 1807, giving a bounty of 3 cents for each crow scalp and 1½ cents for each squirrel scalp. These scalps were traded in lieu of money for taxes, if delivered to the Treasurer before the 1<sup>st</sup> day of November of each year. In 1811 black squirrels were very numerous; again in the fall of 1842 they swarmed through the wilderness in myriads.<sup>178</sup>

On 21 July 1868, the temperature in the shade at Camden-Square in London, *England* reached a peak of 93.3° F (34.1° C).<sup>97</sup>

In Baltimore, Maryland in the *United States* on 24 July, there was great damage to the city by flood. Many lives lost.<sup>47, 92</sup>

In 1868 a severe drought struck the region near Kalamazoo, Michigan in the *United States*.<sup>114</sup>

In New South Wales, *Australia*, there was a severe drought was in 1868, which was most felt in the Lachlan and Murrumbidgee Rivers.<sup>103</sup>

During 1868-69 in *Australia*, there was a drought in northern Victoria.<sup>101</sup>

In the famine years of 1867-68 in *Finland* about 8% of the population died of hunger and epidemics.<sup>151</sup>

In 1868 during the period between 5 February and 6 May, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow. During the period between 8 November 1868 and 5 February 1869, a drought engulfed Shantung (now Shandong province) on the east coast of *China* at Ling.<sup>153</sup>

In the years 1867-69 in *China*, droughts in the north were severely felt, though not sufficiently intense to cause famine, while the valley of the Yangtze was flooded to such a degree as to cause a local scarcity.<sup>165</sup>

*Also refer to the section 1868 A.D. – 1870 A.D. for information on the famine in India and Afghanistan during that timeframe.*

---

**Winter of 1868 / 1869 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1868 occurred on 17 October. It snowed some hours.<sup>116</sup>

The winter of 1868-69 in Bradford County, Pennsylvania in the *United States* was mild with much fine sleighing. On 7 December, there was a heavy snowstorm with wind, making good sleighing. On 11 January 1869, there was a snowfall of 8 inches [20 cm].<sup>178</sup>

In the *United States* during the winter of 1868-69, the temperature at Glendale, Nebraska fell to -30° F in December. The temperature in Lunenburg, Vermont fell to -30° F in December. The temperature at Fort Abercrombie, North Dakota, fell to -40° F in February and March.<sup>113</sup>

At Christmas, 1868, and again at Christmas, 1870, there were two of the severest frosts that had been known in Florida in the *United States* since 1835. At each of these dates many young buds were ruined, many young seedlings frozen to the ground and much fruit destroyed.<sup>115</sup>

---

**1869 A.D.** In *Ireland* on 30 January 1869, there were great floods in Cork, Dublin, and other places.<sup>47, 90, 92</sup>

On 19 May 1869 in *England*, there was a hailstorm, the effects of which extended over parts of 8 counties.<sup>93</sup>

On 15 June 1869 in *England*, there was a hailstorm, which extended over portions of 14 counties.<sup>93</sup>

On 8 September 1869, a hurricane struck New England in the *United States*. There was one death in Massachusetts. All the crew except for one man perished on the schooner *Helen Eliza* in Maine.<sup>141</sup>

On 8 September 1869, a violent gale struck New England in the *United States*. The storm path was very narrow, only 50 miles [80 kilometers] wide. It passed over Narragansett Bay, Rhode Island and Buzzard Bay, Massachusetts in a northerly direction, then Boston, then Cape Ann where it followed the shoreline into the coast of Maine. The winds were hurricane force. The rain came down in sheets. There was great damage done at both land and sea.<sup>199</sup>

— At Boston, Massachusetts, the famous Coliseum building was wrecked with its great organ and big drum. The spire of the Hanover Street Methodist Church was blown down. In Chelsea, Massachusetts, a tenement block was entirely blown down. In Lynn, the spire of the First Baptist Church, which was 160 feet [49 meters] high, came crashing down on the west wing of the church. In Marblehead Neck, a house was blown down. At Peabody, a large building, 200 feet [61 meters] long, was blown over and several other houses were either blown down or damaged. At Beverly, two houses and several other buildings

were blown down. At Hamilton, the wind destroyed a great barn, which was 100 feet [30 meters] long. — Many vessels dragged their anchors in the harbor. Several vessels were driven ashore at Marblehead, Massachusetts and at Kennebunk, Boothbay, Portland and Orr's island in Maine. Wrecks strewn the shoreline at Gloucester, Massachusetts. The schooner *Helen Eliza* struck Peak's Island, Maine, and was wrecked. Only one crewmember survived.

In *England* on the 11<sup>th</sup> and 12<sup>th</sup> of September, there were great storms and loss of shipping.<sup>57</sup>

Severe gales [in *Great Britain*]; many vessels and lives lost on 11-12 September 1869.<sup>90</sup>

On 4 October 1869, a hurricane struck New York and Maine in the *United States* and the coastal region of New Brunswick, *Canada* causing 37 deaths.<sup>141</sup> [The Saxby Gale was the name given to a tropical cyclone which struck eastern Canada's Bay of Fundy region on the night of 4/5 October 1869.]

In October 1869, there were the worst floods on record at Northfield, Massachusetts in the *United States*, particularly in the Connecticut River. [Quoted from a local diary kept by A.D. Elmer, Sr., and refers especially to Northfield, as equally heavy floods have occurred in the lower Connecticut.]<sup>138</sup>

In 1869 there were heavy floods in Queensland, *Australia*.<sup>103</sup>

In 1869 during the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Ch'ing.<sup>153</sup>

In the years 1867-69 in *China*, droughts in the north were severely felt, though not sufficiently intense to cause famine, while the valley of the Yangtze was flooded to such a degree as to cause a local scarcity.<sup>165</sup>

*Also refer to the section 1868 A.D. – 1870 A.D. for information on the famine in India and Afghanistan during that timeframe.*

**Winter of 1869 / 1870 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1869 occurred on 27-30 October. It snowed some hours each day.<sup>116</sup>

The winter of 1869-70 in Bradford County, Pennsylvania in the *United States* produced a heavy snowfall on 18 December. The winter was open and mild. Most of January and February produced spring like weather, although 15 inches [38 cm] of snow fell on 8 February, and 2 feet [0.6 m] fell on 15 & 16 March.<sup>178</sup>

The winter of 1869-70 in New England in the *United States* was mild. The weather was mild during the first two months of winter but then the weather turned stormy. Spring was late and cold.<sup>199</sup>

### **1870 A.D. – 1872 A.D. Iran. Famine**

There was a great famine in *Persia* during 1870-71. Over a wide area of the country almost no rain fell during the winter of 1869/70 and in the following year only the western and southern provinces receive rain. Many areas did not receive a single drop of rain during this two-year period. In the region that is presently *Iran*, the areas of Khurasan, Isfahan [Esfahān], Yazd and Fars were hit particularly hard. The Zayandeh-rud [Zayanderud River] dried up. The drought caused food prices to rise dramatically. In Kashan, the price of wheat rose to twenty times the normal price.<sup>89</sup> [*Persia* is now *Iran*. Khurasan is located in northwestern *Iran*. Isfahan and Yazd are in central *Iran*. Fars is in southwestern *Iran*. Zayandeh-rud is the largest river on the central plateau of *Iran*. Kashan is in north-central *Iran*.]

In *Persia* during 1871-72, there was a severe famine.<sup>57, 90, 91</sup>

One of the most terrible famines raged in *Persia* in 1870-72. The distress and starvation was greatly increased through the hideous rapacity and stupidity of the authorities. About 1,500,000 (nearly one-fourth of the entire population) perished. A traveler reported that a few years later, while traveling through large towns and cities, that they were almost entirely depopulated. And misery reigned supreme among many of the survivors.<sup>155</sup>

---

**1870 A.D.** During 30 January to 20 February 1870, a cyclone struck Queensland, *Australia*. Townsville and Bowen were badly damaged. Fallen trees block the main road, Finders Street, in Townsville. Several ships were destroyed. Clermont was flooded.<sup>101</sup>

On 30 January 1870, a cyclone struck Bowen in Queensland, *Australia*. The cyclone caused heavy damage and flooding in Bowen and the district. Many houses were damaged by winds. Flying debris killed one man. Clermont had a 5-foot (1.5 meter) flood, which carried away many houses and drowned residents. At Peak Downs and Lilyvale, nine people were drowned. A total of 14 people died in the floods. Approximately 10,000 sheep were lost.<sup>99</sup>

On 20 February 1870, a cyclone struck Townsville in Queensland, *Australia*. The cyclone caused very heavy damage to the town affecting almost every house. Two ships were destroyed.<sup>99</sup>

On 21 February 1870, there was a great cyclone at Townsville in Queensland, *Australia*.<sup>103</sup>

In 1870 in *Australia*, there were many floods. New South Wales, Victoria and Tasmania experienced heavy flooding. In South Australia, the Murray River reached record river heights. The Avon and Swan Rivers in Western Australia experienced severe floods.<sup>101</sup>

On 5 March 1870, a cyclone struck Maryborough in Queensland, *Australia*. The cyclone damaged many buildings and leveled weaker homes at Maryborough. The wharf was inundated and damaged. Communications were cut off. The storm caused heavy flooding in the region. Many houses were flooded and four at Gympie washed away. One person drowned.<sup>99</sup>

On 17 April 1870, at Knoxville, Tennessee in the *United States*, the weather produced a cold, cloudy day, with snow.<sup>130</sup>

In April 1870, there was a moderate flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 45 feet (13.72 meters) above the water mark at Windsor.<sup>99, 109</sup>

In 1870, the Murrumbidgee River flooded five times in New South Wales, *Australia*. On 27 April the river rose to 38 feet above the high water mark at Gundagai and 35 feet at Wagga Wagga. On 14 May the river height reached 32 feet at Gundagai and 32 feet 6 inches at Wagga Wagga. On 24 May the river height reached 28 feet 6 inches at Gundagai and 28 feet at Wagga Wagga. On 4 June the river height reached 28 feet 6 inches at Gundagai and 28 feet at Wagga Wagga. On 30 October the river height reached 30 feet 4 inches at Gundagai and 31 feet at Wagga Wagga.<sup>103</sup>

In 1870 in New South Wales, *Australia*, at Palmer's Farm of 100 acres; 50 acres were washed away and the confluence of the Hawkesbury and the Grose rivers were entirely changed.<sup>103</sup>

On 15 June 1870, one of the most destructive floods ever known struck Sugar Run Creek in Wilmot Township in Bradford County, Pennsylvania in the *United States*. Hardly a bridge or milldam was left standing over the whole length of the creek. Farms were deluged, crops destroyed, buildings undermined and roads washed away.<sup>178</sup>

On 16 and 17 June 1870 in *England*, there were severe storms of short duration, but great destructiveness, on each of these days.<sup>93</sup>

On 30 July 1870, a storm [hurricane] struck Mobile, Alabama in the *United States*. This was the earliest hurricane on record at Mobile; the [storm surge] high-water mark was about the same as that of 1860 hurricane.<sup>117</sup>

In July and August 1870, there were major record setting floods in New South Wales, Victoria and South Australia regions of *Australia*. The floods included the highest known flood levels in the Murray River. The record flood heights at Mildura and Echuca and other centers downstream of Yarrowonga caused heavy crop losses and damage to buildings and homes. The Ovens River produced the highest flood level ever recorded at Wangaratta. The Goulburn River produced the 3<sup>rd</sup> highest flood level ever recorded at Shepparton. The Campasope River produced the 3<sup>rd</sup> highest flood level ever recorded at Rochester and Echuca.<sup>99</sup>

On 9 September 1870, there were great floods in Victoria, *Australia*.<sup>103</sup>

In October 1870, there were great floods in *Western Australia*.<sup>103</sup>

On 7-8 October 1870, a great Atlantic hurricane struck *Cuba* causing approximately 2,000 deaths.<sup>107</sup>

On 7-8 October 1870, a hurricane struck *Cuba*. [Various accounts lists the number of deaths as 2000, 1000, >800 and 136.]<sup>141</sup>

On 20 October 1870, a hurricane struck offshore central Florida and Virginia in the *United States* causing more than 52 deaths.<sup>141</sup>

On 6 November 1870, there was a great storm at Sydney, *Australia*; attended with loss of life.<sup>103</sup>

In Rome, *Italy* in December, there were considerable floods, causing great distress.<sup>47, 92</sup>

On 28-29 December 1870, inundation at Rome, *Italy* causing great distress, which was relieved by the king.<sup>90</sup>

In 1870 during the period between 5 February and 6 May, a drought engulfed Hopei (now Hebei province) in northern *China* at Hsin-yüeh and Shantung (now Shandong province) on the east coast of *China* at Huang. Then during the period between 29 June and 27 July, floods struck along the Hu-t'ö River in Hopei province and in Hupeh (now Hubei province) in central *China* at I-ch'êng, Chih-chiang, Kung-an, Tzū-kuei and Huang-kang. At Chih-chiang, almost all the houses were damaged by the floodwaters. During the period between 8 August and 8 November, floods struck Shensi (now Shaanxi province) in central *China* at Tso-shui and Hupeh province at Ao-ch'êng and Huang-p'ö.<sup>153</sup>

*Also refer to the section 1868 A.D. – 1870 A.D. for information on the famine in India and Afghanistan during that timeframe.*

*Also refer to the section 1870 A.D. – 1872 A.D. for information on the drought and famine in Iran during that timeframe.*

---

**Winter of 1870 / 1871 A.D.** The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1870-71, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

The winter of 1870-71 will always be remembered as that during which the siege of Paris, *France* was carried on, and the last scenes of the Franco-Prussian war took place. The winter was severe because of the extreme cold in December and January (notwithstanding the mild weather of February), and also because of the fatal influence, which the cold exercised upon the public health at the close of the war with *Germany*. "The great equatorial current [the winds which blow over the prolongation of the Gulf Stream] which generally extends to *Norway*, stopped this year at *Spain* and *Portugal*, the prevailing wind being from the north. On the 5<sup>th</sup> of December, there was a temperature of 5.0° F (-15° C) degrees and on the 8<sup>th</sup>, at Montpellier [*France*] the thermometer stood at 17.6° F (-8.0° C). A second period of cold set in on the 22<sup>nd</sup> of December, lasting until the 5<sup>th</sup> of January. In Paris, the Seine [River] was blocked with ice, and seemed likely to become frozen over. On the 24<sup>th</sup> [of December] there were 21.6 degrees of frost (10.4° F, -12° C); and at Montpellier on the 31<sup>st</sup>, 28.8 degrees (3.2° F, -16° C). It is well known that many of the outposts around Paris, and several of the wounded that had been lying for fifteen hours upon the field were found frozen to death. From the 9<sup>th</sup> to the 15<sup>th</sup> of January a third period of cold set in, the thermometer marking 17.6° F (-8.0° C) at Paris, and 8.6° F (-13.0° C) at Montpellier. The most curious fact was that the cold was greater in the south than in the north of *France*. At Brussels, the lowest temperature was 11.1° F (-11.6° C) in December and 8.2° F (-13.2° C) in January. There were forty days of frost at Montpellier [*France*], forty-two at Paris [*France*], and forty-seven at Brussels [*Belgium*] during these two months." In *Northern Europe*, this was also a very hard winter, though the cold set in at a different time than that for *France*. There were forty days of frost at Copenhagen, *Denmark*. On February 12 the temperature was -5.0° F (-20.6° C) in Copenhagen. In Périgueux in southwestern *France* the temperature fell to -9.4° F (-23.0° C) and at Moulins, *France* the temperature fell to -13.0° F (-25.0° C).<sup>70</sup>

The winter of 1870-71 in Bradford County, Pennsylvania in the *United States* was open and mild with little snow. Farmers plowed their fields during the greater part of January and all of February. On 6 February, temperatures dropped to -6° F [-21° C]. During the first week in March, people sat in their homes without fires and with their doors and windows open.<sup>178</sup>

At Christmas, 1868, and again at Christmas, 1870, there were two of the severest frosts that had been known in Florida in the *United States* since 1835. At each of these dates many young buds were ruined, many young seedlings frozen to the ground and much fruit destroyed.<sup>115</sup>

---

**1871 A.D.** In *England*, there were extensive floods.<sup>47, 92</sup>

In Prome, Burmah (Pyay, *Burma*), there were great floods.<sup>47, 92</sup>

In 1871, a flood on the Gumti River wrecked 4,000 homes at Jaunpur in the state of Uttar Pradesh, *India* and another 9,000 in villages along the river.<sup>181</sup>

On 22 & 23 April 1871, there was "frost at night" at Knoxville, Tennessee in the *United States*.<sup>130</sup>

From April 17 to August 18, 1871, there were nineteen severe hailstorms that visited different parts of *England* between these dates. There were two storms in April, one in May, four in June, nine in July, and three in August. The most destructive hailstorms were in July.<sup>93</sup>

In July 1871, there was a great storm in Tasmania, *Australia*.<sup>103</sup>

On 6 July 1871, a heavy shower accompanied by wind and lightning, passed over Granville, LeRoy and Franklin, Pennsylvania in the *United States*. In its course fences were prostrated, fruit trees uprooted and acres of timber laid low. In August, the water level on the Susquehanna River was extremely low.<sup>178</sup>

In the *West Indies* on the 21<sup>st</sup> of August, a hurricane desolated Antigua, St. Kitts, and other islands; many buildings destroyed.<sup>57</sup>

A cyclone desolated Antigua, St. Kitts, and other isles; religious and manufacturing buildings destroyed, and thousands made homeless on 21 August 1871.<sup>90</sup>

On 21 August 1871, a hurricane struck the *Virgin Islands* causing 27 deaths.<sup>141</sup>

On 21 August 1871, a hurricane struck St. Kitts in the *West Indies*.<sup>144</sup>

In September 1871, there were great floods in *New Zealand*.<sup>103</sup>

In 1871 during the period between 5 February and 6 May, a severe drought engulfed Hopei (now Hebei province) in northern *China* at Pao-ting. Crops were damaged. Then during the period between 6 May and 8 August, floods struck Hopei province at Wu-ch'ing and P'ing-ku. During the period between 8 August and 8 November, floods struck Hupeh (now Hubei province) in central *China* at Kung-an and along the Ssü River in Shantung (now Shandong province) on the east coast of *China* where the dikes were damaged.<sup>153</sup>

In 1871, at Chihli, Shingking and the other northern provinces in *China* suffered from an excess of rain, while Chêhkiang and partially Kiangsu were deprived of their ordinary rainfall. The monsoon at Shanghai generally breaks up about the end of August and cooler weather and variable winds mark the beginning of September. In 1871 the summer monsoon had apparently broken up, and the residents were looking forward to ordinary autumnal weather. On the 4<sup>th</sup> of September the southerly monsoon again set in with a remarkable rise in temperature, the average by day being 86° F. Increasing during the week from the 16<sup>th</sup> to the 22<sup>nd</sup> to 91° F. The enormous quantities of water carried north by this unusual phenomenon were deposited in a belt from 150 to 200 miles wide, and which was traced from Shantung by Peking, Siuen-hwa-foo, Tai-yuen-foo to the valley of the upper Han and the north and west of Szech'wan, in the latter district lasting for six days and causing a local famine. The length of this belt of rainfall must thus have been at least 1,500 miles.<sup>165</sup>

On 2-3 October 1871, a hurricane struck the east coast of Texas in the *United States*. There were 2 deaths [on land?] plus a steamer foundered and all hands were lost with the exception of one man.<sup>141</sup>

In 1871, a prolonged and widespread drought and high temperature turned the Upper Midwest of the *United States* into a tinderbox. And then on October 8, a furious storm with extreme gale force winds roared through the Midwest setting off a series of firestorms.<sup>159, 160, 161, 162, 163, 164</sup>

On the evening of October 8, 1871 the worst recorded forest fire in North American history raged through Northeastern Wisconsin and Upper Michigan, destroying millions of dollars worth of property and timberland, and taking between 1,200 and 2,400 lives. The firestorm destroying between 1.2 to 1.5 million acres of forest. This fire later became known as the Great Peshtigo Fire because of the devastation it brought to Peshtigo, Wisconsin. The damage was estimated at \$169 million from this massive forest fire. [In present currency, that would be equivalent to \$3 billion in damages based on the Consumer Price Index (CPI) inflation rates.]

On Sunday evening of October 8, a fire started in Chicago, Illinois and quickly spread throughout the entire city. It burned for two days and devastated the entire central business district of Chicago. The fire killed at least 300 people, destroyed 3.3 square miles of buildings, made 90,000 people homeless and caused \$222 million of damage. [In present currency, that would be equivalent to \$4 billion in damages based on the Consumer Price Index (CPI) inflation rates.]

On October 8 & 9, a firestorm destroyed Holland, Michigan. One life was lost, and 300 families were made homeless. Destroyed were 210 dwellings, 75 stores/shops/offices, 15 manufacturing factories, 5 churches, 3 hotels, 45 miscellaneous buildings, 5 docks and warehouses, one tugboat. Property damage was estimated at \$900,000. [In present currency, that would be equivalent to \$16 million in damages based on the Consumer Price Index (CPI) inflation rates.] “The entire territory covered by the fire was mowed as clean as with a reaper; there was not a fencepost or sidewalk plank and hardly a stump of a shade tree left.”

On October 8, a firestorm, a sea of flame, destroyed Manistee, Michigan. The fire caused an estimated \$1 million in damages, a large portion of the population were left homeless, and many of the lumber mills in which the men were employed totally obliterated. [In present currency, that would be equivalent to \$18 million in damages based on the Consumer Price Index (CPI) inflation rates.] “Buildings, foundations, fences, sidewalks, trees, shrubbery – everything – was mowed close to the surface of the earth, and grass burned out by the roots.”

On October 8, the Great Michigan Fire swept from one side of the state of Michigan to the other side, from Lake Michigan to Lake Huron. This date was remembered afterwards as “The Day Michigan Burned”. Holland was reduced to ashes, Manistee nearly consumed, Glen Haven destroyed. The Saginaw Valley and territory northwest as far as the Au Sable River were fire swept. The fires reached the “Thumb” region of Michigan. Port Huron, Sand Beach, White Rock and Forestville completely destroyed and two thirds of the population of Huron and Sanilac County were left homeless. The fire burned 2 million acres between Lake Michigan and Lake Huron. Rough estimates place the death toll as greater than 500 people.

On October 12, a fire in Windsor, Ontario, *Canada* [near Detroit, Michigan] consumed much of downtown, destroying over 100 buildings.

*Also refer to the section 1870 A.D. – 1872 A.D. for information on the drought and famine in Iran during that timeframe.*

**Winter of 1871 / 1872 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1871 occurred on 10 November. Rain, hail, and snow.<sup>116</sup>

The winter of 1871-72 in Bradford County, Pennsylvania in the *United States* was comparatively mild. The coldest weather was in March and the coldest day of the season, 4 March, when thermometers registered -12° F [-24° C]. Short intervals of good sleighing followed the snowfalls of 3 February and 15 April. Ice in the Susquehanna River broke up and passed out on 5 April. The winter was memorable for a severe and protracted drought. Springs, wells and creeks went dry. Many people were compelled to melt ice to get water for ordinary purposes. Livestock had to be driven long distances for water, or supplied from water drawn in barrels.<sup>178</sup>

In the *United States* during the winter of 1871-72, the temperature at Camp Baker, Montana fell to -53° F (-47.2° C) in December. The temperature at Madison Barracks (Sackets Harbor, New York) fell to -44° F (-42.2° C) in December. The temperature at Fort Ellis (Bozeman, Montana) dropped to -53° F (-47.2° C) in January and February.<sup>113</sup>

**1872 A.D.** In *England* on the 24<sup>th</sup> of January, the barometer very low, great storm; much damage.<sup>57, 90</sup>

In *India* on the 1<sup>st</sup> of May, there was a destructive cyclone at Madras [Chennai]; ships lost.<sup>57, 90</sup>

In June 1872, a fierce gale struck *Inaccessible Island*, the second largest island in the remote Tristan Group. The storm causes a whaleboat to be washed off the beach and wrecked. As a result, the

inhabitants, the two Stoltenhoff brothers, lose their ability to move about the islands, which by August 10 caused their stores of provisions to run short.<sup>105</sup> [Inaccessible Island is located southwest of Tristan da Cunha in the south Atlantic Ocean.]

In *England*, after several days' intense heat, violent storms broke out producing deluges of rain in the midland and southern counties. These occurred on the 24<sup>th</sup> – 26<sup>th</sup> of June. Other storms struck in July and August. Violent gales occurred on the 8<sup>th</sup> of December.<sup>57</sup>

On 11 June 1872, there were great floods in Tasmania, *Australia*.<sup>103</sup>

On 24-26 June 1872, after several days' intense heat, violent storms, and deluges of rain in midland and southern counties [of *England*]; several persons killed.<sup>90</sup>

Between April 18 and September 4, 1872, there were 54 hailstorms in *England*. Some of the storms were of a very destructive character.<sup>93</sup>

The summer of 1872 in Bradford County, Pennsylvania in the *United States* was remembered for numerous electrical storms during which many buildings were struck by lightning and burned.<sup>178</sup>

The storms throughout *Europe* during summer were intense and violent.<sup>57</sup>

On 11 July 1872, one of the hailstorms that visited the Eastern part of Essex, *England* inflicted damage on the grain crops to the extent of over £10,000. A public subscription was started at Colchester.<sup>93</sup>

In July 1872 in *England*, the River Medlock overflowed its banks and caused great destruction of property.<sup>47, 92</sup>

On 10 August 1872, there was a heavy snowstorm within 30 miles of Sydney, *Australia*.<sup>103</sup>

In *Italy* in October, there were great floods in the north; the Po River and other rivers overflowed; thousands of people unhoused. Mantua, Ferrara, etc. suffered much.<sup>47, 92</sup>

During the latter part of October 1872, there was a great inundation from the mountains in northern *Italy*. The Po and other rivers overflow. Thousands of people lost their homes. Mantua, Ferrara, and nearby cities suffered much damage.<sup>47, 90</sup>

On 8 December 1872, a violent gale [in *Great Britain*]; much destruction (wind, greatest velocity 57 miles an hour).<sup>90</sup>

On 16 December 1872, near Bathurst in New South Wales, *Australia*, the town of Kelso was partly submerged during a flood.<sup>103</sup>

On 21 December 1872, there were heavy floods at Inverell in New South Wales, *Australia*.<sup>103</sup>

In *India*, there were great floods in Khandeish and Nassick (Bombay Presidency). These floods were mainly attributable to the denudation of the hills of their forest trees.<sup>47</sup> [Khandeish (Khandesh) is located in central *India*. Nassick (Nashik) is located in north-central *India*.]

In 1872 during the period between 5 February and 8 August, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow. Then during the period between 8 April and 6 May, floods struck Hupeh (now Hubei province) in central *China* at Kung-an and Chih-chiang. During the period

between 6 July and 3 August, floods struck along the Hu-t'ò River in Hopei (now Hebei province) in northern *China* and in Kiangsu (now Jiangsu province) on the east coast of *China* at Kao-ch'un, Yangchow and Lin-ch'ü.<sup>153</sup>

*Also refer to the section 1870 A.D. – 1872 A.D. for information on the drought and famine in Iran during that timeframe.*

---

**Winter of 1872 / 1873 A.D.** On 7 September 1872, snow fell in Detroit, Michigan in the *United States*.<sup>135</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1872 occurred on 29 November. Snow, hail, and thunder.<sup>116</sup>

During the winter of 1872-73 in Bradford County, Pennsylvania in the *United States* the first snow fell on 19 December. On 17 January, ice in the Susquehanna River broke up and passed out. On 30 January the temperature fell to -26° F [-32° C]. On 27 March, the snow was so deep in the woods that [maple] sugar makers were unable to gather sap. On 21 & 22 April, snow fell to the depth of nearly two feet [0.6 m]. On 3 May, it snowed on the highlands.<sup>178</sup>

The blizzard of 7-10 January 1873 was very severe and violent in the Dakotas in the *United States*.<sup>121</sup>

In the *United States* during the winter of 1872-73, the temperature at Fort Townsend, Washington fell to -22° F in December. The temperature at Shelbyville, Indiana fell to -27° F on January 29. The temperature dropped to -30° F at Logansport, Indiana in January. The temperature dropped to -22.9° F at Saint Louis, Missouri in January. The temperature at Rock Island Arsenal, Illinois fell to -29° F in January. The temperature at La Crosse, Wisconsin fell to -43° F in January and -23° F in March. The temperature at Milwaukee, Wisconsin fell to -21° F in January. The temperature at Escanaba, Michigan fell to -28° F in January. The temperature at Rochester, New York fell to -13° F in January. The temperature at Omaha, Nebraska fell to -21° F in January. The temperature at Fort Garland, Colorado fell to -40° F in January. The temperature at Fort McHenry (at Baltimore, Maryland) fell to -15° F in January. The temperature at Carlisle Barracks (Carlisle, Pennsylvania) fell to -28° F in January. The temperature at Fort Brady (at Sault Sainte Marie, Michigan) fell to -42° F in January. The temperature at Fort Davis, Texas fell to -15° F in January. The temperature at Atlanta, Georgia fell to 3° F in January. The temperature at Leavenworth, Kansas fell to -29° F in January. The temperature at Dodge City, Kansas fell to -20° F in January. The temperature at New London and New Haven, Connecticut fell to -14° F in January. The temperature at Fort Fetterman (near Douglas, Wyoming) fell to -40° F in February. The temperature at Saint Paul, Minnesota fell to -22.5° F in March. The temperature at Breckenridge, Minnesota fell to -32° F in March.<sup>113, 126</sup>

The storm of 13-16 April 1873 was one of the most severe that ever occurred in South Dakota in the *United States*. It was generally known as the "Custer Blizzard," because General Custer, United States Army, was encamped at that time at Yankton, South Dakota. General A. W. Greely, in his volume, *American Weather*, says of this storm: "The wind blew at Yankton, South Dakota, from 13<sup>th</sup> to 16<sup>th</sup>, inclusive, for a continuous period of nearly one hundred hours, at an average velocity of 39 miles per hour, and on April 15 the velocity for the entire twenty-four hours was over 52 miles per hour. This hurricane-like wind was accompanied by fine drifting snow, which was like sand, and so filled the air that one could not see a dozen yards. The Seventh Regiment, United States Cavalry, was encamped at Yankton at the time, and for more than forty-eight hours officers and men alike were obliged to seek shelter in the houses of the citizens."<sup>137</sup>

“The frost which scourged all the vineyards in *France* during the nights of 24<sup>th</sup>, 25<sup>th</sup>, and 26<sup>th</sup> of April, when also snow and hail fell at intervals and often in abundance, has proved most fatal in Champagne.”  
“On the authority of the most trustworthy accounts from all quarters, it may fairly be reckoned that at present a proportion equal to two-thirds of the Champagne crop has been annihilated.”<sup>47</sup>

In *France* in 1873, there was a severe frost; great damage done to the vineyards.<sup>93</sup>

---

**1873 A.D.** On 14 January 1873, there were great flood of the Condamine River in Queensland, *Australia*. At the same time there were disastrous floods at Normanton.<sup>103</sup>

In February 1873, there were floods in Sydney and Hawkesbury Valley, New South Wales, *Australia*. The water level was recorded at 41.5 feet (12.66 meters) above the water mark at Windsor. Sydney flooded. Water was 5 feet (1.5 meters) in Pitt Street. There was severe damage to buildings and one person drowned.<sup>99, 109</sup>

On 1 June 1873, there were heavy floods at Cooma in New South Wales, *Australia*.<sup>103</sup>

In *Scotland* on the 22<sup>nd</sup> and 23<sup>rd</sup> of July, there was an awful storm; much loss of life and property.<sup>57, 90</sup>

From April to September 1873, there were 14 more-or-less serious hailstorms in *England*, extending their damage into 16 different counties.<sup>93</sup>

In *France*, the losses in 1873 from hailstorms were estimated at £2,372,971. [In today's currency, that would be the equivalent of £156,000,000 or \$254,000,000 U.S. dollars using the retail price index.]<sup>93</sup>

The hurricane of 14-27 August 1873 was one of the most destructive storms that ever visited the Atlantic coast of the *United States*. It recurved between the island of Bermuda and Cape Hatteras, North Carolina and its center at no time touched the coastline. Twelve hundred and twenty-three vessels were known to have been destroyed, and two hundred and twenty-three human lives were definitely reported as lost.<sup>120</sup>

A severe storm [hurricane] struck North America in August 1873, which caused the loss of probably 600 lives and over 1,000 vessels, involving losses aggregating \$3,500,000, and seriously crippled the fishing interests of the *United States* and *Canada*. [In present currency, that would be equivalent to \$63 million in damages based on the Consumer Price Index (CPI) inflation rates.] This storm first appeared at Saint Thomas, *Virgin Islands* on the 18<sup>th</sup> and *Bermuda* on the 21<sup>st</sup>.<sup>121</sup>

On 24-27 August 1873, a hurricane struck Nova Scotia, *Canada* and the western *Atlantic Ocean*. [Various accounts list the number of deaths as >600, 600, 223, and 128.]<sup>141</sup>

On 26 September to 9 October 1873, a hurricane struck *Cuba* and the southwest *Atlantic Ocean* causing at least 26 deaths. [Twenty-six deaths from ship *Maisi*; in addition, "...numerous disasters were caused by it at sea...", according to *Monthly Weather Review*, possibly including 16 deaths in loss of schooner *Maine*. The *New York Times* reported one survivor of English brig *Gamay* (possibly foundered in same storm) picked up on 9 October in southwestern Atlantic Ocean.]<sup>141</sup>

*Russia* suffered from a major famine in 1873.<sup>96</sup>

On 3-8 October 1873, a severe cyclone, first located south of western *Cuba*, recurved over the eastern Gulf; passed over Florida on the 6<sup>th</sup>, and continued its course northeastward off the Atlantic coast of the *United States*. Numerous disasters were caused at sea, and the settlement of Punta Rassa, Florida was entirely destroyed, a hurricane velocity of ninety miles per hour being recorded at that place. Damage

was also caused at Lake City, Saint Augustine, and Jacksonville, Florida, and at Charleston, South Carolina.<sup>120</sup>

On 19-20 October 1873, a hurricane struck the western *Atlantic Ocean*. The schooner *Enterprise* was feared lost in the storm.<sup>141</sup>

A storm developed over north Georgia in the *United States* on 16 November 1873. It passed off the North Carolina coast on the 17<sup>th</sup>, and over the Bay of Fundy into the Gulf of Saint Lawrence in *Canada* during the 18<sup>th</sup>, attended by fierce gales and fearful seas. At Norfolk, Virginia, the barometer fell to 28.86 inches (733 millimeters) on the 17<sup>th</sup>. In Chesapeake Bay the storm was extremely severe. At Cape May, New Jersey, the barometer fell to 28.76 inches (730 millimeters), and the gales off the coast were reported the severest in years. On the 18<sup>th</sup> the barometer fell to 28.72 inches (729 millimeters) at New Haven, Connecticut. At Wood's Hole, Massachusetts, the barometer fell to 28.60 inches (726 millimeters). At Boston, Massachusetts the barometer fell to 28.61 inches (727 millimeters). At Portland, Maine the barometer fell to 28.49 inches (724 millimeters). [According to the barometric pressure, this storm would have been rated at least a Category 3 hurricane as it passed this location.] The storm was also very severe over the Canadian Maritime Provinces, and was attended throughout by heavy rain or snow.<sup>119</sup>

In *England* on the 16<sup>th</sup> of December, there were great storms in Lancashire and Yorkshire.<sup>57, 90</sup>

In 1873 during the period between 26 May and 24 June, a drought engulfed Hupeh (now Hubei province) in central *China* at Kung-an and Chih-chiang. Then during the period between 25 June and 23 July, floods struck Hupeh province at Kung-an. During the period between 8 August and 8 November, floods struck Kiangsu (now Jiangsu province) on the east coast of *China* at Lin-ch'ü and Kao-ch'un; Hopei (now Hebei province) in northern *China* at Ch'ing; and Hupeh province at Ch'ien-chiang.<sup>153</sup>

---

### 1873 A.D. – 1875 A.D. Bangladesh, India and Asia Minor. Famine

In *Asia Minor* a famine broke out in the province of Angora and Iconia (now Ankara and Konya in *Turkey*) in 1873, and continued for two years, causing thousands to die of hunger.<sup>155</sup>

In *India* in 1874 in Bengal [*India* and *Bangladesh*], there was a famine arising from drought. The government took early measures and at a cost of 6,500,000*l.* organized a system of relief. About 1,000,000 tons of rice were carried into the distressed districts; and about 100,000 remained after the relief was concluded.<sup>91</sup> “During the three successive years the weather in Bengal had been abnormal. In 1871 the rain was excessive, but the crops were good. In 1872 the rain was deficient, but although extraordinarily scanty, it was happily distributed both in time and place, and the crops were good in Bengal, and not bad in Behar. The year 1873 was again dry, almost beyond precedent, and what rain there was, was unfortunately distributed. South of the Ganges [River] it was excessive; but in North Behar, and almost the whole of Bengal, the rain was below the average. Coupled with deficient rainfall, the monsoon of 1873 was abnormally hot . . . . In January 1874, it was reported that the frost and west winds were drying up the crops in Patna [in eastern *India*]. The famine reached its culminating point in April and May.”<sup>57</sup>

In 1873 in *India*, there was a severe drought in Behar and parts of Northern Bengal [*India* and *Bangladesh*].<sup>47</sup>

There was a great famine in the Gorakhpur Division in the eastern part of the state of Uttar Pradesh, *India* in 1873-74. When compared to a normal year (1872), the incident of mortality rose 70% during this famine. The Banda District and other regions of *India* were also affected.<sup>185</sup>

During the great famine of 1873-74 in *India*, frost was reported to cause some damage to the crops in

Behar [now Bihar in northern *India*].<sup>179</sup> The famine affected the districts in Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and Bihar and to a lesser extent the Benares division.<sup>181</sup>

In 1873-74, *Bengal* [now *India* and *Bangladesh*] was threatened with famine. The government had organized an excellent system of food distribution, and was thus able by means of railways and dawk routes [dawk is a system of mail delivery by relays of bearers or horses stationed at intervals along a route], to feed the 15 million needy people and greatly lessen the loss of life.<sup>155</sup>

In Bengal [*India* and *Bangladesh*] in 1874, there was a famine caused by a drought.<sup>90</sup>

In 1873, there was a famine in Bengal [Bengal today is West Bengal in *India* and East Bengal in *Bangladesh*].<sup>156</sup>

In *Asia Minor* during 1874-75, there was a severe famine.<sup>57, 90</sup> Great efforts made by *Turkey* to alleviate. Also subscriptions raised in *England*. Deaths up to July 1874 were 150,000.<sup>57, 91</sup>

**Winter of 1873 / 1874 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1873 occurred on 12 November. Hard storm. On November 18, there was another snowstorm. Winter weather and good sleighing.<sup>116</sup>

The winter of 1873-74 in Bradford County, Pennsylvania in the *United States* was open and mild. Snow fell on October 6<sup>th</sup> covering the hills and surrounding country. There was a run of sleighing the last two weeks in November. The beginning of January was as mild and balmy as in May. On 26 February, snow fell to the depth of several inches. March came in warm which continued until the 19<sup>th</sup>, when a heavy rain fell and was immediately followed by a snowstorm and some good sleighing. The heaviest snowfall of the season was on April 9<sup>th</sup>, being 10 inches [25 cm] deep. April continued unusually cold and no farming was done until after the 8<sup>th</sup> of May.<sup>178</sup>

April 1874 was abnormally cold in the *United States*. Vegetation everywhere was reported from ten to twenty days behind normal at the end of April.<sup>129</sup>

In Maine, the average temperature was the lowest recorded in 38 years.

In Vermont, the average temperature was the lowest recorded in 24 years.

In Massachusetts, the average temperature was the lowest recorded in 34 years.

In New York, the average temperature was the lowest recorded in 25 years.

In Pennsylvania, the average temperature was the lowest recorded in 20 years.

In New Jersey, the average temperature was the lowest recorded in 9 years.

In Connecticut, the average temperature was the lowest recorded in 20 years.

In Maryland, the average temperature was the lowest recorded in 10 years.

In Indiana, the average temperature was the lowest recorded in 10 years.

In Illinois, the average temperature was the lowest recorded in 23 years.

In Kansas, the average temperature was the lowest recorded in 10 years.

April 1874 also produced significant snowfall during the month:

The snowfall in Maine varied from 15 to 41 inches.

The snowfall in New Hampshire varied from 30 to 43 inches.

The snowfall in Vermont varied from 33 to 56 inches.

The snowfall in Massachusetts varied from 11 to ? inches.

The snowfall in Connecticut varied from 12 to 22 inches.

The snowfall in New York varied from 10 to 50 inches.

The snowfall in Pennsylvania varied from 4 to 38 inches.

The snowfall in Ohio varied from 2 to 16 inches.

The snowfall in Indiana varied from 2 to 4 inches.

The snowfall in Illinois varied from 5 to 11 inches.

In Colorado 20 inches of snow, and in New Mexico 15 inches of snow fell in a single storm on the 20<sup>th</sup> of April. The total fall in Colorado appears to have varied between 18 and 33 according to the locality of the stations, being entirely without precedent since the settlement of the State in 1857, and producing great destruction among the herds of cattle and sheep, etc.<sup>129</sup>

---

**1874 A.D.** In January 1874, the Hunter River in New South Wales, *Australia*, flooded and the river reached a height of 33 feet 9 inches above the high water mark.<sup>103</sup>

On 8 February 1874, there was a destructive hurricane at Auckland, *New Zealand*.<sup>103</sup>

In London, *England* in March, there was great damage on the banks of the River Thames from a very high tide.<sup>47, 92</sup>

On 20 March 1874, floods on banks of the River Thames in England caused by a very high tide.<sup>90</sup>

During April 1874, severe floods were reported from all the tributaries of the Mississippi River, and resulted in disastrous overflow throughout Mississippi, Louisiana and Arkansas in the *United States*. The usual spring flood had, during the latter part of March, caused considerable damage to the levees near New Orleans, which were being repaired when the extraordinary rains of April began throughout Louisiana. The most severe levy breaks occurred at Hickey's, Hushpuckana, the Grand Levee or Morganza, McCullum's, Waterproof, Bonnet Carré, Belle Chasse and Greenwood. Through these crevasses and general overflow of the banks of the Mississippi River, the whole valley of the river was devastated to such an extent that it is estimated that the loss is equivalent to one-sixth of the annual farm produce of the region.<sup>129</sup>

In the *United States* in April, there was a great flood in the Mississippi valley, mainly in Louisiana. About 250,000 acres (101,000 hectares) of cotton, 100,000 acres (40,000 hectares) of corn, and 500,000 acres (202,000 hectares) of sugar were submerged. New Orleans was in considerable danger for a time, part of the levees, which protect that city being broken down. About 25,000 persons were wholly or partially ruined.<sup>47, 92</sup>

On 16 May 1874, the reservoir in Mill River Valley, near Northampton, Massachusetts in the *United States* burst. Several villages destroyed and about 140 lives lost.<sup>47, 90, 92</sup>

On 30 May 1874, there was a great gale at Auckland, *New Zealand*.<sup>103</sup>

On 30 June 1874, the temperature in Bradford County, Pennsylvania in the *United States* reached 101° F [38° C].<sup>178</sup>

On 4 July 1874 in Bergen County, New Jersey in the *United States*, there was a hailstorm. While the inhabitants of the village of Westwood were celebrating the "nation's birthday," a sudden darkness came over the scene of festivity, and the village was wrapped in a mysterious gloom. Before the holidaymakers had time to disperse, down came the hailstorm on their heads. Hailstones, 2½ inches in diameter, and as hard and heavy as cobble stones, rattled down in a furious shower from the sky. Hens and chickens were killed in large numbers, and the bodies of cows and horses, stunned by the descending volley, lay prostrate in every direction. One young lady was frightfully lacerated on the wrist and arm by one of the hailstones, and was conveyed home insensible with great difficulty by her friends and relatives. A large building in the village was almost demolished, every pane of glass was broken, and the hailstones broke through the roof as though they had been cannon balls. The storm covered an area of about 25 miles, leaving desolation like that of a battlefield. Every tree was stripped of its fruit, grain fields of rye and

corn were destroyed, and all hopes of hay this season utterly extinguished. The shower continued 30 minutes, and in this short time affected damage to the extent of many thousand dollars. The hailstones on an average were the size of turkey's eggs, and of every conceivable shape, with sharp corners and edges, which cut like knives. The thunder and lightning were incessant.<sup>93</sup>

In London, *England* on the 11<sup>th</sup> of July, there was an awful storm; lightning set buildings on fire; lives lost, railways flooded.<sup>57</sup>

On 11 July 1874, an awful storm struck northeastern London, *England*. Several persons were killed, churches and buildings were fired and, railways flooded.<sup>90</sup>

On 28 October 1838; 11 July 1874; 11 April 1878, and 12 December 1883, storms struck London, *England*, which destroyed from twenty to thirty lives in each case, and from \$1 to \$3 million (U.S.) dollars in property damage. [In present currency, that would be equivalent to \$27-\$81 million dollars in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

In Nevada in the *United States* on July 24<sup>th</sup>, there was a great rainfall and waterspouts. About thirty lives lost.<sup>47</sup> [Generally speaking a waterspout is a tornado or lesser whirlwind occurring over water. This might be an unusual event for desert-like Nevada. The New York Times of 30 September 1866 describes a similar event in Nevada calling it a waterspout. This event was in fact a very strong cloudburst producing a massive flash flood, a wall of water sweeping through the canyon floor.]

On 24 July 1874, Eureka, Nevada in the *United States* suffered an inundation through rain and a waterspout. Between 20 and 30 people perished.<sup>90,92</sup>

The most violent rains are the cloudbursts of the mountainous and arid regions of the west in the *United States*. These storms are not confined to any particular state or region but may occur in mountainous localities throughout the entire territory bounded by the British possessions on the north [Canada], the Mexican border on the south, the foothills of the Rockies on the east and the Sierras on the west. In the true cloudburst the rain seems to pour down rather than fall in drops, and, as a rule, the downpour of water covers an extremely small area. It often happens that the downpour occurs over rather narrow basins or on mountain slopes whose outlets are canyons or gorges leading to a valley or plain below. In these cases almost the entire amount of water quickly finds its way into the drainage channel, and, as a result, a wave of water rushes down the outlet with considerable velocity and in sufficient volume to destroy everything in its path. Such a flood wave almost swept away the town of Eureka, Nevada, in 1874, and caused the loss of 15 lives. A far greater disaster occurred in Bear Creek Canyon, Colorado, in July 1896. Thirty lives were lost and property valued at more than \$100,000 was destroyed. [In present currency, that would be equivalent to \$2.6 million in damages based on the Consumer Price Index (CPI) inflation rates.] The amount of rain that falls in one of these torrential downpours has never been ascertained. A cloudburst passed over the edge of the little town of Palmetto, Nevada, in August 1890. A rain gauge that was not exposed to the full intensity of the storm caught 8.80 inches of water in an hour. In August 1891, two storms passed over Campo, California, within a few minutes of each other. The second storm was a veritable cloudburst. The observer succeeded in measuring the rainfall of the first shower and a portion of the second. Eleven and a half inches were measured within an hour. The rain gauge and support were carried away by the torrent of water in the second storm and the full record was not obtained.<sup>137</sup>

On 26 July 1874, in Pittsburg and Alleghany, in western Pennsylvania in the *United States*; storm of rain caused the rivers to overflow; about 220 persons drowned.<sup>90</sup>

In Pittsburg and Alleghany County, Pennsylvania in the *United States* on July 26<sup>th</sup>, there was a great rainstorm; and about 220 persons drowned.<sup>47, 92</sup>

From May 8 to September 2 1874, there were 24 storms in *England*. The most severe being on 24 June, 24 July, and 10 August. The hail damage extended over 20 counties.<sup>93</sup>

In Hong Kong, *China* on the 22<sup>nd</sup> of September, there was a great typhoon at Macau.<sup>57</sup>

On 22 September 1874, a typhoon caused much destruction at Macao [Macau], Hong Kong, and vicinity in *China*.<sup>90</sup>

On 22 September 1874, a typhoon struck Macau and Hong Kong, *China* and several cities in *India*. The typhoon killed 10,000 people and wrecked between 40,000 and 60,000 houses.<sup>197</sup>

On 31 October - 2 November 1874, a hurricane struck *Jamaica*.<sup>124</sup>

On 19 November 1874 in *Scotland*, there was a severe hailstorm. Almost without warning a cloudbank descended over the streets, transforming the light of a fair November day into night-like gloom. One or two vivid flashes of lightning, succeeded by loud peals of thunder, were quickly followed by a storm of hail, which, though its duration was less than 5 minutes, was sufficiently heavy to cover the ground to a depth of an inch and a half. The hailstones were remarkably large, many of them apparently being fragments of ice. Others were as large as marbles, and descended in places with such force as to break panes of glass. For five minutes, the village of Holytown was enveloped in midnight darkness, and the people set a crying, thinking that Doomsday had arrived. In other Lanarkshire towns, there were brief periods of darkness.<sup>93</sup>

In *England*, there were violent gales, with destruction of life and property on the 21<sup>st</sup> October; 29<sup>th</sup> November; 7<sup>th</sup>, 8<sup>th</sup>, 10<sup>th</sup> and 11<sup>th</sup> of December.<sup>57, 90</sup>

In *France*, the losses from hailstorms were very serious in 1874.<sup>93</sup>

In *France*, the losses in 1874 from hailstorms were estimated at £6,063,130. [In today's currency, that would be the equivalent of £417,000,000 or \$678,000,000 U.S. dollars using the retail price index.]<sup>93</sup>

In 1874 during the period between 16 April and 15 May, a drought engulfed Hupeh (now Hubei province) in central *China* at Chiang-ling, Kung-an and Chih-chiang. Then during the period between 14 June and 13 July, floods struck Hupeh province at Kung-an. During the period between 8 August and 8 November, floods struck Shensi (now Shaanxi province) in central *China* at Kan-ch'üan and Tso-shui; Hupeh province at Ch'ien-chiang; and Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p'ing. At Hsüan-p'ing, over 80 house-sections were damaged by the floodwaters and over 20 persons were drowned. Also during the period between 8 August and 8 November, a drought engulfed Hupeh province at Chün.<sup>153</sup>

*Also refer to the section 1873 A.D. – 1875 A.D. for information on the drought and famine in Bangladesh, India and Asia Minor during that timeframe.*

---

**Winter of 1874 / 1875 A.D.** In *England*, there was a very severe frost in December 1874.<sup>47, 90, 93</sup>

On 1-3 January 1875, severe snowstorms struck *Scotland*. Several lives were lost.<sup>57, 90</sup>

On 12 March 1875, a severe snowstorm struck southern *England*. There was destruction of life and property. Telegraph wires were broken.<sup>90</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1874 occurred on 20 November. It snowed considerably.<sup>116</sup>

The winter of 1874-75 in Bradford County, Pennsylvania in the *United States* was preceded by a summer-like fall and ploughs were kept running until the 10<sup>th</sup> of December. Then there was a general freeze-up. On January 10<sup>th</sup>, temperatures dropped to the range of -12° F to -16° F [-24° C to -27° C]. January was bitterly cold as was February until the 22<sup>nd</sup>, when warm weather succeeded. On February 9<sup>th</sup>, temperatures dropped to -18° F [-28° C]. On February 13<sup>th</sup>, temperatures dropped to -23° F [-31° C] at Rome. The ice in the Susquehanna River at Towanda broke up and passed out on February 27<sup>th</sup>. The heaviest snowfall of the season was March 7<sup>th</sup>, being a foot [30 cm] deep at Towanda and two feet [0.6 m] at Barclay. Sleighing was good on the hills until March 27<sup>th</sup>. On April 13<sup>th</sup>, there was a heavy snowfall, followed by several days of very cold weather.<sup>178</sup>

In the *United States* during the winter of 1874-75, the temperature at Chicago, Illinois fell to -20° F in 1875. The temperature at Fort Benton, Montana fell to -58° F in January. The temperature at Virginia City, Montana (a ghost town 20 miles west of Yellowstone National Park) fell to -44° F in January. The temperature at Denver, Colorado fell to -29° F in January. The temperature dropped to -25° F at Milwaukee, Wisconsin in January and -22° F in February. The temperature dropped to -40° F at Embarras, Wisconsin in January. The temperature at Saint Louis, Missouri fell to -16° F in January. The temperature dropped to -10° F at Louisville, Kentucky in January. The temperature dropped to -10° F at Mount Auburn, Ohio, a suburb of Cincinnati in January. The temperature at Pittsburg, Pennsylvania fell to -12° F in January. The temperature at Philadelphia, Pennsylvania fell to -5° F in January. The temperature at Fort Lapwai (near Lewiston, Idaho) dropped to -32° F in January. The temperature at Coalville, Utah dropped to -30° F in January. The temperature at Fort Colville (near Colville, Washington) dropped to -33° F in January. The temperature at Portland, Oregon fell to 3° F in January. The temperature at Cheyenne, Wyoming dropped to -38° F in January. The temperature dropped to -8° F at Nashville, Tennessee on January 3<sup>rd</sup> & 9<sup>th</sup>. The temperature dropped to 10° F at Vicksburg, Mississippi on January 6<sup>th</sup>. The temperature at Morgantown, West Virginia dropped to -6° F in January and -10° F in February. The temperature dropped to -6° F at New York City, New York on January 10<sup>th</sup>. The temperature at Barnegat City, New Jersey fell to -10° F in January. The temperature at Mount Washington, New Hampshire fell to -46° F in January. The temperature dropped to -38° F at Grand Rapids, Michigan on February 9<sup>th</sup>. The temperature at Fort Pembina, North Dakota fell to -45° F in February. The temperature at Belvidere, Illinois fell to -31.5° F in February. The temperature at Saint Paul, Minnesota fell to -32° F in February. The temperature at Dubuque, Iowa fell to -31° F in February. The temperature at Pike's Peak, Colorado fell to -37.0° F in February and -29° F in March. The temperature at Fort Brady (at Sault Sainte Marie, Michigan) fell to -55° F in February and -32° F in March. The temperature at Escanaba, Michigan fell to -32° F in February. The temperature at Detroit, Michigan fell to -20° F in February. The temperature at Fort McPherson (near North Platte, Nebraska) fell to -24° F in February. The temperature at Albany, New York fell to -18° F in February. The temperature at Buffalo, New York fell to -13° F in February. The temperature at Erie, Pennsylvania fell to -16° F in February. The temperature at La Crosse, Wisconsin fell to -34° F in February.<sup>113, 126</sup>

April 1875 was known for the extraordinary cold weather in the *United States*. The lateness of the spring, the prevalence of severe frosts and the injury to vegetation were the most obvious features of April's weather. A record of April frosts, kept in Florence, Alabama, from 1849 to 1853, and from 1853 to the present year (1875) in Knoxville, Tennessee, gives the following data:

April 16, 1849, at Florence, Alabama, "severe frosts, and vegetation supposed to be all killed."

April 16, 1850, "disastrous frosts, which killed vegetation, and even young oak trees, from Tennessee to the Gulf."

April 19, 1852, snow in the morning at Florence, Alabama.

April 17, 1870, at Knoxville, Tennessee, cold, cloudy day, with snow.

April 22<sup>nd</sup> and 23<sup>rd</sup>, 1871, "frost at night." At Knoxville, Tennessee.

April 23, 1875, frost was reported at Knoxville, Tennessee. At Norfolk, [Virginia] on the 17<sup>th</sup>, there was a heavy frost, which was reported as very disastrous to peas, strawberries and peaches. On the 18<sup>th</sup> and 19<sup>th</sup>, another heavy frost (Thermometer 27°F.) fell at Norfolk, nearly destroying the pears, plums and cherries; also ruining the early vegetables and strawberries. At Nashville, Tennessee, on the 17<sup>th</sup>, the thermometer fell to 25.5° F., forming ice about one-eighth of an inch thick, seriously injuring vegetation and killing many fruit trees. There was frost at Leavenworth, Kansas, on the 16<sup>th</sup>, and snow at Lynchburg, Virginia, on the 17<sup>th</sup>, and freezing weather nearly all day at Lynchburg on the 18<sup>th</sup>, causing a great loss of all varieties of early fruits and early wheat. Frost occurred at Wytheville, Virginia, on the 22<sup>nd</sup>, 23<sup>rd</sup> and 24<sup>th</sup>; at Charleston, South Carolina, on the 19<sup>th</sup>, (heavy); at Aiken, South Carolina, on the 17<sup>th</sup> and 18<sup>th</sup>; at Mobile, [Alabama] on the 3<sup>rd</sup>; heavy frost at Savannah, Georgia, on the 18<sup>th</sup> and 19<sup>th</sup>, with ice nearly half an inch thick on tranquil pools in the countryside. At Asheville and Mount Pleasant, North Carolina, the frosts on the 17<sup>th</sup> and 18<sup>th</sup> killed the peach and cherry crops and injured the apples. Light frost was deposited at Augusta, Georgia, and Wilsonville, Alabama, on the 17<sup>th</sup> and 19<sup>th</sup>. On the interior lakes of New York, and in the Adirondacks, it is reported ice remained two to three feet thick as late as April 15<sup>th</sup>. Frost was also reported at Brookhaven, Mississippi, on the 24<sup>th</sup>, (latest known); light frost on the 18<sup>th</sup> at Mayport, Florida, and on the 24<sup>th</sup>, at Troy, Alabama; at St. Marks, Florida, on the 18<sup>th</sup>, and on the 19<sup>th</sup>, at Wellborn, Florida. At Fallston, Maryland, water pipes buried three feet underground that were frozen in the winter, were first sufficiently thawed to admit flow of water on the 3<sup>rd</sup> of April. At Nichols, New York, the ground was not free from frost till the end of April. At Kenton, Ohio, and Hector, New York, frost disappeared from the soil on the 10<sup>th</sup>. At Fall River, Massachusetts, water pipes frozen February 12<sup>th</sup> remained frozen until after the 20<sup>th</sup> of April. The rivers and lakes in the *United States* were very late in opening to navigation in 1875.<sup>130</sup>

In April 1875, there were unusually large quantities of drift ice and enormous icebergs off the Atlantic coasts of the *United States*.<sup>130</sup>

**1875 A.D.** On 20 January 1875, the record setting temperature at Melbourne, *Australia*, reached 110.4° F (43.6° C).<sup>103</sup>

On 24 February 1875, a cyclone struck off the coast of Home Hill in Queensland, *Australia*. During this severe cyclone, the steamer *Gothenberg* ran onto the Great Barrier Reef during a storm & sank almost immediately. One hundred and three passengers and crew were drowned. Only 20 survived eventually safely made their way to Bowen on the mainland. During the search for gold rumored to be in the ship, divers found victims still in the cabins where they had been trapped.<sup>99</sup>

In February and March 1875, there were heavy floods in Queensland, *Australia*.<sup>103</sup>

In 1875, *China* experienced flooding during 8 March - 5 April. At Kiangsu (now Jiangsu province) on the east coast of *China* at Ch'ing-p'u had over 50% of its area flooded. Shantung (now Shandong province) on the east coast of *China* at Yü-t'ai also had over 50% of its area flooded. Hupeh (now Hubei province) in central *China* at Ch'ien-chiang also experienced flooding during this time.<sup>153</sup>

On 25 April 1875, there was a heavy flood of Fitzroy River in Queensland, *Australia*.<sup>103</sup>

On 2 May 1875, there was a heavy gale in Sydney, *Australia* from the eastward, with rain.<sup>103</sup>

On 6 May 1875, there was a remarkable waterspout observed near Inverell (an inland town of New South Wales, *Australia*).<sup>103</sup>

On 10 May 1875, there were destructive floods in *South Australia*.<sup>103</sup>

On 9 June 1875, there was a heavy flood of the Campaspe River in Victoria, *Australia*.<sup>103</sup>

In *France* in June, there were tremendous floods in the south; at Toulouse, Verdun, Bordeaux, etc. many villages swept away; in the whole 6,900 houses destroyed. About 1,000 lives lost. The loss, mainly occasioned by the rising of the Garonne River was estimated at from 12,000,000*l.* to 15,000,000*l.* Public subscriptions opened in *England*.<sup>47, 92</sup> [In present currency, that would be equivalent to 1-1.2 billion pounds in damages based on the retail inflation price index.]

In June 1875, a large part of Toulouse, *France* was destroyed by the rising of the Garonne River. About 1,000 lives lost and much property destroyed.<sup>90</sup>

On 11 June 1875 in *England*, there was a hailstorm in Surrey, Buckinghamshire, and other areas. About midday, a very severe thunderstorm, with heavy rain and hail struck. In a short time the hail covered the ground to about an inch deep, causing great destruction amongst the tender foliage. In the woods, the lime trees looked as if they had been riddled with grapeshot, and in the kitchen garden the leaves of the trees upon the walls facing the blast were completely riddled. Lettuce and celery looked as if a flock of sheep had been pasturing amongst them, they were so cut up; and peas fit for pulling looked as if they were well hammered. The farmers' field beans and young turnips suffered severely. A great amount of damage was done in the neighborhoods of Dorking and High Wycombe.<sup>93</sup>

In *Hungary* in June, there were disastrous floods near Budapest; great loss of life and property.<sup>47, 92</sup>

In Budapest, *Hungary* on the 26<sup>th</sup> of June, there were destructive storms; about 200 persons killed.<sup>57, 90, 197</sup>

On 28 June 1875, there were heavy storms on the coast of New South Wales, *Australia*.<sup>103</sup>

On 7 and 8 July 1875 in *Switzerland*, there was a great hailstorm in the Val de Travers, Geneva, and elsewhere. The following account from the Journal de Geneve relates to the storm of the 8th only—that from which the city suffered most. This storm appears to have begun in the Department of Ain [in eastern *France* bordering *Switzerland* on western shores of Lake Geneva], and thence it took an eastwardly course up the valley of the Rhone to Geneva. Reaching the city, it then spread over a wider area, and directed its course towards Savoy. At Geneva, as midnight came on, the heat was suffocating, and not a breath of wind swept over the surface of the streets; but, higher up, light objects on the roofs of the houses began to be whirled about and carried off as by a tempest. At the same time a dull, rumbling sound, resembling neither wind nor thunder, announced the approach of the storm, and at midnight exactly, it burst over the city in all its fury. An avalanche of enormous, hailstones, with no trace of rain, was precipitated from the clouds, and shot against opposing objects by a tempest of wind from the southwest. In a moment the street lamps were extinguished, and in a brief interval incredible damage was inflicted, the glass and tiles of houses were smashed to powder, trees stripped of their bark on the side facing the west, and crops of every sort were in many places all but destroyed. The smallest of the hailstones were the size of hazelnuts; many were as large as walnuts and chestnuts, and some even as large as a hen's egg. Some of the hailstones measured four inches in diameter, and six hours after they fell weighed upwards of 11 ounces (300 grams). For the most part the hailstones were of a flat or lenticular form, with a central nucleus of 0.16 to 0.40 inch in diameter, enveloped in several concentric layers of ice, generally from 6 to 8, alternately transparent and opaque. The electrical phenomena were very remarkable; the flashes of lightning succeeded each other with such rapidity, from midnight until a few minutes after 1 A.M., that a

mean of from 2 to 3 were counted each second, or from 8000 to 10,000 per hour. Electrical phosphorescence was very intense before and during the hail. The ground, animals, and prominent objects, as well as the hailstones, were strongly phosphorescent. Immediately after the hail, ozone was largely developed, the smell being so perceptible as to be compared by nearly all observers to that of garlic. The incessant electrical discharges passed from cloud to cloud, over a central point from which the hail fell, but thunder was very rarely heard.<sup>93</sup>

In *Hungary* in July, another storm broke over Budapest; great damage. Public subscription opened.<sup>47, 92</sup>

In *Geneva, Switzerland* on the 7<sup>th</sup> and 8<sup>th</sup> of July, there was a violent hailstorm; great destruction of glass and crops.<sup>57</sup>

In the *United Kingdom* in July, there were great floods in the midland and eastern counties, West of *England, Wales* and in *Eastern Scotland*.<sup>47, 92</sup>

On 15-16 July 1875, heavy rains caused inundations in west of *England* and *Wales*. The floods caused destruction and loss of life at Newport and Monmouth.<sup>90</sup> [Newport is in Shropshire, *England* bordering *Wales*.]

In July 1875 in *Silesia* [now mainly *Poland*], torrents of rain caused great damage.<sup>92</sup>

Between May 19 and August 16, 1875, there were many hailstorms in *England*. The most destructive storms were in July.<sup>93</sup>

In *France*, the losses in 1875 from hailstorms were estimated at £3,673,768. [In today's currency, that would be the equivalent of £257,000,000 or \$418,000,000 U.S. dollars using the retail price index.]<sup>93</sup>

In August 1875 in west-central *Germany*, a waterspout burst near the town of Kirn; a number of persons drowned; much property destroyed.<sup>47, 92</sup>

In August 1875 in the *United States*, there were great floods in the Central States; in Central Illinois and in the Ohio and Mississippi Valleys; also in *Arkansas*.<sup>47, 92</sup>

In August 1875 in *Burma*, there were heavy floods, exceeding those of 1871.<sup>47, 92</sup>

In *India* in August, there were disastrous floods in the northwest provinces; great loss of life and destruction of property.<sup>47, 92</sup>

In *France* in September, again there were great floods in the south of *France*, at Montpelier etc. Vineyards damaged.<sup>47, 92</sup>

In east-central *Switzerland* in September, there were great floods in Canton Glarus.<sup>47, 92</sup>

In *Holland* [now *the Netherlands*] in September, there were great floods.<sup>47, 92</sup>

In the *West Indies* on 9 September, at the island of St. Vincent, 19 inches of rain fell in twelve hours.<sup>47</sup>

In the *West Indies* on 9 September, the Isle of St. Vincent swept by a hurricane of unusual severity. Much damage.<sup>57</sup>

On 15 September 1875, a hurricane struck Indianola, Texas in the *United States*, nearly wiping it off the

face of the earth. Approximately 126 lives were lost and \$1,000,000 of property damage was sustained. [In present currency, that would be equivalent to \$27 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

In Texas in the *United States* in September, there was a great flood in Indianola, nine-tenths of the houses destroyed and much other damage. Public subscription through the *United States*.<sup>47, 92</sup> [Indianola, Texas is a ghost town today. It once was a county seat. In 1875, the city had a population of 5,000, but on September 15 of that year, a powerful hurricane struck, killing between 150 and 300 and almost entirely destroying the town. Indianola was rebuilt, only to be wiped out on August 19, 1886, by another intense hurricane, which was followed by a fire.]

On 15-18 September 1875, a storm struck on the coast of Galveston, Texas in the *United States* and other places. Many people were injured and villages were washed away by the sea. There was great loss of life.<sup>90</sup>

In Texas in the *United States* on the 15<sup>th</sup> – 18<sup>th</sup> of September, a great storm struck Galveston and Indianola, and other places; houses and villages washed away, and great loss of life.<sup>57</sup>

On 15 September 1875, Indianola, Texas in the *United States* was nearly destroyed by a storm wave from the Gulf, which caused a loss of 176 lives and over \$1,000,000 worth of property.<sup>124</sup> [In present currency, that would be equivalent to \$20 million in damages based on the Consumer Price Index (CPI) inflation rates.]

The storm [hurricane] of 15 September 1875, caused a loss of one hundred and seventy six lives, and three-fourths of the town of Indianola, Texas in the *United States* was swept away.<sup>120</sup>

On 16-17 September 1875, a hurricane struck *Cuba* and Texas in the *United States*. The total deaths may be as high as 800. [Snow (1952) has 150 deaths at Indianola, Texas with the remainder elsewhere in Texas. However, quite a few lives lost in Cuba according to Appendix of Gutierrez-Lanza in Sarasola (1928).]<sup>141</sup>

On 22-24 September 1875, a great storm struck in Ahmedabad, *India* inundating the area. About 20,000 were left homeless.<sup>90</sup>

In *England* on September 28, there were whirlwinds in the Isle of Wight which caused great destruction; also hurricane in Oxfordshire.<sup>57</sup>

On 28 September 1875, Charleston, South Carolina in the *United States* was struck by a severe gale.<sup>124</sup>

In *England* in October, there were great floods in the Midland Counties, also in the northwestern counties at Dawlish.<sup>47, 92</sup>

On 17-23 October 1875 and again on 13-16 November 1875, an inundation in the midland and western counties of *England*, especially near Nottingham caused destruction and loss of life.<sup>90</sup>

In Venice, *Italy* in October, there was a considerable flood; the *Adriatic* driven in by a gale.<sup>47, 92</sup>

On 24 December 1875, a cyclone struck Exmouth Gulf in *Western Australia*. The cyclone hovered in the area for 13 days. The storm caused the death of 69 people. Most of these fatalities were from ships at sea in the region.<sup>99</sup>

In 1875 in *Australia*, there were several floods. The Sturt and Para Rivers flooded in South Australia. Northern Tasmania experienced floods. There were floods along the coast of New South Wales and the tablelands. Southeast Queensland also experienced floods.<sup>101</sup>

*Also refer to the section 1873 A.D. – 1875 A.D. for information on the drought and famine in Bangladesh, India and Asia Minor during that timeframe.*

---

**Winter of 1875 / 1876 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1875 occurred on 19 November. It snowed some hours.<sup>116</sup>

The winter of 1875-76 in Bradford County, Pennsylvania in the *United States* was warm with light snows and rains. 1 January 1876 broke all heat records for the first day of the year. The farmers did most of their spring plowing in January and February and most oats were sown by the first of March. The summer of 1876 was warm and the year was an exceedingly fruitful one.<sup>178</sup>

In January 1876, the steamship *City of Limerick* passed through the center of a violent hurricane. The barometer went down to 28.00 inches. The winds ceased from 10:30 p.m. on January 27<sup>th</sup> to 2:30 a.m. on January 28<sup>th</sup> [as it passed through the eye of the hurricane] at latitude 47 ¾° North, longitude 40° W. [The barometric pressure would indicate this was a Category 3 hurricane on that date.]<sup>140</sup>

In the *United States* during the winter of 1875-76, the temperature at Eastport, Maine fell to -20° F in December. The temperature at Portland, Maine fell to -12° F in December. The temperature at Boston, Massachusetts fell to -11° F in December. The temperature at Springfield, Massachusetts fell to -10° F in December. The temperature at Albany, New York fell to -17° F in December. The temperature at Rochester, New York fell to -8° F in December. The temperature at Newport, Rhode Island fell to -3° F in December. The temperature at Fort Benton, Montana fell to -42° F in March.<sup>113, 126</sup>

In February 1876, the minimum temperatures in the *United States* were: Yankton, South Dakota -18° F; St. Paul, Minnesota -22° F; Pike's Peak, Colorado -17° F; Pembina, North Dakota -48° F; Omaha, Nebraska -19° F; Alpena, Michigan -11° F; Burlington, Vermont -12° F; Breckenridge, Minnesota -28° F; Duluth, Minnesota -28° F; Eastport, Maine -20° F; Escanaba, Michigan -12° F; Fort Sully, South Dakota -28° F; Marquette, Michigan -16° F; Milwaukee, Wisconsin -10° F; North Platte, Nebraska -14° F; Malone, New York -16° F; and Mount Washington, New Hampshire -42° F.<sup>140</sup>

In February 1876, ice in rivers and harbors in the *United States*: at Falls River, Massachusetts, the Mount Hope Bay was frozen over on the 25<sup>th</sup>; at Traverse City, Michigan, the Grand Traverse Bay was frozen on the 22<sup>nd</sup>; at Kensico, New York [village flooded to create the Kensico Reservoir in 1893], the pond ice was 6 inches thick on the 28<sup>th</sup>; at North Shippen, Pennsylvania, the pond ice was 5 inches thick on the 6<sup>th</sup>; at West Charlotte, Vermont, Lake Champlain was completely frozen and crossed by skaters on the 4<sup>th</sup> and crossed by horsemen on the 12<sup>th</sup>; at Bloomfield, Wisconsin, the ice in Geneva Lake was 12½ inches thick; at Philadelphia, Pennsylvania, the ice in the Schuylkill River was 5 inches thick on the 6<sup>th</sup>; at Duluth, Minnesota, Lake Superior was frozen the entire month.<sup>140</sup>

One of the coldest temperatures recorded on the North American Continent was by the British Arctic Expedition of 1875-76, where the temperature of -73.8° F (-58.8° C) was recorded in March 1876 at Floeberg Beach, *Canada*.<sup>125</sup> [Floeberg Beach is on the northeast coast of Ellesmere Island, the most northerly of *Canada's* Arctic islands.]

On 12 March 1876, snowstorms were reported from Nevada to Montana in the *United States*. These storms were unusually heavy and terrific in the Sierra Nevada Mountains, and completely blockaded railroads. They extended eastward over Colorado and The Dakotas during the 13<sup>th</sup>.<sup>140</sup>

On 1 April 1876, the snowstorm that struck Denver, Colorado in the *United States* was considered the severest in the previous eight years. On 4-5 April, a heavy snowstorm struck New England. At the close of April, the snow in the forest of Massachusetts was 1-foot deep.<sup>140</sup>

### 1876 A.D. - 1879 A.D. Worldwide Drought and Famine

This period produced many great droughts covering the globe. In addition to *China*, this great drought and heat wave was also felt in *India, Australia, South Africa, Morocco, French Indo-China, the Dutch East Indies, Turkey, the United States and Canada.*<sup>47</sup>

#### China

The deadliest drought in recorded history occurred in *China* over the 4 years period from 1876 to 1879. Rivers were so dry that most crops and livestock died. There was no food production in a 390 thousand square mile (1-million square kilometer) area of nine provinces. The drought led to the death of an estimated nine million people.<sup>50</sup>

During the years 1874-1875, there had been a marked deficiency of moisture, a want which was further intensified in 1876, and which ultimately ended in rendering absolutely sterile the seed sown by the farmers. The results were disastrous in the extreme. With such imperfect means of communication as the Chinese possessed at that time, it was impossible to supply the deficiencies of one district by the excess of others with sufficient speed to prevent the occurrence of famine. Over four provinces of Chihli, Shansi, Honan, and Kansu (now called Hebei, Shanxi, Henan, and Gansu provinces), a dire scarcity prevailed, and though every effort was made, both by foreigners and natives, to bring aid to the starving people, upwards of nine million perished before succeeding crops supplied food for the survivors.<sup>154</sup>

In 1875-1878 four provinces in northern *China*, the district known as the "Garden of China," suffered a failure of crops owing to lack of rain, in an area about the size of France; 9,000,000 people perished.<sup>84</sup>

In 1875, during the period of 6 May – 8 November, Hopei (now Hebei province) in northern *China* at Ch'ing experienced drought conditions.<sup>153</sup>

In 1876, several regions of *China* experienced droughts.<sup>153</sup>

— During the period of 5 February – 6 May, Hopei (now Hebei province) in northern *China* at Wang-tu, Li, Luan and Lin-yü experienced drought conditions.

— During the period of 23 May – 21 June, Shantung (now Shandong province) on the east coast of *China* at Fei-ch'êng experienced drought conditions.

— During the period of 18 September – 16 October, Hopei (now Hebei province) in northern *China* at Kao-ch'êng experienced drought conditions.

“Lord Derby received a report drawn up by Mr. Mayers, Chinese Secretary of the Legation at Peking [now Beijing], upon the distress which the drought of the last two years has caused in the northern and central provinces of *China*. This famine, it seems, has been most severely felt in the district furthest from the coast. With the exception of Chefoo [now Yantai], and in a lesser degree, Tien-tain [now Tianjin], no foreign settlement has come directly into contact with the misery which has been described as existing in the interior, nor are any immediate traces of it visible in the neighborhood of the capital. The apparent cause was disturbance in the usually unfailing regularity of the summer monsoons. The spring and summer of 1876 were marked in the southern maritime provinces, Kwangtung [Guangdong] and Fuhkien [Fujian], and in a less degree also along the coast as far north as Ningpo [Ningbo], by an excessive rainfall, causing in the two provinces above named disastrous floods and much destruction of crops. In the north, on the contrary, from the Yangtze [River] to the neighborhood of Peking [Beijing] and thence eastward to the borders of Corea [Korea], an unusual drought was experienced.”<sup>57</sup> [Chefoo and Tien-tain

are in northeastern *China* bordering the Yellow Sea. Kwangtung and Fuhkien are provinces on the southeast coast of *China*. Ningpo is a seaport city on east-central coast of *China*. The Yangtsze to the neighborhood of Peking can be interpreted as the Yangtsze [or Yangtze, Yangzi or Cháng Jiāng] River that drains into the China Sea at Shanghai, so in other words from Shanghai to Beijing.]

In 1877, several regions of *China* experienced droughts.<sup>153</sup>

During the period of 13 May – 10 June, the following areas were affected:

— Kiangsu (now Jiangsu province) on the east coast of *China* at Wu-chin experienced drought conditions.

— Shantung (now Shandong province) on the east coast of *China* at Chan-hua and Ning-yang experienced drought conditions.

— Hopei (now Hebei province) in northern *China* at Nan-yüeh and T'ang-shan experienced drought conditions

During the period of 6 May – 8 November, the following area was affected:

— Hupeh (now Hubei province) in central *China* at Ying-shan experienced severe drought conditions.

Six-million out of the population of 56 million in northern *China* starved to death in 1877.<sup>96</sup>

There is in *China* no mountain range of sufficient altitude or importance to determine the northern limit of the summer monsoon. During the year 1877, the monsoon could scarcely reach the valley of the Yangtsze; and in consequence central and southern *China* was drenched with excessive rain, while not a drop fell in the parched and famine stricken provinces of Chihli and Shansi.<sup>165</sup>

In *North China* during 1877-78 there was a great famine. In a telegram dated 26 January 1878 says: “Appalling famine raging throughout four provinces *North China*. Nine million people reported destitute. Children daily sold in markets for [raising means to procure] food. Foreign Relief Committee appeal to *England* and *America* for assistance.” The total population of the districts affected was 70 million. Mr. Fredk. H. Balfour, of Shanghai said: “The people’s faces are black with hunger: they are dying by thousands upon thousands. Women and girls and boys are openly offered for sale to any chance wayfarer. When I left the country, a respectable married woman could be easily bought for six dollars, and a little girl for two. In cases, however, where it was found impossible to dispose of their children, parents have been known to kill them sooner than witness their prolonged sufferings, in many instances throwing themselves afterward down wells, or committing suicide by arsenic.”<sup>57</sup>

In the northern provinces of *China* in Shensi, Shansi and Honan containing a population of 56 million, a famine broke out in 1877. The famine was caused by the continued failure of crops and lasted several years. In their desperation, the lower classes resorted to the most barbaric measures, butchering and selling their children for meat, and organizing bands for plunder and ravage. It is estimated that between four and six million perished.<sup>155</sup>

Further papers on this famine were presented to Parliament on 2 July 1878: The number of souls for whom relief is required is said to be between 3 and 4 million. One point brought out is the enormous cost of transporting supplies to the province of Shansi [Shanxi], where a mountain range has to be crossed and a distance of some hundreds of miles to be traversed by carts. Mr. Mayers says the reported cost of transporting these supplies to Shansi would be about 4 taels per picul, or say 12*l.* sterling per ton. Mr. Hugh Fraser sends from Peking, 18<sup>th</sup> January, the translation of a memorial addressed to the throne by Yen King-Ming, “Special High Commissioner for the Superintendence of the Arrangements for Famine Relief in Shansi. The commissioner dwells upon the painful scenes he has witnessed at every stage of his journey, in the course of which his chair has continually been surrounded by crowds of the famine-stricken population imploring relief, to whom he has administered comfort in soothing words, assuring them of the Imperial sympathy. The roads are lined with corpses in such numbers as to distance all

efforts for their interment, while women and children, starving and in rage, know not where to look for the means of keeping body and soul together. The memorialist, his heart wrung with despairing pity, cannot but ask why has a calamity so awful as this been visited upon the people. He can only ascribe it to his own failure in the due discharge of his duty, and he feels that his shortcoming admits of no excuse. In reply, the Grand Council has received a rescript expressing profound sympathy with the sufferings of the people as reported in this memorial, and directing that all that is possible for their relief be done, in consultation with the governor of the province.”<sup>57</sup> [Shansi is an inland northeastern province of *China*.]

In 1877-78, the famine was very severe in northern *China*. 9,500,000 said to have perished.<sup>90</sup>

In 1878, several regions of *China* experienced droughts.<sup>153</sup>

During the period of 5 February – 6 May, the following areas were affected:

— Shantung (now Shandong province) on the east coast of *China* at Tung-p’ing experienced drought conditions.

— Shensi (now Shaanxi province) in central *China* at San-yüan experienced drought conditions

During the period of 30 July – 27 August, the following areas were affected:

— Hopei (now Hebei province) in northern *China* at Nei-ch’iu, Ching-ching, Peiping, T’ang-shan, P’ing-hsiang, and Lin-yü experienced drought conditions.

During the period of 28 August – 25 September, the following area was affected:

— Hupeh (now Hubei province) in central *China* at Ching-shan experienced drought conditions.

#### **Korea**

In 1877, a famine continues in *Corea* [*North Korea* and *South Korea*].<sup>106</sup>

#### **Turkey**

In 1876, *Turkey* experienced a severe drought that caused the loss of crops and animals and the migration of farmers to other areas. The drought caused the loss of more than 200,000 people because of famine and disease epidemics.<sup>53</sup>

#### **Egypt**

In *Egypt* in 1877, it had become clear that *Egypt* was headed towards a drought. The Nile River had remained stationary for four days at a level of fourteen feet below the three-year average. This points to the possibility of a calamity of appalling magnitude. Most people are aware that from the earliest times of which any historical record exists the Nile River has annually overflowed its banks at this period of the year, bringing down with it from the mountains of Abyssinia a mass of alluvium in solution containing 48% alumen, 18% of carbonate of lime, 4% of carbonate of magnesia, 4% of silica, 6% of oxide of iron and 9% of carbon. As the inundation overspreads the Delta of the river, these fertilizing agents are precipitated, and in the months of October and November, the husbandmen [farmers] begin sowing their grain and green crops. The ordinary rise at Cairo, *Egypt* is from twenty-five to twenty-seven feet. If it exceeds this, it becomes a devastating flood, but if it attains a rise of eighteen or twenty feet, it forebodes a season of sterility. For what was true 1800 years ago, when Pliny wrote his *Natural History*, is equally true today. “When the water” he says “rises to only 12 cubits, the country experiences the horrors of famine; when it attains 13 hunger is still the result; a rise of 14 cubits is productive of gladness; a rise of 15 sets all anxieties at rest; while an increase of 16 is productive of unbounded transports of joy.” At present the rise is 3 cubits below Pliny’s minimum. At the same time, the fact that the Nile has not risen during the past 3 days is a very ominous sign. If the customary overflow should not take place, the food supply of upwards of 4 million people will be cut off for the ensuing year.<sup>106</sup>

In *Egypt* in 1877, the rainfall was short and the Nile River was low. There was great scarcity.<sup>57</sup>

#### **India and Bangladesh**

In October 1876, a terrible cyclone, followed by strong tidal waves, burst upon the seaboard of Bengal [today this is *Bangladesh* and the state of West Bengal in *India*] and caused not only the destruction of all crops but also a large number of human lives and heads of cattle.<sup>179</sup>

In 1876-77 in Chhindwara, *India*, the autumn crops were damaged by excessive rain and heavy floods. The rainfall of the year was 49.88 inches.<sup>180</sup>

In 1877 in *India*, a severe drought was reported in Madras [Chennai], Mysore, and parts of Bombay.<sup>47</sup>

In 1877 in Bombay, Madras, and Mysore, *India*, there was a famine and about 500,000 perished.<sup>90</sup>

On 15 September 1877, the *Tasmanian Mail* [Australian Newspaper] reports, there is a protracted famine in southern *India*. The population is expected to be dependent on imported food until January. Rice, for example is scarce in Calcutta and in Burma, the supplies are exhausted. On the 29<sup>th</sup> of September, they wrote that the famine is now raging in India. The famine is being accompanied by much fearful suffering and loss of life. The attention of the whole world is being drawn to it. Many countries are sending relief. On 21 September the famine at Madras continues but prospects are getting brighter because partial rains have fallen. On the 3<sup>rd</sup> of November, they wrote that the famine in *India* has passed through the worst stage. On the 10<sup>th</sup> of November, they wrote that there had been 750,000 deaths by famine in *India*.<sup>106</sup>

In *India*, the famine of 1876-78, was the most wide spread and the most prolonged that India has yet known. The drought commenced in Mysore by the failure of the monsoon in 1875. Over the entire Deccan, from Poona to Bangalore, the southwest monsoon failed to bring its usual rainfall in the summer of 1876. The autumn northeast monsoon of 1876 was very weak in the southeastern districts of the Madras [Chennai]. The main food crop, therefore, entirely perished throughout an immense tract of country. This shortage was compounded by the fact that the harvest of the previous year had also been short. As a result, prices quickly rose to famine rates. The summer monsoon of 1877 proved a failure; some relief occurred in October of 1877 by the autumn monsoon; but all anxiety was not removed until the arrival of a normal rainfall in June 1878. Meanwhile the wave of drought had reached northern India, where it found the stocks of grain greatly depleted to offset the famine demand in the south. Bengal [*India* and *Bangladesh*], Assam, the Northwest Provinces, the Punjab, Rájputána, and the Central Provinces alike suffered from drought through all the summer of 1877, and from its consequences well into the following year.<sup>54</sup> [Assam is located in northeastern *India*. Rájputána was the pre-1949 name of the present-day Indian state of Rājasthān, in northwestern *India*.]

In *India* in 1877 there was a drought in the Madras Presidency. This was one of the most extended famines on record. The cost to the government of *India*, in remedial measures and loss of revenue is estimated at 10,000,000*l*. The actual amount of mortality occasioned is difficult to determine, the estimates vary so much. Cholera prevailed in some of the famine districts, and added greatly to the number of deaths. The Mansion House Relief Fund, instituted by the lord mayor (Sir Thomas White) exceeded half million sterling. "The season of 1874 was generally good, but in parts it was unfavorable. In 1875 the season was in many places unpropitious. In 1876 the southwest monsoon, or summer rains, were deficient throughout the greater part of the Madras Presidency, and in the Bombay district of Poona [Pune]. In the northern portions only of the Madras Presidency . . . was the rainfall ordinarily propitious. The northeast monsoon, or autumn rains, failed still more disastrously. In October the whole of the nine districts of the Bombay Deccan were threatened with a serious famine, nearly all the monsoon crops having perished, and there having been no later rains to admit of sowing the rabi [spring crop] . . . The spring and summer rains again failed in 1877 . . . and added to this, the rainfall was short almost all over northern *India*."<sup>57</sup> [The Bombay Deccan was a group of former princely states in western *India*. They were incorporated into Bombay state in 1948 and are now part of Gujarat and Maharashtra states.]

A famine in southern *India* in 1876-1878 resulted in 5,200,000 people starving to death in the British territory alone.<sup>84</sup>

There was a great famine in the Gorakhpur Division in the eastern part of the state of Uttar Pradesh of *India* in 1877-78. When compared to a normal year (1872), the incident of mortality rose 73% during this famine. Also affected were the districts of Rae Bareilly, Banda, Jalaun and Pratapgarh; the Agra Division; the cities of Gurgaon, Bhurtore and Amethi, and other regions of *India*.<sup>185</sup>

In 1877-78 in Chhindwara, *India*, heavy downpours in December were followed by a frost in January. This caused rust on the wheat crop and destroyed the linseed. This year was called *Jhiri ki sal* or Rust Year.<sup>180</sup>

In 1877-78, a drought affected the western parts of the North-Western Provinces of *India*.<sup>181</sup>

In 1879 in Cashmere [now Kashmir in northwestern *India*], there was severe famine.<sup>57, 90</sup>

In the southern part of *India*, a famine broke out in 1876 in the Deccan, including the Bombay and Madras presidencies, containing a population of 23 million. The year produced only one-sixteenth of an average harvest, but the facilities for transportation were more favorable than at any other place, and the local government, aided by liberal contributions from without, and were able to cope fairly well with the famine. Nevertheless, at the end of the famine in 1878, it is estimated that about 6.3 million individuals had succumbed to the ravages of the famine and the attendant disorders, although about \$50 million [\$1.1 billion in present currency] had been spent for the support of the people.<sup>155</sup>

In the autumn of 1879 in Bulandshahr in the state of Uttar Pradesh, *India*, there was an unusually heavy rainfall, following several years of drought. As a consequence, a terrible epidemic followed that literally decimated the population of that district. The crops were left uncut in the fields. The shops remained closed in the bazaars. There was no traffic on the main roads and no business in the marketplaces. When the floodwaters of the great rivers receded, the sands were piled high with corpses. In most towns and villages, there was not a single house in which at least one person had died. In many, entire families had perished – parents, grandparents and children. Whole streets were deserted.<sup>181</sup>

### **Australia**

The summer of 1876-77 in *Australia* was dry. In August 1877, the drought in New South Wales, *Australia*, continues in the northern and western districts. The drought produced heavy livestock losses in the north. There was dry weather for the last two summers. The rainless winter was followed by a third dry summer. In Queensland, the drought is continuing and there are public prayers for rain.<sup>106</sup>

On 4 December 1877 in Sydney, *Australia*, because of a lack of water on the Darling River almost all the stations are shearing in the grease. [The sheep can be washed prior to shearing the wool, but otherwise unwashed fleece shearing is referred to as “shearing in the grease”.]<sup>106</sup>

In 1877 and 1878, *Australia* reported “The intensity of the late drought in Australia may be judged, perhaps, by the simple calculation made by the inspector of livestock, that in New South Wales alone 4 million sheep were lost last year from the effects of the dry weather. This estimate is generally admitted not to indicate the full extent of the losses, as it omits to take account of the last six weeks of the drought, which extended into the middle of February of this year, during which time the effects of the lack of rain were daily intensifying in increasing ratio. At least another million must be added to those figures to account for the losses of this year and for the loss suffered by small holders and others who were for various reasons omitted from the returns. Thus we have 5 million sheep, valued at 2,500,000 pounds at least, destroyed, directly or indirectly, through the lack of pasturage consequent on the drought. In 1876

the Australian Colonies possessed between them over 45 million sheep, of which 20 million belonged to New South Wales. There is reason to believe that in Victoria and South Australia the effects of the drought were quite as disastrous as in New South Wales, while in Queensland they were doubly severe. It is not, therefore, too much to estimate that at least the same proportion of the flocks elsewhere were destroyed as in New South Wales, and that in Australia alone, omitting Tasmania and New Zealand, 9 million sheep perished in a single summer. If we extend our view to Cape Colony, which, with the whole of *South Africa*, endured a similar calamity, we shall find that over 10 million sheep must have succumbed to the drought of 1877-78, or nearly one-third of the number of sheep supported by the whole of the United Kingdom.”<sup>47</sup>

During the drought of 1877-78 in *Australia*, another account speaks of the expected failure of the grain crops, and adds, “The kangaroos and wallaby proved so numerous that they alone consumed all that was left green. Water was carted in many cases from 10 to 12 miles (16 to 19 kilometers).”<sup>47</sup>

In 1877, all the colonies of *Australia* experience a drought. Western Australia and western Victoria were the worst hit areas. In Western Australia the swamps dried up and the native trees died.<sup>101</sup>

The temperature at Coonamble in New South Wales, *Australia* on 27 November 1877 was 112° F (44.4° C) in the shade.<sup>106</sup>

In New South Wales, *Australia* in 1878, there was a drought.<sup>103</sup>

On 18 January 1878, the temperature at Brewarrina in New South Wales, *Australia* rose to 124° F (51.1° C) in the shade.<sup>103</sup>

On 21 February 1878 at Rockhampton in Queensland, *Australia*, there were four sudden deaths caused by the great heat.<sup>103</sup>

### **New Zealand**

In November 1877, it was reported that there was a great destruction of retail goods at Dunedin, *New Zealand* owing to the want of water for the streets and there are continuing clouds of dust. It was proposed that seawater be lifted from the sea for the purpose of putting down the dust on the streets. On 5 December 1877 in Dunedin, there was a hot wind blowing. Water was very scarce and was selling for 5 pence a bucket.<sup>106</sup> [Dunedin is on the South Island of *New Zealand* in the southeastern side.]

### **South Africa**

During 1877, *South Africa* experienced drought conditions.<sup>167</sup>

— At Colesberg, “No rain of material advantage have fallen during a period of seventeen months. We have had no drought since 1829 equal in duration and intensity to the one which we now hope is drawing to a close.”

— At Murraysburg, “The almost unprecedented drought, ... has caused very severe losses to flock masters and agriculturalists. Dams which have never been known to fail have been dry during the greater part of the year.”

— At Humansdorp, “The year 1877 has been the most unfavourable one that this district has experienced for many years past. The Gamtoos River, which usually carries a large body of water, is now perfectly dry.”

— At Uitenhage, “The Sunday River, which flows the length of the district... has been for a considerable time so low that irrigation has been impossible.”

— At Bedford, “Losses in cattle and small stock were very numerous owing to the protracted drought.”

In 1878 at Cape Colony, intelligence from the interior of Cape Colony [then a British Colony in the southern region of now *South Africa*] and the Orange Free State [then an independent Boer republic in northern region of now *South Africa*] represents the country as having suffered most severely from the effects of the prolonged drought. Galekas and Gaikas (African tribes) combined are declared to be

incapable of their worst of inflicting a tenth part of the injury on the country, which has been caused by the lack of rain. Not only are the cattle and horses described as becoming daily more attenuated, and dying from the want of food and water, but human beings have succumbed to starvation, and numbers of farmers have “trekked” – deserted their lands and homes in search of food for themselves and their flocks. The failure of the crops threatened, at last advices, a disastrous famine unless rain speedily fell in abundance. New the coast the drought gave signs of breaking two months ago, but in the interior the roads are like iron, dams were dried up, springs were failing, and not a cloud was to be seen in the sky. Of the fruit crops the grapes alone had been saved. Such a state of affairs has not been known since 1862, when a disastrous but less extensive drought occurred. The necessity for works for storing water and for irrigation purposes has been more than ever impressed on the colonists by the serious check, which is thus placed on all commercial enterprises throughout the country. The Act passed last year for encouraging irrigation works will tend to the gradual relief, by artificial means, of the natural drawbacks of the country which, in this respect, resembles India or Egypt, being dependent on the periodical rains, and consequent floods, for the production of its wonderfully fertile soil.<sup>47</sup>

### Morocco

In *Morocco* in 1877, the drought from the preceding season produced a famine.<sup>57</sup>

In 1878, advices from the *Barbary Coast* of North Africa received in May received at Gibraltar give a gloomy picture of the state of affairs in the town of Casablanca, owing to the drought. Starvation is staring the native tribes of Bedouins in the interior in the face. Their fields are completely parched, and they are in great distress for want of employment. Gaining their subsistence by tilling the ground and gathering in the crops whenever chance offered, these poor Bedouins, who vied with each other in assisting their brethren of the Riff coast last year, are now as badly, in not worse, off than they were. The want of the rain, which would enable them to raise fodder, causes the holders of cattle to bring them into the town to be disposed of as best they can at any sacrifice. On the 10<sup>th</sup>, bullocks were being offered at \$4 and \$5 each and sheep at 8 rvn. and on the 15<sup>th</sup>, thirty cows were sold for the paltry sum of six pesetas each, and the sheep at 5 rvn. Many head of cattle in a lean condition remained unsold for want of buyers, though offered at half the above price. Grain is reported to be very scarce, and the little that is to be seen in the market is very dear. Rice and flour are being imported from *England* and *France*, but up to the present in small quantities. The province of Mogador is in a frightful state of misery owing to the want of rain. People, especially the Hebrews, flock into the town seeking the necessities of life from the charitable. At Tangiers some late showers have done much good by refreshing the fields for the benefit of the cattle.<sup>47</sup> [Casablanca and the province of Mogador are located in western *Morocco*. Tangiers is in northern *Morocco*.]

In *Morocco* in 1878, a correspondent of the *Jewish World*, residing at Mogador, and carrying on business in that city as a merchant, writes: “I regret to say that from want of rain the southern part of Morocco, comprising the provinces of Soos, Haha, Antuga, and the Morocco districts, is suffering from famine, every description of food being exceedingly scarce, and the pauper population of Mogador, always disproportionately large, forming about one-third of its entire inhabitants, is being rapidly increased by numerous famished Jewish and Moorish families from the adjacent districts. It is a fearful sight to see some of them – mere living skeletons. The Jews are behaving well, and have collected large sums and distributes them; they have now agreed to pay a tax of 3½ *d.* on every package of food and grain imported, and the money is being distributed weekly among the Jewish poor. The Moors, poor creatures, get no assistance from the Government, and little or nothing from their co-religionists; they are mainly dependent upon the charity they receive from the Jews and a few Christians. Unless the Government quickly does something to assist the sufferers, I fear that the limited resources of the merchants here will necessarily fail under the continual drain, and render them unable to assist the increasing number of poverty-stricken people. There is no kind of business now doing, except in articles of food, and consequently the working classes have nothing to do. They are selling their clothes and furniture to

obtain food, and when these have gone the amount of destitution will be increased. I fear, unless relief comes from the Government here, or from some charitably disposed persons, that I shall have to relate the most distressing accounts. Already some cases of actual starvation have occurred among the Moors. If you could see the terrible scenes of misery – poor starving mothers, breaking and pounding up bones they find in the streets, and giving them to their famished children – it would make your heart ache. Raise a few pounds if you can, and if you can do so lay it out in rice at the wholesale brokers, and have it shipped by the steamers leaving *England*.”<sup>57</sup>

### **Brazil**

In *Brazil* in South America in 1877, there was a great drought in northern provinces, and upwards of 200,000 of the population exposed to famine.<sup>57</sup>

In 1877, a scarcity of rain exposed 200,000 people in the northern provinces of *Brazil* to suffering.<sup>84</sup>

### **United States**

The maximum temperatures in the *United States* in June 1876 were: 96° F at Breckenridge and Washington D.C.; 97° F at Charleston, Denver, Kitty Hawk, Memphis, Tybee Island, Vicksburg and Yankton; 98° F at Augusta, Mobile, St. Marks; 99° F at Corsicana, Jacksonville, Montgomery, Savannah and Wilmington; 100° F at Dodge City and Norfolk; 101° F at North Platte; 111° F at Fort Sully; 115° F at several stations in Arizona.<sup>140</sup>

The maximum temperatures in the *United States* in July 1876 were: Baltimore, Cape Henry, New York City and Washington D.C., 99° F; Bismarck, Denison, Lynchburg, Philadelphia, Sandy Hook and Tybee Island, 100° F; Denver, Jacksonville, Montgomery and Pittsburgh, 101° F; North Platte and Norfolk, 103° F; Corsicana, 105° F; Dodge City, 108° F.<sup>140</sup>

In July 1876, throughout the *United States* east of the Rocky Mountains, the heat in many places became so intense as to produce fatal results, to cause the suspension of business, and an increase of the death rates of many of the large cities to the highest percentage.<sup>140</sup>

In August 1876 there were severe droughts in many regions of the *United States* including Florida, Illinois, Maine, New Hampshire, Vermont, New York, New Jersey, Pennsylvania, Tennessee, Virginia and Texas. At Standish, Maine, the drought was very severe, streams were dry and wells low. In St. Lawrence County, New York, the farmers were feeding grain to cattle to prevent starvation. At the end of the month at Wappingers Falls, New York, there was not enough water in the streams to run the factories. At Tioga, Pennsylvania, it was the driest period in 80 years. Because of the excessive summer heat and the lack of rainfall that resulted in droughts, several forest fires raged throughout the country. There were forest fires on the 5<sup>th</sup>, at New Brunswick, New Jersey; 8<sup>th</sup> to 12<sup>th</sup> at Carson City, Nevada; 16<sup>th</sup> on Campobello Island, Canada at the easternmost tip of the United States; 17<sup>th</sup> and 18<sup>th</sup> at Shelburne, New Hampshire; 22<sup>nd</sup> to 31<sup>st</sup> at Auburn, New Hampshire; 24<sup>th</sup> to 31<sup>st</sup> at Blooming Grove, Pennsylvania; 25<sup>th</sup> at North Hammond, New York; 27<sup>th</sup> to 31<sup>st</sup> at Fishkill Mountains, New York; 28<sup>th</sup> in the mountains near Pond Eddy, Pennsylvania vast amount of timber destroyed; around Honesdale, Pennsylvania, woods burning fiercely; in Clinton township, Pennsylvania, men fighting the fire; the Moosic Mountains, Pennsylvania, ablaze for miles, a vast amount of timber destroyed, but one rain in this section since July 4<sup>th</sup>; in the mountains in Essex County, New York; in the Highlands, opposite Newburg, and near West Point, immense surface burned over; 31<sup>st</sup> at Mt. Desert, Maine, fires raging in woods; Pike's County, Pennsylvania, fires raging with great violence, valuable timber destroyed; St. Lawrence County, New York, large quantities of timber, hay and grain destroyed, and some cattle burned; near Boonton, New Jersey, several thousand acres of bog meadows on fire for a number of days; near North Conway, New Hampshire, large quantities of valuable timber destroyed in mountains.<sup>140</sup>

During October 1876, the drought continued in many parts of the *United States*, including Maine, Massachusetts, Mississippi, New Hampshire, New York, Vermont, West Virginia, Texas and Utah. At Corsicana, Texas, the drought continued and along with grasshoppers destroyed the stock ranges, and in some parts of the country people were hauling water 10 to 12 miles. No wheat planted, ground too hard to plough. In Massachusetts, Watuppa Lake was 58¾ inches below the high water mark, probably the lowest since 1857.<sup>140</sup>

In July 1877 in California in the *United States*, the wheat planting season was an unpropitious one, very few districts in the State having been favored with sufficient moisture to enable the farmers to get their crops properly in the ground. While in many, the most extensive number of fields, did not have enough rainfall all through the winter to allow the field to be plowed at all. Even in the most favored districts the amount of rainfall was barely sufficient to make the crop, and in these only the best-cultivated fields gave a full yield.<sup>106</sup>

The year 1877 was a very dry year due to a lack of winter rains in California in the *United States*. In Santa Barbara County, hay sold for \$40 per ton. Many farmers lost their entire herd of sheep.<sup>200</sup>

In July 1878 in the *United States*, for eleven days past the weather in the Mississippi Valley and in the North-Western States has been exceedingly hot, the temperature averaging from 90° F to 102° F (32° C to 39° C) in the shade, in some places reaching even 110° F (43° C). In St. Louis, Missouri during this period 1,500 persons have been affected by the heat, of whom 150 have died. Most kinds of public work and business generally were suspended during the first half of the present week or done at night. The letter-carrier service was also interrupted during the middle of the day. In many parts of Southern Missouri and Kansas the harvesting has been done by moonlight. At Fort Dodge, Iowa, the thermometer last Tuesday, at sunset, registered 101° F (38° C) and in Milwaukee, Wisconsin on Wednesday it ranged from 90° F to 100° F (32° C to 38° C) in the shade. One hundred and three cases of sunstroke were reported in Chicago, Illinois on Wednesday, of which thirty-one resulted in death. The same day, throughout the Province of Ontario, in *Canada*, the thermometer ranged from 90° F to 103° F (32° C to 39° C) in the shade. The heat wave moved slowly eastward, and at Wheeling, West Virginia, the thermometer showed 101° F (38° C) in the shade. On Thursday, in the cities on the Atlantic coast, the temperature ranged from 88° F to 98° F (31° C to 37° C) in the shade. A cool wave from the north setting in after the torrid one reached Chicago, Illinois on Thursday morning.<sup>47</sup>

On 19 April 1879, the most severe drought in 30 years struck Dallas, Texas in the *United States*. On many plantations, the wheat was not more than one foot high and is heading out. There were fears of a famine in corn and oats. The high and dry winds that prevailed for three weeks was still blowing, with no moisture in the air and not a cloud to be seen in the heavens. The drought covers all that portion of Texas lying upon a line of Denison and San Antonio, including every county west of it, and an average of two tiers east. In some portions of this territory people are hauling water for drinking purposes a distance of from three to six miles.<sup>131</sup>

---

**1876 A.D.** On 28 January 1876, there was a destructive hailstorm in Tasmania, *Australia*.<sup>103</sup>

In February 1876, tornadoes or energetic storms with destructive gust of wind were reported on the 13<sup>th</sup> near Friendsville, Illinois; 14<sup>th</sup> at Buffalo, New York; 27<sup>th</sup> St. Charles, Missouri, Princeton & St. Meinrad, Indiana in the *United States*.<sup>140</sup>

In March 1876, tornadoes were reported at Hazel Green, Wisconsin, and Hassard, Missouri, on the 10<sup>th</sup>; near Larned, Kansas on the 5<sup>th</sup>; South Hartford, New York in the *United States* on the 21<sup>st</sup>.<sup>140</sup>

On 21 March 1876, a cyclone struck Townsville in Queensland, *Australia*. The cyclone caused damage

on land and 17 deaths at sea when the *Banshee* sank off Hinchinbrook Island.<sup>99</sup>

In *France* and Holland [now *the Netherlands*] in March, there was severe inundations.<sup>47, 90, 92</sup>

In *China*, there were great floods in the northern provinces.<sup>47</sup>

In 1876, several regions of *China* experienced flooding including:<sup>153</sup>

— During the period between 23 May and 21 June, floods struck Kiangsi (now Jiangxi province) in southern *China* at Nan-ch'ang, Ch'ing-chiang, Lin-ch'uan, P'o-yang, Nan-k'ang, Kiukiang, and Chi-an; and Hupeh (now Hubei province) in central *China* at Ch'ien-chiang.

— During the period between 21 July and 18 August, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ing-t'ien and Hsüan-p'ing.

— During the period between 18 September and 16 October, floods struck Hopei (now Hebei province) in northern *China* at Hsing-t'ai.

In April 1876, a tornado in Iowa in the *United States* began in Wright County on the 11<sup>th</sup>, traversed through Franklin County and last heard of in Clayton county, 150 miles to the east of its origin. A second tornado occurred near Louisville Kentucky on the 14<sup>th</sup>. A tornado struck near Barnegat, New Jersey on the 16<sup>th</sup> and near Dodge City, Kansas on the 26<sup>th</sup>.<sup>140</sup>

On 6 May 1876, tornadoes struck Kansas, Illinois and Indiana in the *United States*. At Leavenworth, Kansas, a severe whirlwind passed over the city destroying three buildings and unroofing 10 others. In Indiana, a tornado formed at White River about two miles from the north line of Marion County. It traveled about 20 miles. Farmhouses and barns were destroyed. Cattle and sheep were taken up and whirled through the pipe. The tornado was shaped like an hourglass. A tornado struck Chicago, Illinois. It demolished a fog-bell tower. About \$250,000 in damages was done to property in and about the city. [In present currency, that would be equivalent to \$5 million in damages based on the Consumer Price Index (CPI) inflation rates.] At Carbondale, Illinois, a tornado struck the city destroying houses, uprooting trees and demolishing an *Illinois Central Railroad* depot. A few miles to the north at Neoga, a locomotive and railroad cars were blown from the tracks. The tornado also struck Anna, Illinois damaging buildings and trees.<sup>140</sup>

In June 1876, a very severe tornado struck Dodge City, Kansas in the *United States* on the 7<sup>th</sup>. A tornado struck Paris, Kentucky on the 23<sup>rd</sup>; another tornado struck Portage, Pennsylvania on the 24<sup>th</sup>. On the 25<sup>th</sup> a tornado passed just east of Lenoir, North Carolina where several houses were blown down. On the 25<sup>th</sup> a tornado or waterspout passed through Kingsbury, Hartford and Hebron, New York; the width of the storm track was about 200 yards, its duration at any point was 17 or 18 minutes. During the storm heavy hailstones fell, of which 15% were one inch in diameter. At the same time with the preceding storm, a more violent one passed in nearly the same direction, 40 or 50 miles to the north, passing into Vermont near Rutland. On the 26<sup>th</sup>, near Pueblo and Hard Scrabble canon, Colorado, a very severe storm was reported, having a track about two miles wide; hailstones, to the depth of 18 inches, were lying on the ground the next day; it was noted that clouds had been collecting for two days previously, and that shortly before the storm they were seen to be rising from the neighborhood of Pike's Peak in huge black masses.<sup>140</sup>

On 16 June 1876, unusually heavy rainfall occurred in South Carolina and Georgia in the *United States*. At Gainesville, Georgia and an area 100 miles to the east and to the south, the floods caused \$1 million in damages [\$20 million in today's dollars] and the loss of 8 lives.<sup>140</sup>

On 4 July 1876, a tornado struck Spiceland, Indiana in the *United States*, blowing down trees. Also on July 4<sup>th</sup>, destructive tornadoes struck Iowa. Tornadoes struck Lee, Davis, Van Buren, Clark, Lucas,

Appanoose, Harrison, Delaware, Jones, Linn and Cedar counties in Iowa and caused great loss of life and serious injury to crops. The storm was particularly severe at Dubuque, and at Rockdale, Iowa, where thirty-nine persons were drowned by a flood in the small stream upon which the village is located. A whirlwind with a storm of grasshoppers was observed on Pike's Peak, Colorado on the 11<sup>th</sup>. On the 13<sup>th</sup>, tornadoes struck Nottaway and Norfolk, Virginia.<sup>140</sup>

In July and August 1876, the hailstorms in *England* were few in number, but very severe. Damage to crops to the extent of more than £10,000 was occasioned in one section of Shropshire.<sup>93</sup>

On 18 August 1876, a storm in Paris, *France* produced a very unusual form of ball lightning called "bead flashes". "Towards seven in the morning at the moment when the storm began to descent on Paris, one flash remarkable amongst the others discharged itself from the cloud to the ground, describing a curve like an elongated 'S', and remained visible during an appreciable time, forming a string of brilliant beads scattered along a very thin luminous thread."<sup>271</sup>

In *France*, the losses in 1876 from hailstorms were estimated at £1,867,222. [In today's currency, that would be the equivalent of £130,000,000 or \$211,000,000 U.S. dollars using the retail price index.]<sup>93</sup> On 22 July 1876 in the Clarence River district in New South Wales, *Australia*, there were devastating floods and loss of life. The damage done at Grafton alone was estimated at £50,000.<sup>103</sup>

On 10 September 1876, the heaviest gales on record occurred on the *Australian* coast. On Sunday night the wind obtained the remarkable velocity of 135 miles per hour. The ship, the *Dandenong*, was lost at sea in this gale. The *S.S. City of Melbourne* on passage to Melbourne, Australia was caught in this gale off Jervis Bay, and racehorses to the value of £20,000 were lost.<sup>103</sup>

In September 1876 one of the worst gales in *Australia's* history occurred in Jarvis Bay off the coast of New South Wales. The steamer *Dandenong* was wrecked when her propeller shaft broke and she began to leak badly. Preparations were made to transfer the passengers and crew to the barque *Albert William*. Some lives were lost when lifeboats were swamped by huge seas but a few reached safety, leaving about 30 on the doomed vessel. By first light the *Dandenong* had gone. At the same time, a few kilometers away, the *S.S. City of Melbourne* with passengers and cargo including 11 horses, fought to survive. Although 8 horses were lost and the ship was badly damaged, she managed to survive.<sup>99</sup>

In September 1876, a hurricane passed near *Antigua* and *St. Kitts* on the 12<sup>th</sup>, *St. Thomas* and *Puerto Rico* on the 13<sup>th</sup>. The destruction of crops and buildings was reported as very great at these islands. On the 14<sup>th</sup> it passed near Santiago de Cuba, *Cuba* and on the 15<sup>th</sup> on the Bahamas Banks, *Bahamas*. The observer at Hampton, Virginia in the *United States*, reported lowest barometer (29.10 reduced to Signal Service standard) occurred at 1:20 p.m. on the 17<sup>th</sup>; at Washington, D.C. the records of the central office showed that the lowest barometer was 29.15 about 4:35 p.m. during a period of calm, which lasted from 4:50 to 5:50 p.m. The hurricane on the 16<sup>th</sup> and 17<sup>th</sup> caused unusually high water along the Atlantic coast.<sup>140</sup>

On 12 September 1876, a hurricane struck *St. Kitts* in the *West Indies*.<sup>144</sup>

On 13-17 September 1876, a hurricane struck *Puerto Rico* and North Carolina in the *United States*. Nineteen deaths were reported [in *Puerto Rico*], but historians suspect the Spanish Government withheld actual damage and death toll data. Two drowned in Onslow County, North Carolina and from Okracoke to Rocky Mount, reports were gathered of killed and injured citizens.<sup>141</sup>

On 13 September 1876, a waterspout was observed near New River, North Carolina in the *United States*. A strange phenomenon was observed originating from the apex of a cumulostratus cloud, very near the

beach. The base of the cloud was apparently about two hundred feet above the surface of the sea; a rushing noise and gyratory motion at the base of the cloud attended the phenomenon at its first appearance, and soon the cloud projected downward, lashing the sea in a furious manner; a deafening roaring of the water was heard, and in a few moments a completely-formed water-spout appeared; the column of water rose to the height of about forty feet, having a diameter of about twenty feet at its base. The waterspout now moved northward towards the beach, and twenty minutes after its formation the cloud rose and the column of water fell obliquely, in the direction of its course, on the beach, cutting a trench in the sand, ten feet in depth and twenty-five feet in width, throughout the entire length of the column.<sup>140</sup>

On 3-4 October 1876, a cyclone passed over Central America, with great destruction of property and loss of life, especially at Anagua [Antigua, *Guatemala*] and Blewfields [Bluefields, *Nicaragua*].<sup>140</sup>

On 17 October 1876, a hurricane was observed in the Caribbean Sea, south of Cuba and in the vicinity of the *Cayman Islands*. On the 18<sup>th</sup> it struck the western half of *Cuba*. On the 19<sup>th</sup>, it was over the southern portion of Florida in the *United States*. On the 23<sup>rd</sup>, it was over *Bermuda*.<sup>140</sup>

On 19-21 October 1876, a storm [hurricane] was first encountered by vessels in the Caribbean Sea south of *Cuba*. At Havana, Cuba, the barometer reached its minimum, about 28.70 inches (729 millimeters), at 11:45 a.m. on the 19<sup>th</sup>. The storm passed directly over Havana, and slightly to the east of Key West, Florida in the *United States*, where the lowest barometer, 28.73 inches (730 millimeters), was noted at 8 p.m. on the 19<sup>th</sup>. The highest force of wind at Key West was eighty-eight miles per hour at 8:45 p.m. on the 19<sup>th</sup>. The storm moved off the east-central coast of Florida on the morning of the 20<sup>th</sup>, and thence passed northeastward.<sup>120</sup>

During the night of 31 October 1876, a cyclone passed over the districts of Soonderbonds [Sundarbans] and Backergunje [Brackerganj], and the mouths of the Ganges and Bramapootra [Brahmaputra] rivers, east of Calcutta, British *India*, producing an immense tidal wave. Late accounts said 120,000 persons perished.<sup>140</sup> [The Sundarbans is in the Bay of Bengal, in northeastern Bengal [*India*] and west Bengal [*Bangladesh*]. The Sundarbans is the largest single block of tidal halophytic mangrove forest in the world. Backergunje [Brackerganj or Bakerganj] is located in southern *Bangladesh*.]

In Bengal, India [*India* and *Bangladesh*] on October 31, there was a great cyclone. A tidal wave, extending, it was estimated, over 3,000 square miles (7,800 square kilometers), being in many places more than 20 feet (6 meters) deep. The loss of life was estimated at 215,000, while the destruction of property was incalculable.<sup>57</sup>

On 31 October 1876, a storm wave, 10 to 50 feet high, swept the eastern edge of the Ganges delta, destroying over 100,000 lives.<sup>124</sup>

Destructive cyclone, in southeast Bengal [now *Bangladesh*] on 31 October 1876. Calcutta, *India* barely escaped. About 215,000 persons perished.<sup>90</sup>

In 1876, a powerful cyclone struck Backerganj, *Bangladesh* causing 200,000 deaths.<sup>98</sup>

In October 1876 in Bengal [*India* and *Bangladesh*], there was a great inundation of tidal wave caused by a hurricane. Estimates of loss of life as high as 200,000; loss of property immense.<sup>92</sup>

In *Wales* in October, there was great damage in South Wales from overflow of River Ebbw. Collieries [coal mines and associated buildings] damaged.<sup>47, 92</sup>

In *India* (now in *Bangladesh*) on November 7, the district of Baharganj (the delta thrown out by the united waters of the Ganges) desolated by a cyclone.<sup>57</sup>

In *Scotland* in November, there were great floods in Perth and Forfar. Caledonian Railway much injured.<sup>47, 92</sup>

Severe storms near [*Great Britain*] caused great loss of shipping on 11-13 November 1876; 2-3 and 22-23 December 1876; and 2 January 1877.<sup>90</sup>

In December, there were floods generally throughout *England*.<sup>47, 92</sup>

During 25-31 December 1876, severe floods struck *England* caused by heavy rains.<sup>90</sup>

In *Turkey* in December, there was a deluge of rain round Adrianople; 1,000 houses said to be swept away; and other serious damage.<sup>47, 92</sup> [Adrianople is now Edirne located in northwestern *Turkey*.]

In *Spain* and *Portugal* in December, there were great floods in Andalusia, and especially in Seville. Also in southern Portugal.<sup>47, 92</sup>

[Although this item does not fall under the category weather, I have included this material within brackets because of its unique nature. It appears that a large asteroid or comet fragment passed very near Earth on 21 December 1876 and broke apart over the *United States* forming a string of pearls as it passed across the sky: “The great meteor of the evening of the 21<sup>st</sup> was one of the most remarkable that has lately been recorded in the United States; reports concerning it have been received from about 120 stations. From a brief study of these it becomes apparent that the meteor entered the earth's atmosphere somewhere over or west of Kansas or Nebraska, its true course was nearly due east, and it was last seen over the State of New York. Its visible track, as projected upon the earth, is therefore over a thousand miles long. The times of its appearance and disappearance, as noted by the observers, are extremely discordant. The average of about 45 observations, pretty uniformly distributed along its course, gives 9 hours 26 minutes as the Washington [D.C.] mean time, which may, therefore, represent the moment when it was at the middle of its visible path. No definite conclusion can be satisfactorily arrived at, with reference to its actual velocity in miles, from a comparison of the records of distant observers; but the observations of the individual observers, taken by themselves, give velocities relative to the earth's surface of between 1 and 5 miles per second, or 2 to 5 miles [per second] relative to the earth's centre, and as the meteor was overtaking the earth in its annual orbit, its velocity in space relative to the sun was 20 to 25 miles [per second], its movement being, towards a point in Lat. 20°, Long. 35°, with reference to the plane of ecliptic. When first seen the meteor appeared to be as large as the moon, but much brighter. In passing over Indiana its main body divided into two portions, and one of these subsequently broke into a hundred fragments, which at first kept together in one cluster, but gradually fell behind each other, forming a long train in single-file and as such passed over Ohio into New York. The brightness of the meteor was everywhere described as far surpassing bright moonlight. No reliable accounts speak of any noise heard during the visibility of the meteor, but in from two to five minutes after its passage a shock resembling thunder was heard, which in the majority of cases was described as tremendous, shaking the ground and the houses, and was especially alarming to those who, on account of the prevailing cloudiness, were unable to see the preceding meteor. The uniform character of the sound heard at all stations shows that it was not due to any violent explosion, (properly so-called,) but was a peculiar acoustic phenomena, depending on the fact that that portion of the line described by the meteor when nearest to any observer, became, as it were instantaneously along a length of several miles, the origin of a series of simultaneous sounds which, although in themselves comparatively feeble, were concentrated into a violent sound when they reached the observer's ear. No records have come to hand of the finding of any fragments of this meteor, nor is it likely that any of any size fell to the earth, as the main body evidently passed out of the atmosphere when over New York, and the smaller fragments or sparks that were seen to fly off were rapidly burned up and disappeared in its train.”]<sup>140</sup>

*Also refer to the section 1876 A.D. – 1879 A.D. for information on the worldwide drought and famine during that timeframe.*

---

**Winter of 1876 / 1877 A.D.** During the winter of 1876-77, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1876 occurred on 15 October. It snowed all day; 4 or 5 inches deep.<sup>116</sup>

During the winter of 1876-77 in Bradford County, Pennsylvania in the *United States*, there was a long run of good sleighing on the highlands lasting from the end of November until the first of April. The deepest snowfall was on 6 January with a fall of 12 inches [30 cm]. A snowstorm, which began on 12 March lasted 36 hours, but the snowfall was light. The coldest days of this winter occurred on the morning of 9 January when the temperature fell to -20° F [-29° C] and on 18 March when temperatures dropped to -15° F [-26° C].<sup>178</sup>

Frost occurred in the Gulf States in the *United States* during much of December 1876. The first period of cold from the 1<sup>st</sup> to the 6<sup>th</sup> at Punta Rassa, Florida, scarcely anything escaped being injured by the cold. Large quantities of fish of all sizes and kinds, were killed by the cold water, and cast up on the beach daily.<sup>140</sup> [Punta Rassa today is a ghost town. It is located on State Road 867 just before crossing the bridge for Sanibel Island on the south side of the Caloosahatchee River.]

In December 1876 many rivers and lakes in the *United States* were frozen over. The Mississippi River at Davenport, Iowa was frozen over on the 4<sup>th</sup> when men crossed the river on foot. By the 10<sup>th</sup> teams [of horses and wagons] crossed the frozen river. At St. Louis, Missouri the Mississippi River was frozen over on the 11<sup>th</sup>. At La Crosse, Wisconsin the ice on the Mississippi River averaged 19 inches in thickness, and some ice was cut 31 inches thick, on the 31<sup>st</sup>. At Pittsburg, Pennsylvania and at Cincinnati, Ohio, the Ohio River was frozen over on the 10<sup>th</sup>. At Logansport, Indiana, the Wabash and Eel rivers were frozen over. At Alpena, Michigan on the 8<sup>th</sup>, the Thunder Bay River and harbor were frozen over. At Monticello, Iowa, the Maynoketa River [Maquoketa River] was frozen over on the 2<sup>nd</sup>. At Shelburne, New Hampshire, the Androscoggin River crossed by pedestrians on the 3<sup>rd</sup> and by teams on the 10<sup>th</sup>. At Trenton, New Jersey on the 4<sup>th</sup>, the Delaware River was frozen over. At Decatur, Illinois on the 8<sup>th</sup>, the Sangamon River was frozen over. At Philadelphia, Pennsylvania on the 9<sup>th</sup>, the Schuylkill and Delaware rivers were frozen over. At Morgantown, West Virginia, the Monongahela River was frozen over. At Bloomfield, Wisconsin, Geneva Lake was frozen over. At Washington, D.C., the Potomac River was closed [due to the ice] on the 12<sup>th</sup>. At Salem, New Jersey, the Salem Creek was closed on the 15<sup>th</sup> when the ice was 10 inches thick. At Asheville, North Carolina on the 18<sup>th</sup>, the French Broad River was crossed on ice by cattle, &c, for several days about this date. This was the first time that this had ever occurred within the knowledge of the observer. On the 19<sup>th</sup>, at Fall River, Massachusetts, the Taunton River and Narragansett Bay were frozen over. On December 25<sup>th</sup> at Standish, Maine, Sebago Lake was frozen. This lake has not been known to freeze with the water so low since 1838.<sup>140</sup>

The following were the lowest temperatures observed in January 1877 in the *United States*:<sup>112</sup>

Pembina, Dakota Territory	(-53° F, -47.2° C)
Fort Ripley, Minnesota	(-41° F, -40.6° C)
Mount Washington, New Hampshire	(-36° F, -37.8° C)
Orono, Maine	(-32° F, -35.6° C)
Coalville, Utah	(-30° F, -34.4° C)
Independence, Iowa	(-28° F, -33.3° C)
Duluth, Minnesota	(-27° F, -32.8° C)
Woodstock, Vermont	(-27° F, -32.8° C)
Neillsville, Wisconsin	(-27° F, -32.8° C)
Malone, New York	(-25° F, -31.7° C)
Westerville, Ohio	(-24° F, -31.1° C)

Contoocookville, New Hampshire	(-23° F, -30.6° C)
Spiceland, Indiana	(-22° F, -30.0° C)
Fort Sanders, Wyoming Territory	(-22° F, -30.0° C)
DeSota, Nebraska	(-22° F, -30.0° C)
Riley, Illinois	(-21° F, -29.4° C)
Kenton, Ohio	(-21° F, -29.4° C)
Laconia, Indiana	(-21° F, -29.4° C)
Tioga, Pennsylvania	(-20° F, -28.9° C)
Austin, Tennessee	(-20° F, -28.9° C)
Yankton, Dakota Territory	(-19° F, -28.3° C)
Fort Lyon, Colorado	(-19° F, -28.3° C)
Corning, Missouri	(-18° F, -27.8° C)
Embarrass, Wisconsin	(-17° F, -27.2° C)
Murphy, North Carolina	(-16° F, -26.7° C)
Burlington, Vermont	(-16° F, -26.7° C)
Omaha, Nebraska	(-16° F, -26.7° C)
Billerica, Massachusetts	(-15° F, -26.1° C)
Alpena, Michigan	(-14° F, -25.6° C)
Council Grove, Kansas	(-14° F, -25.6° C)
Cheyenne, Wyoming Territory	(-14° F, -25.6° C)
Nicholasville, Kentucky	(-12° F, -24.4° C)
Cornish, Maine	(-11° F, -23.9° C)
Wet Glaz, Missouri	(-11° F, -23.9° C)
Woodstock, Maryland	(-10° F, -23.3° C)
Keokuk, Iowa	( -9° F, -22.8° C)
Louisville, Kentucky	( -9° F, -22.8° C)
South Pueblo, Colorado	( -9° F, -22.8° C)
Snowville, Virginia	( -8° F, -22.2° C)
Salem, West Virginia	( -8° F, -22.2° C)
Memphis, Tennessee	( -6° F, -21.1° C)
Lansing, Michigan	( -6° F, -21.1° C)
Colebrook, Connecticut	( -6° F, -21.1° C)
Hudson, New York	( -5° F, -20.6° C)
Sedgwick, Kansas	( -4° F, -20.0° C)
Salem, New Jersey	( -4° F, -20.0° C)
Milford, Delaware	( -4° F, -20.0° C)
Fort McHenry, Maryland	( -3° F, -19.4° C)
Washington, D.C.	( -3° F, -19.4° C)
Weston, West Virginia	( -2° F, -18.9° C)
Dover, Delaware	( 0° F, -17.8° C)
Anna, Illinois	( 0° F, -17.8° C)
Spartansburg, South Carolina	( 0° F, -17.8° C)
Fort Gibson, Indian Territory	( 0° F, -17.8° C)
Fort Union, New Mexico	( 0° F, -17.8° C)
Camp McDermitt, Nevada	( 0° F, -17.8° C)
Mount Ida, Arkansas	( 1° F, -17.2° C)
Carson City, Nevada	( 1° F, -17.2° C)
Boston, Massachusetts	( 2° F, -16.7° C)
Brownsville, Pennsylvania	( 2° F, -16.7° C)
Atco, New Jersey	( 3° F, -16.1° C)
Salt Lake City, Utah	( 3° F, -16.1° C)
Atlanta, Georgia	( 4° F, -15.6° C)
Chepachet, Rhode Island	( 4° F, -15.6° C)
New Haven, Connecticut	( 4° F, -15.6° C)
Weldon, North Carolina	( 6° F, -14.4° C)
Santa Fe, New Mexico	( 6° F, -14.4° C)

Newport, Rhode Island	( 7° F, -13.9° C)
Mesquite, Texas	( 8° F, -13.3° C)
Monticello, Arkansas	( 10° F, -12.2° C)
Carlowville, Alabama	( 13° F, -10.6° C)
Fort McKavett, Texas	( 14° F, -10.0° C)
Fort Sill, Indian Territory	( 14° F, -10.0° C)
Norfolk, Virginia	( 16° F, -8.9° C)
Montgomery, Alabama	( 16° F, -8.9° C)
Vicksburg, Mississippi	( 16° F, -8.9° C)
Aiken, South Carolina	( 17° F, -8.3° C)
Baton Rouge, Louisiana	( 18° F, -7.8° C)
Milton, Florida	( 20° F, -6.7° C)
Salinas City, California	( 21° F, -6.1° C)
Lake Charles, Louisiana	( 23° F, -5.0° C)
St. Marys, Georgia	( 26° F, -3.3° C)
Brookhaven, Mississippi	( 26° F, -3.3° C)
Portland, Oregon	( 27° F, -2.8° C)
El Monte, California	( 34° F, 1.1° C)
Key West, Florida	( 50° F, 10.0° C)

In the *United States* during the winter of 1876-77, the temperature dropped to -10° F at Mount Auburn, Ohio, a suburb of Cincinnati in December. The temperature at Kenton, Ohio fell to -20° F in December. The temperature at Fort Lyon (now Las Animas, Colorado) fell to -30° F in December. The temperature at Dubuque, Iowa fell to -19° F in December. The temperature at Fort Wallace (near Wallace, Kansas) fell to -24° F in December. The temperature at Dodge City, Kansas fell to -15° F in December. The temperature at Billerica, Massachusetts fell to -20° F in December. The temperature at Shelbyville, Indiana fell to -26° F on January 9<sup>th</sup>. The temperature at Coalville, Utah dropped to -30° F in January. The temperature at Pembina, North Dakota fell to -53° F in January. The temperature at Lenoir, North Carolina fell to -16° F in January. The temperature at Lynchburg, Virginia fell to -4° F in January. The temperature at Helvetia, West Virginia fell to -14° F in January.<sup>113, 126</sup>

The depth that rivers, streams, lakes and ponds froze in January 1877 in the *United States*:<sup>112</sup>

- \* At Decatur, Alabama, ice on Tennessee River 2 inches thick on January 2<sup>nd</sup> – 4<sup>th</sup>, navigation suspended 3 days.
- \* At Albemarle, North Carolina, the Pedee River had ice in eddies 4 inches thick on January 15<sup>th</sup>.
- \* At Lenoir, North Carolina, in ponds and streams were frozen 3 to 8 inches.
- \* At Snowville, Virginia, ice 18 inches thick.
- \* At Salem, New Jersey, creek remains firm on January 31<sup>st</sup>, had been 15 to 18 inches thick.
- \* At Philadelphia, Pennsylvania, ice on the Schuylkill River reported 34 inches thick on January 25<sup>th</sup>.
- \* At Wappinger's Falls, New York, pond ice reported 30 inches thick on January 6<sup>th</sup> and 36 inches on 31<sup>st</sup>.
- \* At Malone, New York, Pond ice 30 inches thick on January 13<sup>th</sup>.
- \* At Morgantown, West Virginia, ice 8 to 15 inches thick on January 13<sup>th</sup>.
- \* At Wooster, Ohio, ice 24 inches thick.
- \* At Afton, Iowa, pond ice 14 inches thick on January 25<sup>th</sup>.
- \* At Keokuk, Iowa, river ice 20 to 30 inches thick on January 13<sup>th</sup>.
- \* At Independence, Iowa, river ice 21 inches thick.
- \* At Leavenworth, Kansas, ice 15 inches thick on January 8<sup>th</sup>.
- \* At Omaha, Nebraska, ice 24 inches thick on January 31<sup>st</sup>.
- \* At Plattsmouth, Nebraska, ice 24 to 30 inches thick on January 13<sup>th</sup>.
- \* At La Crosse, Wisconsin, river ice 13 inches thick on January 31<sup>st</sup>.
- \* At Breckenridge, Minnesota, ice on the Red River of the North 40 inches thick, and on the Bois des Sioux 43 inches thick on January 31<sup>st</sup>.

The depth that the ground was frozen in January 1877 in the *United States*:<sup>112</sup>

- \* At Brookhaven, Mississippi, the ground was frozen to a depth of 5 inches on January 1<sup>st</sup>.

- \* At Alta Vista, Virginia, the ground was frozen 7 inches deep on January 6<sup>th</sup>.
- \* At Danville, Kentucky, the ground was frozen 1 foot on January 9<sup>th</sup>.
- \* At College Hill (near Cincinnati), Ohio, the ground was frozen 3½ feet on January 13<sup>th</sup>.
- \* At Freehold, New Jersey, the ground was frozen 14 inches on January 29<sup>th</sup>.
- \* At Breckenridge, Minnesota, the ground was frozen 6 feet, 4 inches on January 30<sup>th</sup>.
- \* At Dover, Delaware, ground was frozen 30 inches at the close of month.
- \* At Tabor, Iowa, the ground was frozen 4 feet.
- \* At Independence, Iowa, the ground was frozen 18 inches.
- \* At Creswell, Kansas, the ground was frozen 1 foot.
- \* At Sedgewick, Kansas, the ground was frozen 10 inches.
- \* At Fallston, Maryland, the ground was frozen 7 inches.
- \* At Somerset, Massachusetts, the ground was frozen 14 inches.
- \* At Wooster, Ohio, the ground was frozen 1 foot.
- \* At North Lewisburg, Ohio, the ground was frozen 16 inches.
- \* At Ardenia, New York, owing to the heavy covering of snow, the frost had penetrated the ground to only a depth of 8 inches.
- \* At Westboro, Massachusetts, the ground under the snow was reported free of frost.

---

**1877 A.D.** In London and *England* generally in January, there was great damage done in the southern districts of London by high tide combined with floods; also in Thames Valley generally. Destruction estimated at over 200,000*l*. A subscription opened by Lord Mayor for relief of poorer sufferers. Large sums raised. In the eastern, midland and southwestern counties great floods.<sup>47 92</sup>

On 1 January 1877, an inundation greatly injured the piers at Folkestone, Dover, and Hastings in *England*.<sup>90</sup>

On 18 February 1877, a terrible hurricane occurred at the Lacepede Islands, *Australia*.<sup>103</sup> [These islands are off the northwest coast of Western Australia.]

During March and October 1877, there were hailstorms in *England*. The hailstorms commenced very early in the year— these were designated "Lambing Storms." On the 29th of March, a most severe storm visited the northern districts of the metropolis, effecting great destruction of glass. The hailstorms continued to an unusually late period of the year.<sup>93</sup>

On 3 May 1877 at Mason, Texas in the *United States*, there was a terrific and destructive storm that produced hail as large as a man's hand, crushing crops and killing thousands of sheep.<sup>112</sup>

On the 16<sup>th</sup> to 19<sup>th</sup> of May 1877, a very heavy "Kona" storm and rain passed over the *Sandwich Islands* [now *Hawaiian Islands*]. At Honolulu, *Hawaii*, the storm produced heavy snowfall on the mountains and a large waterspout. The "Kona" is a strong northerly wind, interrupting the regular northeast trade, and usually preceding a hurricane.<sup>112</sup>

On 18 May 1877, a storm in the *United States*, produced 3 inch diameter hailstones at Webster, Massachusetts; 4 inch diameter hail at Oxford, Massachusetts, and 5 inch diameter hail in Bennington Virginia.<sup>112</sup>

On 27 May 1877 at 22 miles north of Mason, Texas in the *United States*, 3 to 4 inch diameter hail crashed through the roofs.<sup>112</sup>

The following maximum temperatures were observed during the summer from June-September 1877 in the *United States*:<sup>112</sup>

96° F, (35.6° C) at Boerne, Texas; Cheyenne, Wyoming; Keokuk, Iowa; La Crosse, Wisconsin; Lynchburg, Virginia; Memphis, Tennessee; Nashville, Tennessee; New Orleans, Louisiana; Pittsburgh, Pennsylvania; and Yankton, South Dakota; Leavenworth, Kansas; Fort Hayes, Kansas; Hennepin, Illinois; and Castroville, Texas.

97° F, (36.1° C) at Salinas City, California; Galveston, Texas; Saint Louis, Missouri; and Wilmington, North Carolina.

98° F, (36.7° C) at Salt Lake City, Utah; Fort Gibson, Indian Territory; Smithville; and Washington D.C.

99° F, (37.2° C) at Fort Richardson, Texas; Camp Sheridan, Nebraska; Vicksburg, Mississippi; Shreveport, Louisiana; Fort Sill, Indian Territory; Norfolk, Virginia; Omaha, Nebraska; St. Marks, Florida; Tybee Island, Georgia; and Denver, Colorado.

100° F, (37.8° C) at Mobile, Alabama; Charleston, South Carolina; Florence, California; Indianola, Iowa; Jacksboro, Concho, Texas; Independence, Iowa; Augusta, Georgia; Jacksonville, Florida; Mason, Georgia; and Savannah, Georgia.

101° F, (38.3° C) at Dodge City, Kansas; and Atlanta, Georgia.

102° F, (38.9° C) at Campo, California; Tucson, Arizona; Denison, Texas; Montgomery, Alabama; Baton Rouge, Louisiana; Chepachet, Gilmer, Texas; Clarksville, Texas; Melissa, Texas; Eagle Pass, Texas; Fort Griffin, Texas; Fort Clark, Texas and Fort Rice, North Dakota.

103° F, (39.4° C) at Sacramento, California; Corsicana, Texas; Fort McKavett, Texas; and Visalia, California.

104° F, (40.0° C) at Camp Verde, Arizona; Laredo, Texas; Winnemucca, Nevada; Phoenix, Arizona; Uvalde, Texas; Mesquite, Texas; and New Ulm, Texas.

105° F, (40.6° C) at Fort Lyon, Colorado.

106° F, (41.1° C) at Red Bluff, California; Brackettville, Texas; and Boise City, Idaho.

107° F, (41.7° C) at North Platte, Nebraska.

108° F, (42.2° C) at Fresno, California; Wickenburg, Arizona; San Antonio, Texas; and Fort McPherson, Nebraska.

109° F, (42.8° C) at Fort Sully, South Dakota; and Rio Grande, Texas.

111° to 122° F, (43.9° to 50.0° C) at Spring Valley, California.

112° F, (44.4° C) at Los Angeles, California; Maricopa Wells, Arizona; Fort Yuma, California; and Cajon Rancho, California.

114° F, (45.6° C) at Yuma, Arizona

116° F, (46.7° C) at Stanwix Station, Arizona.

From a paper by Mr. G.J. Symons, F.M.S., “On the Climate of the Various British Colonies”

Annual Climatological Data for the Principal British Colonies:<sup>112</sup>

<u>Name of Colony and Station</u>	<u>Absolute Maximum</u>	<u>Absolute Minimum</u>	<u>Average Rainfall</u>
London	95.0° F	5.0° F	25 inches
St. Helena, Longwood	77.6° F	52.0° F	40 inches
Cape of Good Hope	97.4° F	37.7° F	24 inches
Natal	97.8° F	29.0° F	30 inches
Mauritius	90.0° F	62.8° F	56 inches
Bengal, Calcutta	106.0° F	52.7° F	66 inches
Bombay	93.5° F	58.0° F	71 inches
Madras	110.0° F	57.6° F	48 inches
Ceylon	95.0° F	68.3° F	76 inches
Straits-Settlements	93.0° F	65.0° F	95 inches
Queensland, Brisbane	108.0° F	34.5° F	51 inches
New South Wales, Sydney	107.0° F	36.0° F	50 inches
Victoria, Melbourne	111.2° F	27.0° F	26 inches
South Australia, Adelaide	113.5° F	34.2° F	21 inches
Tasmania, Hobart Town	105.0° F	29.0° F	23 inches
New Zealand, Wellington	83.0° F	30.0° F	47 inches
British Guiana	89.0° F	68.0° F	94 inches
Barbadoes	85.0° F	64.0° F	67 inches
British Honduras, Belize	88.0° F	58.0° F	71 inches
Bermuda	95.0° F	46.0° F	48 inches

Canada, Newfoundland	92.5° F	- 21.0° F	55 inches
Canada, Toronto	99.2° F	- 26.5° F	36 inches
Canada, Manitoba	95.0° F	- 43.1° F	22 inches
Canada, British Columbia	100.0° F	- 29.0° F	---

[Longwood is on the island of St. Helena in the South Atlantic Ocean. The Cape of Good Hope is in the southern region of South Africa. Natal is in the northeastern region of South Africa. Mauritius is an island in the west Indian Ocean. Calcutta is now Kolkata in northeastern India. Bombay is now Mumbai in northwestern India. Madras is now Chennai in southeastern India. Ceylon is now Sri Lanka. Straits-Settlements is now Singapore and Malaysia. Brisbane is on the east-central coast of Australia. Sydney and Melbourne are on the southeastern coast of Australia. Adelaide is on the south-central coast of Australia. Hobart Town is on the southeastern coast of Tasmania, Australia. Wellington is in the southern region of the South Island in New Zealand. British Guiana is in northern South America. Barbadoes (Barbados) is a Caribbean island in the West Indies. British Honduras is now Belize in Central America. Bermuda is a Caribbean island in the West Indies. Newfoundland is in northeastern Canada. Toronto is in southern Canada. Manitoba is in central Canada. British Columbia is in western Canada.]

During the middle of June 1877, floods on the banks of the River Thames in *England* did much damage throughout the country.<sup>90</sup>

On 24 June 1877, a tornado and waterspout passed 2½ miles north of Fort Lyon (Las Animas), Colorado in the *United States*. The tornado formed and touched down pulling up a vast column of dust, and then suddenly a waterspout formed in the center of the whirl. It passed across the prairie with a terrific noise. Very large size hail dropped from the center of the whirl. The pieces of ice (hailstones) were “so large that they could not be grasped in one hand.” The violent wind unroofed the railroad depot, and demolished a switch house. Examining the tornado path the next day, it was determined the tornado was about 500 yards wide.<sup>112</sup>

On 30 June 1877 in Vevay, Indiana in the *United States*, at the close of a remarkably violent storm, there was a heavy shower lasting five minutes, which fell from an apparently cloudless sky. The raindrops were of a large size and when caught by a sheet of blotting paper made circles 2½ inches in diameter.<sup>112</sup>

On 3 July 1877, there was a destructive hailstorm that passed over the eastern portion of Bradford County, Pennsylvania in the *United States*. Growing crops along Wyalusing Creek were almost totally destroyed. Persons living in the vicinity report that hailstones were piled up along the fences 30 inches [0.8 m] in depth.<sup>178</sup>

On 6 August 1877, a severe wind and rainstorm occurred at Council Bluffs, Iowa, in the *United States* between 2 and 3 o’clock in the morning coming from the northwest. The new building of the Deaf and Dumb Institute was left a mass of ruins. The roof was caught up bodily carried to the southeast and literally torn into fragments. One piece weighing not less than five tons, being carried 40 rods (660 feet, 200 meters). While other pieces weighing between two and three tons were carried still further away. There were fragments scattered over the country for more than a mile. To give some idea of the force of the wind, the front wall of the main building, having a stone basement two feet in thickness, is said to have been moved seven inches at the top, gradually decreasing to about one half inch at the base. The brick walls of the third story in some places were blown entirely down. The fourth story was almost entirely demolished. The buildings in the rear of the main building and somewhat protected were also greatly damaged. The roofs of the engine and gashouses being torn away and two chimneys blown down.<sup>112</sup>

On 12 August 1877 in Jamestown, New York in the *United States*, at 1:15 p.m., “during a thunderstorm, a ball of fire, apparently two feet in diameter, entered a church, killing one boy and severely burning several persons; instantly the whole interior of the building grew hot and dry, the air hard to breathe and supremely oppressive.”<sup>112</sup> [ball lightning]

On 21 August 1877, there was a violent wind and hailstorm that struck Chestertown, Maryland in the *United States* and extended to Queen Anne’s County. Hailstones as large as hen’s eggs did much damage to the orchards and window glass. This was the sixth hailstorm of the season and the most destructive one. It struck between Centreville and Ruthsburg. One of the hailstones weighed one-quarter pound. They killed poultry and broke the leg of a hog. The destruction to fruit and grass amounts to almost a total loss, while the corn is more than a third destroyed.<sup>112</sup>

On 21 August 1877, London reported there have been unusually severe floods throughout *Great Britain* and *Ireland*. This flood caused great damage to crops.<sup>106</sup>

On 25 August 1877 in Omaha, Nebraska, in the *United States*, there was a severe wind and rainstorm at 3 a.m. Two spans of the Missouri River Bridge, each 150 feet along with the stable of the Omaha Omnibus Company were blown down. As the immense cloud passed over the river, a tornado dropped down lifting up the water in vast quantities and whirling it around in a funnel shape. The spans destroyed were at the eastern terminus of the bridge. The wrought iron stringers and columns of the bridge spans were twisted and bent like so many pieces of paper and carried partly into the river and partly against the eastern embankment of the river on the south side of the bridge.<sup>112</sup>

In *Great Britain*, it was reported on 31 August 1877, that the most disastrous flood ever known in southern *Wales* devastated a portion of the country between Cardiff and Swansea. The railway traffic was entirely suspended, and the destruction to the crops, in a circuit of 50 miles is irreparable. Some small towns were inundated and valuable cattle drowned. South London was subjected to a succession of thunderstorms and rainfalls to those experienced in the tropics. Gardens and conservatories sustained immense damage.<sup>106</sup>

In September 1877, millions of sheep and cattle perished, and hundreds of families rendered homeless by floods in *Argentina*.<sup>106</sup>

On 21 September to 5 October 1877, a storm [hurricane] moved from the *Barbados* westward over the Caribbean Sea and recurved between *Cuba* and *Yucatan* into the Gulf of Mexico, and by the night of October 2<sup>nd</sup> had reached the coast of Florida near Saint Marks in the *United States*. Moving thence northeast the storm passed off the middle Atlantic coast, and was central south of Newfoundland, *Canada* on the night of the 5<sup>th</sup>. This storm caused immense damage to property and considerable loss of life in the *West Indies*, and during its passage over the continent was attended by very severe storms and destructive tides.<sup>120</sup>

On 21 September to 5 October 1877, a hurricane struck the *Caribbean* island of Curacao, and Pennsylvania and the eastern coast of the *United States*. Most sources indicate more than 84 deaths resulted. [Additionally there was some loss of life in *Cuba* according to Appendix of Gutierrez-Lanza in Sarasola (1928) and a steamship *Magnolia* foundered off Hatteras in North Carolina.]<sup>141</sup>

On 8 October 1877, there were three feet of snow in Schipka Pass [Balkan Mountains in *Bulgaria*]. The roads were unfit for the movement of troops. On 15 October, the bridge over the Danube River at Nicopol [northern *Bulgaria*] was swept away. On 26 October, it is reported that there has been much rain and snow in the *Balkans*, impeding [military] operations. Horses are daily suffocated in liquid mud four feet deep.<sup>106</sup>

On 14-15 October 1877, there was a most violent gale that caused great destruction of property on land and shipping throughout *England*, with loss of life.<sup>90</sup>

On 14 October 1877, a violent gale swept over the *United Kingdom* and inflicted enormous damage and loss of life. In fury and violence it exceeded any storm in *England* for many years. The west of England, Bristol, Bath and Bridgewater suffered most, roofs were stripped, skylights carried away, trains stopped by overthrown timber and telegraph posts, railway stations, churches, private houses, and buildings either wrecked or seriously damaged. In the Midland counties there was also great havoc, while in both *Wales* and *Scotland*, the storm was very severe. At most of the seaports the destructive effects of the gale were very manifest. In Windsor and other parks, the largest trees were uprooted. At Wolverhampton [in West Midlands, *England*], there was scarcely a street in the town where the houses are not partly unroofed. Many vessels were lost and in some cases none of the crew were saved. The *Olga*, towing the Cleopatra's Needle, an ancient Egyptian obelisk, had to abandon her charge in the Bay of Biscay. [The *Olga* capsized and all six members of her crew were lost.] The obelisk has since been recovered and taken into Perrot. The *Lockfyne*, from Calcutta to London was thrown on her beam in the *Channel* and the *Knapton Hall* steamer, in endeavoring to assist, collided and floundered with nine of the crew drowned.<sup>106</sup>

In 1877, during the night of the November 23<sup>rd</sup>-24<sup>th</sup>, when a storm, which had advanced from the north Pacific coast, was central in West Virginia in the *United States*, the *U.S.S. Huron* was wrecked on the North Carolina coast 50 miles north of Cape Hatteras. A southeasterly wind was blowing, with a heavy southeast swell, at the scene of the disaster.<sup>119</sup>

On 24 and 25 November 1877, a storm produced unusually heavy rainfall and widespread flooding in the *United States*. As a result, the Savannah River reached its maximum height, 23 feet 10 inches, at Augusta, Georgia on the 23<sup>rd</sup> when the lower portion of the city flooded. The Chervis and Horn's creeks were higher than ever before recorded. Fishing Creek in South Carolina was the "highest water ever known" – train wrecked. The Roanoke River at Weldon, North Carolina, rose 6 feet 9 inches higher than the highest water mark known, sweeping away two railroad bridges. The Dan River at Danville, Virginia was "within one foot of highest water mark ever known". The Little and Big Sandy Rivers "higher than ever known." In Pittsylvania and Henry counties in Virginia and Caswell and Rockingham counties in North Carolina, the streams all overflowed, doing immense damage; in Fall Creek "every bridge swept away". The James River at Buchanan, rose 6 feet higher than during the freshet of 1842; the railroad lumber house, which was several feet above the high water mark of 1842 was swept away; immense damage done to the James River and Kanawha Canal. At Lynchburg, Virginia, the water reached within three feet of the great freshet of 1870, the maximum of the flood being 33 feet. The Amherst and two other bridges were swept away. At Richmond, Virginia, on the 25<sup>th</sup>, the river rose 24 feet 7 inches above the ordinary high tide or 2 feet 1 inch above the high water mark of 1870. The river, which is normally 200 yards wide, was now from two to three miles wide, flooding the whole riverfront of the city to the tops of houses. The city of Manchester, Virginia, opposite Richmond was nearly half underwater. The Rivanna, North Anna and Jacksons rivers "all as high as 1870". The Rivanna River causing great damage at Charlottesville, Virginia. The Rappahannock River at Fredericksburg, Virginia rose 22 feet above the ordinary water level. The North Branch of the Potomac River at Piedmont, Virginia was stated to be higher than any flood since 1810. Along the course of the South Branch, immense damage was done. At the junction of the Potomac and the Shenandoah rivers, on 25 November, both rivers were twenty-six feet above the low water mark, or three feet higher than in 1870. Considerable damage was done in all valleys. Conococheague creek rising in South Mountain, Pennsylvania rose four feet higher than the highest watermark known or 15 feet above the ordinary level at Chambersburg, Pennsylvania at midnight on the 24<sup>th</sup> doing considerable damage. In Washington D.C., Baltimore, Maryland and Philadelphia, Pennsylvania, the wharves and streets along the riverbank were submerged. In Georgetown D.C. at 7

p.m. on the 24<sup>th</sup>, the Potomac was 3 feet and 9 inches below the level of the wharf at the foot of Washington Street. But by 1 a.m. on the 26<sup>th</sup>, when the highest point of the flood was reached, it was 6 feet and ½ inch above the wharf. In Maine, severe freshets also occurred on the 26<sup>th</sup> in the Passumpsic, Androscoggin and Kennebec rivers.<sup>112</sup>

On 24-25 November 1877, there was a storm that caused much damage on the southeastern coast [of *Great Britain*].<sup>90</sup>

On 27 November 1877, a very severe hurricane struck the Grenfell district in New South Wales, *Australia*. The Wesleyan and Primitive Methodist churches, the Oddfellows' Arms Hotel, and a number of other places were blown to the ground. The Presbyterian Church, public hospital, public school, Anglican parsonage, flour company's mill, the principal stores and numerous other buildings sustained serious injury. Scarcely a building in the town escaped damage. Stores and private dwellings have been unroofed, and windows and doors smashed in all directions. Falling timber injured several persons. Considerable damage was done to the harvest, particularly the wheat crops. Many farmers are ruined. [The winds were so strong that] the wheat grain being threshed out of the haystacks and blown away. Falling trees killed many sheep and cattle. Trees and gardens were destroyed and the telegraph lines interrupted so that communications completely stopped. During the thunderstorms, two horses were struck by lightning and died.<sup>106</sup>

On 27 November 1877, a severe hurricane devastated the Grenfell district in New South Wales, *Australia*.<sup>103</sup>

In 1877 in southeastern *Spain*, inundations in the province of Murcia caused serious damage to railways. Also, the floods caused twenty-two people to drown.<sup>106</sup>

In 1877 at Wreschen (now Września in central *Poland*), during service, the church was struck by lightning killing six and injuring 80 others.<sup>106</sup>

In 1877, a fearful hurricane struck the island of Curaçao, on the coast of *Venezuela*, involving the loss of property valued at 2 million dollars, and the loss of life was great. In the city of Curaçao, many solid structures were crushed by the waves, burying hundreds of people in the ruins.<sup>106</sup>

In 1877 during the period between 11 June and 10 July, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Hsüan-p'ing.<sup>153</sup>

*Also refer to the section 1876 A.D. – 1879 A.D. for information on the worldwide drought and famine during that timeframe.*

---

**Winter of 1877 / 1878 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1877 occurred on 29 November.<sup>116</sup>

The winter of 1877-78 in Bradford County, Pennsylvania in the *United States* was open and mild without sleighing until the middle of February. There were only a few cold days, about the middle of January. By the 10<sup>th</sup> of March, the snow had entirely disappeared, the weather was warm and the bluebirds appeared. Planting was completed early. There were severe frosts in May and on June 6 there was a frost with ice.<sup>178</sup>

The winter of 1877-78 in New England in the *United States* was mild. The weather was mild during the first two months of winter but then the weather turned stormy. Spring was late and cold.<sup>199</sup>

In the *United States* during the winter of 1877-78, the temperature dropped to -38° F at Woodstock, Vermont in January. The temperature at Albany, New York fell to -18° F in January.<sup>113</sup>

---

**1878 A.D.** On 14 January 1878, a cyclone struck Darwin in the Northern Territory of *Australia*. Every building in Darwin was damaged.<sup>99</sup>

On Bourbon Island (now *Reunion Island* and part of the French Republic) in the western *Indian Ocean* on January 15, there was a cyclone that devastated the island and the next crops, it is feared, will show a considerable deficiency.<sup>57</sup>

On 17 January 1878, a cyclone struck Darwin, *Australia*. Every building was damaged in the city.<sup>101</sup>

On 6 February 1878, there was an extraordinary fall of rain in Sydney, *Australia*; nearly 8 inches in 24 hours. The heavy rains were very general throughout Riverina.<sup>103</sup>

In *Tahiti* in the southern Pacific Ocean on February 7<sup>th</sup>, there was a terrible hurricane, by which much property was destroyed and about 120 lives lost.<sup>57</sup>

In *Australia* in February, "After the terrible drought which has afflicted the country, the abundant storms have been welcomed, but the parched earth has not been equal to carrying off such an enormous quantity of water suddenly poured upon it, and disastrous floods have followed, causing great destruction of life and property. The railway at Campbeltown was flooded to a depth of 2 feet, mail carts have been washed away, numbers of trees, fences, walls, etc., uprooted and thrown down, bridges destroyed and other serious disasters have occurred. At Scone, near Sydney, 1.33 inches of rain fell in twenty-five minutes. Some hailstones, which accompanied the rain, measured as much as 1½ inch in circumference. Serious damage has also been done by heavy thunderstorms, many buildings being struck and destroyed by lightning." During a storm in Sydney, as much as 10.88 inches of rain fell in forty-eight hours.<sup>47</sup>

On 20 February 1878, there were disastrous floods at Sandhurst in Victoria, *Australia*.<sup>103</sup>

On 8 March 1878, a cyclone struck Cairns, *Australia*, doing considerable damage.<sup>101</sup>

On 16 March 1878, there was a serious flood in Melbourne, *Australia*. Several chains of the Yau Yean aqueduct were swept away.<sup>103</sup>

In California in the *United States*, in the early months of this year great damage was sustained in the lowlands of this important grain-producing State. We draw the following summary from the letter of the (London) *Times* correspondent:<sup>47</sup>

"By the overflow of the Sacramento and American rivers, the whole country around Sacramento was flooded, the water breaking through the levees that were built to protect the city from inundation, and the safety of the entire city was at one time imperiled. The river rose 25 feet 11½ inches above low water mark, and a rise of a few inches more would have completely swamped the city. Fortunately the Yolo levees gave way in time, and allowed the water within the embankment to spread out over the Yolo and Solano plains. Immense exertions were made to repair the broken levees by means of sand bags, which were brought to the scene of disaster by a locomotive, followed by a train and flat cars. In the neighbouring town of Washington the water in many places stood 10 feet deep, trees were laid prostrate, and shanties and outhouses washed away. Although several houses were completely wrecked and a great deal of property destroyed, no lives were lost, though several persons had very narrow escapes. In other parts of the country the people were not so fortunate. Of the twenty-five islands which may be counted in the

Sacramento Archipelago, scarcely one was to be seen during the inundation, Union and Sherman Islands, both protected by levees, having been submerged. Boats and steamers were busy in every direction in affording assistance to the distressed, and moving among the islands and sloughs for the purpose of carrying off cattle and people to the mainland.”<sup>47</sup>

“In Sutter county the whole of the tule lands were overflowed, dwellings, barns, outhouses, and fencing completely destroyed, and a large amount of grain in bags carried away by the flood. The loss in livestock in many parts of the country has also been very severe. The area of land thus submerged embraces the richest and most productive portions of the State, sufficient to produce cereals for our (*England's*) entire population. Besides the immense amount of damage sustained in loss of property, the floods have left a deposit of silt, to do away with which will cause much trouble and expense to our farmers. What the amount of loss experienced in the Sacramento Valley is, I have not the means of ascertaining, but it is supposed to be several million dollars. The bed of the Sacramento has been elevated several feet, and the elevation increases in some places at the rate of about one foot a-year. The debris washed down from mining camps above the Yuba River long since caused an overflow of lands in the Marysville district, and the entire destruction of agricultural pursuits on those lands. The same causes are extending to and influencing the Sacramento, and even the harbour at Mare Island, the naval station of the Pacific, is said to be shoaling so much as to prevent freedom to navigation. The question as to whether mining tailings should be allowed to be shot into rivers, and, by filling them up, injuring agricultural interest, has long been discussed by the legislature; but the consideration of impeded navigation and the serious destruction of property by excessive floods, will probably now turn the scale in favour of some restrictions on the mining interest, which has so long withstood any reform in this respect.”<sup>47</sup>

In *England* on the 29<sup>th</sup> of March, there was a tornado in the south of *England*, followed by snow. It was during this event, that Her Majesty's ship “*Eurydice*” was lost off the Isle of Wright.<sup>57</sup>

In *Ceylon (Sri Lanka)* in March, “During the last four months *Ceylon* has been visited by a succession of floods, which have caused great destruction of property and seriously impaired the prospects of the coming coffee crop. In some districts as much as 50 inches of rain have been registered in twenty days; and from the 1<sup>st</sup> of November to the 20<sup>th</sup> of January last, 130 inches of rain were gauged at Laggala. The natives express the opinion that the ‘sky is moth eaten, and hence the constant leakage.’ Up to the last advices from Galle the prospects of fine weather were as remote as ever. Rice and grain have consequently increased enormously in price – from an exactly opposite cause to that which gave rise to the late famine in the adjoining continent, and which has also created such distress in *Australia* and at the Cape of Good Hope (*South Africa*). In all these colonies prolonged droughts, which have only just broken, have prevailed to such an extent as to seriously interfere with business operations of all kinds.”<sup>47</sup>

In *France* in March, “There were inundations in the Indre-et-Loire, and the Seine and other rivers were also very high. Snow is falling in the east, and frost has done some damage in the south. At Vernay, near Tours, the flood swept away a bridge over a rivulet, and part of a luggage train fell into the water, the stoker and conductor being drowned.”<sup>47</sup>

In *England* in April, there was very heavy fall of rain in and round London. (This rainfall was said to amount to 3 inches.) Great floods in Kent. At Lewisham (south London) all ordinary traffic was suspended, and the inhabitants were carried through the streets to the railway stations in boats and carts.<sup>47</sup>

In *England* in the early days of April, there was a terrible gale. The *East Anglian Daily Times*, in describing the effects of the gale upon Lowestoft fishing boats said that upwards of 200 lost every net

they had onboard, and out of 500 boats, only 100 are now fit for sea.<sup>57</sup> [Lowestoft is in Suffolk on the North Sea coast of southeastern *England*.]

On 10-11 April 1878, there were inundations in London, *England* from storms and heavy rain.<sup>90</sup>

On 28 October 1838; 11 July 1874; 11 April 1878, and 12 December 1883, storms struck London, *England*, which destroyed from twenty to thirty lives in each case, and from \$1 to \$3 million (U.S.) dollars in property damage. [In present currency, that would be equivalent to \$27-\$81 million dollars in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

In Canton (now Guangzhou), *China* on April 12, there was a destructive hurricane, accompanied by two waterspouts, caused immense damage.<sup>57</sup>

In the Bay of Biscay (off the coast of *Spain*) on April 20, there were continuous storms. "During the recent hurricane about 150 fishermen from the neighbourhood of Bilbao and Santander were drowned."<sup>57</sup>

In *England* in May, there were great floods in the Thames valley.<sup>47</sup>

On 20 May 1878 in the *United States*, there was a great hailstorm in the city of San Antonio, Texas. "Our city is a perfect wreck; every house in it has received some damage: many are in complete ruins, with nothing but fragments of walls standing. The hailstones penetrated the best roofs, going through tin roofs like cannon balls. All the windows facing to the north have been smashed in; even windows, shutters, and doors were broken down. The appearance of the city could not have been worse under a severe bombardment. The roofing of the entire city is perforated like a sieve. The hailstones were of irregular shape and all sizes, as if a mass of ice had broken above our devoted heads, and been driven by a tornado to the earth. One hailstone was found weighing over 5 pounds (2.3 kilograms), while a great many as large as a man's fist were picked up. Many of the families whose houses were beaten down took shelter under beds and tables, and thus escaped bodily harm. We have only heard of one death, a negro boy; several had limbs broken and were severely bruised, while the whole population was frightened almost to death. The damage is of every character, and 500,000 dollars will not cover it all. [In present currency, that would be equivalent of over \$12 million in damages based on the Consumer Price Index (CPI) inflation rates.] The corn patches and gardens are flattened to the ground, and have the appearance of having passed through a chopping mill. All the fruit crop is destroyed. The storm resembled a terrific battle; so fearful was the noise that no one could hear unless they screamed in each other's ears. We learn that the hailstorm extended from 5 to 25 miles in extent—destroying everything over a region 30 miles from north to south, and 10 to 20 miles from east to west."<sup>93</sup>

In Hong Kong, *China* on May 21, there were terrible thunderstorms, occasioning much damage.<sup>57</sup>

In 1878 during the period between 6 May and 8 August, floods struck Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ang-shan; Kiangsi (now Jiangxi province) in southern *China* at Chi-an, Nan-ch'ang, Ch'ing-chiang, Lin-ch'uan, Nan-k'ang, Kiukiang and Shang-jao; Hupeh (now Hubei province) in central *China* at Ao-ch'êng; and Kwangtung (now Guangdong province) on the south coast of *China* facing the South China Sea at Jao-p'ing.<sup>153</sup>

In the *United States* on May 23, a terrible tornado crossed a portion of Wisconsin, passing from the southwest to the northeast, and devastating a long strip of country, including the towns of Mineral Point, Mount Vernon, Primrose, Oregon, and Paoli, while the feeble effects of the same tornado were felt at Madison also as far south as Chicago. In the direct path of the storm everything was demolished, and hundreds of buildings were destroyed. The debris was blown many miles. From reports thus far received it appears that 30 persons were killed and 50 injured. Several dead were carried to long distances by the

whirlwind and then dashed to the ground. Those injured were generally in destroyed buildings. In one case a school house with the teacher and scholars were carried away several rods, three of the scholars being killed, but some escaping unhurt.<sup>57</sup>

In *Great Britain* in May, there was a severe storm, accompanied with lightning in various parts of the kingdom. During the storm which passed over Perthshire, *Scotland* on the 28<sup>th</sup> and 29<sup>th</sup>, the monument which was erected by Mr. Crieff in 1832 in memory of Sir David Baird, the hero at the storming at Seringapatam, was almost entirely destroyed. The monument, which was a counterpart of Cleopatra's Needle, was 80 feet high, and cost 4,000*l.* to erect. It was struck on the top 20 feet of it was thrown to the ground, and the base was also injured by the electric field.<sup>57</sup>

In June 1878, there was an inundation in northern *Italy*. Much damage was caused by the overflowing of the Po and Mincio rivers.<sup>90</sup>

In *England* in June, great rainfall at Bath and other parts of the West of *England*.<sup>47</sup>

On 12-14 June 1878 at Point Pleasant, Louisiana in the *United States*, 16.55 inches of rain fell.<sup>116</sup>

On 23 June 1878 in *England*, there was a most severe hailstorm in Surrey. "The hail increased in size to more than an inch in diameter, and fell more than one hour and a half, doing an incredible amount of damage. At the time I write—4:30—it still rains, but the hail lies on the garden paths like shingle on the seashore. Chickens and birds were killed, fruit and vegetables of all kinds utterly destroyed. The glass in all the houses is much damaged; our nearest neighbor has only three panes left. The villagers, I am told, were crying and afraid to stay in their houses, which were rapidly becoming flooded."<sup>93</sup>

On 27 June 1878 in *Scotland*, there was a severe hailstorm in Edinburgh.<sup>93</sup>

In *Ireland* on June 27, a great storm struck the south of *Ireland*; much damage occasioned.<sup>57</sup>

On 29 June 1878 in *England*, there was a severe hailstorm in Berkshire and Oxfordshire. At Abingdon the stones were of the size of walnuts. In the neighborhood of Bicester, the hail, which accompanied the storm, was almost blinding. People were unable to discern anything at a greater distance than 30 yards. Two sheep were killed by the electric fluid [lightning] at Fewcott; another place in the same district. The storm lasted nearly half an hour.<sup>93</sup>

In *England* on June 30, there were very severe storms in various parts of the country, accompanied by lightning and torrents of rain. At Enfield (north of London) 3.07 inches of rain was recorded during a thunderstorm. Hailstones in west of *England*.<sup>57</sup>

In the *United States* on the 4<sup>th</sup> of July, a tornado, accompanied by thunder, lightning, and hail occurred at Pittsburg, Pennsylvania, inflicting great damage within a radius of 10 miles from that town. The lightning destroyed the Vesta Oilworks, consuming 80,000 barrels of petroleum. Torrents of rain at the same time swept down the hills into the Alleghany and Monongahela rivers. One house was quite swept away, and five persons were drowned. The tornado burst over a party picnicking at Rossgrove, seven miles from Pittsburg, uprooting five large trees, which fell upon a large number of people who had sought shelter beneath them, killing fourteen and injuring thirty.<sup>57</sup>

In southern *Austria* on July 9, along the Valley of the Save, a severe hailstorm caused a great deal of damage to crops. The hailstones are reported to have been unusually large. They broke the tiles on roofs and severely injured several persons.<sup>57</sup>

In *Switzerland* on July 23, great damage was done throughout Central and Eastern Switzerland by a series of severe thunderstorms. Many buildings were destroyed and set on fire by the lightning, rivers overflowed their banks, and the Berne-Lucerne Railway received injuries so serious that the traffic between those places has had to be temporarily suspended. At the same time a heavy hailstorm devastated the crops and vineyards in the neighborhood of Montreux; and the hamlet of Thusinge, Canton Vaud, was almost destroyed by fire.<sup>57</sup>

In *England*, during the latter part of July, there were continued storms of great severity.<sup>57</sup>

On 9 August 1878, a tornado struck Wallingford, Connecticut in the *United States*. The width of the tornado was a ½ mile [0.8 kilometers] wide and the path was 2 miles [3.2 kilometers] long. Thirty-four people lost their lives. One hundred and sixty buildings were totally destroyed. Property damage amounted to \$2 million. [In present currency, that would be equivalent to \$47 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>199</sup>

In August 1878, there were many thunderstorms, which destroyed life and property in *England*.<sup>90</sup>

On 25 August 1878 in *Italy*, a hailstorm did great damage to crops.<sup>93</sup>

In *France*, the losses from hailstorms in 1878 were very light.<sup>93</sup>

From May to September 1878, the hailstorms in *England* were of singular severity, and of unusually wide extent—traversing several counties before their force was spent. Several of the storms occurred at night—a very unusual occurrence.<sup>93</sup>

On 1-13 September 1878, a hurricane struck the *Dominican Republic*, *Haiti*, and east coast of the *United States*. There were 9 deaths from Florida and Pennsylvania. At Aux Cayes, *Haiti*, a number of persons were killed. In the towns of Aquin, and Cavaillon in *Haiti*, a large number of lives were lost.<sup>141</sup>

On 25-28 September 1878, a hurricane struck *Haiti*. An American brigantine was wrecked at Tiburon and all hands lost.<sup>141</sup>

On 9-13 October 1878, a hurricane struck coastal New England in the *United States* causing 27 deaths.<sup>141</sup>

On 16-17 October 1878, an inundation caused by heavy rains struck Murcia, *Spain*. The provinces of Andalusia, Alicante, Almeria, and Malaga in southern *Spain* suffered about 1,000 lives lost. There was much damage to property and about 2,000 houses were destroyed.<sup>90</sup>

On 21-24 October 1878, a hurricane struck *Cuba* and the eastern coastal waters of the *United States* causing more than 71 deaths.<sup>141</sup>

On 21-24 October 1878, a storm [hurricane] moved from south of *Cuba* northward to the North Carolina coast of the *United States*, and thence to south central New York, where it recurved eastward and passed over New England and south of Nova Scotia, *Canada*. A hurricane prevailed at Havana, Cuba, on the night of the 21<sup>st</sup>, with heavy rain, doing much damage to buildings and shipping. At Key West, Florida, the barometer fell to 29.53 inches (750 millimeters), and the highest wind force was fifty-four miles per hour. At Kitty Hawk, North Carolina, the wind reached a velocity of eighty-eight miles per hour, and the barometer fell to 29.06 inches (738 millimeters) on the 22<sup>nd</sup>. The storm's vortex passed almost directly over Washington, D.C., where the lowest barometer reading of 28.80 inches (732 millimeters), occurred about 7:15 a.m. on the 23<sup>rd</sup>. The storm moderated somewhat in severity after recurving eastward over New England, but throughout its entire course over the continent was exceptionally severe, and ranks as

one of the most destructive storms on record for the Atlantic coast. At Philadelphia, Pennsylvania, over seven hundred substantial buildings were totally destroyed or seriously damaged, bridges injured, and twenty-two vessels sunk, entailing a loss variously estimated at from \$1,000,000 to \$2,000,000. [In present currency, that would be equivalent to \$22 to \$45 million in damages based on the Consumer Price Index (CPI) inflation rates.] Other loss of life and great damage by freshets and winds occurred elsewhere in Pennsylvania. A large number of steamers, ships, and coasting vessels were dismantled, wrecked, or sunk along the New Jersey, Virginia, and North Carolina coasts, entailing loss of life and immense pecuniary damage. The wind reached seventy-two miles per hour at Philadelphia, and from eighty to eighty-eight miles per hour along the Atlantic coast.<sup>120</sup>

On 4 November 1878, the Murrumbidgee & Yass Rivers in New South Wales, *Australia* flooded. The Murrumbidgee River was 25 feet (7.6 meters) above the normal summer water level at Gundagai.<sup>99</sup>

About 10 December 1878, there was an inundation in *Hungary*.<sup>90</sup>

Around 12 December 1878, the Susquehanna River flooded and at Towanda, Pennsylvania in the *United States*, the water rose 20 feet [6.1 m].<sup>178</sup>

*Also refer to the section 1876 A.D. – 1879 A.D. for information on the worldwide drought and famine during that timeframe.*

---

**Winter of 1878 / 1879 A.D.** The winter was noted in *England* for constant low temperature and long continued moderate frosts. That winter in *England* was approximately 5.4 degrees Fahrenheit colder overall (November – February) than the 20-year average.<sup>70</sup>

The winter of 1878-79 in Bradford County, Pennsylvania in the *United States* was mild. The first week of January was cold but the end of the month was warm. The first snowstorm was on 6 November when it snowed all day; the deepest snowfall, 10 inches [25 cm] occurred on 17 February. It snowed every day the last week in February. There was good sleighing nearly all of January and February.<sup>178</sup>

In the *United States* during the winter of 1878-79, the temperature dropped to -16° F at Mount Auburn, Ohio, a suburb of Cincinnati on January 3<sup>rd</sup>. The temperature at Columbus, Ohio fell to -20° F in January. The temperature at Omaha, Nebraska fell to -22° F in January. The temperature at Newport, Rhode Island fell to 3° F in January. The temperature near Arlington, Illinois fell to -25° F in January. The temperature at Winnemucca, Nevada fell to -14° F in January. The temperature at Fayette, Mississippi fell to 7° F in January. The temperature at Clarksville, Tennessee fell to -10° F in January. The temperature at Shreveport, Louisiana fell to 6° F in January. The temperature in Norfolk, Virginia fell to 8° F in January. The temperature at Kitty Hawk and Charlotte, North Carolina fell to 11° F in January. The temperature at Sandy Hook, New Jersey fell to -3° F in January.<sup>113, 126</sup>

---

**1879 A.D.** In February 1879, there was a flash flood in the Northern Territory of *Australia*. The Daly River and Katherine flooded, and the Overland Telegraph was severely disrupted. Six people were killed.<sup>99</sup>

In March 1879, there were heavy floods at Cooma in New South Wales, *Australia*.<sup>103</sup>

On 12-13 March 1879, there was an inundation at Szegedin [now Szeged in southern] *Hungary* caused by storms and rain. The dams of the River Theiss gave way and the town was nearly destroyed. Out of 6,566 houses, only 331 stood. Many persons drowned and thousands were left homeless. [Another inundation occurred about 3 June 1887 but not quite so disastrous, and still another in March, 1888].<sup>90</sup>

On 13 March 1879 in *India*, there was a hailstorm of extraordinary severity that passed over the Tipperah district in Eastern Bengal. The magistrate's official report says: "Some hailstones fell as large as cricket-balls. The storm lasted only about 15 minutes, and its track was apparently not more than 300 yards wide. Large trees were uprooted; bamboo clumps swept down like grass, and houses leveled with the ground. Twenty-nine persons were killed and 114 wounded, mostly by the falling trees and houses. A considerable number of cattle were killed, and among the victims was a tiger."<sup>93</sup> [Tripura is a landlocked hilly state in northeastern *India*.]

There were heavy rainfalls in the North-Western Provinces of *India* in 1879.<sup>185</sup>

In 1879-80 in Chhindwara, *India*, the autumn crops were poor due to excessive rain.<sup>180</sup>

On 22-24 April 1879 at Terrell, Texas in the *United States*, 18.0 inches of rain fell.<sup>116</sup>

From May 16 to August 3, 1879, there was a series of destructive hailstorms in *England*, especially that of the date last named, extending over a great part of the Eastern Counties, and lasting for some hours.<sup>93</sup>

In 1879, several regions of *China* experienced flooding during the period of 20 June – 18 July:<sup>153</sup>  
— Hopei (now Hebei province) in northern *China* at Yü-t'ien and Pao-ti experienced flooding.  
— Kansu (now Gansu province) in northwest *China* at Wu-tu and Wên experienced flooding. At Wên, the city walls were damaged and over 10,830 people were drowned. The flooding in this region continued into the period of 19 July - 17 August, when Wên and Wu-tu both reported innumerable people and cattle drowned.

On 3 August 1879 in *England*, there was a hailstorm at Kew and Richmond (Middlesex and Surrey). The Royal Gardens at Kew were devastated by the storm. The storm, which began at 2 A.M. lasted about 10 minutes in duration. It drove from the northeast, and expended its greatest fury in the neighborhood of Richmond. There was violent thunder and lightning. About 16,000 squares of glass were broken—many of the squares having clean "bullet" holes through them. The hailstones averaged about 1½ inches in diameter [one as large as 3½ inches was reported from an adjoining locality], and came down with sufficient force to become embedded in the loose soil and even in the lawns. The stones also went clean through the leaves of many of the plants. Damage at the gardens £2000.<sup>93</sup>

On 2-3 August 1879, a storm struck Kew, *England* and neighborhood. On 16-17 August 1879, a storm struck Cheshire, *England* and *Wales*.<sup>90</sup>

On 17-19 August 1879, a storm of great strength moved from the *Bahamas* along the Atlantic coast of the *United States*, attended by gales of hurricane force and unusually high tides.<sup>119, 120</sup>

On 18 August 1879, record high winds was observed at Cape Lookout, North Carolina in the *United States*, where the velocity of 138 miles an hour was registered before the anemometer was blown away, and the winds reached an estimated velocity of 165 miles an hour.<sup>124</sup>

The hurricane of 16-20 August 1879 entered the *United States* at Cape Lookout, North Carolina and skirted the Atlantic coast thence northeastward to Eastport, Maine. An enormous amount of damage resulted from this storm. Not only was the damage to inland property very excessive, but also the damage to maritime interests may be estimated from the fact that over one hundred large vessels were shipwrecked, dismantled, or disabled, and two hundred yachts or smaller vessels injured. The wind reached a measured velocity of one hundred and thirty-eight miles per hour at Cape Lookout, where the anemometer was carried away. The barometer fluctuated with extraordinary rapidity, producing a fall of 0.85 inch in 5½ hours off the New Jersey coast, followed by a rise of 0.93 inch in 6½ hours.<sup>120</sup>

On 18 August 1879, a hurricane struck North Carolina and coastal Virginia in the *United States* causing 46 deaths.<sup>141</sup>

During the autumn of 1879, a drought prevailed throughout Bradford County, Pennsylvania in the *United States* and a great portion of nation from August until the beginning of November. Wells, springs and smaller streams dried up. In September, the water level on the Susquehanna River was extremely low and never known to have been lower. Many farmers were required to drive their livestock long distances for water. Pastures were ruined and livestock were only kept alive by feeding them hay and grain. Forest fires did great damage.<sup>178</sup>

In September 1879, there was a serious flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 43 feet 3 inches (13.91 meters) above the sea level height at Windsor Bridge.<sup>99, 109</sup>

On 24-28 October 1879, a hurricane struck the *Gulf of Mexico*. A schooner from Pensacola, Florida was completely wrecked and all the crew was lost except for two men.<sup>141</sup>

On 16-21 November 1879, a hurricane struck the east coast of the *United States* and some lives were lost.<sup>141</sup>

In November 1879, a West Indian hurricane, first located over the southeastern *Bahamas*, moved rapidly northward and northeastward, passing Cape Hatteras, North Carolina in the *United States* on the night of the 19<sup>th</sup>, and Halifax, Nova Scotia, *Canada*, the afternoon of the 20<sup>th</sup>, and thence moved northeast over the Gulf of Saint Lawrence or Newfoundland, *Canada*. Furious gales, attaining hurricane force at sea, attended the passage of this storm, and barometer readings falling to, or nearly to, 29.00 inches (737 millimeters) were reported by shipmasters.<sup>119, 120</sup>

On 28 December 1879, a violent gale struck *Scotland*. The Tay bridge was blown down.<sup>90</sup>

*Also refer to the section 1876 A.D. – 1879 A.D. for information on the worldwide drought and famine during that timeframe.*

---

**Winter of 1879 / 1880 A.D.** There were long frosts with thaws from 22 November 1879 to 2 February 1880 [in *England*].<sup>90</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1879 occurred on 3 November.<sup>116</sup>

The winter of 1879-80 in Bradford County, Pennsylvania in the *United States* was one of the warmest and most remarkable ever remembered. It began with much rain and little snow. There was a light snowfall on 24 October and 21 & 25 December. On 3 February, there was a heavy snowfall, which supported sleighing for around ten days (the only run of winter). The last snow fell on 11 & 15 March. Only on two days, 20 December & 1 February, did the temperature fall below zero Fahrenheit. There were many summer-like days in January and February. Considerable plowing was done in January, and [maple] sugar camps were operating in January and February. Bluebirds and robins appeared the first week in March and most of the month produced beautiful weather. Spring opened early and warm, although there was a heavy frost on the 13<sup>th</sup> & 14<sup>th</sup> of May.<sup>178</sup>

The minimum temperatures in degrees Fahrenheit in the *United States* during January 1880 were as follows: **Maine**: -15° at Orono and 0° at Eastport. **New Hampshire**: -12° on Mt. Washington and -10° at

Dunbarton. **Vermont:** -12° at Newport and 0° at Burlington. **Massachusetts:** -10° at Billerica and 8° at Boston and Springfield. **Rhode Island:** 15° at Newport. **Connecticut:** 0.7° at Southington and 10° at New Haven. **New York:** -6° at Madison Barracks, -2° at Sidney Plains and Plattsburg Barracks, 1° at Albany, 16° at Buffalo and 17° at New York City. **Pennsylvania:** -3° at Dyberry, 3° at Catawissa, 19° at Philadelphia and 20° at Pittsburg. **Delaware:** 20° at Dover. **Maryland:** 3° at Woodstock, 12° at Cumberland, and 17° at Baltimore. **District of Columbia:** 14° at Washington. **Virginia:** 13° at Mt. Solon, 23° at Lynchburg, 29° at Walnut Grove and 31° at Cape Henry and Norfolk. **West Virginia:** 12° at Morgantown and 18° at HeIvetia. **North Carolina:** 15° at Highlands, 25° at Fayetteville and Wilmington, 26° at Weldon, and 34° at Cape Lookout. **South Carolina:** 27° at Aiken and 33° at Charleston. **Georgia:** 30° at Atlanta and Gainesville, and 34° at Savannah and Forsyth. **Florida:** 36° at Gulf Hammock, 40° at Pensacola and Houston, 45° at Jacksonville and 65° at Key West. **Alabama:** 30° at Green Springs and 39° at Mobile. **Mississippi:** 32° at Brookhaven and Fayette, and 35° at Vicksburg. **Louisiana:** 28° at Okaloosa, 33° at Shreveport and 42° at New Orleans. **Texas:** 5° at Fort Elliott, 21° at Pilot Point, 28° at Mason, 32° at Denison, 38° at Rio Grande and 47° at Galveston. **Ohio:** 6° at Westerville and Urbana, 15° at Columbus, 18° at Cleveland and 25° at Cincinnati. **Kentucky:** 28° at Louisville and Bowling Green. **Tennessee:** 25° at Knoxville and McMinnville, 26° at Ashwood and 29° at Nashville, and Chattanooga. **Arkansas:** 20° at Mt. Ida and 32° at Little Rock. **Michigan:** -2° at Marquette, 5° at Alpena, 9° at Lansing and Kalamazoo, 12° Grand Haven, 13° at Northport, 16° at Port Huron and 19° at Detroit. **Indiana:** 15° at Spiceland, 18° at Fort Wayne, 20° at Indianapolis and 26° at New Harmony. **Illinois:** 10° at Riley, Belvidere and Sterling, 20° at Chicago and 30° at Cairo. **Missouri:** 14° at Corning, 18° at Kansas City and 23° at St. Louis. **Kansas:** -3° at Fort Wallace, 15° at Holton, Manhattan, Cedar Vale and Yates Center, and 20° Leavenworth. **Wisconsin:** -12° at Ashland and Neillsville, -6° at La Crosse, and 6° at Madison. **Iowa:** -6° at Cresco, -3° at Fort Dodge, 6° at Glenwood, 10° at Des Moines and Dubuque, and 21° at Keokuk. **Nebraska:** -19° at Fort Sidney, -2° at Genoa and North Platte, and 5° at Omaha. **Indian Territory:** 23° at Fort Sill and 26° at Fort Gibson. **Minnesota:** -19° at Duluth and -12° at St. Paul. **Dakota:** -35° at Fort Buford, -32° at Pembina, -21° at Bismarck, -7° at Deadwood, -5° at Morrilton and -2° at Yankton. **Colorado:** -17° at Fort Garland, -15° on Pike's Peak, -7° at Fort Lyon and -3° at Denver and Huerfano. **New Mexico:** -2° at Santa Fe, 7° at Silver City and 20° La Mesilla. **Wyoming:** -25° at Fort Fred Steele and -11° at Cheyenne. **Utah:** -16° at Coalville and 2° at Salt Lake City. **Nevada:** 0° at Winnemucca. **Arizona:** -17° at Prescott, 8° at Fort Verde, and 30° at Yuma. **Idaho:** -11° at Fort Hall and 13° at Boise City. **Montana:** -18° at Virginia City. **California:** 25° at Sacramento and Salinas City, 26° at Red Bluff, 27° at Visalia and Princeton, 30° at Los Angeles and 37° at San Francisco. **Oregon:** 18° at Umatilla, 25° at Roseburg and 26° at Portland.<sup>125</sup>

In the *United States* during the winter of 1879-80, the temperature at Fort Stevenson, (now located under 120 feet of water in Lake Sakakawea, North Dakota) fell to -54° F in December. The temperature at Fort Totten, North Dakota fell to -51° F in December. The temperature at Sydney Barracks (now Sidney, Nebraska) fell to -37° F in December. The temperature at Omaha, Nebraska fell to -17° F in December. The temperature at North Platte, Nebraska fell to -27° F in December and -21° F in March. The temperature at Fort Hall, Idaho fell to -30° F in December. The temperature at Fort Halleck, Nevada fell to -22° F in December. The temperature at Winnemucca, Nevada fell to -20° F in December. The temperature at Prescott, Arizona fell to -18° F in December. The temperature at Fort Apache, Arizona fell to -2° F in December. The temperature at Santa Fe, New Mexico fell to -13° F in December. The temperature at Fort Elliott, Texas fell to -10° F in December. The temperature at Salt Lake City, Utah fell to -10° F in December. The temperature at Cresco, Iowa fell to -35° F in December. The temperature at Dubuque, Iowa fell to -19° F in December. The temperature at Saint Paul, Minnesota fell to -39° F in December. The temperature at Burlington, Vermont fell to -19° F in December. The temperature at La Crosse, Wisconsin fell to -20° F in December. The temperature at Fort Custer, Montana fell to -23° F in March. The temperature at Cheyenne, Wyoming fell to -24° F in December and -17° F in March.<sup>113, 126</sup>

The United States Signal Service observer at St. Michaels, *Alaska*, reported the winter of 1879-80 as one of unusual severity. Long continued cold weather prevailed during January, February and March of 1880, accompanied by severe gales and much snow during the two latter months. The natives report that no winter of such severity has ever been known by them. The temperature at Fort Reliance, 400 miles southeast of Fort Yukon, reached  $-69^{\circ}$  F ( $-56^{\circ}$  C). Migrating birds were from eight to ten days late this spring in arriving at St. Michaels. The winter was exceedingly severe, very cold and stormy, from the mouth of the Sanana [Tanana River], down the Yukon River and along the seacoast from Kuskoquim [Kuskokwim] River to Cape Prince of Wales. The natives narrowly escaped starvation, being compelled in some cases to eat their dogs and the tanned sealskin covers of their boats, while large numbers of dogs died of starvation. Spring was from ten to fifteen days late.<sup>125</sup>

---

### **1880 A.D. – 1886 A.D. Australia. Drought**

During 1880-86, *Australia* experienced a national drought.<sup>101</sup>

On 24 and 25 January 1880, the high temperature in Perth, *Australia* reached  $110^{\circ}$  F ( $43.3^{\circ}$  C). There were 21 days in January/February 1880 where the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

During the summer of 1880-81 in Perth, *Australia*, there were 10 days when the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

On 17 February 1882, the high temperature in Perth, *Australia* reached  $113.8^{\circ}$  F ( $45.4^{\circ}$  C). A week earlier on 10 February, the high temperature was at  $113.6^{\circ}$  F ( $45.3^{\circ}$  C). During the summer of 1881-82, there were 10 days when the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

On 14 December 1882, the high temperature in Perth, *Australia* reached  $111^{\circ}$  F ( $43.9^{\circ}$  C). During the summer of 1882-83, there were 6 days when the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

During the summer of 1883-84 in Perth, *Australia*, there were 5 days when the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

On 31 January 1885, the high temperature in Perth, *Australia* reached  $112^{\circ}$  F ( $44.4^{\circ}$  C). During the summer of 1884-85, there were 9 days when the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

During the summer of 1885-86 in Perth, *Australia*, there were 14 days when the temperature was  $100.0^{\circ}$  F or greater.<sup>102</sup>

In New South Wales, this drought was the worst drought since 1837-39. The areas most affected were the south coast, the northern tablelands and the northern wheat belt. At Bourke, the Darling River was below the low summer levels for 17 months during 1884-85. It is estimated that 9 million sheep died during this period. The number of cattle fell by 2.9 million during 1879-85. The wheat yield in 1885-86 was 10.5 bushels per acre, the lowest since 1870-71.<sup>101</sup>

Southeastern Queensland suffered from drought beginning in 1881. The coastal areas and central highlands were severely affected beginning in 1883. In 1883, the summer rains failed. The year 1884 was one of the worst seasons ever in the western districts. In 1884, two million sheep died in Queensland. In 1885, the wheat yield was 65% of the average annual yield harvested in the prior decade. During the period 1882-86, cattle livestock increased by 0.5 million in Queensland, while at the same time they decreased 1.2 million in New South Wales.<sup>101</sup>

In Victoria, the worst areas affected by the drought were Gippsland and the north. In 1885, the Goulburn River flow at Murchison was cut in half. On 1 January 1886, in the Otway Range, a severe brushfire raged for 2 days. Forest and homesteads were destroyed between Warrnambool and Port Phillips.

On 4 and 5 January 1886, Western Australia suffered from damaging fires.<sup>101</sup>

In South Australia, the severe drought affected the interior in the years 1882 and 1884. Agriculture was badly hit beginning in 1884. The wheat yield in 1885 of 3.2 bushels per acre was the lowest since recordkeeping began in 1859.<sup>101</sup>

---

**1880 A.D.** On 12 January 1880, there was a great flood at Basseterre on the Island of St. Kitts in the *West Indies*. According to William Alexander, “While strolling one morning along the streets of this city the writer’s attention was attracted to a plain, massive monument in the cemetery with the following inscription: “Sacred to the memory of those who perished in the flood in Basseterre, St. Christopher, on the 12 of January, 1880, and commemorative to that awful visitation, in which 231 persons lost their lives, of whom 101 are buried here.” Beyond the mere facts as to dates and results, as set forth in the above inscription, there seems to be no official record bearing on the event, and I have compiled the following lines by the help of the memory of eyewitnesses:<sup>123</sup>

— It seems there was no premonitory signs of the impending disaster further than toward sunset an unusual warmth was felt which continued up to 9 o’clock p.m., when “an intense cold set in,” then a light shower of rain fell. The clouds gathered early in the evening, and very soon the city was enshrouded in intense darkness. “The darkness could almost be felt.”

— Occasional flashes of lightning accompanied by “deep rumbling thunder” now and then relieved the painful feeling. About 11 o’clock the rain began again, and eyewitnesses say it “looked like sheets of water pouring out of the clouds.” Soon the place was flooded, and ere long the water began to creep into the houses, to the great consternation of the inmates, who, upon attempting to escape, found the streets like rivers, making egress not only unsafe but well-nigh impossible. Those who were so fortunate as to possess an “upstairs” availed themselves of the security afforded by a more elevated position, but unfortunately the great bulk of the population lived then, as now, in little one-story, one-roomed houses (if one can call them houses at all) built of light material and loosely put together, so that soon houses and all began to move seaward. The rain continued for about four hours, resulting as above indicated in the drowning of 231 persons certainly, and possibly more, beside the loss of property.

— Many were buried beneath a layer of mud several feet deep that came down from the fields and mountains.

— It was very roughly estimated that 23 inches of rain fell in those four hours.

In 1880, there was a great flood on the island of St. Kitts in the *West Indies*.<sup>144</sup>

On 24 March 1880 in southwestern *India*, there was a great storm in Dharwad. The storm which was ushered in by the fall of some very heavy hailstones — several of the largest stones, which were spherical in shape, measuring no less than 9 or 10 inches in circumference. One piece of ice picked up was about 5 inches long, and pointed at one end. There were lightning and thunder on a grand scale.<sup>93</sup>

On 4 March 1880, a severe tornado struck Indianapolis, Indiana in the *United States*. The tornado followed a zigzag course through the city causing an estimated \$100,000 in damage [approximately \$2.2 million in present dollars using the Consumer Price Index (CPI)].<sup>125</sup>

On 31 March 1880, a very violent hailstorm struck parts of Cowen and Dallas counties in Texas in the *United States*. Near Plano, the hail zone was 200 yards wide and the hailstones were as large as hickory nuts. The ground was covered like snowdrifts.<sup>125</sup>

On 3 April 1880, a hailstorm produced hail as large as a man's fist was reported near Mt. Airy, Georgia in the *United States*. On 6 April, a hailstorm struck Augusta, South Carolina with hailstones the size of partridge eggs. This hailstorm was reported to have killed young livestock in Orangeburg County, South Carolina. On 7 April, a hailstorm struck Maxey, Georgia in the United States with several hailstones 12 inches in circumference. At Bairdstown, Georgia, one hailstone weighed 2 pounds.<sup>125</sup>

Around 18 April 1880, destructive tornadoes struck the western states in *North America* and caused great loss of life and property.<sup>90</sup>

April 1880 produced a rash of tornados and high winds in many areas of the *United States* causing considerable destruction of property and loss of life. Some of the areas affected include: Kansas, Louisiana, Georgia, Missouri, Arkansas, Iowa, Illinois, Indiana, Wisconsin, Ohio, Pennsylvania, New York and Mississippi. On 2 April, a severe tornado struck Ottawa, Kansas destroying much property and injuring 15 persons and killing many. It began by demolishing seven houses, then unroofed a freight depot and overturned two railroad cars. On 2 April, a severe tornado struck Girard, Kansas, killing 3 persons and destroying 17 houses. On 3 April, a tornado struck Dalton, Georgia killing two people and injuring many and 18 houses were completely demolished. This tornado was one mile wide. This tornado travelled 100 miles and then struck Cherokee, Georgia at 2 a.m. in the morning of the 3rd. Hail was reported the size of a man's fist. Even though this county was sparsely populated at the time, the tornado destroyed 50 dwellings of all kinds, killed 3 people and badly injured many. The average width of the tornado was 1 mile. The tornado passed through the northern part of Elbert County, Georgia blowing down many houses and the largest trees. Its passage resembled a cloud of smoke and fire rolling on the ground. On 16 April, a high storm with severe winds unroofed two freight depots and damaged several other buildings in Wheeling, West Virginia. On the same day high winds struck the entire central and southern parts of Ohio unroofing many buildings. This storm also brought high winds to Pennsylvania, New York and Lake Erie causing considerable damage. On 18 April, a severe tornado struck Beloit, Wisconsin causing loss of life and approximately \$75,000 in property damage. Also on the 18<sup>th</sup> a furious tornado struck Greenville, Illinois demolishing or tearing to pieces numerous houses in almost every portion of the city. On the same day in Champaign, Illinois the old university building was badly wrecked and many other buildings partially demolished. Storms struck many parts of Illinois on that day. At Jacksonville, Illinois, the storm tore the roof off the county poorhouse and tore a large icehouse to pieces and swept away the bridge across the Big Sandy River. Also on the 18<sup>th</sup>, another line of tornados struck. They began in Missouri near the Arkansas line, where 10 persons were killed in the Crow creek settlement and six on Flat creek. This tornado struck Marshfield, Missouri around 6 p.m. All of the buildings, both brick and frame, in a city of nearly 2,000 inhabitants were demolished (except half a dozen). The ruins took fire during the storm. Sixty-five people were killed and about 200 were injured. In the vicinity of the town, the violence of the storm was such that trees three feet in diameter were for a space of several hundred yards wide lifted entirely out of the ground, limbs twisted off and split into kindling wood, and the bark of trees peeled off as if struck by lightning. Loss of property in these two counties (Green and Webster) was estimated at over 1 million dollars [approximately \$22.3 million in present dollars using the Consumer Price Index (CPI)]. At the same time, another tornado struck Webster County, Missouri killing 7 people. At Licking, Missouri, the entire town was destroyed, except three houses: 300 persons were left homeless, one person was killed and 17 wounded (5 seriously). At Cuba, Missouri, the town and surrounding country were nearly laid to waste. The tornados struck several other towns and countryside in Missouri bringing death and destruction including New Bloomfield, Barnettsville, Russellville, the Pacific Railroad near Scott's Station, several locations in Callaway County. Those near the tornado described the terrible tornado cloud and the sound of "10,000 express trains". The Missouri Weather Service describes the average width of the (Finley Creek Valley storm) destructive path for a distance of 100 miles and a width of at least 3,000 feet. They describe the Marshfield storm was about 45 miles long and an average of 1,500 feet wide. The Missouri storms took the lives of at least 100 people. The storms also struck Arkansas on the same day (April 18<sup>th</sup>). A tornado

struck Fayetteville, Arkansas destroying 100 buildings, killing 2, injuring 20-30 people, and causing over \$100,000 in damage. The town of Goshen, Arkansas was almost entirely swept away by the tornado. At El Paso, Arkansas, the tornado killed 10 persons and injured 20 more. On April 24, a tornado struck Joplin, Missouri. Barns, hoisters, engine rooms and buildings through the mines all demolished. Twelve houses were blown down and several persons injured. Webb City, Missouri was completely wrecked by this storm. On April 25, a tornado struck Macon, Mississippi. It demolished 22 houses and other buildings, including all railroad shops and depots. Sixteen boxcars were blown off the tracks, many of the cars were turned bottom side up. Twenty-two persons were killed and 72 injured. Damage was estimated at over \$100,000. A pair of railroad car trucks, weighing 8,000 pounds, was lifted 200 yards from the track. Many other tornados were reported during this April outbreak.<sup>125</sup>

The rash of tornados that struck the *United States* in April 1880 continued into the months of May and June. On 10 May, tornados and violent storms struck a number of cities in Illinois. At Jacksonville, Illinois, 20-30 buildings were demolished and seven persons killed. At Alsey, Illinois, not a dozen houses remained standing within the city limits. At Arrowsmith, Illinois, damage was estimated at \$100,000 [approximately \$2.2 million in present dollars using the Consumer Price Index (CPI)]. At Woodlawn, Illinois, a tornado destroyed a railroad station and other buildings, killing 4 people. On 22 May, a tornado struck Wakeman, Ohio causing \$25,000 damage. Solid oak trees, three to five feet in diameter, were twisted off like brittle pipe-stems; animals were carried long distances and dashed in shapeless masses, and poultry were stripped of their feathers and yet found alive. On 28 May, a tornado swept through Savoy, Texas, killing 12 people and injuring over 60, some fatally. Every house in a tract, 48 in number, was destroyed. On 29 May, a tornado struck Suffield, Connecticut causing \$30,000-\$40,000 damage. The width of the storm track was about 1 mile. On 10 June, a ½ mile wide tornado struck Pottawattamie County, Iowa, destroying everything in its path. Twenty people were killed outright and all buildings literally torn to pieces. On 14 June, storms struck many towns in Ohio. At Venice and Symmes Corner, Ohio between 50-60 buildings were badly injured or destroyed. A heavy iron bridge, 113 feet long, spanning Indian Creek, was whirled from its abutments. Two other heavy bridges in the vicinity were similarly destroyed. At Miami, Ohio, the storm left the town in ruins. A large covered bridge over the Little Miami River was swept away.<sup>125</sup>

On 25 May 1880 in northern *India*, there was a great storm at Mussoorie [in the foothills of the Himalayas]. In the afternoon a storm remarkable for its fury, extensive area, and size and structure of its hailstones, enveloped that station and Deyrab and Rajpore at the foot of the hill. A discharge of stones as large as pigeons' eggs opened the attack. This was followed by a continuous downpour of hailstones, oblate spheres as large as small marbles. The whole station was penetrated by these hailstones, and it presented the appearance of being strewn broadcast with acidulated drops. These stones were of pure clear ice, and, barring their shape, quite amorphous. Not so the large stones, whose structure and mode of formation were very puzzling. First an opaque nucleolus surrounded by a concentric nucleus of clear ice, and this by a radiating periphery. The nucleus being opaque was rapidly frozen; it must then have moved through alternate layers of hot and cold air to receive the concentric accretions of pure ice. The radiating periphery was translucent, but not transparent.<sup>93</sup>

On 30 May 1880 at 5:30 p.m., a large hailstorm struck Silver City, Iowa in the *United States* covering an area 3-4 miles wide and 12 miles in length. An hour after the storm, many of these hailstones measured 1½ inches in circumference. The next day at 10 a.m., they were the size of hen eggs. Many were rough, jagged blocks of ice.<sup>125</sup>

Floods struck Texas and Indiana in the *United States* in May 1880. From the 27<sup>th</sup> to the 29<sup>th</sup>, heavy rains produced floods in Texas affecting many cities including Castroville, Pilot Point, Coleman, San Saba, Calvert, Lampasas and Brackettville. At Brackettville, the water was 8-feet deep on Main Street and over 20 people were reported drowned. The Colorado River rose 30 feet during the storm. The floods in

Indiana occurred on the 21<sup>st</sup> affecting many cities including Vincennes, Sullivan, Huntington, and Wabash. A brickyard near Vincennes, Indiana was submerged and a quarter of a million bricks were washed away.<sup>125</sup>

On 18 June 1880 in *Switzerland*. "During the last few days various parts of *Switzerland* have been visited with severe thunder and hailstorms. The crops in the district of Porrentruy [in northeastern *Switzerland*] are completely ruined, many of the hailstones which fell there weighing upwards of 15 grams."<sup>93</sup>

On 20 June 1880 in southeastern *Romania*. "Heavy hailstorms caused grave damage to the crops in the district of Brălia [Brăila]."<sup>93</sup>

On 21 June 1880, a terrific storm of wind and hail passed over western Bradford County, Pennsylvania in the *United States*, extending from Wells to LeRoy. The wind blew down trees, fences and buildings from Granville Center in a southeasterly direction to Towanda Creek and LeRoy Township. Hail destroyed nearly all the wheat, corn and oats on some farms. The path of the storm was a half-mile [0.8 km] in width.<sup>178</sup>

The maximum temperatures in degrees Fahrenheit in the *United States* during July 1880 were as follows: **Maine**: 95° at Orono, 94° at Portland. **New Hampshire**: 100° at Dunbarton, (62° on summit of Mt. Washington). **Vermont**: 99° at Charlotte, 89° at Burlington. **Massachusetts**: 101° at Boston, 100° at Somerset. **Rhode Island**: 88° at Newport. **Connecticut**: 97° at Mystic, 88° at New London. **New York**: 96° at Ardenia, 91° New York City, 85° at Buffalo. **New Jersey**: 99° at Atlantic City and Moorestown. **Pennsylvania**: 96° at Chambersburg, Egypt and Wellsboro, 95° at Philadelphia. **Delaware**: 97° at Dover. **Maryland**: 99° at Baltimore. **District of Columbia**: 98° at Washington. **Virginia**: 102° at Norfolk. **West Virginia**: 89° at Morgantown. **North Carolina**: 104° at Weldon, 98° at Wilmington. **South Carolina**: 97° at Charleston. **Georgia**: 100° at Forsyth, 96° at Augusta. **Florida**: 100° at Houston, 97° at Key West and Jacksonville. **Alabama**: 100° at Montgomery. **Mississippi**: 97° at Vicksburg. **Louisiana**: 101° at Point Pleasant, 96° at Shreveport. **Texas**: 108° at Eagle Pass, 103° at Laredo, Rio Grande and Edinburg, 102° at Stockton, 101° at Denison, Pilot Point, Concho and Castroville, 100° at Griffin, Fort McKavett and Decatur. **Ohio**: 98° at Jacksonburg, 97° at Columbus. **Kentucky**: 95° at Louisville. **Tennessee**: 95° at Memphis, Nashville and Chattanooga. **Arkansas**: 96° at Mt. Ida, 95° at Little Rock. **Michigan**: 95° at Niles, 93° at Detroit. **Indiana**: 97° at Laconia, 93° at Indianapolis. **Illinois**: 100° at Louisville, 96° at Springfield. **Missouri**: 98° at Corning, 95° at St. Louis. **Kansas**: 103° at Fort Wallace and 95° at Leavenworth. **Wisconsin**: 95° at La Crosse. **Iowa**: 98° at Keokuk. **Nebraska**: 98° at Genoa, 97° at North Platte and Omaha. **Indian Territory**: 100° at Fort Gibson. **Minnesota**: 90° at Minneapolis. **Dakota**: 98° at Fort Keogh. **Colorado**: 95° at Denver. **New Mexico**: 107° at La Mesilla. **Wyoming**: 93° at Cheyenne. **Utah**: 95° at Salt Lake City. **Nevada**: 96° at Winnemucca. **Arizona**: 110° at Yuma and Burkes. **Idaho**: 98° at Boise City. **Montana**: 86° at Virginia City. **California**: 108° at Red Bluff, 105° at Visalia. **Oregon**: 107° at Umatilla. **Washington Territory**: 94° Olympia.<sup>125</sup>

On 13 July 1880 in northeastern *England*. "Very large stones in the neighborhood of Liverpool."<sup>93</sup>

On 24 July 1880 in *Ireland*, there was a very severe hailstorm at Moylough in the County of Galway, which lasted half an hour.<sup>93</sup>

In July 1880, there was a very severe famine in Tauris [southern *Turkey*] and *Asia Minor*.<sup>90</sup>

Many thunderstorms in *England* in July 1880.<sup>90</sup>

On 12-13 August 1880, a storm of great strength in the west Gulf of Mexico devastated the Texas coast at the mouth of the Rio Grande in the *United States*.<sup>119, 120</sup>

On 10-13 August 1880, a hurricane struck offshore Yucatan, *Mexico* causing 30 deaths. [The dates in several accounts of this event vary.]<sup>141</sup>

On 18-19 August 1880, a hurricane struck *Jamaica*. Some accounts identify 30 deaths while others claim 12.<sup>141</sup>

On 18 August 1880, a storm of great strength at the Island of *Jamaica* caused loss of life and immense damage to shipping and property.<sup>119, 120</sup>

On 18 August 1880, a hurricane struck *Jamaica*.<sup>124</sup>

In August 1880, a hurricane struck Port Royal, *Jamaica*. It wrecked every vessel in the island except the Commodore's ship and a little surveying schooner.<sup>67</sup>

*Russia* suffered from a major famine in 1880.<sup>96</sup>

In 1880 in *Germany*, the hail damage losses sustained by the Magdeburg Company were very heavy during this season.<sup>93</sup>

On 20 August 1880 in central *France*, there was a terrific hailstorm at Riom (a fertile plain near the Ambone). The storm lasted for 20 minutes. The hailstones were as large as fowls' eggs, and some as large as a man's fists. Branches of trees were cut off, and birds were killed.<sup>93</sup>

On 26-31 August 1880, a storm of great strength moved north of the *Bahamas* and crossed north Florida in the *United States* on 29<sup>th</sup>-30<sup>th</sup>, strewing the Florida coast with wrecks and doing great damage to property and crops.<sup>119, 120</sup>

On 29 August 1880, a hurricane struck near St. Augustine, Florida in the *United States* causing 68 deaths.<sup>141</sup>

About 8-11 October 1880, inundations struck the midland counties of *England* causing much damage.<sup>90</sup>

On 12-13 October 1880, a hurricane struck the southeast coast of Texas in the *United States*. Many lives were lost.<sup>141</sup>

On 27-28 October 1880, there were severe storms in *England* that caused much destruction by inundations.<sup>90</sup>

Mr. J. Eliot in an elaborate report on the Madras Cyclone of May 1877 drew several conclusions about cyclones in the *Bay of Bengal*. He observed that the most powerful cyclones in the Bay tend to occur at or about the minimum sunspot period and that at least one intense cyclone occurs at each minimum sunspot period.<sup>125</sup> [Madras is now Chennai, *India*.]

A tropical hurricane traced across the ocean and became one of the most disastrous storms ever experience in Europe. On 28 October 1880, a deep depression appeared off the southwest coast of England, with unusually heavy rains in *England* and snow in *Scotland*. More than 160 vessels were reported wrecked on the British coast alone, and many lives lost. This storm also caused great damage along the shores of the North Sea and the Baltic.<sup>75</sup>

A typhoon struck the coast of *Japan* on 4 October 1880. Wind speed of 100 miles per hour were measured in Tokio [Tokyo] where it demolished more than 1,000 houses, damaged 2,000 other homes, killed 28 persons and injured 60 more some seriously. An immense scaffolding, used in the building of the temple of Hijio-Honto, was blown down, the debris forming a mass more than one hundred feet high. At Yokohama, Kobi [Kobe] and at many other villages in the interior, the loss of life and property was very great. Many bridges were swept away, and vessels in the harbors dragged their anchors and were driven out to sea.<sup>75</sup> [Hijio-Honto is in Nara, the ancient capital, in southern Honshū Island, *Japan*. Heijio-kyo, the Heijio Palace, extended about one kilometer wide and one kilometer long and served as the site of the Emperor's residence and the government offices. Yokohama and Kobi are located in southeastern Honshū Island.]

In 1880 during the period between 8 August and 8 November, a drought engulfed Kiangsu (now Jiangsu province) on the east coast of *China* at Yangchow; Shantung (now Shandong province) on the east coast of *China* at Yü-t'ai; and Hopei (now Hebei province) in northern *China* at Hsing-t'ai.<sup>153</sup>

*Also refer to the section 1880 A.D. – 1886 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1880 / 1881 A.D.** The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1880-81, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

Winter set in very early in *Russia* during the winter of 1880-81. In October 1880, they experienced a series of twelve consecutive days of hard frost. On 17 October 1880, the river Neva [in northwestern *Russia*] was covered with thick ice. According to the records dating back to 1706, the river was covered with ice in October on only three other times: 29 October 1805, 31 October 1811 and 30 October 1852.<sup>75</sup>

On the 16<sup>th</sup> of January 1881, an area of low pressure developed over the *Azores*. On the 17<sup>th</sup>, this disturbance moved northeastward and was centered near the southern part of the *Bay of Biscay*. On the 18<sup>th</sup>, the storm center moved over the *English Channel*. The storm produced violent easterly gales over the *North Sea* and at nearly all weather stations on the *British Isles*, while strong westerly gales occurred in the *Bay of Biscay*, and in western *France*. On the 18<sup>th</sup>, an unusually heavy fall of snow occurred in *England* and in the northern half of *France*. In the southern counties of *England*, the snowfall ranged from ten to eighteen inches, and in some instances, the latter amount may have been exceeded. Snowdrifts of four to twelve feet were general over southern *England*, and, in some cases they attained a depth of twenty feet. The number of deaths due to the snow in *England* and *Wales* is estimated at a hundred. In Paris, *France*, the snowfall caused hundreds of market-wagons to be abandoned near the suburbs of Paris, in the heavy drifts, which had formed, and many of the streets of Paris were completely blocked. By the 19<sup>th</sup>, the storm center had moved over *Belgium* and Holland [now *the Netherlands*] and then into *Germany*. By the 20<sup>th</sup>, the center had moved into eastern *Prussia*. On the 21<sup>st</sup>, the center was over central *Russia*. On the 22<sup>nd</sup>, the center was in the vicinity of the Ural Mountains.<sup>75</sup>

On 17-21 January 1881, there was a severe snowstorm, or blizzard [in *Great Britain*]. Railways and other traffic were largely stopped. There was great loss of life at sea.<sup>90</sup>

There was a very severe frost in *Britain* beginning on 18 January 1881 lasting about 14 days.<sup>90</sup>

The winter of 1880-81 in Bradford County, Pennsylvania in the *United States* was long and cold with much snow. The first snowstorm struck on 18 November and the last on 12 April. During the winter a total of 98 inches [2.5 m] of snow fell. The heaviest single snowfall was 10½ inches [27 cm] in the latter part of December. On December 30<sup>th</sup> the temperature dropped to -8° F [-22° C] and on February 7<sup>th</sup> it dropped to -19° F [-28° C]. The winter was a most unhealthful one. Spring did not appear until after the

middle of April.<sup>178</sup>

In the *United States* during the winter of 1880-81, the temperature dropped to -12° F at Mount Auburn, Ohio, a suburb of Cincinnati on November 19<sup>th</sup>. The temperature at Fort Benton, Montana fell to -59° F in December. The temperature at Fort Assiniboine (near Havre, Montana) fell to -42° F in December. The temperature at Milwaukee, Wisconsin fell to -21° F in December. The temperature at Dubuque, Iowa fell to -19° F in December. The temperature at Chicago, Illinois fell to -15° F in December. The temperature at Escanaba, Michigan fell to -23° F in December. The temperature at Detroit, Michigan fell to -11° F in December. The temperature at Saint Louis, Missouri fell to -15° F in December. The temperature at Cheyenne, Wyoming fell to -24° F in December. The temperature at Columbia, South Carolina fell to 5° F on December 30<sup>th</sup>. The temperature at Wabash and Spiceland, Indiana fell to -18° F in December. The temperature at Emmitsburg, Maryland fell to -19° F in December. The temperature at Flemington, West Virginia fell to -21° F in December. The temperature at Charleston, South Carolina fell to 13° F on December 30<sup>th</sup>. The temperature at Montgomery, Alabama fell to 8° F in December. The temperature at Mobile, Alabama fell to 14° F in December. The temperature at Linden, New Jersey fell to -18° F in December. The temperature at Pensacola, Florida fell to 17° F in December. The temperature at Atco, New Jersey fell to -24° F in January. The temperature at Fort Niobrara, Nebraska fell to -35° F in January. The temperature at North Platte, Nebraska fell to -27° F in January. The temperature at Saint Vincent, Minnesota fell to -42° F in December and -44° F in January. The temperature at Marquette, Michigan fell to -26° F in January. The temperature at Baltimore, Maryland fell to -6° F in January. The temperature at Fort Union, New Mexico fell to -25° F in January and -21° F in February. The temperature at Fort Concho, Texas fell to -1° F in January. The temperature at Atlanta, Georgia fell to 1° F in December and -1.3° F in January. The temperature at Mount Solon, Virginia fell to -18° F in January. The temperature at Charlotte, North Carolina fell to 11° F in January. The temperature at Washington D.C. fell to -13° F in December and -14° F in January. The temperature at Camp Sheridan (near Hay Springs, Nebraska) fell to -29° F in February. The temperature at Denver, Colorado fell to -20° F in February.<sup>113, 126</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

During the winter of 1880/81, there was very heavy snowfall in South Dakota in the *United States* and old residents state that at the end of February the average depth of snow in the vicinity of Huron, South Dakota was 3 to 4 feet.<sup>137</sup>

There were heavy snowstorms in the *United States* and *Canada* during April 1881. At Westerville, Ohio, the month opened with from twelve to fifteen inches of snow; on the 5<sup>th</sup> there was a snowfall of seven inches. At Sioux City, Iowa on the 8<sup>th</sup>, there was a very heavy storm of sleet and snow, over ten inches on the level; wires broken and railroad communication obstructed. At Sheldon, Iowa on the 8<sup>th</sup>, for sixty miles to the eastward the whole country covered with from two to three feet of snow; the *Chicago, Milwaukee and St. Paul* railroad, for a distance of thirty miles, passed through snowcuts [a road cut through deep snow], the walls of which were in many places above the tops of the [railroad] cars. In Sanborn, Hartley, Spencer, Emmetsburg, Algona and other neighboring towns in Iowa, people have been cut off from the necessities of life, by snow blockades for the previous three weeks, and until within a few days not a single train had passed through that section since the 1<sup>st</sup> of January; fully two-thirds of the livestock in that section perished. At Fairmount, Minnesota on the 11<sup>th</sup>, there was a very heavy snow in southern Minnesota during night; trains delayed. At Greenbrier County, West Virginia, there was sixteen inches deep snow in several localities west of White Sulphur Springs. At Yankton, [South Dakota] on the 13<sup>th</sup>, all railroads north and west were still blockaded by snow; the entire Missouri slope buried in snow. At Derby Line, Vermont on the 15<sup>th</sup> & 16<sup>th</sup>, there was very heavy snow, eleven inches deep on the level. At Edgerton, Wisconsin on the 16<sup>th</sup>, the snowdrifts were from three to five feet high. At Manitoba,

Canada on the 20<sup>th</sup>, the snow was very heavy about the tributaries of the Mississippi River. In the towns of Havelock and Winthrop, Iowa and others to the north on the 22<sup>nd</sup>, the ground was still covered with several feet of snow. In vicinity of Big Storm and Traverse Lakes, Dakota on the 22<sup>nd</sup>, the snow was partly gone from the hills, but in the ravines and gulches the snow was fifteen to fifty feet deep.<sup>132</sup>

---

**1881 A.D.** On 12 April 1881, a violent tornado first appeared near Commerce, Mississippi, a small town on the Mississippi River, where it wrecked ten cabins, three gin houses and a store. Then the tornado moved near Hernando. In that vicinity the loss to property and life was very severe, 25 buildings of various kinds were totally demolished and 10 persons killed. The length of storm path was about 25 miles and the width from 100 to 300 yards. Very heavy rain and hail followed this tornado at Senatobia and several other points in the vicinity, in some cases the hailstones were the size of hen's eggs. On the same day, a violent tornado visited several towns including Brinkley, Forrest City and Cotton Plant in Arkansas. After the passage of the storm, showers of jagged pieces of ice, four to six inches in width and two to two-and-a-half inches in thickness fell, resembling broken river ice.<sup>132</sup>

On 4 April 1881 there was ice gorging and flooding on the Missouri River, which caused the lower portion of Yankton, South Dakota in the *United States* to flood. The lower floors of over 200 dwellings, shops and mills were covered from 1 to 4 feet of water causing a great damage to property. On the 7<sup>th</sup>, the gorge broke. The water fell rapidly and as a result the steamer *Peninah* was carried away from her moorings and lodged on a railroad track two miles down the river. Reports from the submerged farming districts state that about 200 persons perished from cold and hunger. Thousands of cords of wood were carried away by the ice, leaving whole communities destitute of fuel. On the 13<sup>th</sup>, water in the overflowed districts was gradually subsiding. Ice was piled to a height of 10 to 30 feet along the banks, on the bars and over the bottoms. At Green Island every house but one had been swept away. Ice throughout the place was from 10 to 20 feet deep. Damages to steamboat property was estimated at \$60,000 [\$1.3 million in today's currency]. This included two boats sunk and seven of the largest steamers lying high up on the ice and far inland. In the vicinity of Yankton it is estimated that at least 7,000 people have been driven from their homes: the ice gorge which caused this unprecedented flood extended to Vermillion, filling the river channel for a distance of over 30 miles with solid ice and rising in places to a height of over 30 feet above the surface of the water. About fifteen miles below Yankton, in a bend of the river, were situated 20 families, who could not be rescued because of the mountains of ice surrounding them.<sup>132</sup>

At Omaha, Nebraska in the *United States* on 7 April 1881, the Missouri River was one vast field of ice, cakes varying in size from three to one hundred feet square; trees, logs, bridge timbers, the debris of houses, were constantly flowing downstream. At Mandan, North Dakota on the 8<sup>th</sup>, the immense fields of ice about the city was still intact; over one hundred men were employed in cutting out the railroad track and in opening a road through the heavy ice on Main Street. At Gayville, South Dakota on the 15<sup>th</sup>, the town was submerged to a depth of six feet, and surrounded by heavy ice. At Davenport, Iowa on the 2<sup>nd</sup>, the Mississippi River was open from the bridge down to the ferry crossing at the foot of Main Street. At some places along the shore, the ice was piled up to a height of 30 feet, composed of huge blocks three feet in thickness. On the 10<sup>th</sup>, an area of thirty to forty acres [of ice] passed down in a body and the levee flooded for two miles. At 11 a.m., the water stood seven inches deep in stores, warehouses and machine shops on Front Street, and whole blocks of dwelling houses were inundated. The sawmills suffered heavily, many piles of lumber and rafts were swept from their booms. One raft of 600,000 feet of lumber was broken up and carried away in front of the city. At 11.45 a.m., water rose to 18 feet 8 inches above the low-water mark, being 4 inches higher than ever before recorded. At Elgin, Illinois on the 21<sup>st</sup>, ice on the Fox River gorged for a distance of nine miles, and piled up to a height of 12 feet, damage to property \$500,000 [\$11 million in today's currency].<sup>132</sup>

At Battleford, *Canada* on the 21 April 1881, ice gorged and Saskatchewan River overflowed. By the 22<sup>nd</sup>, the river was higher than ever before. All bridges for miles about were swept away. Every house in lower part of town flooded. There was water of unusual depth in swamps along the line of the *Canada Pacific* [railroad], between Winnipeg and Portage la Prairie, owing to the sudden melting of heavy snow.<sup>132</sup>

In April 1881, massive flooding occurred in the *United States* and *Canada* causing an unprecedented loss of life and property and these floods were typified by the extreme height to which the water rose during the prevalence of the flood. The loss of property in monetary figures:

\* Over the territory from British America [*Canada*] southward to the latitude of Sioux City, Iowa, \$3.3 million [In present currency, that would be equivalent to \$74 million in damages based on the Consumer Price Index (CPI) inflation rates.]

\* From Sioux City, Iowa to the latitude of St. Louis, Missouri the loss was \$2.5 million [a \$56 million loss in present currency].

The probable causes that were at work in producing this great calamity, other than the immediate influence of the breaking up of ice, are worth discussion. First, note that in the Northwest, up to about the 12<sup>th</sup> of April, snow was upon the ground to the depth of 15 to 50 feet, the accumulation of almost the entire winter. In the Upper Mississippi valley as far south as Burlington, Iowa, it varied from 3 to 5 feet. Second, recall the fact that, during the month of March 1881, these regions were subjected to the heaviest snowstorms experienced, in many instances, for a period of the past twenty-five years. Third, this remarkable accumulation of snow coincided with very low temperatures. The mean temperature for March throughout the Upper Mississippi and Missouri valleys was from -1.4° F. to -3.1° F. below normal. This was a very important factor, which prevented the gradual and harmless disappearance of the large masses of snow. Fourth, during the winter, ice formed in the western rivers to a thickness and extent, in several instances, never before realized. With these conditions present, the month of April opened with occasionally heavy falls of snow and low temperatures between the 1<sup>st</sup> and 12<sup>th</sup>. Following this, the temperature rose slowly until the 20<sup>th</sup>, after which the temperature rise was more rapid, reaching the maximum of the month between the 22<sup>nd</sup> and 26<sup>th</sup>. These were the principal forces responsible for the remarkable floods of April 1881.<sup>132</sup>

Several accounts of the floods of April 1881 in the *United States* and *Canada* are detailed as follows:<sup>132</sup>

— Manitoba, British America [*Canada*] on the 22<sup>nd</sup>, all streams emptying into the Red River of the North overflowed, great loss to lumbermen and farmers.

— Winnipeg, British America [*Canada*] on the 29<sup>th</sup>, river 25 feet above low water mark, several grain warehouses flooded.

— Emerson, British America [*Canada*] on the 29<sup>th</sup>, lower portion of town flooded, bridge carried away.

— Vermillion, South Dakota, on the 8<sup>th</sup>, forty-five houses swept out of the town, highest water ever known.

— Grand Forks, North Dakota on the 21<sup>st</sup>, Red River rose 16 feet in past thirty-six hours.

— Casselton, North Dakota on the 22<sup>nd</sup>, entire town nearly underwater, flood unprecedented, all communication closed.

— Meckling, South Dakota on the April 8<sup>th</sup>, entire town carried away, except the elevator, in which were gathered for safety about 1,000 people.

— Fort Sisseton, South Dakota on the 22<sup>nd</sup>, all bridges between Fort Sisseton and Brown Valley carried away; the entire valley on the Dakota side of the Minnesota River covered to a depth of several feet.

— Mapleton, North Dakota on the 22<sup>nd</sup>, town completely submerged, loss of property very great.

— Yankton, South Dakota on the 8<sup>th</sup>, bottomlands for miles in every direction submerged, nearly 1,000 people have been rescued from farm houses and other buildings in this county alone; some people in their dwellings are still surrounded by ice walls of almost impenetrable character. On the 14<sup>th</sup>, in the district between Yankton and Vermillion, a distance of 23 miles, 2,500 people were suffering for the necessaries of life, and below Vermillion to Big Sioux 5,000 more were completely destitute; from the records of the Surveyor General's office, it has been ascertained that the flood on the Dakota side of the Missouri, covered over 227,000 acres.

- Pierre, South Dakota on the 8<sup>th</sup>, town completely underwater; the floods in this section and for miles on either side are unparalleled; the bottomlands for a width of over fifteen miles were overflowed, making a perfect inland sea.
- Big Stone City, South Dakota on the 23<sup>rd</sup>, Whetstone River overflowed, flooding the country for miles; Big Stone Lake 7 feet above high-water mark, highest ever known; all bridges gone and several miles of the *Hastings and Dakota* Railroad washed away.
- Union County, South Dakota on the 15<sup>th</sup>, water disappearing rapidly, leaving thousands of acres covered with huge cakes of Missouri ice, hay and straw stacks, wire fences, wrecked houses, and the debris of bridges.
- Civil Bend, South Dakota on the 15<sup>th</sup>, heavy river ice covered the fields for miles to the depth of 6 to 8 feet, rendering travel of any kind almost impossible; all sloughs filled with water and have to be crossed in skiffs; houses either wrecked by the ice or floated off by the water; hay, grain, fences, saw logs, lumber and cord wood, entirely swept away; loss of livestock very severe.
- Fargo, North Dakota on the April 23<sup>rd</sup>, Bed River rose four feet during the night, but could rise ten feet more without serious damage; at Williams' farm, 16 miles to the west, entire country flooded.
- Rockford, Illinois on the 20<sup>th</sup>, majority of town flooded, water in many cases flowing into the windows of dwellings; water 22 inches higher than the high-water mark of 1877; river two to three miles wide: loss of property in Kane County estimated at \$300,000; in the newspaper offices, men at work with a foot of water beneath them.
- Sterling, Illinois on the 20<sup>th</sup>, Rock River 12 feet above low-water mark and rapidly rising; lower part of city flooded; *Chicago and Northwestern* Railroad covered with water for five miles; river between Sterling and Erie overflowed, submerging the country for many miles; loss of property estimated at \$150,000.
- Milan, Illinois on the 20<sup>th</sup>, town partially submerged, bridge swept away; loss estimated at \$20,000.
- Chicago, Illinois on the 19<sup>th</sup>, Des Plaines River greatly swollen and pouring into the canal. On the 20<sup>th</sup>, canal broke its barriers, flooding all cellars and basements in the vicinity; flood spread considerably in southwestern part of city; several lumber yards inundated and all the docks on the south side were invisible; at 2 p.m., flood extended from Lincoln Street to the river, a distance of over two miles; canal filled with floating corn and hay, brought down the river from inundated farms in the surrounding country; water several inches higher than the flood of 1847, which was the highest point ever reached. On the 21<sup>st</sup>, flood increasing; only four cars of freight arrived during day; every railroad track that enters the city covered with water; several street bridges washed away.
- Elgin, Illinois on the 20<sup>th</sup>, Fox River overflowed, portion of city submerged. Two bridges and a dam were swept away; loss estimated at \$150,000. Bridges and dams at Carpentersville, Dundee, South Elgin, St. Charles and Geneva were carried away; loss estimated at \$200,000. The flood was so irresistible that buildings were swept down the stream like shingles. The *Milwaukee and St. Paul* Railroad Bridge was carried away, severing all communication westward for twelve days.
- Rock Island, Illinois on the April 15<sup>th</sup> at 11 a.m., three-fourths of the city underwater, general depth in business part of town 12 inches, while in the lower portions of town it was from three to four feet. Two hundred families were driven from their homes. At 11.45 a.m., [ice] gorge broke, water receding four feet in thirty minutes.
- Joliet, Illinois on the 20<sup>th</sup>, Des Plaines River highest ever known: lower portion of city flooded; damage to property estimated at \$50,000.
- Dixon, Illinois on the 19<sup>th</sup>, Rock River overflowed, much damage to property.
- Quincy, Illinois on the 20<sup>th</sup>, all lowlands above and below the city entirely inundated; river five miles wide; thousands of acres of farmlands overflowed; much loss of livestock, farm machinery and buildings.
- Venice, Illinois on the 25<sup>th</sup>, town entirely surrounded by water; people abandoning their houses.
- Madison, Illinois on the 25<sup>th</sup>, new levee broken; all farms on the American bottoms flooded; loss of livestock, farm buildings and implements very great.
- Fort Dodge, Iowa on the 25<sup>th</sup>, Des Moines River overflowed; rose 6 feet in 30 hours; families on lowlands abandoned their homes.
- Iowa Point, Iowa on the 30<sup>th</sup>, water up to the windows of the depot; every house flooded.
- Plum Hollow, Iowa on the 29<sup>th</sup>, great destruction of property and much suffering on the bottomlands throughout Fremont County; hundreds of families driven from their homes; flood unprecedented.
- Hamburg, Iowa on the April 29<sup>th</sup>, railroad track from Hamburg to Council Bluffs entirely washed away; all telegraph poles down; town flooded, houses abandoned.
- Sioux City, Iowa on the 8<sup>th</sup>, portion of city flooded to a depth of 4 to 6 feet. On the 21<sup>st</sup>, Big Sioux, Floyd, and other streams overflowed, causing great damage to wagon and railroad bridges. On the 29<sup>th</sup>, water rose 2 feet in past 24 hours; many families driven from their homes in the surrounding country by the overflow of creeks and small rivers.

- Lemars [Le Mars], Iowa on the 22<sup>nd</sup>, Floyd River overflowed; several bridges swept away together with 200 feet of railroad tracks.
- Des Moines, Iowa on the 22<sup>nd</sup>, river falling; debris of buildings and bridges floating by for several days.
- Council Bluffs, Iowa on the April 8<sup>th</sup>, all bottomlands about the city completely underwater and many families in the suburbs compelled to abandon their houses. On the 9<sup>th</sup>, water rising rapidly; nearly one-half of the city submerged to a depth of three feet; people rapidly deserting their homes; a broad and heavy stream coming in from a bend in the river north of the town swept down Broadway, the principal business street, carrying away a large amount of property; on the west side of the town the *Union Pacific* transfer depot, the bridges over Spoon Lake, together with the *Union* Stock Yards and numerous residences and railroad buildings, were inundated; all railroad communication has ceased; all transfers have to be made by boats, or by shoving flat cars through the water over the small bridges; several hundred loaded freight cars were entirely submerged. The *Kansas City, St. Joe and Council Bluffs* railroad, from the latter place to Pacific Junction, a distance of eighteen miles, was completely underwater. Ice was piling up fast all over the flooded section. On the 22<sup>nd</sup>, river rising at rate of one inch per hour; all bottomlands flooded to a depth of four to six feet; railroad tracks and the *Union* depot inundated. Water 17 inches higher than ever before known. On the 23<sup>rd</sup>, river now eight miles wide; over 500 houses in southern part of city surrounded by water; all communication with Omaha cut off. On the 29<sup>th</sup>, water 22 feet above low-water mark; 300,000 feet of lumber washed away during day by breaking away of the cofferdam.
- Burr Oak, Kansas on the 30<sup>th</sup>, town entirely flooded; water reaching to the eaves of many buildings; inhabitants floating about on rafts or buoys day and night.
- Elmwood, Kansas on the 30<sup>th</sup>, town submerged; inhabitants lost everything.
- Wathena, Kansas on the April 30<sup>th</sup>, town flooded; people passing about in skiffs or on rafts; houses abandoned.
- Belmont, Kansas on the 30<sup>th</sup>, all bottomlands underwater; town abandoned.
- George City, Kansas on the 30<sup>th</sup>, lower portion of city and the adjacent bottoms submerged; all railroad communication cut off; highest water ever known.
- Atchison, Kansas on the 25<sup>th</sup>, water 20 feet 8 inches above low-water mark; highest point ever reached. All houses on the east bank south of railroad track flooded; brick stack over 200 feet from the shore; all lowlands between the timber belt and town submerged; ice houses at Sugar Lake undermined and destroyed. On the 26<sup>th</sup>, East Atchison entirely surrounded with water; people leaving in boats for places of safety.
- Oak Mills, Kansas on the 29<sup>th</sup>, entire town swept away. A large island nearby upon which were gathered all the livestock of the neighborhood, was submerged, drowning the animals.
- Troy, Kansas on the 30<sup>th</sup>, all bottomlands overflowed: water highest ever known; town deserted.
- Leavenworth, Kansas on the 12<sup>th</sup>, river overflowed; all railroad travel suspended. On the 14<sup>th</sup>, river falling; 15<sup>th</sup>, railroad travel resumed; 22<sup>nd</sup>, water rising; railroad track again submerged; 23<sup>rd</sup> to 26<sup>th</sup>, river rising slowly; bottomlands overflowed and much property washed away. On the 27<sup>th</sup>, water 5 to 20 feet deep over the bottoms, with a width of over two miles; all buildings abandoned; several miles of railroad track washed away; river filled with debris of every description, showing that destruction of property upstream was immense. On the 28<sup>th</sup>, river rose rapidly all day, houses and barns carried away and much livestock along the Missouri river bottoms drowned; opposite city, bottoms from 3 to 10 feet underwater; over 100 families left destitute; town of east Leavenworth entirely abandoned and several houses floated away; river over three miles wide; highest water since 1844.
- Alpena, Michigan on the April 29<sup>th</sup>, Richardson's dam near mouth of Alpena River carried away by unprecedented high water; 500,000 feet of logs swept out into the bay.
- St. Paul, Minnesota on the 29<sup>th</sup>, water 19½ feet above low-water mark. West St. Paul entirely submerged; every house abandoned; water so deep that some of the houses only showed their gables above the flood; river full of debris of every description, coming down from the upper portions of the State; hundreds of cattle, horses and hogs drowned in the surrounding country. On the east side, flats above the city covered with water and the Sioux City shops and stockyards surrounded. The following are dates of highest water for many years past: June 1851; July and August 1852; April 1862; April 23<sup>rd</sup> 1866; April 19<sup>th</sup> and July 20<sup>th</sup> 1867; April 18<sup>th</sup> 1869; April 1<sup>st</sup> 1870. Loss to railroads and private property estimated at over \$100,000.
- Cassilton, Minnesota on the April 25<sup>th</sup>, Red Lake River overflowed, inundated the town; people abandoned their homes.
- Bell Plain, Minnesota on the 25<sup>th</sup>, bottomlands covered to a depth of five feet.
- Lenseur, Minnesota on the 25<sup>th</sup>, town partially underwater; wagon bridge carried away.
- Halleck, Minnesota on the 25<sup>th</sup>, all lowlands underwater; highest water ever known.
- Redwood Falls, Minnesota on the 22<sup>nd</sup>, Minnesota River highest since 1868; water fifteen feet above low-water mark; Ramsey creek 11 feet above low-water mark, highest since the floods of 1870; all dams and bridges in vicinity carried away.

- Le Sueur, Minnesota on the April 22<sup>nd</sup>, river covered the entire valley between the bluffs, water rising two inches per hour. On the 23<sup>rd</sup>, water rose 30 inches during the night. Henderson Bridge was carried away. Greatest flood ever experienced in this section.
- Mankato, Minnesota on the 23<sup>rd</sup>, lower portion of town flooded to a depth of several feet; West Mankato, Le Hillier and the city flats covered with water 2 to 5 feet deep; several hundred cords of wood carried away; Mineopa and Warren creeks overflowed, causing much damage in the vicinity; warehouses at Gardiner City, containing 7,000 bushels of wheat, swept away; all railroad tracks completely washed out.
- Marshall, Minnesota on the April 22<sup>nd</sup>, Redwood River overflowed; bottomlands underwater, and also the entire railroad tracks between Marshall and Amiret.
- Springfield, Minnesota on the 22<sup>nd</sup>, Cottonwood River overflowed; thousands of acres underwater; all communication cut off.
- Carver, Minnesota on the 22<sup>nd</sup>, river 10 feet above low-water mark; portion of the town underwater.
- Huron, Minnesota on the 22<sup>nd</sup>, James River overflowed; several buildings submerged to a depth of three feet.
- Sleepy Eye, Minnesota on the 22<sup>nd</sup>, surrounding country submerged; all railroad travel closed.
- Burns, Minnesota on the 22<sup>nd</sup>, Cottonwood River overflowed: railroad bridge and 80 feet of track carried away.
- St. Peter, Minnesota on the 22<sup>nd</sup>, river rising very rapidly, washing away over 700 feet of railroad track; river opposite town over a mile wide; largest portion of town flooded.
- Granite Falls, Minnesota on the April 25<sup>th</sup>, town entirely surrounded by water; all bridges carried away.
- Minnesota Falls, Minnesota on the 23<sup>rd</sup>, all the bottoms covered to depth of 4 to 6 feet; water highest ever known.
- St. James, Minnesota on the 22<sup>nd</sup>, Watonwan River overflowed; railroad bridges at Wadelia [Madelia] carried away; all railroad communication cut off.
- Shakopee, Minnesota on the 23<sup>rd</sup>, water 3½ feet above low-water mark, or 26 inches higher than ever before recorded, damage to property very great.
- Big Stone, Minnesota on the 28<sup>th</sup>, town flooded; railroad tracks washed away; highest water ever known.
- Sioux Falls, Minnesota on the April 22<sup>nd</sup>, three street bridges carried away; property of the Sioux Falls Water Power Company seriously damaged. On the 27<sup>th</sup>, several flouring mills carried away; every building in the town more or less damaged; loss estimated at \$140,000.
- Fergus Falls, Minnesota on the 25<sup>th</sup>, upper country one unbroken sheet of water for about 25 square miles.
- Ortonville, Minnesota on the 25<sup>th</sup>, bottomlands covered with 4 feet of water; highest flood ever experienced.
- Crookston, Minnesota on the April 25<sup>th</sup>, all the lowlands between Crookston and Glyndon overspread with ice, carried up by overflowing rivers and creeks; Red Lake River above its banks; wagon bridge carried away.
- Stevenson, Minnesota on the 25<sup>th</sup>, surrounding country covered with water; railroad tracks washed out; all communication closed.
- Montevideo, Minnesota on the 22<sup>nd</sup>, river higher than for many years. Water extends from bluff to bluff in a vast lake, varying in depth from 8 to 10 feet. In the lower portion of town, houses filled with 4 to 8 feet of water. The bridge across the Chippewa River was carried away. All communications were cut off. On the 23<sup>rd</sup>, water still rising rapidly; all of the bottomlands at the confluence of the Minnesota and Chippewa rivers one vast sea of water, covering many thousands of acres; many miles of railroad track washed away; all bridges on Dry Weather creek carried away.
- Craig, Missouri on the 25<sup>th</sup>, water three-feet deep in stores and houses; all business suspended; portion of town abandoned.
- Phelps City, Missouri on the 25<sup>th</sup>, town nearly submerged; inhabitants fled to the bluffs for safety; highest water and most destructive flood ever known.
- St. Joseph, Missouri on the April 25<sup>th</sup>, river 29 feet 9 inches above low-water mark, or 9 inches above the highest point ever reached. French bottoms, above city, flooded; people abandoned their houses. Opposite city all lands flooded; inhabitants fled to the hills for safety; railroad machine shops surrounded and all railroad tracks underwater.
- Hannibal, Missouri on the 21<sup>st</sup>, railway tracks on Front Street submerged; steamboat warehouses entirely surrounded. On the 25<sup>th</sup> at 3 a.m., Say levee broke at a point 1½ miles above East Hannibal, the break was 130 feet and still cutting; loss of ice about 28,000 tons; river over 19 feet above low-water mark and still rising.
- Forrest City, Missouri on the April 25<sup>th</sup>, levee built to protect town of Harlem and the broad bottomlands opposite city gave way during the night, flooding the bottomlands to a depth of 10 feet. In the town of Harlem only six houses were above the waterline, a large number of neighboring farms were 4 to 6 feet underwater. On the 29<sup>th</sup>, 7,000 people were driven from their houses. All the railroad tracks were underwater. Business was entirely suspended. Over 1,500 houses flooded and abandoned.
- St. Louis, Missouri on the 25<sup>th</sup>, Sny levee broke during the evening opening a crevasse 175 feet wide, flooding 40,000 acres of growing wheat. The estimated value of icehouses and ice destroyed was over \$100,000. About 40

miles of the *Keokuk and St. Louis* railroad was inundated. On the 28<sup>th</sup>, large portion of North St. Louis and Carondelet were submerged, all bottoms on the Missouri side were flooded, and situation on the Illinois side very deplorable. All buildings and railroad tracks between the stockyards and Venice were badly damaged, water several feet deep.

— Lexington, Missouri on the 29<sup>th</sup>, river 22 feet and 8 inches above low-water mark, highest since 1844. The Roy and Lafayette county bottoms submerged and rapidly depopulated; thousands of horses, cattle and hogs perished, water seven feet deep in many of the houses.

— Oregon, Missouri on the 24<sup>th</sup>, all the bottomlands flooded, about 3,000 people in Holt County rendered homeless. The river reached its highest point on the 27<sup>th</sup>, higher than ever before experienced, not excepting the great flood of 1844.

— Covington, Nebraska on the April 8<sup>th</sup>, town completely submerged and entirely abandoned by its inhabitants.

— Brownville, Nebraska on the 25<sup>th</sup>, town partly underwater, all business suspended.

— White Cloud, Nebraska on the 26<sup>th</sup>, river highest ever known, railroad tracks washed out, several buildings under water.

— Doniphan, Nebraska on the 26<sup>th</sup>, water highest since the flood of 1844. All the lowlands underwater, great loss to railroad and other property.

— Nebraska City, Nebraska on the 20<sup>th</sup>, the river was 10 miles wide. It is estimated that about 10,000 head of cattle perished along the bottomlands.

— Jackson, Nebraska on the 7<sup>th</sup>, entire portion of state between Jackson and Covington submerged, all communication cut off, loss of property without precedent; no such flood since the settlement of the country.

— Plattsmouth, Nebraska on the 23<sup>rd</sup>, all bottomlands underwater to a depth of six to eight feet, farmers on Iowa side have abandoned their houses and report heavy losses of cattle.

— Pacific Junction, Nebraska on the 23<sup>rd</sup>, town submerged to a depth of four to eight feet; great suffering and loss of property.

— Omaha, Nebraska on the April 8<sup>th</sup>, river 21 feet above low-water mark, highest ever known here and 2½ feet higher than the April flood of 1875 or the June flood of 1867; everything on the levee submerged and the lowlands on the east side of the river flooded for miles; river three miles wide opposite the city and filled to a considerable extent with floating ice; twelve of the largest buildings of the *Union Pacific* Railroad Company's shops were flooded to a depth of six to twelve inches and 1,300 men temporarily thrown out of employment. On the 9<sup>th</sup>, river opposite city increased to a width of six miles; damage to property immense. On the 20<sup>th</sup>, water 20 feet above low-water mark; all the bottoms again submerged; railroad business entirely suspended, shops and depots flooded. On the 22<sup>nd</sup>, water 22 feet 10 inches above low water mark and rising at the rate of one inch per hour; all railroad connections severed; Union stockyards flooded; 300,000 feet of lumber carried away; Elkhorn River overflowed, railroad partially carried away. On the 23<sup>rd</sup>, at 2 p.m., river 23 feet and 4 inches above low-water mark, or 16 inches higher than ever before recorded; all passengers going east compelled to pass to the local depots in boats; \$30,000 worth of lumber carried away. On the 24<sup>th</sup>, water 4 feet higher than the flood of 1867; current very rapid; all railroad tracks washed away. On the 29<sup>th</sup>, water still rising; 50,000 feet of lumber carried away; the *Union Pacific* Railroad shops, smelting works, Willow Springs distillery and several large warehouses were flooded.

— Huntsville, Texas on the 22<sup>nd</sup>, heaviest storm of rain ever known here; surrounding country flooded; all bridges carried away; crops seriously damaged.

— Beloit, Wisconsin on the 20<sup>th</sup>, town partially inundated; great loss to mill property.

— Fort Atkinson, Wisconsin on the 20<sup>th</sup>, all the lowlands flooded; ice came down in huge masses, crushing bridges, dams and every obstacle in its path; water rose to within a few inches of the top piers of the city bridge; highest ever known.

— Milwaukee, Wisconsin on the April 21<sup>st</sup>, flood highest and most destructive ever known here; basements along the docks and several lumberyards and tanneries submerged. At West Bend, Thevisville, Newburg and other neighboring places all dams and bridges gone.

On 15 July 1881, the temperature in the shade at Camden-Square in London, *England* reached a peak of 94.6° F (34.8° C).<sup>97</sup>

On 16 July 1881, a tornado struck Bradford County, Pennsylvania in the *United States*. July was an exceedingly hot month and the weather continued notably warm without rain through August and September. On July 10 and August 5, local thermometers stood at 102° F [39° C]. The drought prevailed from the first week in July until the 13<sup>th</sup> of October. It was widespread and extended over several states,

causing much damage and suffering. Corn and buckwheat especially were ruined. Wells, springs and creeks dried up and there was virtually a water famine. The water level in the Susquehanna River was the lowest in 41 years. Forest fires did much damage.<sup>178</sup>

In August 1881, significant rainfalls produced floods in Cheshire and Lancashire, *England*.<sup>90</sup>

On 27 August 1881, a storm of great strength moved northwest to the coast near Savannah, Georgia in the *United States*, causing extensive destruction of property and loss of life.<sup>119, 120</sup>

On 27 August 1881, a hurricane struck Georgia and South Carolina in the *United States* causing approximately 700 deaths.<sup>141</sup>

On 28 August 1881, a hurricane struck South Carolina in the *United States*.<sup>117</sup>

On 23-28 August 1881, a storm [hurricane] entered the *United States* near Savannah, Georgia and followed a very unusual course to the northwestward to Minnesota. The loss of life and damage to property in Charleston, South Carolina; Tybee Island, Georgia; and along the adjacent coast was very great. About four hundred persons lost their lives, and hundreds of houses were totally destroyed. The loss of property was estimated at over one and one-half million of dollars. [In present currency, that would be equivalent to \$33 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>120</sup>

In October 1881, there were great inundations caused by rains in southeast *Europe*.<sup>90</sup>

On 8 October 1881 a typhoon struck Haiphong, *Vietnam* and several cities in *China*. Approximately 300,000 people perished.<sup>197</sup>

On 8 October 1881, a typhoon struck Haifong [Hai Phong, *Vietnam*], about 300,000 people perished.<sup>90</sup>

In 1881, a powerful cyclone struck Haiphong on the northeast coast of *Vietnam* causing 300,000 deaths.<sup>98</sup>

On 14 October 1881 the maximum temperature measured at the Central Vermont Railroad station [in Northfield, Massachusetts] in the *United States* was 92° F.<sup>138</sup>

On 14-19 October 1881, a violent hurricane struck *England*. There was great destruction of life and property. Houses were thrown down or unroofed. Large trees were torn up by the roots. Telegraph wires and poles were blown down. There were about 130 wrecks of which 105 were British.<sup>90</sup>

On 19-20 October 1881, a storm on the south and west coasts of *England* caused many wrecks with much loss of life.<sup>90</sup>

On 26-27 November 1881, there was great destruction of life and property [in *Great Britain*] by gales.<sup>90</sup>

On 27 November 1881, the lighthouse, Calf Rock, in Bantry Bay, *Ireland* was destroyed.<sup>90</sup>

On 17-21 December 1881, destructive gales struck *England*. There were many wrecks and loss of life by sea and land.<sup>90</sup>

*Also refer to the section 1880 A.D. – 1886 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1881 / 1882 A.D.** The following are the lowest temperatures observed in January 1882 in the *United States and Canada:*<sup>75</sup>

St. Vincent, Minnesota	(-42° F, -41.1° C)
Fort Pembina, Dakota Territory	(-40° F, -40.0° C)
Saranac Lake, New York	(-40° F, -40.0° C)
Mount Washington, New Hampshire	(-39° F, -39.4° C)
Parry Sound, Canada	(-38° F, -38.9° C)
Fort Keogh, Montana	(-37° F, -38.3° C)
Terry's Landing, Montana	(-36° F, -37.8° C)
Saratoga, New York	(-36° F, -37.8° C)
Whitehall, New York	(-35° F, -37.2° C)
Fort Brady, Michigan	(-34° F, -36.7° C)
Halleck, Nevada	(-34° F, -36.7° C)
Norwich, New York	(-33° F, -36.1° C)
Fort Stevenson, Dakota Territory	(-32° F, -35.6° C)
Fort Missoula, Montana	(-31° F, -35.0° C)
Eagle Rock, Idaho	(-30° F, -34.4° C)
Halleck, Nevada	(-30° F, -34.4° C)
Wells, Nevada	(-30° F, -34.4° C)
Lunenburg, Vermont	(-29° F, -33.9° C)
St. Johns, New Brunswick, Canada	(-28° F, -33.3° C)
Alpena, Michigan	(-27° F, -32.8° C)
Cooperstown & Johnstown, New York	(-27° F, -32.8° C)
Gardiner, Maine	(-27° F, -32.8° C)
Carline, Nevada	(-27° F, -32.8° C)
Quebec, Canada	(-26° F, -32.2° C)
Montreal, Canada	(-26° F, -32.2° C)
Glen's Falls, New York	(-26° F, -32.2° C)
Burlington, Vermont	(-25° F, -31.7° C)
Elko, Nevada	(-25° F, -31.7° C)
Lake George, New York	(-25° F, -31.7° C)
Plattsburgh, New York	(-25° F, -31.7° C)
Ticonderoga, New York	(-25° F, -31.7° C)
Coalville, Utah	(-25° F, -31.7° C)
Burlington, Vermont	(-24.8° F, -31.6° C) coldest day since 1857
Keeseville, New York	(-24° F, -31.1° C)
South Lee, Massachusetts	(-24° F, -31.1° C)
Portsmouth, New Hampshire	(-24° F, -31.1° C)
Grafton, New Hampshire	(-22° F, -30.0° C)
Pike's Peak, Colorado	(-22° F, -30.0° C)
Fort Bridger, Wyoming	(-22° F, -30.0° C)
Port Henry, New York	(-22° F, -30.0° C)
Embarrass & Neillsville, Wisconsin	(-20° F, -28.9° C)
Blooming Grove, Pennsylvania	(-19° F, -28.3° C)
Kingston, Canada	(-19° F, -28.3° C)
Toronto, Canada	(-18° F, -27.8° C)
Cresco, Iowa	(-17° F, -27.2° C)
Saugeen, Canada	(-16° F, -26.7° C)
Anticosti, Canada	(-16° F, -26.7° C)
Fort Wallace, Kansas	(-15° F, -26.1° C)
Contoocookville, New Hampshire	(-15° F, -26.1° C)
Eastport, Maine	(-14° F, -25.6° C)
Southington, Connecticut	(-14° F, -25.6° C)
Albany, New York	(-14° F, -25.6° C)
Boston, Massachusetts	(-13° F, -25.0° C)
New Haven, Connecticut	(-12° F, -24.4° C)

Cheyenne, Wyoming	(-12° F, -24.4° C)
La Crosse, Wisconsin	(-11° F, -23.9° C)
Fort Union, New Mexico	(-11° F, -23.9° C)
Port Stanley, Canada	(-10° F, -23.3° C)
Newport, Rhode Island	( -8° F, -22.2° C)
Deer Park, Maryland	( -8° F, -22.2° C)
North Platte, Nebraska	( -8° F, -22.2° C)
Colfax, Washington Territory	( -8° F, -22.2° C)
Prescott, Arizona	( -8° F, -22.2° C)
Elmira & Morrison, Illinois	( -7° F, -21.7° C)
Rochester, New York	( -7° F, -21.7° C)
Fort Supply, Indian Territory	( -6° F, -21.1° C)
Newport, Rhode Island	( -6° F, -21.1° C)
Dubuque, Iowa	( -5° F, -20.6° C)
Oregon, Missouri	( -4° F, -20.0° C)
South Orange, New Jersey	( -4° F, -20.0° C)
Winnemucca, Nevada	( -4° F, -20.0° C)
Erie, Pennsylvania	( -2° F, -18.9° C)
Barnegat, New Jersey	( -1° F, -18.3° C)
Dodge City, Kansas	( 0° F, -17.8° C)
Hudson, Ohio	( 0° F, -17.8° C)
Salt Lake City, Utah	( 0° F, -17.8° C)
Summit, California	( 1° F, -17.2° C)
Denver, Colorado	( 1° F, -17.2° C)
Lafayette, Indiana	( 1° F, -17.2° C)
Chicago, Illinois	( 1° F, -17.2° C)
Cleveland, Ohio	( 2° F, -16.7° C)
Umatilla, Oregon	( 4° F, -15.6° C)
Fort Elliott, Texas	( 4° F, -15.6° C)
Weldon, North Carolina	( 5° F, -15.0° C)
Saint Louis & Springfield, Missouri	( 6° F, -14.4° C)
Baltimore, Maryland	( 7° F, -13.9° C)
Indianapolis, Indiana	( 7° F, -13.9° C)
Santa Fe, New Mexico	( 7° F, -13.9° C)
Campo, California	( 7° F, -13.9° C)
Washington, D.C.	( 8° F, -13.3° C)
Chincoteague, Virginia	( 8° F, -13.3° C)
Flemington, West Virginia	( 8° F, -13.3° C)
Morgantown, West Virginia	( 9° F, -12.8° C)
Breakwater, Delaware	(10° F, -12.2° C)
Mount Ida, Arkansas	(15° F, -9.4° C)
Ashwood, Tennessee	(16° F, -8.9° C)
Louisville, Kentucky	(16° F, -8.9° C)
Charlotte, North Carolina	(16° F, -8.9° C)
Bowling Green, Kentucky	(18° F, -7.8° C)
Knoxville, Tennessee	(18° F, -7.8° C)
Aiken, South Carolina	(21° F, -6.3° C)
Augusta, Georgia	(22° F, -5.6° C)
Fort Barrancas, Florida	(22° F, -5.6° C)
Thornville, Georgia	(24° F, -4.4° C)
Montgomery, Alabama	(24° F, -4.4° C)
Little Rock, Arkansas	(24° F, -4.4° C)
Charleston, South Carolina	(26° F, -3.3° C)
Fayette, Mississippi	(28° F, -2.2° C)
Shreveport, Louisiana	(30° F, -1.1° C)
Vicksburg, Mississippi	(30° F, -1.1° C)

Jacksonville &amp; Pensacola, Florida

( 32° F, 0.0° C)

The depth that rivers and lakes froze in January 1882 in the *United States*:<sup>75</sup>

- \* At Le Claire, Iowa, ice on *Mississippi River* frozen over opposite city and 10 inches thick at the head of the upper rapids on January 16<sup>th</sup>.
- \* At Dubuque, Iowa, the *Mississippi River* frozen over; teams [of wagons] crossing on the ice on the 18<sup>th</sup>.
- \* At La Crosse, Wisconsin and St. Paul, Minnesota, the *Mississippi River* frozen over during the month.
- \* At Yankton, South Dakota and Omaha, Nebraska, the *Missouri River* frozen over during the month.
- \* At Clay Centre, Kansas, the *Republican River* frozen over on the 28<sup>th</sup>, ice eight inches thick.
- \* At Marysville, California, the *Yuba River* on the 13<sup>th</sup> full of floating ice; coldest weather for years.
- \* At Madison, Wisconsin, *Forest Lake* frozen over on the 2<sup>nd</sup>.
- \* At Terry's Landing (Terry, Montana), the *Yellowstone River* closed by ice on the 13<sup>th</sup>.
- \* At Fort Keogh, Montana, the *Yellowstone River* frozen over on the 5<sup>th</sup>.
- \* At Fort Custer, Montana, the *Big Horn River* closed by ice on the 9<sup>th</sup>.
- \* At Charleston, Illinois, the *Embarrass River* was frozen over on the 5<sup>th</sup>; on the 24<sup>th</sup> the ice was 3-5 inches thick.
- \* At Rockford, Illinois, the *Rock River* was frozen solid on the 1<sup>st</sup>.
- \* At Fort Brady, Michigan, the *Sault St. Marie River* was frozen over on the 3<sup>rd</sup>.
- \* At Madison Barracks, New York, *Lake Ontario* bay was frozen over on the 2<sup>nd</sup>.
- \* At Buffalo, New York, the *Niagara River* was frozen over on the 4<sup>th</sup>.
- \* At Port Huron, Michigan, an ice bridge formed across *Lake Huron* Bay from Fort Gratiot Lighthouse to Point Edwards on the 24<sup>th</sup>.
- \* At Alpena, Michigan, Thunder Bay on *Lake Huron* was frozen over on the 1<sup>st</sup>; navigation closed.
- \* At Grand Haven, Michigan, the *Grand River* was frozen over on the 4<sup>th</sup>.
- \* At Duluth, Minnesota, *Lake Superior* was frozen over 600 feet from the docks on the 10<sup>th</sup>.
- \* At Red Bank, New Jersey, the *North Shrewsbury River* was frozen over.
- \* At Peekskill, New York, the *Hudson River* frozen solid for many miles northward. "Ice cutting very active everywhere north of Catskill". [Ice was cut during the winter for refrigeration during the summer months.]
- \* At Poughkeepsie, New York, on the *Hudson River*, a steamer, *Daniel S. Miller*, bound for New York, became fast in the ice on the 24<sup>th</sup> off Cold Spring in the Highlands.
- \* In New York City, navigation on the *North Hudson River* was closed on January 4<sup>th</sup> due to the ice. [This is rather later than normal. During the previous 100 years, navigation on the river continued later than December only eleven times.]
- \* At Chincoteague Island, Virginia, the *Chincoteague Bay* was partially frozen over and navigation was obstructed on the 24<sup>th</sup>.
- \* At Cape Lookout, North Carolina, the *Core Sound* was frozen over on the 22<sup>nd</sup>.
- \* At Chicago, Illinois on the 3<sup>rd</sup> and Milwaukee, Wisconsin on the 5<sup>th</sup>, *Lake Michigan* was frozen.
- \* At Port Huron, Michigan, the *Black River* was frozen over on the 1<sup>st</sup> and the ice was 7 inches thick on the 17<sup>th</sup>.
- \* At Toledo, Ohio, the *Maumee River* was frozen over on the 2<sup>nd</sup>.
- \* At Cleveland, Ohio, the *Cuyahoga River* was frozen over on the 2<sup>nd</sup> and *Lake Erie* on the 4<sup>th</sup> was full of ice as far as the eye could reach.
- \* At Erie, Pennsylvania, ice formed in the harbor of *Lake Erie* to a depth of 8 inches on the 1<sup>st</sup>.
- \* At Burlington, Vermont, *Lake Champlain* was frozen between the docks on the 5<sup>th</sup> and navigation was closed on the 23<sup>rd</sup>.
- \* At Sandusky, Ohio, the *Sandusky Bay* was frozen over during the night of the 1<sup>st</sup> and navigation was suspended.
- \* At Bangor, Maine, the *Penobscot River* was closed for navigation on the 2<sup>nd</sup>.
- \* At New Haven, Connecticut, the *Quinnipiac River* and the harbor was frozen over on the 4<sup>th</sup>. On the same day, the *Connecticut River* was closed for navigation. [This is rather later than normal. Over the previous 40 years, the river was always closed earlier in the winter season.] The steamer *Granite State* from New York to Hartford caught in the ice at Lynn.

The winter of 1881-82 in Bradford County, Pennsylvania in the *United States* was warm and open with little snow and only a short run of sleighing during the beginning of February. There was a flurry of snow on the 4<sup>th</sup> of November but the weather soon became warm and December was remarkably summer-like. During the second week in January, the weather turned cold and there was a snowstorm on the 19<sup>th</sup>. The coldest day was 24 January when the temperature dropped to -10° F [-23° C]. On 4 & 5 February, snow

fell to the depth of 8 inches [20 cm], the heaviest fall of the season. Sleighing was of short duration. February was a month of unusual mildness. Most of March was warm while April presented all sorts of weather with snow squalls.<sup>178</sup>

On 12 & 13 January 1882, a snowstorm struck Southern California in the *United States*. At San Geronimo, California on the 12<sup>th</sup>, there was a remarkable fall of snow in the surrounding country. From San Bernardino eastward to the edge of the desert and from San Diego southward, snow fell to a depth of 4 to 15 inches. [Colton, California recorded 10 inches of snow in January.] There is no record of any such storm in former years, but some of the old Mexican inhabitants speak of a similar storm as occurring some 50 years ago. The storm was unusual because it came from the east and was accompanied by a violent gale. In Los Angeles on the 13<sup>th</sup>, the hills all about the city were white with snow. In the San Geronimo Pass, two special freight trains were blocked by the snow. The cuts in the Pass were filled to a depth of from six to eight feet with drifted snow. [San Geronimo, California received a total of 16.5 inches of snow in January. At San Geronimo the minimum temperature was 19° F (-7.2° C) on the 12<sup>th</sup>.] At Riverside, California on the 13<sup>th</sup>, snow was 5 inches and still falling; good sleighing in the orange groves. In Tucson, Arizona on the 12<sup>th</sup>, there was very heavy snowfall during the night in the desert and on the 13<sup>th</sup>, a fierce snowstorm raged in the mountains. In Campo, California on the 12<sup>th</sup>, the minimum temperature was 6.5° F (-14.2° C). On the 13<sup>th</sup>, snow fell to a depth of 20 inches and “all communications with the outside world cut off.” On the 15<sup>th</sup>, there was nearly 3 feet of snow on the ground with drifts 8 feet deep. It was the most remarkable storm ever known at Campo. Hundreds of birds were killed by exposure and livestock suffered severely. On the 16<sup>th</sup>, all communications still cut off. On the 18<sup>th</sup>, snow slowly disappearing and reports from the surrounding country show great losses in livestock. The roads were still impassable.<sup>75</sup>

In San Diego, California, the storm, which began on the 12<sup>th</sup>, was the most remarkable storm since 1847. It continued for 38 hours and gave the largest rainfall of any one storm in the month of January. [As of the 13<sup>th</sup>, the rainfall was 3.02 inches.] It was also the coldest storm on record. On the morning of the 14<sup>th</sup>, snowflakes were observed but they melted as fast as they fell. Accompanying this storm, snow varying in depth from two to five inches was reported from the low hills at El Cajon, Poway, Bernardo, and other points within 15 to 25 miles of the station, “where such a thing was never before experienced.”<sup>75</sup>

The storm as it passed over Ventura County, California on the 12<sup>th</sup>, produced a very violent windstorm. It is said a tornado occurred in Ojai valley, destroying houses and barns and uprooting and breaking the strongest trees. At Wilmington [Los Angeles], California on the 12<sup>th</sup>, there was a most terrible storm for many years, accompanied by a blinding fall of snow and sleet; several vessels dragged anchor in the harbor, and one of them became a total wreck. At San Buenaventura [Ventura], California, the weather was extremely cold: lambs and sheep dying from exposure.<sup>75</sup>

Several snowstorms struck *North America* during February 1882. At St. Paul, Minnesota, snowstorms on the 20<sup>th</sup> and 21<sup>st</sup> dumped nearly two feet of snow and because of the winds, the snow was badly drifted. All trains delayed because of snow blockades. In Montreal, Canada on the 22<sup>nd</sup>, the streets were blockaded by 4 feet of snow. In Carbondale, Pennsylvania on the 4<sup>th</sup> the snowstorm dropped 36 inches on the level. In Springfield, Massachusetts, the snowstorm was the heaviest since 1854. On 1 February in Massachusetts, the snowfall at Springfield was 22 inches on the level; at Stockbridge 22 inches; at Boston 18 inches; at Gloucester 18 inches; at South Framingham 20 inches; and at Lowell 18 inches on the level. At St. John in New Brunswick, Canada on February 10, there was a heavy snowstorm accompanied by violent winds from the northeast. All trains on the St. John and Maine Railroads were blockaded and tremendous drifts formed on the Inter-Colonial Railroad. The railroad car shed of the latter railway company was demolished by the heavy weight of the snow; loss estimated at \$75,000 [approximately \$1.7 million in present dollars using the Consumer Price Index (CPI)].<sup>75</sup>

During the winter of 1881-82, Lake Constance at the *Switzerland/Germany/Austria* border froze over on 6 February. In *Italy*, the winter was very severe. In Venice, water froze in the cisterns causing a scarcity of drinking water. In Naples, Italy, frost and snow prevailed.<sup>75</sup>

During the winter of 1881-82, news from *Iceland* states that the Spitzbergen floe-ice surrounds the north and east coasts, entirely preventing navigation. Owing to the presence of these immense ice fields, vegetation has made no progress, causing a great loss of horses and sheep through starvation. Epidemics of measles and smallpox have been introduced into the island from Europe, and are making extensive ravages among the population, especially at Rejkjavik.<sup>75</sup>

An article by Mr. E. Douglas Archibald was published in *Nature*. He suggested that an abundance of icebergs in the lower latitudes of the *North Atlantic*, tend to be associated with the solar maximum of the sunspot cycle.

Years of the Greatest Frequency of Floating Ice	Sunspot Cycle (corrected)
1789	Solar Cycle 4 / Solar Maximum 1787
1816-1818	Solar Cycle 6 / Solar Maximum 1816
1828-1829, 1831	Solar Cycle 7 / Solar Maximum 1830
1862-1864	Solar Cycle 10 / Solar Maximum 1860
1868-1869	Solar Cycle 11 / Solar Maximum 1870

In 1862, Heis's 'Wochenschrift' noted that floating ice masses in the Atlantic causes a noticeable cooling of weather in June over *Europe*.<sup>75</sup>

**1882 A.D.** Severe gales produced much destruction in *England* and *Scotland* on 6 January and 29 April 1882.<sup>90</sup>

On 16-17 January 1882, a severe cyclone struck Darwin, *Australia*.<sup>101</sup>

On 17 January 1882, a cyclone struck Darwin in the Northern Territory of *Australia*. The gale caused severe damage to buildings in the city.<sup>99</sup>

Indiana in the *United States* experienced great floods during February 1882. At New Albany, Indiana, the greatest flood on the Ohio River occurred in 1832, which set the high water mark. (The flood of 1847 was two feet below this mark. The flood of 1867 was 4 ½ feet below the high water mark. The flood of 1882 was close to the 1867 flood level. The flood of 1869 was 5 feet below the high water mark.) At New Albany on the 21<sup>st</sup>, 600 homes were under water. Portions of the city along the riverfront flooded for a distance of 2 miles. All manufacturing establishments were closed. Over 100 feet of the trestlework of the Air Line Railroad was washed away. On the opposite shore of the Ohio River at Louisville, Kentucky, several portions of the city were under floodwater 4-6 feet deep. Most of the distilleries were compelled to close and many factories were surrounded by water. At Madison, Indiana on the 19<sup>th</sup>, the starch factory, saw mills, shipyards, cooper shops and cellars on Ohio Street and the railroad depot were flooded with the water still rising. By the 21<sup>st</sup>, nearly a 1,000 people were thrown out of employment as manufacturers and residences flooded. At Aurora, Indiana on the 21<sup>st</sup>, the water was 4-6 feet deep on many streets and people were compelled to move to the second story of their homes. At Lawrenceburg on the 21<sup>st</sup>, all communications with the town was cut off. Almost the entire city was a sea of muddy water. Railroads were all washed out, highways submerged and no steamer could affect a landing. About 3,000 people were homeless. The water attained a depth of 12 feet in the streets and rushed through with a terrible force. Horses, cattle and hogs were left to their fate and soon the rushing torrents covered their bodies. The Kentucky shore opposite Evansville, Indiana, was entirely submerged to the tops of trees. In Terre Haute, Indiana, the Wabash River flooded. The railroads were badly damaged and all communications suspended.<sup>75</sup>

The flooding in the *United States* in February 1882 was fairly widespread. The flooding even extended into Ontario, Quebec and Montreal, *Canada*. At Greenville, Mississippi a levee broke flooding the surrounding country. Damage to the levee is estimated at \$500,000 [approximately \$11 million in present dollars using the Consumer Price Index (CPI)]. At St. Louis, Missouri, about 500,000 feet of lumber were carried off by the floodwaters. In New York, the heavy rains caused landslides. At Thurman, New York, 400 feet of railroad track was covered and at Hadley, New York, 100 feet of railroad track was covered. Throughout the United States, scores of bridges, homes, business, farms, roads, telegraph poles & wires, and railroad tracks were washed away. In Tennessee, the floods endangered 30,000 individuals and resulted in the loss of one million bales of cotton, the loss of 30,000 head of livestock and 50 human lives.<sup>75</sup>

The flooding in the *United States* continued into March 1882 in the central Mississippi and Ohio valleys and in Tennessee. The Mississippi River ranged from 10 to 20 miles in width from Cairo, Illinois to New Orleans, Louisiana. Clarendon, Arkansas, reported that the backwaters from the Mississippi River extended to a distance of 135 miles, and that the entire countryside was underwater. The river was 2 feet higher than ever known before. In Louisiana, the overflow in Concordia Parish extends from the Black to the Mississippi Rivers (35 miles); in Tensas Parish it extends from the Tensas River and Bayou Macon to the Mississippi River (30 miles); in Franklin Parish it extends from the Tensas to the Ouachita Rivers (10 miles), in Madison Parish it extends from Bayou Macon to the Mississippi River (35 miles), and in East Carroll Parish it extends from Bayou Macon to the Mississippi River (10 miles). Following the course of the river from Vicksburg to Coldwater, is about 450 miles. The entire country contiguous is swampland. In width it is probably 60 miles and is known as the Yazoo Delta. It is bounded on the east by hills and on the west by the Mississippi River. During this flood the entire lowlands were submerged, with the exception of a few knolls or Indian mounds where livestock and people gathered to flee the flood. Tributary streams (Coldwater, Tallahatchie, Yazoo, Sunflower, Big and Little Deer Creek) were swollen beyond memory. Even though the loss of life from the flood was not large; the loss of cattle, livestock, provisions, and agricultural implements was great beyond comparison. In Arkansas, families are huddled together like animals praying<sup>75</sup> for food. They cling to rafts, scaffolds and logs. For a distance of 300 miles, no land is to be seen.

Early in March 1882, the Mississippi River in the *United States* flooded. About 85,000 persons were made homeless through floods in the lower Mississippi valley.<sup>97</sup>

During early March 1882 in Bradford County, Pennsylvania in the *United States*, a freshet on Wyalusing Creek caused considerable damage to bridges and dams. On 26 June 1882, a furious wind and hailstorm passed over the southeastern portion of Bradford County. The storm uprooted trees, unroofed buildings and destroyed crops. Hailstones fell the size of a hen's egg. The storm was most severe around Lime Hill, Camptown, Merryall and Spring Hill.<sup>178</sup>

On 26 March 1882, a hailstorm struck 20 miles north of Corning, Missouri in the *United States*. The hailstones drifted to a depth of 3 ½ feet [1.1 meters] in some places. On 5 May, a hailstorm struck St. Louis, Missouri. Some of the hailstones were the size of hen's eggs but the largest were the size of baseballs. On 8 June, a hailstorm struck Laredo, Texas. Some of the hailstones weighed one pound and they drifted to a depth of 6 inches. On 16 June 1882, in Dubuque, Iowa in the *United States*, for thirteen minutes, commencing at 2:54 p.m., the largest and most destructive hailstones fell that were ever seen at this place. The hailstones measured from one to seventeen inches in circumference; the largest weighing one pound twelve ounces. Washington Park was literally covered with hailstones as large as lemons, and large basketfuls could be gathered in a few minutes. They exhibited diverse and peculiar formations, some being covered with knobs and icicles half an inch in length; others were surrounded by rings of different colored ice with gravel and blades of grass imbedded within them. The foreman of the Novelty

Iron Works, of this city, stated that in two large hailstones, melted by him, were found small living frogs. [Although this account may sound implausible, consider the fact that hailstorms are often paired with very energetic tornadoes.] A number of persons were severely cut and bruised by the falling hailstones. The damage inflicted is estimated at \$5,000 [equivalent to \$110,000 in today's dollars]. One florist lost 2,387 panes of glass. Hundreds of windows of south and west exposure were broken, including twenty windows of heavy French plate glass.<sup>75</sup>

Due the late heavy rains, on 26 April 1882, the main sewer of Saint Louis, Missouri drainage system suddenly gave way. Fifteen blocks of houses were flooded almost immediately. Many of the occupants had to be rescued by boat. The damage was estimated between \$250,000 and \$500,000 [approximately \$5.5 million to \$11 million in present dollars using the Consumer Price Index (CPI)].<sup>75</sup>

On 10 May 1882, a tornado struck McAlester, Indian Territory [now McAlester, Oklahoma] in the *United States*. Approximately 125 lives were lost and \$500,000 in property damage was sustained. [In present currency, that would be equivalent to \$13.6 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

In May 1882, excessive rain in the western Gulf States in the *United States* caused disastrous floods, especially in the state of Arkansas. At Jacksonport, Arkansas, the overflow caused the town to be completely submerged. People fled to the upper stories of storehouses. The whole country for miles around being a sea of water. In Batesville, Arkansas on May 12<sup>th</sup>, during a heavy rainstorm, which continued in torrents for 24 hours, the rivers and creeks rose to an unusual height. Mills, houses, bridges, and fences were washed away, and not only the crops but in many cases, the soil is gone, leaving only a bare clay surface. The damage to property in the valley of the White River is estimated at \$500,000 [approximately \$11 million in present dollars using the Consumer Price Index (CPI)]. Floods were also reported in southern Illinois, southern Indiana, Kentucky, Tennessee (where at Memphis 600,000 - 1,000,000 feet of logs were carried out of the Wolf River), Louisiana, Mississippi, Texas, Minnesota and Iowa.<sup>75</sup>

On 19 April 1882, a tornado struck Brownsville, Mississippi in the *United States* completely destroying a large part of the town. Eleven persons were killed and 150 injured. Over 50 houses in the heart of town were demolished. At Monticello, Mississippi, the entire town was destroyed by a tornado. Only 3 houses on the outskirts of town remained standing. Ten persons were killed instantly. Out of a population of 150, very few escaped without injury. During the night of 8 May at McAllister, a mining settlement in the Indian Territory, a violent tornado destroyed the entire place. Fifty-nine houses were totally demolished and twenty-seven damaged, twenty-one people were killed and forty-two wounded. Also in May, a tornado struck South Fork, Arkansas. It lifted and carried away the town's post office. Hundreds of sheep, hogs, horses and cattle were lost or killed. \$5,000 in silver and currency were scattered to the winds and lost. One hundred families were rendered homeless and without shelter. Damage estimated at \$150,000 [approximately \$3.3 million in present dollars using the Consumer Price Index (CPI)].<sup>75</sup>

The year 1882 produced other powerful tornados in the *United States*. The town of Grinnell, Iowa, was destroyed, with a loss of \$1,000,000 in property and 100 lives. [In present currency, that would be equivalent to \$27 million in damages based on the Consumer Price Index (CPI) inflation rates.] Just seven days later Emmetsburg, Iowa, was blotted off the map, with a loss approximately equal to that at Grinnell.<sup>197</sup>

On 17 June 1882, a tornado first observed in Jefferson, in Green County, Iowa in the *United States* and then travelled 200 miles to Grinnell, Iowa. Along its path, it struck several towns including Malcolm, Brooklyn and Mount Pleasant. The damage to property and crops in the towns and vicinity is estimated at \$500,000 [approximately \$11 million in present dollars using the Consumer Price Index (CPI)]. This

tornado then struck Grinnell where it destroyed or damaged 140 houses, killed 60 and seriously injured about 150 people. The loss of property in Grinnell was estimated at \$600,000 [approximately \$13 million in present dollars using the Consumer Price Index (CPI)]. This tornado also leveled to the ground a three-story building at Iowa College and wrecked a train consisting of an engine and 21 cars.<sup>75</sup>

The weather was cold almost across the entire *United States* in May and many areas sustained damaging frosts. These frosts destroyed crops and fruit trees. During May, snow fell in many states including New Hampshire, Vermont, Massachusetts, Pennsylvania, Michigan, Illinois, Minnesota, Dakota, Montana, Wyoming, Colorado, New Mexico, Idaho, Washington Territory, Nevada, Iowa, Maine, New Jersey and North Carolina.<sup>75</sup>

On 23 June 1882, a tidal wave on Lake Erie struck Cleveland, Ohio in the *United States*. A curtain-like cloud, moving silently inward with terrific velocity produced immense waves that broke on the shoreline. Hundreds of fish were cast ashore and the fires in the Lake Erie rolling mills were put out. A scow loaded with sand landed high and dry on the shore. The wave broke completely over the railroad tracks along the shore, covering them to a depth of several feet and submerging the Erie street pier. The damage was estimated at \$30,000 and affected the shoreline for a distance of 35 miles. Similar lake and river tidal waves observed prior to this one includes:<sup>75</sup>

- \* A tidal wave on Lake Erie on 10 May 1823 at Otter Creek on the *Canadian shore* and at Kettle Creek twenty miles away, which attained a height of 9 feet.
- \* Three tidal waves on Lake Erie in 1830 at Madison Creek, Ohio, the first rising 15 to 20 feet.
- \* A tidal wave on Lake Erie in 1844 or 1845 at Euclid Creek, fifteen feet in height.
- \* On 5 December 1856 at Toledo, Ohio the waves in Lake Erie suddenly rose ten feet higher.
- \* In 1841 at Berne, *Switzerland*, Lake Geneva receded suddenly leaving ships at anchor on the bare ground.
- \* In 1789 on Lake Superior, opposite Isle Royal, the water suddenly fell four feet, returning with a great rush.
- \* In August 1845, an enormous wave, twenty feet in height on Lake Superior was observed between Cooper Harbor and Eagle River.

The following are the highest temperatures observed during July 1882 in the *United States*:<sup>75</sup>

Opelika, Alabama	(102° F, 38.9° C)
Mobile, Alabama	( 96° F, 35.6° C)
Phoenix, Arizona	(114° F, 45.6° C)
Texas Hill, Arizona	(118° F, 47.8° C)
Prescott, Arkansas	(100° F, 37.8° C)
Fort Smith, Arkansas	(100° F, 37.8° C)
Red Bluff, California	(105° F, 40.6° C)
Indio, California	(117° F, 47.2° C)
West Las Animas, Colorado	( 99° F, 37.2° C)
Fort Lyon, Colorado	(101° F, 38.3° C)
New Haven, Connecticut	( 90° F, 32.2° C)
New London, Connecticut	( 90° F, 32.2° C)
Delaware Breakwater, Delaware	( 88° F, 31.1° C)
Washington, D.C.	( 95° F, 35.0° C)
Live Oak, Florida	( 98° F, 36.7° C)
Key West, Florida	( 95° F, 35.0° C)
Jesup, Georgia	(101° F, 38.3° C)
Savannah, Georgia	( 95° F, 35.0° C)
Fort Lapwai, Idaho	(113° F, 45.0° C)
Chicago, Illinois	( 90° F, 32.2° C)
Peoria, Illinois	( 97° F, 36.1° C)
Indianapolis, Indiana	( 89° F, 31.7° C)
Fort Wayne, Indiana	( 94° F, 34.4° C)

Des Moines, Iowa	( 92° F, 33.3° C)
Clinton, Iowa	( 94° F, 34.4° C)
Wellington, Kansas	(101° F, 38.3° C)
Dodge City, Kansas	(101° F, 38.3° C)
Louisville, Kentucky	( 91° F, 32.8° C)
Franklin, Louisiana	(101° F, 38.3° C)
Shreveport, Louisiana	(100° F, 37.8° C)
Portland, Maine	( 94° F, 34.4° C)
Baltimore, Maryland	( 93° F, 33.9° C)
Boston, Massachusetts	( 98° F, 36.7° C)
Sumerset, Massachusetts	(102° F, 38.9° C)
Port Huron, Michigan	( 91° F, 32.8° C)
Harrisville, Michigan	( 92° F, 33.3° C)
Saint Paul, Minnesota	( 92° F, 33.3° C)
Vicksburg, Mississippi	( 96° F, 35.6° C)
Meridian, Mississippi	(104° F, 40.0° C)
Springfield, Missouri	( 98° F, 36.7° C)
Sedalia, Missouri	(100° F, 37.8° C)
Fort Buford, Montana	(101° F, 38.3° C)
Cartersville, Montana	(106° F, 41.1° C)
North Platte, Nebraska	( 93° F, 33.9° C)
Omaha, Nebraska	( 93° F, 33.9° C)
Winnemucca, Nevada	( 97° F, 36.1° C)
Beowawe, Nevada	(108° F, 42.2° C)
Mount Washington, New Hampshire	( 60° F, 15.6° C)
New Market, New Hampshire	( 94° F, 34.4° C)
Little Egg Harbor, New Jersey	( 99° F, 37.2° C)
Fort Bayard, New Mexico	(115° F, 46.1° C)
La Mesilla, New Mexico	(107° F, 41.7° C)
Fort Hamilton, New York	( 97° F, 36.1° C)
New York City, New York	( 93° F, 33.9° C)
Wadesborough, North Carolina	(105° F, 40.6° C)
Kitty Hawk, North Carolina	( 96° F, 35.6° C)
Cincinnati, Ohio	( 90° F, 32.2° C)
Ruggles, Ohio	( 92° F, 33.3° C)
Fort Supply, Oklahoma	(101° F, 38.3° C)
Umatilla, Oregon	(105° F, 40.6° C)
Philadelphia, Pennsylvania	( 94° F, 34.4° C)
Fort Adams, Rhode Island	( 90° F, 32.2° C)
Narragansett Pier, Rhode Island	( 89° F, 31.7° C)
Charleston, South Carolina	( 94° F, 34.4° C)
Chester, South Carolina	(100° F, 37.8° C)
Fort Sully, South Dakota	(100° F, 37.8° C)
Memphis, Tennessee	( 93° F, 33.9° C)
Withe [White], Tennessee	( 96° F, 35.6° C)
Eagle Pass, Texas	(111° F, 43.9° C)
Salt Lake City, Utah	( 96° F, 35.6° C)
Promontory, Utah	(110° F, 43.3° C)
Charlotte, Vermont	( 94° F, 34.4° C)
Cape Henry, Virginia	( 95° F, 35.0° C)
Norfolk, Virginia	( 95° F, 35.0° C)
Alamota, Washington	(105° F, 40.6° C)
Morgantown, West Virginia	( 84° F, 28.9° C)
Milwaukee, Wisconsin	( 88° F, 31.1° C)
La Crosse, Wisconsin	( 88° F, 31.1° C)
Fort Washakie, Wyoming	( 97° F, 36.1° C)

In 1882, a powerful cyclone struck Bombay [now Mumbai], *India* causing 100,000 deaths.<sup>98</sup>

Violent gales with damage struck [*Great Britain*], 22-23 August and 24 October 1882.<sup>90</sup>

On 8 August 1882, the propeller ship “Menominee” on Lake Michigan on her way to Chicago, Illinois in the *United States* encountered in mid-lake a thick cold cloud which burst on her decks, covering them with snow and slush to a depth of 6 inches. For 5 minutes the atmosphere was like winter, but as the steamer was moving rapidly she soon came into warmer weather.<sup>75</sup>

A heavy rainstorm in Texas in the United States on 23 & 24 August 1882 cause the Concho River to flood. Houses were swept away. People sought shelter in the tops of the highest trees but these were swept away and many people drowned. The town of Ben Fichlin was completely washed away. The town of San Angelos was also inundated. It was estimated that 50 people drowned in this flood and between 10,000 - 15,000 horses, cattle and sheep were lost. Property damage was estimated at \$150,000 [approximately \$3.3 million in present dollars using the Consumer Price Index (CPI)]. [Today, Ben Fichlin or Benficklin is a Texas ghost town.]<sup>75</sup>

On 2 September 1882, storm [hurricane] appeared north of *San Domingo*, moved westward over *Cuba* to the central Gulf where it recurved to the Alabama coast of the *United States* by the night of 9<sup>th</sup>.<sup>120</sup>

On 5-6 September 1882, a hurricane struck *Cuba* creating a good number of victims.<sup>141</sup>

A hurricane passed over Havana, *Cuba*, on 6 September 1882. The storm affected the major part of the island causing the most damage at Villa Clara and Cienfuegos. The storm traveled through the Gulf making landfall in the *United States* on 9 September near Port Eads, Louisiana. The vortex of the hurricane passed at midnight east of Pensacola and then moved northerly over Alabama, Georgia and South Carolina on the 10<sup>th</sup>. On the 11<sup>th</sup> the storm moved across North Carolina and then entered the Atlantic Ocean. New Orleans, Louisiana sustained \$200,000 in damage. Cedar Keys, Florida sustained \$100,000 in damage. Tuskegee, Alabama suffered \$50,000 in damage. At Beaufort [South Carolina], a double team was crushed by a falling tree killing two persons and injuring one other. At Pensacola, Florida, two men were drowned when the quarantine boat “Gov. Bloxham” on route to the quarantine station was capsized. At Quincy, Florida, five persons were killed. Many ships out at sea were damaged and a few sunk, but because of advanced Weather Service storm warnings, these were kept to a minimum. It was estimated that \$13 million [\$290 million in today’s dollars] of property and many persons remained safe in harbors on account of these warnings.<sup>75</sup>

On 21-24 September 1882 at Paterson, New Jersey in the *United States*, 17.9 inches of rain fell.<sup>116</sup>

A flood caused by heavy rainfall struck Rahway, New Jersey in the *United States* on 24 September 1882. It caused \$500,000 in damages [approximately \$11 million in present dollars using the Consumer Price Index (CPI)]. The streets were flooded, eight bridges were washed away, and two other bridges were undermined. All communications were cut off with the city for many hours. One person drowned and several were injured.<sup>75</sup>

During the middle of September 1882, there were inundations caused by the rising of the Lossie and Spey rivers in northern *Scotland*. A bridge was broken and other damage occurred.<sup>90</sup>

In September 1882, there was an inundation in the Tyrol River. There was much damage with loss of life in northern *Italy* and *Hungary*, and southern *France*.<sup>90</sup> [There are 41 rivers and streams of Tyrol. Tyrol is a historical region of west-central *Europe*.]

On 2 October 1882, a strong storm hit California in the *United States* causing approximately \$400,000 in damages to wheat, hay and grape crops [approximately \$9 million in present dollars using the Consumer Price Index (CPI)]. The greatest damage was done in Sacramento, San Joaquin, and Napa valleys, and was caused by heavy rains. The winds in this storm had attained a hurricane-like force.<sup>75</sup>

On 8-10 October 1882, a storm [hurricane] moved from south of *Cuba* to the east Gulf coast of the *United States*. Great loss of life and damage to property was reported in *Cuba*. The cyclone lost much of its energy after leaving *Cuba*.<sup>120</sup>

On 8 October 1882, a hurricane passed over *Cuba*. The greatest destruction occurred in the Vuelta Abajo region. The town of Pinar del Rio was almost destroyed. At Consolacion del Sur, Cuba, 75 percent of the houses were demolished and at Majaqua Galvez, Pilotos, Ceja de Luna Vinales, the damage was equally great. Thirty-six bodies were found in the vicinity of Consolacion del Sur, and many people were missing. At San Juan and Martinez, Cuba, 1,500 warehouses and dwellings were destroyed; in the Hacienda del Valle, Cuba, three hundred houses were ruined. Most of the houses in the township of San Luis, Cuba, were swept away, and thousands of cattle were drowned. In the district of Guane, Cuba, it is estimated that 2,000 houses and tobacco storage buildings were laid in ruins. The hurricane passed near Cedar Keys, Florida in the *United States* on the 10<sup>th</sup>. The center passed over the northern part of Florida and by the morning of the 11<sup>th</sup>, was in southeastern Georgia. On the afternoon of the 11<sup>th</sup>, the center was near Savannah, Georgia. The storm then continued up the Atlantic coast, following the trend of the shore, and finally passed off to the east of Cape Hatteras on the 12<sup>th</sup>.<sup>75</sup>

On 8-15 October 1882, a hurricane struck western *Cuba* and the coast of Labrador, *Canada*. One account cites 140 deaths while another claims 36 casualties.<sup>141</sup>

In *Germany*, there was a great rise of the Rhine and Danube rivers in November and December 1882. Five villages with above 250 houses, near Wiesbaden [in southwestern *Germany*] were destroyed in December 1882.<sup>90</sup>

In December 1882, there were great floods in the Thames valley and midland counties of *England*.<sup>90</sup>

In 1882 during the period between 18 April and 16 May, floods struck Hupeh (now Hubei province) in central *China* at Ao-ch'êng; Kiangsi (now Jiangxi province) in southern *China* at Tê-an; and Chekiang (now Zhejiang province) on the east coast of *China* at Ch'ang-shan. At Ch'ang-shan, the crops were damaged by the floodwaters. Then during the period between 15 July and 13 August, a drought engulfed Hupeh province at Chün, Yün-mêng and Hao-fêng. Then during the period between 8 August and 8 November, floods struck Chekiang province at Ch'ang-shan.<sup>153</sup>

*Also refer to the section 1880 A.D. – 1886 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1882 / 1883 A.D.** At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1882 occurred on 25 November.<sup>116</sup>

The winter of 1882-83 (following a fine fall) in Bradford County, Pennsylvania in the *United States* was moderate and broken. There was a short run of sleighing during the end of November. December was cold and dry but there was no further sleighing until the middle of January when the snow remained on the ground for a month. January 23 was the coldest day when temperatures dropped to -10° F to -14° F [-23° C to -26° C]. Bluebirds and robins appeared March 1<sup>st</sup> and most of the month produced beautiful weather. Spring began early, but there was frost on May 12, 13 and 14. May was memorable for numerous and severe thunderstorms.<sup>178</sup>

In the *United States* during the winter of 1882-83, the temperature at Spokane Falls, Washington fell to -28° F in January. The temperature at Lancaster, Wisconsin fell to -41° F in 1883. The temperature at Olympia, Washington fell to 9° F in January. The temperature at Fort Buford (near Williston, North Dakota) fell to -46° F in January and -40° F in February. The temperature at Pike's Peak, Colorado fell to -37° F in January. The temperature at Fort Washakie, Wyoming fell to -27° F in December. [This is the only U.S. Military Outpost named after an American Indian - Chief Washakie of the Shoshone tribe.] The temperature at Roseburg, Oregon fell to 12° F in January. The temperature at Salt Lake City, Utah dropped to -20° F in January. The temperature in San Francisco, California fell to 36° F in January. The temperature at Red Bluff, California fell to 19° F in January. The temperature at Dubuque, Iowa fell to -26° F in January. The temperature at Fort Grant, Arizona fell to 10° F in January. The temperature at Fort Elliott, Texas fell to -12° F in January. The temperature at Saint Vincent, Minnesota fell to -38° F in February. The temperature at Fort Assiniboine (near Havre, Montana) fell to -47° F in February. The temperature at Fort Benton, Montana fell to -41° F in February. The temperature at North Platte, Nebraska fell to -29° F in February. The temperature at Omaha, Nebraska fell to -24.9° F in February. The temperature at Cheyenne, Wyoming fell to -28° F in February. The temperature at Mount Washington, New Hampshire fell to -34° F in March.<sup>113, 126</sup>

**1883 A.D.** *Russia* suffered from a major famine in 1883.<sup>96</sup>

Early in January 1883, inundations near Worms, *Germany* caused much destruction. About 60 people drowned.<sup>90</sup>

On 10 January 1883, Raab [now Győr] in northwestern *Hungary* was partly submerged by a flood.<sup>90</sup>

Violent gales with damage struck [*Great Britain*], 26-28 January, 10 February, and 6 March 1883.<sup>90</sup>

In February 1883, there were inundations in Pennsylvania, and Cincinnati, Ohio in the *United States*.<sup>90</sup> [This produced very severe flooding along the Ohio River.]

In April 1883, tornadoes struck the southern states of the *United States*. About 150 people were killed.<sup>90</sup>

On 21-23 April 1883 very violent tornadoes occurred in the states of Iowa, Mississippi, Alabama, and Georgia in the *United States*. The destruction of property was very great; and in Mississippi and Georgia, there were from two to three hundred lives lost, and about one thousand persons injured.<sup>133</sup>

— At Talladega, Alabama, the tornado threw the northbound train on the east *Tennessee, Virginia and Georgia* railroad from the track down an embankment. Near Springville, Alabama, more than twenty houses were unroofed; one person was killed and several were wounded.

— At Sioux City, Iowa, during the night of the 21<sup>st</sup>, a severe storm passed over the eastern parts of Woodbury and Monona counties. A building near Correctionville, was carried a distance of eight rods (132 feet), and was badly damaged. At Dunlap, Iowa on the 21<sup>st</sup>, a tornado destroyed many farmhouses and killed much livestock. Trees were torn up by their roots and many small buildings were completely carried away; some loss of life was also reported. On the evening of the 22<sup>nd</sup>, a tornado passed up Maple River Valley, following the course of the *Chicago and Northwestern* railroad. At Danbury, Iowa, a church was wrecked and three houses blown down.

— At a point 2½ miles south of Botsford, Georgia, the tornado blew down all buildings and fences in its path. Several people were seriously injured and some were killed. At Swainsboro, Georgia on the morning of the 23<sup>rd</sup>, the tornado ripped through town scarcely leaving a house standing in its track, and rendering several families homeless. Two persons were known killed and several were injured. At Eastman, Georgia, a tornado passed over that place during the early morning of the 23<sup>rd</sup>, causing loss of life and property. At Augusta, Georgia on the 23<sup>rd</sup>, a destructive storm passed along the Athens branch of the Georgia railroad. Two dwellings near Woodville and Lexington were blown down, and also a large number of Negro cabins and gin-houses in Lincoln and Taliaferro

counties. At Albany, Georgia, eight persons were killed and about twenty-five wounded. The storm produced significant loss of life and great damage to property in Clark and Crawford counties in Georgia.

— At Starkville, Mississippi on the 22<sup>nd</sup>, the severest storm ever experienced in this community passed in a northeasterly direction about two miles north, sweeping everything before it. The width of the tornado's track was about three hundred yards, and within it everything was leveled to the ground. The largest trees were twisted off or blown down. At Starkville, thirteen houses were entirely destroyed. One of the number, a small frame building, was blown away, the only mark of its former position being the four sills upon which it rested. The ruins of the other houses presented the appearance of having been torn to pieces by an explosion. One life was lost. The towns of Wesson and Beauregard, Mississippi were visited by a most violent and destructive tornado on the 22<sup>nd</sup>. At Wesson, a town of about 1,700 inhabitants, twenty-seven houses were destroyed; thirteen persons were killed, and sixty were injured. The total loss at Wesson exceeded \$20,000. At Beauregard, Mississippi, a town of six hundred inhabitants every dwelling and store in the town was destroyed. Two rows of buildings on Railroad Avenue were leveled to the ground, and goods valued at \$150,000 were ninety percent damaged or destroyed. Twenty-nine persons were killed, and about forty were more or less seriously wounded. The force of the wind threw a solid iron screw of a cotton press, weighing six hundred and seventy-five pounds, a distance of 300 yards; and to drive through a red oak sapling, a piece of scantling [timber] three by four inches and ten feet in length. The damage at Beauregard from the tornado was estimated at \$450,000. [In present currency, that would be equivalent to \$10 million in damages based on the Consumer Price Index (CPI) inflation rates.] At Tillman Station, Mississippi, the storm was very violent, causing great damage to all property and some loss of life. Clay County, Mississippi was visited by two very violent tornadoes, causing loss of life and destroying buildings, trees and fences. In Monroe and the neighboring counties lying northward, a number of persons were killed, and many others were injured. The storm passed entirely through Clay County totally destroying a Negro settlement near Aberdeen. At Red Lick, Mississippi, a tornado struck about one mile east of the city on the 22<sup>nd</sup>, causing some loss of life and great damage to property. Everything in the track of the storm, which was about two hundred yards wide, was swept away. Ten persons were killed at Harrisville, and seven were killed near Morton. In Lowndes County, Mississippi a violent wind and rain storm from the southwest completely demolished all of the buildings on many of the plantations. At Caledonia, two persons were killed; every fence for miles around was swept away, and many trees and building were blown down. The town of Lawrence suffered heavy loss of property but no loss of life. The storm passed east of Natchez, on the opposite side of the river, in Concordia parish, Louisiana, where houses were unroofed, one person was killed and several wounded. Monticello, Mississippi, was almost destroyed by a tornado on the 21<sup>st</sup>, causing some loss of life. The track of the storm was about two hundred yards wide, within which everything was swept away.

— On the 23<sup>rd</sup>, violent tornadoes also struck near Stateburg, Charleston, Bishopville, Darlington and Saint Stephen's, South Carolina.

New Orleans, Louisiana in the *United States* reported that Arcadia, Bienville parish, was hit by a severe hailstorm during the afternoon of the 28 April 1883. The storm stripped the foliage from trees, killed some [live]stock and caused other damage within its track, which was from four to five miles in width. The ground was covered with hailstones, some of which weighed three-fourths of a pound, measuring eleven inches in circumference and four inches in diameter.<sup>133</sup>

On 16 May 1883, floods in Cachar [in Assam State in northeastern] *India* caused great distress.<sup>90</sup>

About 21 June 1883, the River Neisse [in southwestern *Poland*] rose and flooded *Silesia* [now in *Poland*] causing much damage.<sup>90</sup>

In 1883, several storms struck Bradford County, Pennsylvania in the *United States*. On 2 July 1883, a violent windstorm struck Sayre. The wind came from the north and blew out part of the southern side of seven brick houses on North Elmer Avenue and one residence from its foundation. Many outbuildings were blown away. Then on 5 July a terrific storm visited Towanda and vicinity. The Universalist church was struck by lightning for the second time that week. The streets were flooded everywhere. In Sheshequin, Wysox and Standing Stone, land was gutted and bridges carried away. On 29 October 1883, a furious windstorm visited the valley of Sugar Creek, uprooting trees, unroofing and demolishing buildings. The storm passed through Towanda and Wysox and did much damage.<sup>178</sup>

About 11-12 July 1883, there was an inundation in the Thames valley, Ontario, *Canada*, which caused much destruction of property. About 30 lives were lost.<sup>90</sup>

On 26 August 1883, a hurricane struck the Newfoundland banks in *Canada* causing 80 deaths.<sup>141</sup>

On 1-2 September 1883, violent gale in the *British Channel* caused many wrecks.<sup>90</sup>

On 4-5 September 1883, a hurricane struck *the Bahamas* causing 50 deaths.<sup>141</sup>

On 6 September 1883, a storm [hurricane] moved from off the eastern extremity of *Cuba* northwestward over the Bahamas to the North Carolina coast of the *United States* by the 11<sup>th</sup>.<sup>120</sup>

[A green sun was observed on the 9-10 September 1883 (in New England in the *United States*), a few weeks after the great eruption of the volcano at Krakatau, in the Sunda Strait. (Krakatau is a volcanic island in the Sunda Strait between the islands of Java and Sumatra in *Indonesia*.) Similar strangely colored suns were indeed observed at that time in other parts of the world, and had been observed on many other occasions. The Editor of this Monthly Weather Review had an excellent observation of a pale green sun in the damp atmosphere of Cape Ledo, [Angola] on the west coast of Africa, through a rather thick cirrus cloud. The explanation of this phenomenon has been made remarkably clear by the researches of Professor Barus. It appears that when the moisture begins to condense into cloud, the minute globules grow in size from microscopic invisibility up to the globules of fog. When these are all of some one uniform size the sunlight that penetrates them is analyzed into its elementary colors, as in the spectrum, and the visible color of the sun, as seen by us, depends upon the diameter of these globules, so that the color of the sun tells us of the size of the drops. These colors usually occur only when the globules are very small; that is to say, in the early stages of cloudy condensation, and the phenomenon is very closely allied to the colors shown by the soap bubble and known as the colors of thin plates.<sup>115</sup>]

On 11 September 1883, a hurricane struck *the Bahamas* and North Carolina in the *United States* causing 106 deaths.<sup>141</sup>

On 26 September 1883, a destructive gale struck on the coast of *Scotland* and *Ireland*.<sup>90</sup>

Around 29 October 1883, there was an overflow of the River Peneus in Thessaly, in central mainland *Greece* which did much damage.<sup>90</sup>

In the morning of 12 December 1883, a storm caused great loss of life and damage in London and other parts of *Great Britain*.<sup>90</sup>

On 28 October 1838; 11 July 1874; 11 April 1878, and 12 December 1883, storms struck London, *England*, which destroyed from twenty to thirty lives in each case, and from \$1 to \$3 million (U.S.) dollars in property damage. [In present currency, that would be equivalent to \$27-\$81 million dollars in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

In 1883 during the period between 8 February and 8 March, floods struck Hopei (now Hebei province) in northern *China* at Yü-t'ien and Peiping; Shensi (now Shaanxi province) in central *China* at Tso-shui; and Kansu (now Gansu province) in northwest *China* at Lanchow.<sup>153</sup>

*Also refer to the section 1880 A.D. – 1886 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1883 / 1884 A.D.** The minimum temperatures in Montana, Dakota and Minnesota in the *United States* on the January 4<sup>th</sup>, 1884 and over the central valleys and Southern states on the 5<sup>th</sup> and 6<sup>th</sup> were generally the lowest recorded since the establishment of the Signal Service stations. Over northeastern Montana and the northern parts of Dakota and Minnesota, the minimum temperatures were -40° F (-40° C) and below, on the morning of the 4<sup>th</sup>. Very low temperatures also occurred on the 24<sup>th</sup> – 26<sup>th</sup> during the passage of a high-pressure region over the lake region. The following are the lowest temperatures observed during January 1884.<sup>126</sup>

Montgomery, Alabama	( 8.0° F, -13.3° C)	
Mobile, Alabama	( 14.0° F, -10.0° C)	
Green Springs, Alabama	( -4.0° F, -20.0° C)	
Little Rock, Arkansas	( -3.0° F, -19.4° C)	
Lead Hill, Arkansas	(-15.0° F, -26.1° C)	
Huron, Dakota	(-38.0° F, -38.9° C)	[now Huron, South Dakota]
Bismarck, Dakota	(-40.0° F, -40.0° C)	[now Bismarck, North Dakota]
Vermillion, Dakota	(-34.5° F, -36.9° C)	[now Vermillion, South Dakota]
Jacksonville, Florida	( 21.0° F, -6.1° C)	
Pensacola, Florida	( 16.3° F, -8.7° C)	
Atlanta, Georgia	( -1.3° F, -18.5° C)	
Augusta, Georgia	( 14.0° F, -10.0° C)	
Olney, Illinois	(-30.0° F, -34.4° C)	
Springfield, Illinois	(-22.5° F, -30.3° C)	
Rockford, Illinois	(-40.0° F, -40.0° C)	
Chicago, Illinois	(-18.5° F, -28.1° C)	
Cairo, Illinois	(-16.0° F, -26.7° C)	
Marshall, Illinois	(-30.0° F, -34.4° C)	
Peoria, Illinois	(-27.0° F, -32.8° C)	
Edgington, Illinois	(-34.0° F, -36.7° C)	
Riley, Illinois	(-30.5° F, -34.7° C)	
Collinsville, Illinois	(-23.0° F, -30.6° C)	
Indianapolis, Indiana	(-25.0° F, -31.7° C)	
New Albany, Indiana	(-23.0° F, -30.6° C)	
Vincennes, Indiana	(-30.0° F, -34.4° C)	
Rising Sun, Indiana	(-22.0° F, -30.0° C)	
Shelbyville, Indiana	(-26.0° F, -32.2° C)	
Logansport, Indiana	(-24.0° F, -31.1° C)	
Vevay, Indiana	(-23.0° F, -30.6° C)	
Sunman, Indiana	(-24.0° F, -31.1° C)	
Dubuque, Iowa	(-24.0° F, -31.1° C)	
Sioux City, Iowa	(-21.0° F, -29.4° C)	
Council Bluff, Iowa	(-24.0° F, -31.1° C)	
Burlington, Iowa	(-33.0° F, -36.1° C)	
Des Moines, Iowa	(-30.4° F, -34.7° C)	
Fort Madison, Iowa	(-30.0° F, -34.4° C)	
Humboldt, Iowa	(-33.0° F, -36.1° C)	
Leavenworth, Kansas	(-21.0° F, -29.4° C)	
Independence, Kansas	(-20.0° F, -28.9° C)	
Fort Scott, Kansas	(-24.0° F, -31.1° C)	
Louisville, Kentucky	(-19.5° F, -28.6° C)	
Cynthiana, Kentucky	(-22.0° F, -30.0° C)	
Bangor, Maine	(-40.0° F, -40.0° C)	
Grand Rapids, Michigan	(-30.0° F, -34.4° C)	
Alpena, Michigan	(-20.0° F, -28.9° C)	
Mackinaw City, Michigan	(-15.9° F, -26.6° C)	
Port Huron, Michigan	(-11.3° F, -24.1° C)	
Grand Haven, Michigan	( -8.5° F, -22.5° C)	

Cheboygan, Michigan	(-30.0° F, -34.4° C)	
Minneapolis, Minnesota	(-30.0° F, -34.4° C)	
Vicksburg, Mississippi	( 10.3° F, -12.1° C)	
Saint Louis, Missouri	(-23.4° F, -30.8° C)	
Pierce City, Missouri	(-22.0° F, -30.0° C)	
Factoryville, New York	(-21.0° F, -29.4° C)	
New York City, New York	( 8.0° F, -13.3° C)	
Charlotte, North Carolina	( 5.0° F, -15.0° C)	
Kitty Hawk, North Carolina	( 8.6° F, -13.0° C)	
New River Inlet, North Carolina	( 4.0° F, -15.6° C)	
Fort Macon, North Carolina	( 8.5° F, -13.1° C)	
Scott Hill, North Carolina	( 4.9° F, -15.1° C)	
Raleigh, North Carolina	( 2.0° F, -16.7° C)	
Cincinnati, Ohio	(-20.0° F, -28.9° C)	[at suburb Mount Auburn]
Findlay, Ohio	(-20.0° F, -28.9° C)	
Norwalk, Ohio	(-24.0° F, -31.1° C)	
Wapakoneta, Ohio	(-26.0° F, -32.2° C)	
Urbana, Ohio	(-28.0° F, -33.3° C)	
Dayton, Ohio	(-28.0° F, -33.3° C)	
Toledo, Ohio	(-14.0° F, -25.6° C)	
Columbus, Ohio	(-20.0° F, -28.9° C)	
North Lewisburg, Ohio	(-23.5° F, -30.8° C)	
Westerville, Ohio	(-28.0° F, -33.3° C)	
Fostoria, Ohio	(-20.0° F, -28.9° C)	
Bellefontaine, Ohio	(-27.0° F, -32.8° C)	
Titusville, Pennsylvania	(-33.0° F, -36.1° C)	
Charleston, South Carolina	( 13.0° F, -10.6° C)	
Columbia, South Carolina	( 7.0° F, -13.9° C)	
Seneca, South Carolina	( 4.0° F, -15.6° C)	
Nashville, Tennessee	(-10.0° F, -23.3° C)	
Knoxville, Tennessee	(-16.0° F, -26.7° C)	
Chattanooga, Tennessee	( -1.0° F, -18.3° C)	
Memphis, Tennessee	( -2.0° F, -18.9° C)	
Fort Concho, Texas	( 4.0° F, -15.6° C)	[near San Angelo]
Randolph, Vermont	colder than -40.0° F – mercury froze on 3 occasions in January	
Johnsontown, Virginia	( 4.0° F, -15.6° C)	
Milwaukee, Wisconsin	(-24.3° F, -31.3° C)	
La Crosse, Wisconsin	(-29.0° F, -33.9° C)	
Sussex, Wisconsin	(-24.5° F, -31.4° C)	
Lancaster, Wisconsin	(-34.0° F, -36.7° C)	

The winter of 1883-84 in Bradford County, Pennsylvania in the *United States* was cold with several weeks of good sleighing from the middle of December until the first of March. There was a blizzard on January 3, and on the 10<sup>th</sup> the temperature dropped below zero. On 21 January, the temperature dropped in the county between -6° F and -16° F [-21° C and -27° C]. On 26 January, temperatures ranged from -10° F to -30° F [-23° C to -34° C], being -23° F [-31° C] in Towanda. On February 6, ice in the Susquehanna River broke up, but on the 29<sup>th</sup>, temperature in the county ranged from -6° F to -10° F [-21° C to -23° C]. On the 20<sup>th</sup> of March snow was still a foot [30 cm] deep in the roads on Armenia. On Memorial Day, 30 May 1884, light snow generally fell over the county, being 2 inches [5 cm] deep at Barclay and Long Valley. On 8 July, there was a flurry of snow in parts of the county.<sup>178</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

Major snowstorms struck the *United States* in January 1884. Oswego, New York reported the snowstorm on the 3<sup>rd</sup> interfered with railroad traffic. On the 9<sup>th</sup> the snow was reported to be five to ten feet deep in the cuts. Memphis, Tennessee reported a depth of more than nine inches of snow on the 7<sup>th</sup>. Richmond, Kentucky reported a depth of fourteen inches of snow on the 9<sup>th</sup>. Belleville, Ontario, *Canada* reported on the 9<sup>th</sup> the depth of snow was three feet on the level. Titusville, Pennsylvania reported that the snowfall of the 9<sup>th</sup> was the heaviest ever known to have fallen in one day. The county roads were blockaded in all directions, and trains on the railroads were abandoned. The roofs of many buildings were crushed beneath the weight of the snow. Dempster, New York reported that total depth of snowfall from the 1<sup>st</sup> to the 9<sup>th</sup> of January measured thirty-three inches. Wheeling West Virginia reported a heavy snowstorm prevailed on the 8<sup>th</sup>. The ground was covered to an average depth of twenty inches.<sup>126</sup>

The depth that rivers, bays and lakes froze in January 1884 in the *United States*:<sup>126</sup>

- \* At Calais, Maine, the *Saint Croix River* was closed to navigation during the night of the 15<sup>th</sup>-16<sup>th</sup>.
- \* At Narragansett Pier, Rhode Island, large fields of ice passed out of the *Narragansett Bay* on the 20<sup>th</sup>.
- \* At Block Island, Rhode Island: the harbor froze on the 6<sup>th</sup>.
- \* At Burlington, Vermont, *Broad Lake* froze over on the 9<sup>th</sup>, which is the earliest closing of the last ten years.
- \* At Charlotte, Vermont, the *Lake Champlain* was firmly frozen on the 10<sup>th</sup>.
- \* At New Haven, Connecticut, the harbor froze on the 6<sup>th</sup>.
- \* At New York City, New York, the flood tide on the morning of the 13<sup>th</sup> brought up from the *New York Harbor* an immense floe of ice which blockaded *East River* from shore to shore. At 6.30 a.m. the end of pier 27 was carried away and a two-masted schooner and a lighter on the north side of the pier were sunk. On the 22<sup>nd</sup> navigation was interrupted by ice fields in the upper harbor. All sailing vessels passing through the narrows on that date were compelled to employ tugs.
- \* Persons crossed on the ice from David's Island, New York to the mainland on the 27<sup>th</sup>.
- \* At Barnegat City, New Jersey, *Barnegat Bay* was closed by ice on the 7<sup>th</sup>, cutting off communication with the mainland.
- \* At Little Egg Harbor, New Jersey, there were large quantities of ice in the harbor on the 9<sup>th</sup>.
- \* At New York City, New York, there was considerable floating ice on the *Hudson River* on the 12<sup>th</sup>.
- \* At Philadelphia, Pennsylvania, from Trenton, New Jersey, to Port Richmond, the ice was sufficiently strong; to permit the crossing of teams on the *Delaware River* on the 8<sup>th</sup>. The river below Philadelphia was frozen nearly across for the first time in several years.
- \* At Delaware Breakwater, Delaware, the harbor at *Delaware Bay* was filled with ice on the 7<sup>th</sup>.
- \* At Chincoteague, Virginia, *Chincoteague Bay* froze over on the 6<sup>th</sup>.
- \* At Baltimore, Maryland, brisk winds on the 8<sup>th</sup> drove large quantities of ice from the *Chesapeake Bay* into the river and harbor, causing much inconvenience to vessels. There were large quantities of ice driven into the track of vessels on the west shore. The large amount of ice in the bay on the 9<sup>th</sup> rendered navigation very difficult. Many oyster boats were ice-bound and their crews experienced much suffering.
- \* At Baltimore, Maryland: ice formed rapidly in the harbor on the 6<sup>th</sup>, and on the 7<sup>th</sup> it varied from two to three inches in thickness.
- \* At Washington D.C., the *Potomac River* froze over on the 1<sup>st</sup>. The ice was strong enough for skating from about the 7<sup>th</sup> to 27<sup>th</sup>.
- \* At Oxford, Maryland: a breaking of the ice on the *Choptank River* occurred during the night of the 8<sup>th</sup>-9<sup>th</sup>. No serious damage resulted, although a number of vessels were carried several miles from the harbor by the ice.
- \* At Port Deposit, Maryland, on the 9<sup>th</sup> the ice in the *Susquehanna River* was seven inches thick. At the close of the month the ice in the *Susquehanna* was sixteen inches thick at Wilkes-Barre and Catawissa, Pennsylvania.
- \* At Oswego, New York, the harbor froze over on the 25<sup>th</sup>.
- \* At Detroit, Michigan, the *Detroit River* was frozen from shore to shore on the 1<sup>st</sup>.
- \* At Pittsburg, Pennsylvania: during the night of the 10<sup>th</sup>-11<sup>th</sup>, an ice-dam, which had formed in the *Monongahela River*, broke. Forty-one flats broke from their fastenings and were carried down the river.
- \* At Portsmouth, Ohio, on the 6<sup>th</sup> the *Ohio River* was filled with floating ice, which caused the suspension of navigation.
- \* At Cincinnati, Ohio, heavy floating ice on the *Ohio River* caused the suspension of navigation on the 7<sup>th</sup>-9<sup>th</sup>.
- \* At Cairo, Illinois, there was a heavy flow of ice on the *Ohio River* during much of January.
- \* At Charlestown, West Virginia: the ice in the *Elk River* broke up on the 12<sup>th</sup>, resulting in heavy losses to barge owners and lumbermen. The losses sustained by the stave and bark dealers alone are estimated at \$100,000. [In

present currency, that would be equivalent to \$2.4 million in damages based on the Consumer Price Index (CPI) inflation rates.]

- \* At Canal Dover, Ohio, the *Tuscarawas River* was frozen over on the 4<sup>th</sup>.
- \* At Cooperstown, New York, the ice in *Otsego Lake* was eighteen inches thick at close of month.
- \* At Buffalo, New York, floating ice covered the *Lake Erie* for several miles on the 3<sup>rd</sup>. Traffic on the New York Central railroad was interrupted on account of the tracks being covered with large quantities of ice, washed ashore by the storm of that date.
- \* At Port Huron, Michigan, ice formed on the *Saint Clair River* on the 5<sup>th</sup>.
- \* At Grand Haven, Michigan, the river froze over on the 3<sup>rd</sup>.
- \* At Grand Haven, Michigan, the westerly winds of the 23<sup>rd</sup> drove large quantities of ice from *Lake Michigan* into the entrance to the harbor, where it was reported to be from twenty to twenty-five feet in thickness. On that date heavy ice fields, extending lakeward as far as the eye could reach, were observed floating southward.
- \* At South Haven, Michigan, on the 19<sup>th</sup> a field of ice extended lakeward a distance of ten miles.
- \* At Traverse City, Michigan, the *Grand Traverse Bay* was frozen over on the 15<sup>th</sup>.
- \* In the *Straits of Mackinac* at Mackinaw City, Michigan, the steamer *Algolah*, in attempting to cross the straits on the 3<sup>rd</sup>, became fast in the ice when near the middle of the straits, where the ice was from one to three feet thick; she reached Saint Ignace on the 14<sup>th</sup>, and in attempting to return on the 15<sup>th</sup> became fast in the ice in the center of the straits. She arrived here on the 18<sup>th</sup>, and reported the ice to be from fifteen to twenty feet thick in the channel.
- \* At Keokuk, Iowa, the *Mississippi River* was frozen continually from this point to all points northward, throughout the month. At La Crosse, Wisconsin, the ice was reported to have been twenty-four inches thick on the 9<sup>th</sup>.
- \* At Cairo, Illinois, the *Mississippi River* froze over on the 4<sup>th</sup>.
- \* At Memphis, Tennessee, ice formed along the shores on the west bank of the *Mississippi River* on the 6<sup>th</sup>.
- \* At Saint Louis, Missouri, ice dams on the *Mississippi River* obstructed the harbor from the 8<sup>th</sup> to the 29<sup>th</sup>.
- \* At Vicksburg, Mississippi, the steamer *W. P. Thompson* encountered large quantities of drift ice about thirty-four miles north of this place on the *Mississippi River* on the morning of the 5<sup>th</sup> and was compelled to return back to Vicksburg.
- \* At Leavenworth, Kansas on the 5<sup>th</sup>, loaded wagons crossed the *Missouri River* on the ice, which was ten inches thick.
- \* At Lexington, Missouri, the ice in the *Missouri River* was eight inches thick on the 3<sup>rd</sup>.
- \* At Manhattan, Kansas, ice in the *Kansas River* was ten and one-half inches thick on the 7<sup>th</sup>.
- \* At Nashville, Tennessee, there was floating ice on the *Cumberland River* on the 9<sup>th</sup> and 10<sup>th</sup>.
- \* At Chattanooga, Tennessee, there was floating ice on the *Tennessee River* on the 8<sup>th</sup> and 9<sup>th</sup>. On the 9<sup>th</sup>, heavy floating ice impeded navigation, and the broken ice accumulated along the shore in large quantities.
- \* At Knoxville, Tennessee, the *Tennessee River* froze over one mile above the city on the 7<sup>th</sup>.
- \* At Montgomery, Alabama, on the 30<sup>th</sup>; it is reported that more ice formed in the *Tallapoosa River* than has been known for many years.
- \* In Tennessee, the *Forked Deer River* was reported frozen over at Dyersburg on the 5<sup>th</sup>; ice remained until the 24<sup>th</sup>. The *Elk River* was frozen over near Fayetteville on the 7<sup>th</sup>, sufficient for skating. The *Ocoee River* froze over on the 7<sup>th</sup> and 8<sup>th</sup>.
- \* At Shreveport, Louisiana, there was floating ice on the *Red River* on the 8<sup>th</sup>.
- \* At El Paso, Texas: the *Rio Grande River* froze over on the 1<sup>st</sup>.
- \* At Fort Smith, Arkansas, on the 11<sup>th</sup> an ice dam, which had formed on the *Arkansas River* broke, and resulted in the sinking of the steamer *Fort Smith*, and caused other damage.
- \* At Little Rock, Arkansas, the *Arkansas River* was frozen from the 7<sup>th</sup> to 13<sup>th</sup>.
- \* At Lynchburg, Virginia, ice on the streams in this vicinity was four inches thick on the 9<sup>th</sup>.
- \* At Brevard, North Carolina, the creeks in this vicinity were frozen on the 6<sup>th</sup>.

Durango, Colorado in the *United States* was entirely cut off from communications with other points by snow-blockades from 5-18 February 1884. On 18 February, the snow was 2½ feet deep on the level. In the canyon above Elk Falls, four miles away, the snow averaged fifty-feet deep, and at Barker's Park, it was reported to have been six feet deep on the level.<sup>126</sup>

---

**1884 A.D.** The storm of 9 January 1884 caused very high tides and extensive damage along the Eastern Seaboard of the *United States*. At Narragansett Pier in Rhode Island, 20-30 large bathing houses were damaged; McSparran hotel grounds and dock were almost completely washed away. The engine house

on Lucker's dock was also washed away and the wharf badly damaged. The sea broke over the banks from the mouth of Narragansett Bay to Point Judith, causing great damage to roadways and fencing. At New London, Connecticut, the high tides submerged the Shore Line railroad tracks and caused numerous washouts. This is the first time, since the railroad was built in 1853, that the tracks were submerged by a high tide. Several wharves in this vicinity were carried away and completely wrecked. Osprey Beach, a summer resort, received great damage. The total damage at New London, Connecticut is estimated at \$150,000 [approximately \$3.6 million in present dollars using the Consumer Price Index (CPI)]. At Block Island, Rhode Island, the water washed over the seawall and the tides ran into Great Pond. The Shore Line railroad at West Haven, Connecticut was two feet underwater and the flooring of the bridge over Oyster River was covered. The long wharf roadbed at New Haven was badly washed. At Portland, Maine, the high tides broke completely over the breakwater and many vessels in the harbor were damaged. In New York City, the Manhattan Beach Marine railroad sustained \$70,000 in damage; Engeman's Pier sustained \$10,000; and property owners along the beach from \$6,000 to \$7,000 in damage. At Atlantic City, New Jersey, nearly 4 miles of the coast telegraph lines were carried away.<sup>126</sup>

On 23-24 January 1884, violent southwest gales [in *Great Britain*] caused destruction of life and property. Then on 26-27 January 1884, very severe gales caused many disasters.<sup>90</sup>

On 30 January 1884, a cyclone struck Bowen, *Australia*, unroofing almost all the houses in the city.<sup>101</sup>

On 30 January 1884, a cyclone struck Bowen in Queensland, *Australia*. Almost the entire town of Bowen was unroofed. The cyclone caused a 10-foot (3 meter) storm surge at Poole Island.<sup>99</sup>

During 1883 a drought prevailed in the Red Bluff area of California in the *United States*. The rains of 31 January 1884 brought this drought to an end. Before the rains many farmers had stopped plowing and seeding. And sheep raisers had been compelled to kill their young lambs because there was insufficient water for both their sheep and lambs. Analysis of the rainfall in the Sacramento area since 1849 showed that every sixth or seventh year, drought conditions prevail.<sup>126</sup>

About 7 February 1884, there was a great inundations in Ohio and Pennsylvania in the *United States*. The flood caused about 15 deaths and made 5,000 people homeless.<sup>90</sup>

During the flood of February 1883, in the Ohio River in the *United States*, the water rose above the highest watermarks of any previous record in the vicinity of Cincinnati, Ohio and at points southward. But the flood of February 1884, in the Ohio River, even surpassed that of February 1883. At Pittsburg, Pennsylvania, the highest stage of water was five feet, ten inches above that of 1883; at Cincinnati, Ohio it was four feet, eight and three-fourths inches; at Louisville, Kentucky, it was two feet, two inches. While the Mississippi river at Cairo, Illinois, during 1883, was four inches higher than the highest point of February 1884; and at Memphis it was six inches higher. In the lower Mississippi, the water rose to a greater height than was attained in February 1883. At Vicksburg, the river was still rising at the close of February but was nearly three feet higher than the highest stage of February 1883, and at New Orleans it was one foot, seven inches higher.<sup>126</sup>

The flood of February 1884 affected many communities along the rivers. Pittsburg and Allegheny City, Pennsylvania were flooded. Both cities were without gas, and railroad communication was cut off. As a result of this flood over five thousand people were rendered temporarily homeless, and property valued at more than \$2 million was destroyed [approximately \$48 million in present dollars using the Consumer Price Index (CPI)]. At Wellsburg, West Virginia on the 7<sup>th</sup>, the Ohio River reached the greatest height ever known at this point, when it was thirty-three inches higher than the great flood of 1883. The loss of property, distress, and destitution resulting from the flood were very great. There were only three or four houses in the main part of the town that were not partly underwater. At Marietta, Ohio, on the 10<sup>th</sup>, about

three-fourths of town was inundated and a large number of houses had been swept away. Of the houses that remained 450 houses and barns had been moved from their foundations. At Parkersburg, West Virginia for three days this city was entirely cut off from outside communication. Thousands of people were rendered homeless and were quartered in the churches and the public buildings. More than one hundred houses were carried away and many others were undermined. Thirty-seven cars of the Ohio River Railroad Company were swept away. It was estimated that the losses sustained at Parkersburg would aggregate \$750,000 [\$18 million in today's dollars]. At Belpre, Ohio forty-nine houses floated away and the entire business district was submerged. At Pomeroy, Ohio, the yards of the Columbus, Hocking valley and Toledo Railroad Company was covered with five feet of water. At Catlettsburg, Kentucky, every business house in town and four fifths of the residences were flooded. The damage was greater than \$100,000. At Ashland, Kentucky, one half of the city was underwater and hundreds of families were driven from their homes. At Ironton, Ohio, telegraph and railroad communications was cut off from the 7<sup>th</sup> to the 15<sup>th</sup>. At its height, the flood covered four-fifth of the city. Many houses were swept away or moved from their foundations. At Portsmouth, Ohio, nearly the entire city was underwater and many houses near the river were washed away. About 200 families in Maysville, Chester and Aberdeen, Kentucky were driven from their homes. At Ripley, Ohio, on the 14<sup>th</sup>, fully four-fifths of the town was submerged. On all of the principal streets, the water was from five to fifteen feet deep. On Front Street, the houses were abandoned, and underwater to the second stories. Many houses were swept from their foundations, and about two hundred families were rendered homeless. At Dayton, Kentucky, two-thirds of the town was underwater, about four hundred and fifty houses were submerged and about six hundred families were dependent on charity. It was estimated that this town suffered \$75,000 in damages.<sup>126</sup>

Cincinnati, Ohio sustained the brunt of the damage from the February 1884 flood. The highest flood stage was reached at 11.30 a.m. on the 14<sup>th</sup>, when the water was seventy-one feet and three-fourths of an inch above the low water mark (the highest stage ever known), and was four feet, eight and three-fourths inches above the great flood of 1883. The cold weather with the increasing flood caused intense and widespread suffering among those rendered homeless. At Cumminsville, the water extended from the stockyards to Grear's Turf Exchange on Spring Grove Avenue. At Linwood, the levee was entirely covered with water and Mount Washington and Newton were completely cut off from the city. All passengers leaving the city were conveyed in boats to various points where connection could be made with the railroads. With the increasing flood the condition of Newport grew worse. A large majority of the population of the city was rendered homeless and destitute. Numerous brick houses caved in because their foundations were washed out, while many frame houses floated away. On the corner of Third and Ludlow Streets, foundations of several buildings were undermined and collapsed, which resulted in the loss of ten lives. The Signal Service observer at Cincinnati reported: at Covington, Kentucky (on the opposite shore of Cincinnati), the water invaded four hundred houses, and about 3,000 people received assistance from the relief committees. One-third of Newport, Kentucky was underwater, and 13,000 out of a population of 20,400 were seriously affected by the flood. Navigation on the river was entirely suspended; the high water did not permit the passage of boats under the bridges. Travel on all railroads entering the Cincinnati was interrupted. All of the engines in the city water-works were stopped, which drove fears of a lack of drinking water. It is not possible at the present time to give an accurate estimate of the damage resulting from the flood, but it is variously estimated at from \$10 to \$25 million [approximately \$240 to \$600 million in present dollars using the Consumer Price Index (CPI)]. In February 1883, the river was above the danger-line from the 8<sup>th</sup> to the 23<sup>rd</sup>; during 1884 it was above the danger-line from February 4<sup>th</sup> to the 23<sup>rd</sup>.<sup>126</sup>

At Lawrenceburg, Indiana on 6 February 1884, the track of the Ohio and Mississippi railroad, both east and west of the city, was washed away. East of Lawrenceburg, as far as the eye could reach, there was nothing visible but a broad expanse of water covering thousands of acres of valuable land. About fifteen hundred of the population left the city. Out of four thousand inhabitants of Old Town, all with the

exception of about one hundred, left the place. Many barns and outbuildings in the hundreds were undermined or floated away. In one locality in German town an entire square of buildings was carried away. At Aurora, Indiana on the 6<sup>th</sup>, the floor of the iron bridge west of the city was three feet under water. The greater part of the Ohio and Mississippi railroad track, between this city and Lawrenceburg, was underwater. On the 12<sup>th</sup>, nearly all houses east of George Street were abandoned, and many buildings that withstood the flood of 1883 were raised from their foundations. At Vevay, Indiana, many buildings had only the foundations remaining after the flood. Huge piles of debris had accumulated, fragments of furniture and the bodies of dead animals were scattered around. The floodwaters had deposited 10 to 18 inches of soil across the town. At Carrollton, Kentucky, about seventy-five dwellings and all of the sawmills and distilleries were flooded. At Madison, Indiana, all houses along Front Street were abandoned and the Jeffersonville, Madison and Indianapolis depot was entirely surrounded by water. The town of Milton, Kentucky (opposite Madison, Indiana) was almost entirely inundated, and most of the buildings were flooded. At Louisville, Kentucky, the flood submerged five hundred houses on the "Point," three hundred in Shippingport and Portland, and one hundred on the banks of the Beargrass creek. The total losses sustained are estimated at about \$100,000. At New Albany, Indiana, the flood submerged several hundred houses in the northwestern part of the city. Lower Albany was under from ten to twenty feet of water. The damage to property was estimated at from \$200,000 to \$300,000 [\$4.8 to \$7.2 million in today's dollars]. At Laconia, Indiana, the bottomlands were overflowed, the water reaching the second floors of many of the houses, some of which were washed away. At Paducah, Kentucky, on the 19<sup>th</sup>, the town was completely surrounded by water and one-half of the city was inundated. The damage was estimated at \$200,000 [\$4.8 million in today's dollars]. At Shawneetown, Illinois, the entire town was submerged to a depth averaging eight feet on the 15<sup>th</sup>. Not more than one-fourth of the two thousand inhabitants remained in the town. On the 19<sup>th</sup>, one half of the frame buildings in the city had been moved from their foundations.<sup>126</sup>

The flood of February 1884 in the *United States* affected many other rivers and streams including: Allegheny river, Conodoquinet Creek, French Creek, Maumee River, Sandusky River, Blanchard River, Cuyahoga River, Hockhocking River, Scioto River, Paint River, Muskingum River, Mahoning River, Miami River, Wabash River, Cumberland River, Tennessee River, White River, Alabama River, Raritan River, James River, Arkansas River, and Red River.<sup>126</sup>

On 9 February 1884, tornados struck Missouri, Illinois, Kentucky, Tennessee, Mississippi, Georgia, the two Carolinas and Virginia in the *United States*, in which the aggregate loss was 800 lives and 10,000 houses. In the region covered, there were sixty different tornadoes on that day. The loss of life in the aggregate was greater on that day than was ever known before in wind storms in the United States.<sup>197</sup>

On 14 February 1884, the Susquehanna River in Bradford County, Pennsylvania in the *United States* was the highest that it had been since December 1878, when the high-water mark at Towanda was put on a stone at the foot of Park Street. During this flood the river was nearly one-fourth mile [0.4 km] wide. In 1884, the oldest inhabitant in Bradford County sought in vain for a match for the eight hot September days beginning on the 4<sup>th</sup> and ending on the 11<sup>th</sup>. The records failed to show in any previous year, eight consecutive autumn days when the thermometer stood at 90° F [32° C] in the shade every day. On 27 September, a tornado ¼ mile [0.4 km] wide struck in the vicinity of Ulster.<sup>178</sup>

Floods also occurred in California in the *United States* during February 1884. Heavy rains produced floods and caused a dam to break on the Los Angeles River during the night of the 17<sup>th</sup> – 18<sup>th</sup>. This produced the most disastrous flood ever experienced. The lower part of the city was completely inundated and forty buildings were swept away. Hundreds of families were obliged to abandon their homes and seek shelter on the hills. From Los Angeles to Mojave, a distance of one hundred miles, scarcely a mile of the Southern Pacific railroad track remained in place, and from Los Angeles eastward to San Geronio the destruction was equally great. The California Southern railroad, from Colton to San

Diego, was also washed out. Reports from towns in the southern part of San Joaquin valley stated that the floods in that section were the heaviest ever experienced. Los Angeles estimated the damage at \$750,000 [\$18 million in today's dollars]. Reports from San Bernardino, on the 21<sup>st</sup>, stated that the streets were covered with water to a depth of three feet, and that the houses were flooded. The town of Fallbrook was entirely washed away. Many of the inhabitants were missing and were supposed to have been drowned. Numerous orange groves and vineyards in the San Gabriel Valley were completely destroyed. In Ventura County, California, the storm produced 9.6 inches of rainfall. Several bridges were washed away on the Santa Clara River and in some places landslides occurred on the railroads.<sup>126</sup>

Around 18 February 1884, tornadoes struck in the southern states of the *United States* killing about 600 people.<sup>90</sup>

On the afternoon of 19 February 1884, several of the Southern states in the *United States* were visited by violent tornadoes. They were most destructive in Alabama, Georgia, and the Carolinas. Reports from Atlanta, Georgia stated that about three hundred persons were killed, nine hundred were injured, and that \$2 million worth of property had been destroyed in that state alone [approximately \$48 million in present dollars using the Consumer Price Index (CPI)]. At Cross Plains, Alabama, eight persons were killed and several wounded. At Leeds, fifteen miles east of Birmingham, Alabama, a tornado swept over the town, destroying everything in its path. Houses were blown away and not even their foundations remained; horses, mules, and cattle were killed, and in some instances missiles were driven through the bodies. In Leeds and vicinity, eleven persons were killed instantly and thirty-one were wounded, many of the latter being fatally injured; twenty-seven dwellings were entirely destroyed together with many barns and other out buildings. In the vicinity of Ladiga and Amberson, Alabama, a large number of houses were blown down and fourteen persons were reported killed. Twenty-six persons in the immediate vicinity of Rock Run, Alabama, were killed and many others were injured. At Philadelphia, North Carolina (2 miles from Rockingham), the entire settlement containing about 25 cabins were destroyed and 11 occupants killed. At Chester, South Carolina, forty houses and two churches were blown down, and a number of people killed. At Chappell, South Carolina, not a house was left standing. At Darlington, South Carolina, six persons were killed and 20-30 injured. At Andersonville, South Carolina, five persons were killed.<sup>126</sup>

At Ogreeta, North Carolina in the *United States* on 25 March 1884, a hailstorm dropped very large hailstones weighing as much as a pound. The hailstones fell with such force that they were driven into the earth several inches. The hailstones damaged crops and livestock.<sup>126</sup>

At Vicksburg, Mississippi in the *United States*, the Mississippi River reached a high water mark of forty-nine feet on 23 March 1884. At Rodney, Mississippi, the Kemp levee broke on the night of the 24<sup>th</sup>-25<sup>th</sup>, and Tensas parish was entirely submerged making 20,000 people destitute. At Yuma, Arizona, on 11 March, floods on the Gila River broke through the levee and flooded the town; many families were compelled to vacate their homes, and numerous buildings were undermined. Several miles of the Southern Pacific railroad track were washed away. Damage was estimated at \$250,000 [\$6 million in today's dollars]. Heavy rains caused a levee to break at Robert's Island near Stockton, California during the night of 18/19 March destroying about 27,000 acres of growing wheat. This caused a loss of \$500,000 [\$12 million in today's dollars].<sup>126</sup>

On 15 April 1884, destructive tornados damaged parts of Georgia in the *United States*. At Chipley, forty buildings were destroyed and seven persons were killed. At Meriwether, a large amount of property was destroyed and six persons killed. At Sandtown, ten people were killed and much property destroyed.<sup>126</sup>

From 28 to 31 May 1884, destructive frosts occurred in the Great Lake region, New England and the northern portions of the Mid-Atlantic States in the *United States*. In Connecticut, crop damage from the frost was estimated at \$1 million [\$24 million in today's dollars]. In Illinois, the severe frost destroyed

garden vegetables, corn, potatoes and fruit trees buds. At Woodstock, Illinois, the ice formed to a thickness of 1/8 inch. In Indiana at Fort Wayne, South Bend, La Fayette and Angola, the frost damaged early vegetation. The frost was very severe in the Turkey River Valley in Iowa, destroying corn, potatoes and other vegetables. At Manchester, Preston, Dubuque and Brooklyn, Iowa, similar damage was reported. At Louisville, Kentucky, the cold weather injured the tobacco crop. At Gardiner and Portland, Maine, the frost badly damaged vegetation. At Ocean City, Maryland, the corn and sweet potatoes were damaged by the frost. In Bristol County, Massachusetts, frost damage was estimated at \$100,000. At Athol, Massachusetts, ice formed to a thickness of ¼ inch on the morning of the 30<sup>th</sup>. At Boston, Massachusetts during the night of 29/30 May, the ground froze to a depth of ¼ to ½ inch throughout New England. At Great Barrington, Massachusetts, the temperature fell to 22° F. Incalculable damage was done to crops in Massachusetts. The frost in Michigan seriously injured fruit and vegetables throughout the state. New Hampshire also incurred similar damage. The crops at Cape May, New Jersey were also destroyed by the frost. Many regions of New York sustained great frost damage. At Poughkeepsie, the thermometer fell to 25° F. In Dutchess and Ulster Counties, one half of the grape crop was destroyed. The loss was estimated at \$100,000. In Troy, ice formed to a thickness of ¾ of an inch. At Menand's Station near Albany, the frost of the 30<sup>th</sup> was the severest known to occur in May for the last 40 years; fruits and vegetables in many localities were entirely destroyed. Damage to the strawberry crop at Sag Harbor on Long Island was estimated at \$50,000. Many areas of Ohio sustained frost damage. The frost caused a large amount of damage in Canada in the Province of Ontario. Similar crop damage was reported in Pennsylvania, Rhode Island, Vermont, and West Virginia.<sup>126</sup>

On 25 May 1884, severe hailstorms struck Texas in the *United States*. At Mobeetie, a few miles from Fort Elliott, the hailstones perforated the sheet iron roofs of the buildings. At Fort Davis, the hailstones varied in size from hickory nuts to 5 inches in circumference and fell with such force as to perforate roofs of corrugated iron and tin.<sup>126</sup>

Reports from all portions of the Texas in the *United States* show the rains of the 20<sup>th</sup> and 21<sup>st</sup> of May 1884, to have been the heaviest ever known in Texas, and that the damage to agricultural interests was very great. The flood damage to railroad property was estimated at \$2 million [approximately \$48 million in present dollars using the Consumer Price Index (CPI)], and the combined losses sustained by farmers and railroad companies would reach \$5 million [\$120 million in today's dollars]. Hundreds of culverts and small bridges were washed away. Large numbers of cattle were drowned and the inhabitants were driven to the highlands.<sup>126</sup>

At the end of May 1884, there was a disastrous flood in eastern *Spain*.<sup>90</sup>

About 23 June 1884, there were floods in *Galicia*. A new railway bridge over the Vistula River was destroyed. 20 lives were lost.<sup>90</sup> [Galicia is a historical region in Eastern Europe, currently divided between *Poland* and *Ukraine*. The Vistula River is entirely in *Poland*.]

The following are the highest temperatures observed during July 1884 in the *United States*:<sup>126</sup>

Montgomery, Alabama	( 95° F, 35.0° C)
Mobile, Alabama	( 96° F, 35.6° C)
Fort McDowell, Arizona	(116° F, 46.7° C)
Fort Apache, Arizona	(102° F, 38.9° C)
Texas Hill, Arizona	(118° F, 47.8° C)
Little Rock, Arkansas	(101° F, 38.3° C)
Fort Smith, Arkansas	(104° F, 40.0° C)
Los Angeles, California	( 99° F, 37.2° C)
Fort Bidwell, California	( 97° F, 36.1° C)
Mammoth Tank, California	(126° F, 52.2° C)
West Las Animas, Colorado	(104° F, 40.0° C)

Pike's Peak, Colorado	( 54° F, 12.2° C)
New Haven, Connecticut	( 87° F, 30.6° C)
New London, Connecticut	( 83° F, 28.3° C)
Delaware Breakwater, Delaware	( 80° F, 26.7° C)
Washington, D.C.	( 96° F, 35.6° C)
Pensacola, Florida	( 97° F, 36.1° C)
Jacksonville, Florida	( 96° F, 35.6° C)
Atlanta, Georgia	( 90° F, 32.2° C)
Savannah, Georgia	( 96° F, 35.6° C)
Coeur d'Alene, Idaho	( 88° F, 31.1° C)
Lewiston, Idaho	( 94° F, 34.4° C)
Chicago, Illinois	( 89° F, 31.7° C)
Cairo, Illinois	( 92° F, 33.3° C)
Indianapolis, Indiana	( 90° F, 32.2° C)
Spiceland, Indiana	( 93° F, 33.9° C)
Des Moines, Iowa	( 95° F, 35.0° C)
Davenport, Iowa	( 88° F, 31.1° C)
Leavenworth, Kansas	(101° F, 38.3° C)
Dodge City, Kansas	( 98° F, 36.7° C)
Louisville, Kentucky	( 94° F, 34.4° C)
Bowling Green, Kentucky	( 91° F, 32.8° C)
New Orleans, Louisiana	( 95° F, 35.0° C)
Shreveport, Louisiana	(104° F, 40.0° C)
Eastport, Maine	( 81° F, 27.2° C)
Portland, Maine	( 87° F, 30.6° C)
Baltimore, Maryland	( 95° F, 35.0° C)
Boston, Massachusetts	( 90° F, 32.2° C)
Thatcher's Island, Massachusetts	( 82° F, 27.8° C)
Marquette, Michigan	( 86° F, 30.0° C)
Detroit, Michigan	( 89° F, 31.7° C)
Saint Vincent, Minnesota	( 83° F, 28.3° C)
Saint Paul, Minnesota	( 88° F, 31.1° C)
Vicksburg, Mississippi	( 99° F, 37.2° C)
Saint Louis, Missouri	( 94° F, 34.4° C)
Poplar River, Montana	( 93° F, 33.9° C)
Fort Shaw, Montana	( 85° F, 29.4° C)
North Platte, Nebraska	( 97° F, 36.1° C)
Omaha, Nebraska	( 97° F, 36.1° C)
Winnemucca, Nevada	(105° F, 40.6° C)
Hot Springs, Nevada	( 95° F, 35.0° C)
Mount Washington, New Hampshire	( 67° F, 19.4° C)
Little Egg Harbor, New Jersey	( 90° F, 32.2° C)
Atlantic City, New Jersey	( 90° F, 32.2° C)
Fort Craig, New Mexico	(107° F, 41.7° C)
Rochester, New York	( 89° F, 31.7° C)
New York City, New York	( 90° F, 32.2° C)
Scott's Hill, North Carolina	( 93° F, 33.9° C)
Kitty Hawk, North Carolina	( 97° F, 36.1° C)
Bismarck, North Dakota	( 89° F, 31.7° C)
Fort Buford, North Dakota	( 95° F, 35.0° C)
Sandusky, Ohio	( 91° F, 32.8° C)
Cleveland, Ohio	( 86° F, 30.0° C)
Fort Sill, Oklahoma	(107° F, 41.7° C)
Fort Reno, Oklahoma	(105° F, 40.6° C)
Roseburg, Oregon	( 86° F, 30.0° C)
Ashland, Oregon	(100° F, 37.8° C)

Pittsburg, Pennsylvania	( 97° F, 36.1° C)
Philadelphia, Pennsylvania	( 92° F, 33.3° C)
Narragansett Pier, Rhode Island	( 85° F, 29.4° C)
Charleston, South Carolina	( 95° F, 35.0° C)
Anderson, South Carolina	(104° F, 40.0° C)
Fort Bennett, South Dakota	( 97° F, 36.1° C)
Nashville, Tennessee	( 94° F, 34.4° C)
Chattanooga, Tennessee	( 92° F, 33.3° C)
El Paso, Texas	(111° F, 43.9° C)
Dallas, Texas	(105° F, 40.6° C)
Salt Lake City, Utah	( 93° F, 33.9° C)
Charlotte, Vermont	( 93° F, 33.9° C)
Lynchburg, Virginia	( 96° F, 35.6° C)
Cape Henry, Virginia	( 96° F, 35.6° C)
Dayton, Washington	( 96° F, 35.6° C)
Port Angeles, Washington	( 73° F, 22.8° C)
Helvetia, West Virginia	( 92° F, 33.3° C)
Milwaukee, Wisconsin	( 90° F, 32.2° C)
La Crosse, Wisconsin	( 91° F, 32.8° C)
Cheyenne, Wyoming	( 90° F, 32.2° C)

The *United States* was struck by numerous strong hailstorms in July 1884. On the 21<sup>st</sup> in the vicinity of Carthage, South Dakota, the storm produced hailstones of a remarkable size. These hailstones fell with sufficient force to penetrate the roofs of buildings and to break ordinary weatherboarding. On the 23<sup>rd</sup> in Hand, Spink and Sully counties in South Dakota, the hailstorm destroyed crops, entailing losses estimated at \$50,000. [In present currency, that would be equivalent to \$1.2 million in damages based on the Consumer Price Index (CPI) inflation rates.] In Hamilton County, Iowa, on the 11<sup>th</sup>, the storm produced hailstones half the size of hens' eggs. The storm only lasted from 5 to 10 minutes but left the ground covered with hailstones to a depth of from three to six inches. All windows on the north and east sides of buildings were broken. The total losses from the hailstorm were estimated from \$75,000 to \$125,000. [In present currency, that would be equivalent from \$1.8 million to \$3 million.] In Westmoreland, Kansas on the 24<sup>th</sup>, a storm produced hailstones as large as hen's eggs that broke glass in many windows and badly damaged growing crops. At Fort Assinaboine, Montana on the 15<sup>th</sup>, a hailstorm killed many birds and small animals. At Omaha, Nebraska on the 13<sup>th</sup>, a hailstorm struck with such force that the roofs of buildings were reduced to splinters; many small animals were killed. In Fremont, Nebraska on the 20<sup>th</sup>, the storm produced hailstones as large as hens' eggs. The crops were entirely ruined. The aggregate losses from the storm were estimated at \$100,000. [In present currency, that would be equivalent to \$2.4 million.] In Claremont, New Hampshire on the 19<sup>th</sup>, the hailstones were as large as hens' eggs and accumulated to a depth of two feet on the ground. In Eau Claire, Wisconsin on the 25<sup>th</sup>; hogs, sheep and cattle were killed by hailstones, some of which weighed several ounces.<sup>126</sup>

On 25 July 1884, a waterspout struck Saint Louis, Missouri in the *United States*:<sup>126</sup>

“The storm late yesterday afternoon showed many of the characteristics, in it's coming, of the approach of a tornado. The clouds seemed to approach from the southeast and also from the southwest, but the greatest force was from the former direction. At 4.30 the sky was filled with clouds, but beneath them there appeared a separate installment of lighter colored clouds assuming all kinds of fantastic shapes. They moved to a centre north and west of the city, where they seemed to lose energy, as the agitation and fantastic motion apparently decreased. Passengers on the ferryboats about 5 o'clock, when the rain had begun to fall, saw the most interesting manifestation of the storm. The water opposite the foot of Anna street became violently agitated, and while spectators were wondering what caused the disturbance, a cloud, shaped like an inverted cone, moved over it, and the water rose in a cone to meet it, but as the two cones came together the oblique lines of the two sides became nearly vertical. It was a water-spout, and its movement was very rapid in a northeasterly direction. Opposite the foot of Choteau Avenue the spout left the

river near the Pittsburg dike, and added to its bulk a large amount of sand from the shore. It passed over the Pittsburg Transfer Stables, the east end of which was torn from its foundation and thrown through the engine house. The roof of the engine house was taken off and many pieces were carried to the Little Rolling Mills, a mile away. Here the column lost its force and power of motion. It was precipitated in a torrent of rain, which covered the streets. An eyewitness reports that it appeared to be about five hundred feet in diameter and had a rapid rotary motion, producing a sound like distant thunder. For a few seconds the air seemed to be motionless, when suddenly the column swept across toward the Pittsburg engine house and stables, damaging them as described above.”

Destructive frost occurred on 25 August 1884 in New England, New York, northeastern Pennsylvania and northern New Jersey in the *United States*.<sup>126</sup>

On 29 August 1884, a violent storm struck Evansville, Indiana in the *United States*. A transfer steamer, *Belmont*, plying between Evansville, and Henderson, Kentucky, was capsized and sunk near Stanley's Landing. The number of lives lost is reported to have been from twelve to fifteen. The steamer had in tow a barge containing two passenger coaches with about sixty passengers, all of whom were saved. At Evansville, the storm caused damage estimated at \$250,000 [approximately \$6 million in present dollars using the Consumer Price Index (CPI)]. Hundreds of houses were damaged and a large number of trees were destroyed. One person was killed by the falling wall of a building that was demolished by the storm, and the steamers *Joseph V. Throop* and *Silver Horn* were badly damaged.<sup>126</sup>

On 9 September 1884, a tornado struck White Bear Lake, Minnesota in the *United States*. The sheds of the Saint Paul and Duluth railroad company were demolished, and hundreds of trees were blown across the railroad between White Bear Station and Dellwood. The length of path was one hundred and thirty miles, and its width 2,640 feet. The storm was very destructive to both life and property. Six persons were killed, and seventy-five wounded. Three hundred buildings were destroyed, and much livestock killed. The total valuation of property destroyed is estimated at \$4 million [approximately \$100 million in present dollars using the Consumer Price Index (CPI)]. On the same day, a tornado struck Clear Lake, Wisconsin that left the greater part of the town in ruins and killed three persons. The damage caused by the storms is estimated at about \$150,000. About forty buildings in Clear Lake and vicinity were destroyed.<sup>126</sup>

In September due to heavy rainfall, floods struck Eau Claire, Wisconsin in the *United States*. All of the bridges over the Chippewa River, ten in number, were washed away. It is estimated that the damage in the vicinity of Chippewa Falls and Eau Claire will reach \$1.5 million [approximately \$36 million in present dollars using the Consumer Price Index (CPI)]. Business houses on either side of both rivers were submerged. In Eau Claire nearly four hundred houses were either swept away or wrecked, and 2,000 persons were rendered dependent for shelter upon those living in the higher localities.<sup>126</sup>

On 6-8 October 1884, a hurricane struck *Jamaica* drowning at least 8 people.<sup>141</sup>

On 7 October 1884, storm struck Catania, *Sicily*.<sup>90</sup>

In November 1884, there was a great inundation caused by heavy rains in eastern *Spain*. There was much distress in Alicante, Almeria and Valencia.<sup>90</sup>

*Also refer to the section 1880 A.D. – 1886 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1884 / 1885 A.D.** In the *United States*, the weather was very severe during the last half of the December 1884 from Minnesota westward to the Pacific coast, attended in Oregon and Washington Territory by unusually heavy snowfalls, causing much loss of life and property. At Denver, Colorado on

the 26<sup>th</sup>, continued storms and increasing drifts were reported from many points in the mountains. Leadville was nearly buried in the snow. The stores were reached by deep cuts through the drifts. The main floors of buildings had the character of cellars in their relation to the level outside. Railway communication with the city was kept open only by the constant use of snow plows and an army of shovelers, while the [railroad] branches from that city were buried and the points to which they run are completely isolated. In the Monarch District of Chaffee County, near Marshall Pass, the average depth of snow was at ten feet, with many drifts of greater depth. Families were buried in their houses with limited food supplies.<sup>126</sup>

The winter of 1884-85 in Bradford County, Pennsylvania in the *United States* was a cold. There was a total snowfall of 67 inches [1.7 m]. Generally the sleighing was good from the latter part of December until March. February and March were notably cold months. On February 11<sup>th</sup>, thermometers in the county ranged from -13° F to -24° F [-25° C to -31° C]; and on February 22<sup>nd</sup>, -25° F [-32° C] was reported. March cold records were on the 13<sup>th</sup>, -18° F [-28° C]; 17<sup>th</sup>, -16° F [-27° C]; 18<sup>th</sup>, -22° F [-30° C]; 20<sup>th</sup>, -14° F [-26° C]; 21<sup>st</sup>, -16° F [-27° C]; 22<sup>nd</sup>, -13° F [-25° C]; 23<sup>rd</sup>, -6° F [-21° C] and on the 24<sup>th</sup>, thermometers still indicated zero. The ice, which was of unusual thickness, broke up and passed out of the Susquehanna River on March 31 without doing any damage.<sup>178</sup>

The following are the lowest temperatures observed during January 1885 in the *United States*:<sup>113</sup>

Montgomery, Alabama	( 19.2° F, -7.1° C)	
Mobile, Alabama	( 19.9° F, -6.7° C)	
Prescott, Arizona	( -4.0° F, -20.0° C)	
Fort Apache, Arizona	( -4.0° F, -20.0° C)	
Little Rock, Arkansas	( 9.6° F, -12.4° C)	
Fort Smith, Arkansas	( 2.4° F, -16.4° C)	
San Francisco, California	( 43.0° F, +6.1° C)	
Red Bluff, California	( 33.0° F, +0.6° C)	
Denver, Colorado	(-10.9° F, -23.8° C)	
Pike's Peak, Colorado	(-29.4° F, -34.1° C)	
West Las Animas, Colorado	(-25.9° F, -32.2° C)	
New Haven, Connecticut	( -0.9° F, -18.3° C)	
New London, Connecticut	( 1.0° F, -17.2° C)	
Fort Buford, Dakota	(-45.5° F, -43.1° C)	[now Fort Buford, Montana]
Fort Totten, Dakota	(-37.0° F, -38.3° C)	[now Fort Totten, North Dakota]
Huron, Dakota	(-33.0° F, -36.1° C)	[now Huron, South Dakota]
Delaware Breakwater, Delaware	( 12.1° F, -11.1° C)	
Washington, D.C.	( 10.2° F, -12.1° C)	
Pensacola, Florida	( 24.3° F, -4.3° C)	
Key West Florida	( 59.3° F, +15.2° C)	
Atlanta, Georgia	( 13.7° F, -10.2° C)	
Augusta, Georgia	( 22.0° F, -5.6° C)	
Boise City, Idaho	( -7.3° F, -21.8° C)	
Coeur d'Alene, Idaho	(-22.5° F, -30.3° C)	
Chicago, Illinois	(-12.9° F, -24.9° C)	
Cairo, Illinois	( -4.0° F, -20.0° C)	
Indianapolis, Indiana	(-11.3° F, -24.1° C)	
Monticello, Indiana	(-29.5° F, -34.2° C)	
Fort Reno, Indian Territory	( -2.5° F, -19.2° C)	[now Fort Reno, Oklahoma]

During the winter of 1884-85, the temperature at Fort Benton, Montana fell to -56.5° F in December and -20.8° F in February. The temperature at Fort Assiniboine (near Havre, Montana) fell to -50.0° F in December and -16.7° F in February. The temperature at Fort Buford (near Williston, North Dakota) fell to -39.8° F in December and -32.0 in February. The temperature at Fort Bennett (now located under the

waters of the Oahe Reservoir in South Dakota) fell to  $-41.3^{\circ}\text{F}$  in December. The temperature at Saint Vincent, Minnesota fell to  $-47.8^{\circ}\text{F}$  in December and  $-39.2^{\circ}\text{F}$  in February. The temperature at Saint Paul, Minnesota fell to  $-27.0^{\circ}\text{F}$  in December and  $-24.5^{\circ}\text{F}$  in February. The temperature at Pike's Peak, Colorado fell to  $-20.0^{\circ}\text{F}$  in December and  $-24.0^{\circ}\text{F}$  in February. The temperature at La Crosse, Wisconsin fell to  $-26.0^{\circ}\text{F}$  in December and  $-22.0^{\circ}\text{F}$  in February. The temperature at Milwaukee, Wisconsin fell to  $-21.6^{\circ}\text{F}$  in December and  $-23.6^{\circ}\text{F}$  in February. The temperature at Mount Washington, New Hampshire fell to  $-42.0^{\circ}\text{F}$  in December,  $-30.8^{\circ}\text{F}$  in February and  $-47.8^{\circ}\text{F}$  in March. The temperature at Dayton, Washington fell to  $-26.0^{\circ}\text{F}$  in December. The temperature at Yankton, South Dakota fell to  $-18.2^{\circ}\text{F}$  in February. The temperature at Chicago, Illinois fell to  $-13.7^{\circ}\text{F}$  in February. The temperature at Greencastle, Indiana fell to  $-13.1^{\circ}\text{F}$  in February. The temperature at Dubuque, Iowa fell to  $-20.0^{\circ}\text{F}$  in February. The temperature at Davenport, Iowa fell to  $-17.3^{\circ}\text{F}$  in February. The temperature at Leavenworth, Iowa fell to  $-16.2^{\circ}\text{F}$  in February. The temperature at Escanaba, Michigan fell to  $-25.0^{\circ}\text{F}$  in February. The temperature at Omaha, Nebraska fell to  $-17.9^{\circ}\text{F}$  in February. The temperature at North Platte, Nebraska fell to  $-22.2^{\circ}\text{F}$  in February. The temperature at Toledo, Ohio fell to  $-15.5^{\circ}\text{F}$  in February.<sup>113, 126</sup>

The depth that rivers and lakes froze in January 1885 in the *United States*:<sup>113</sup>

- \* At Sherlock, Kansas, on the *Arkansas River*, the ice was of sufficient thickness to bear the weight of [wagon] teams during the latter part of January.
- \* At Portland Maine, in the *Casco Bay*, the harbor was filled with floating ice. On the 22<sup>nd</sup> the steamer *Popham* was cut through by the ice and sank on Phippsburg flats.
- \* At Chincoteague, Virginia, the *Chincoteague Bay* froze over on the 23<sup>rd</sup>.
- \* At Hartford, Connecticut, the *Connecticut River* was frozen for the third time during the winter on the 21<sup>st</sup> and 22<sup>nd</sup>. The river was frozen for a distance of 500 miles and within 5 miles of Long Island Sound.
- \* At Traverse City, Michigan, the *Grand Traverse Bay* froze on the 26<sup>th</sup>.
- \* At Albany, New York, the *Hudson River* froze on the 3<sup>rd</sup>.
- \* At Port Huron, Michigan, *Lake Huron* on the 19<sup>th</sup> was covered with ice as far as the eye could reach.
- \* At Traverse City, Michigan, *Lake Michigan* on the 28<sup>th</sup> was frozen over as far as the eye could reach. At Manistique, Michigan, the ice on the lake extended beyond the range of vision. At Grand Haven, Michigan, the harbor was closed several times during January because it was blocked by the ice. At Milwaukee, Wisconsin, the ice in *Lake Michigan* was unusually heavy. Navigation was suspended. The propeller *Oneida* was caught in the ice fields off Grand Haven on the 20<sup>th</sup> and drifted with the ice being unable to reach either shore for the rest of the month.
- \* At Duluth, Minnesota, *Lake Superior* on the 16<sup>th</sup> was frozen and the ice extended as far as could be seen.
- \* At Keokuk, Iowa, the *Mississippi River* was frozen from Keokuk northward throughout the month.
- \* At Leavenworth, Kansas, the *Missouri River* was frozen throughout January and at all points northward.
- \* At New Haven, Connecticut, the harbor froze over on the 23<sup>rd</sup>.
- \* At Buffalo, New York, the *Niagara River* was frozen throughout the month.
- \* At Washington, D.C., the *Potomac River* froze several times during January.
- \* At Port Huron, Michigan, the *Saint Clair River* was frozen on the 29<sup>th</sup>.
- \* At Tiffin, Ohio, the *Sandusky River*, the ice was 7 inches thick on the 22<sup>nd</sup>.
- \* At Columbia, Pennsylvania, the *Susquehanna River* froze over on the 23<sup>rd</sup>.
- \* At Port Deposit, Maryland, the *Susquehanna River* on the 23<sup>rd</sup> formed an ice dam that extended from Garret's Island three miles south and several miles northward. As a result, by the afternoon, ice accumulated to a depth of fifteen feet on the opposite side of the river. This caused the river to overflow the entire southern portion of the town.
- \* At Toledo, Ohio, the ice in the *Maumee River* was 8 inches thick on the 21<sup>st</sup>.
- \* At New Haven, Connecticut, the ice on *Lake Whitney* was 10 inches thick on the 28<sup>th</sup>.

Portland, Oregon in the *United States* reports on 28 January 1885 "During the past six weeks heavy storms have prevailed throughout eastern Oregon and Washington Territory. And the loss of livestock is reported as very heavy. The latest reports for the settled regions east of the Cascades are that large numbers of persons froze to death during the late cold and protracted snowstorm. A number of persons during the continuance of the storm are known to have wandered off and perished. Most of the bodies of

such persons have been recovered since the snow disappeared. It is reported that many persons are still missing, and it is supposed that they have perished.<sup>113</sup>

Bozeman, Montana in the *United States* on 2 January 1885 reports that snow in the various livestock ranges was more than two feet deep on the level and that cattle were starving. In the Yellowstone region, the snow was reported to be of great depth. At Fort Canby, Washington Territory on the 8<sup>th</sup>, it was reported that the weather during the past three weeks was the severest ever experienced in the Columbia valley and throughout Oregon and Washington Territory; no trains arrived from the east from 16 December 1884 until 8 January 1885.<sup>113</sup>

Severe snowstorms struck the Midwest and Northeast in the *United States* in January 1885. Hillsborough, Illinois reports on the 16<sup>th</sup>, the snow covered the ground to a depth of nearly two feet. Quincy, Illinois reported one foot of snowfall. Kankakee, Illinois reported on the 28<sup>th</sup>, snow was two feet deep. Pana, Illinois reported that on the 28<sup>th</sup>, the snow was 20 inches deep on the level and in some places the drifts covered the fences. All railroads were delayed and there was much suffering experienced by livestock. At Troy, New York, on the 28<sup>th</sup>, more than a foot of snow fell.<sup>113</sup>

Heavy snowstorms struck the *United States* during February 1885. At Grand Haven, Michigan on the 9<sup>th</sup>, snowdrifts were 1 to 7 feet. At Jackson, Michigan on the 10<sup>th</sup>, snow was three feet deep on the level. At Grand Rapids, Michigan on the 10<sup>th</sup>, the snow was 3 feet deep. Snow blockades halted railroad traffic in the upper Midwest at many locations. At Des Moines, Iowa on the 9<sup>th</sup>, the snow drifted to depths from four to five feet. At Cape May, New Jersey on the 13<sup>th</sup> through 15<sup>th</sup>, and the snow was 12 inches on the level and drifts were from seven to nine feet deep. At Plymouth, New Hampshire during the night of the 16<sup>th</sup>/17<sup>th</sup> snow fell to a depth of eighteen inches. At Troy, New York, the country roads were obstructed by snowdrifts twenty feet deep. At Bangor, Maine, snow fell to a depth of 12 inches on the 17<sup>th</sup>.<sup>113</sup>

During the night of the 13<sup>th</sup>/14<sup>th</sup> February 1885, the village of Alta, Utah in the *United States*, about forty miles southeast of Salt Lake City, was nearly buried beneath an immense snow slide. It had been snowing for nearly a week and the snow had accumulated to great depths. The snow slide occurred about 8 p.m., burying about three-fourths of the place. In the buildings under the snow were twenty-eight persons, some of whom were killed. The damage is estimated at more than \$40,000. [In present currency, that would be equivalent to \$1 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>113</sup>

On 18 March 1885 at Kitty Hawk, North Carolina in the *United States*, one of the heaviest snowfall at this place occurred. In places along the beach, the snow drifted to depths from two to four feet; the average was six inches. Reports from Roanoke Island stated that the snow fell to a depth of two feet. The snowflakes, which were very moist, stuck to the sides of buildings and weighed down trees and shrubbery. During the storm, there was an almost incessant display of lightning.<sup>113</sup>

On 18 March 1885, the minimum temperature at Northfield, Massachusetts in the *United States* was -20° F.<sup>138</sup>

Heavy snowfalls struck Colorado in the *United States* in April 1885. At Denver, Colorado, on 23 April twenty-three inches of snow fell. The snow was very moist and heavy and as a result the snow caused significant damage to roofs of buildings, trees, etc., which were broken down under its weight. The damage caused by this storm is estimated at \$60,000. [\$1.4 million in today's dollars.] At Georgetown, Colorado on the 23<sup>rd</sup>, the snowstorm was of great severity producing three feet of snow. At Idaho Springs, Colorado, the snowstorm began at noon on the 22<sup>nd</sup> and continued for twenty-four hours. Snow fell to a depth of thirty-two inches.<sup>113</sup>

On 16 January 1885, destructive snowstorms struck Piedmont, *Italy*.<sup>90</sup>

---

**1885 A.D.** On the 21 January 1885, a remarkable rainstorm entered western New South Wales, *Australia* not far from Milparinka, and travelled slowly (about 7 miles per hour), straight across country to the sea. The country around Wilcannia received from 10-11 inches of rain during 40 hours. Even though the Darling River had been very low for months before, this heavy rainfall produced a flood. The peak river height recorded on the Darling River at Wilcannia was 28 feet (8.5 meters) above the summer level. This flood did not subside to the old level until February 26. On 25 January, the Melbourne-Sydney Express crashed near Bethungra, where the Clay Creek Bridge had been washed away, along with the rails. Seven people were killed and over 20 injured in the derailment.<sup>99</sup>

At Steelville, Missouri in the *United States*, an unusual electrical phenomenon occurred at the Palmer lead mines, twenty-five miles southeast of this place, during the night of the 8<sup>th</sup>/9<sup>th</sup> of February 1885. A vivid flash of lightning, accompanied by a deafening peal of thunder, struck a large oak tree which was shattered to pieces, the fragments flying in every direction to a distance of three hundred yards; a piece of the tree, weighing three hundred pounds, was hurled through the roof of a barn which stood near; the roots of the tree were also torn out of the ground.<sup>113</sup>

Destructive floods occurred in the southeastern Kansas in the *United States* on 21 April 1885. Traffic on the *Missouri, Kansas and Texas* railroad for many miles both to the north and south of Parsons, Kansas was suspended, and a large number of hogs and cattle were drowned near Parsons. The Marmaton River overflowed and inundated a settlement of from six to eight hundred inhabitants, known as North Fort Scott, the water being from three to five feet deep in the houses. The *Missouri Pacific* railroad was badly washed near Fort Scott, causing suspension of travel. At Kingman, Kansas, a destructive flood occurred in the south fork of the Ne Ne Squaw River on the morning of the 21<sup>st</sup>, which was caused by a "cloud burst". Heavy rains cause the river to rise rapidly and it soon flooded the town. Fifteen dwellings were washed away and a number of persons drowned. At Medicine Lodge, Kansas, the water came down suddenly over the lowlands, flooding them to the depth of from five to twelve feet. In the Elk creek bottoms, east of the town, about a dozen houses were entirely destroyed and many of their occupants drowned, while many others were only saved by clinging to trees. North of Medicine Lodge whole families were drowned. A large number of cattle were also drowned and extensive fields of crops were ruined.<sup>113</sup>

At Montreal, Quebec, in *Canada* on 23 April 1885 the Saint Lawrence River rose and flooded the lower streets. A large part of the village of La Prairie was inundated. The village of Saint Gabriel was submerged in many places to depths of from six to eight feet. The reported damage caused by the freshet at Montreal was estimated at \$100,000 [\$2.4 million in current dollars].<sup>113</sup>

In May 1885, phenomenally large masses of ice, both field and icebergs, were observed in the *Atlantic Ocean*. The region most thickly studded with icebergs and field ice was between 42° and 48° N and from 48° to 51° W. This trend continued into June 1885. The region with icebergs were concentrated between 41° and 44° N and from 47° to 50° W.<sup>113</sup>

There was a destructive forest fire in Sugar Valley and in the White Deer Mountains near Williamsport, Pennsylvania in the *United States* in the week prior to 23 May 1885. An area of 25 miles square was in flames, destroying about \$1 million worth of property [In present currency, that would be equivalent to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.] During the same month forest fires were reported near Bethlehem, Wilkes-Barre, and Easton, Pennsylvania; East Saginaw, Marquette, Ludington, Edmore and East Tawas, Michigan; Milwaukee and Green Bay, Wisconsin; Lynchburg, Virginia; Riverhead (Long Island), New York; Middletown, Maryland; Mount Washington, New Hampshire; and Quebec, Canada. In the prior month, April, at Huntingdon, Pennsylvania, forest

fires burned an area of about 3,500 acres in Diamond Valley, causing a large amount of damage. In July 1885, drought conditions were reported in many parts of Pennsylvania in the *United States*.<sup>113</sup>

In May 1885, great floods struck Texas in the *United States*. At Laredo, Texas, heavy rains on the 7<sup>th</sup> and 8<sup>th</sup> caused numerous washouts on the railroads. A large part of the town was inundated, the water being four feet deep in some places. At Rio Grande City, Texas on the 8<sup>th</sup>, the streets were flooded in some places to a depth of 2½ feet. The Rio Grande River rose twenty feet, overflowing the lowlands south of the city. Serious washouts occurred on the railroads to the north, completely cutting off communication. By the 9<sup>th</sup> the width of the Rio Grande River was about 5 miles across, extending from the plaza in Rio Grande City to Camargo, Mexico. More than two thousand acres of growing crops between Rio Grande City and Camargo were inundated. At Austin, Texas, a freshet occurred during the night of the 25<sup>th</sup>/26<sup>th</sup> causing much damage. Bouldin and Barton Creeks overflowed; the former being higher than ever before known. Two bridges over Bouldin Creek, near Austin, were washed away. Onion Creek, a large tributary to the Colorado River, reached its highest stage since 1809, and overflowed a number of farms along its banks. At Navasota, Texas, the heaviest rain for many years fell during the night of the 25<sup>th</sup>/26<sup>th</sup>. Two bridges at Navasota, over Cedar Creek, were washed away. At Dallas, Texas, the heavy rains of the 26<sup>th</sup> caused the Trinity River to overflow, submerging the turnpike to the west of the city. At Mexia, Texas on the 26<sup>th</sup>, the Navasota River was reported to have been higher than known for several years. At Valley Mills, Texas, a remarkably heavy rainfall occurred during the night of the 27<sup>th</sup>/28<sup>th</sup>. Two thousand feet of railroad track and two culverts were washed away between Valley Mills and Clifton. The Bosque River rose to a greater height than ever before known, overflowing farms along its banks and causing a large amount of damage. Several families were compelled to abandon their houses. Reports placed the flood damage in Bosque County at \$100,000. [In present currency, that would be equivalent to \$2.4 million based on the Consumer Price Index (CPI) inflation rates.] At Waco, Texas, the most destructive flood ever known occurred on the 28<sup>th</sup>. Fine cotton plantations along the banks of the Brazos River were completely submerged. By the evening of the 30<sup>th</sup>, even though the Brazos River had fallen seven feet, there were still about one hundred and fifty dwellings and business houses submerged. Seventeen bridges in McLennan County were washed away by the flood. It is estimated that the damage, independent of that sustained by the railroads, aggregates to \$100,000 [\$2.4 million in current dollars]. At Longview, Texas, the upper Sabine River overflowed on the 29<sup>th</sup>. At Laredo, Texas on the 29<sup>th</sup>, the Rio River was six feet higher than ever before known. At Marlin, Texas on the 30<sup>th</sup>, the surrounding country for a distance of several miles from the Brazos River was entirely submerged, resulting in great damage to all kinds of crops and the loss of much stock. At Calvert, Texas on the 31<sup>st</sup>, the Brazos River was five feet higher than any previous flood mark, and thousands of acres of land under cultivation were flooded.<sup>113</sup>

In 1885, the Brazos River in Texas in the *United States* flooded. On 26-29 May 1885, heavy rains fell over the central and northern portions of the Brazos drainage basin. The heaviest rainfall reported was 8.38 inches at Hewett, in McLennan County, Texas. Floods were reported from McLennan, Bosque, Falls, and Robertson counties on 29 May 1885. In Falls County the Brazos was five miles out of its banks, and all the bottomlands in the county were inundated. The loss at Waco on 29 May 1885 was placed at \$103,000. The crest of the flood reached the vicinity of Hearne on May 31; between the main Brazos and Little Brazos everything was submerged, and water was higher than anytime since 1852. The crest of the flood reached Austin County on 4 June 1885, and reached Columbia, in Brazoria County on 12 June. The water was within four inches of the highest water of the 1852 flood at Columbia. North of Brazoria County the overflow of 1885 was not as high as that of the flood of 1899 by four to six feet.<sup>123</sup>

A strong Atlantic storm struck Nova Scotia and Cape Breton Island in *Canada* on 1 & 2 June 1885 and caused considerable damage to shipping and other property. A second Atlantic storm passed eastward off the New Jersey coast of the *United States* on 5 June 1885, and thence eastward to the Grand Banks by the 7<sup>th</sup>. This storm was especially severe along the Newfoundland coast in *Canada*, and was considered the

most disastrous that had visited the island in forty years. It was estimated that more than fifty vessels were totally wrecked, while a large number were driven ashore and seriously damaged.<sup>120</sup>

On 3 June 1885 a destructive cyclone near Aden, *Yemen*. About 50,000*l.* damages reported. Ships sunk.<sup>90</sup>

On 5 June 1885, a most destructive storm moved eastward from the New Jersey coast in the *United States* and passed eastward to the Grand Banks in *Canada* by the 7<sup>th</sup>. This storm was considered the most disastrous that had ever visited Newfoundland coast during the previous 40 years. It was estimated that more than 50 vessels were totally wrecked, while a large number were driven ashore and more of less damaged.<sup>119</sup>

On the night of 7 June 1885, the Leon River rose and entered the eastern part of Leon, *Mexico*. Two persons were drowned, the Central railway track was washed away and the crops destroyed. Then on the next night, a tremendous waterspout broke a few miles above the town of Paso de Cuarenta, situated twenty miles from Lagos City. The flood was great and sudden, and practically annihilated Cuarenta. One hundred and seventy bodies were recovered. But many bodies at the time of the report had washed several miles down the valley and were still being discovered in the fields. The waterspout also struck Guanajuato where the damage was estimated at \$300,000 [\$7 million in today's dollars].<sup>113</sup>

The observer on the [14,110 foot] summit of Pike's Peak, Colorado in the *United States* reported the following, "during a thunderstorm, on the afternoon of the 28<sup>th</sup> [of June 1885], unusual electrical manifestations were observed. All pointed objects, even the tips of one's fingers and eyebrows, produced a buzzing noise, resembling the sound made by bees."<sup>113</sup>

At Wytheville, Virginia in the *United States* during the night of 30 June and 1 July 1885, a heavy frost prevailed. Then on the morning of 2 July, ice formed at Crockett's Depot, Virginia. This was the first time in the recollection of anyone here that ice has been known to form in Virginia during the month of July.<sup>113</sup>

On July 9<sup>th</sup> a fire started in the great cranberry belt of Burlington County, New Jersey, swept over hundreds of acres of valuable bogs. The continued drought made the grass and vines very flammable and the fire spread with lightning-like speed. Thousands of dollars of cranberries, nearly ripe for market, was destroyed. All the inhabitants of the vicinity were fighting the flames by building backfires and digging ditches. The fires could only be extinguished by heavy rainfall, as the bogs were honeycombed with fire. By the 24<sup>th</sup> it was reported, "The Jersey forest fires are now assuming most alarming proportions, and unless a heavy rain soon quenches the flames, they will accomplish the destruction of a number of towns and small settlements among the pines of Camden, Burlington, and Atlantic counties. They have never before burned so fiercely, and not since 1838 has the country been so dry and favorable for the spread of flames." And by the 25<sup>th</sup>, "The flames are still sweeping through the timber and bog lands of south Jersey, and a great and despairing cry for rain is going up from the people, who have been fighting the fires for the past two weeks. Should the wind change to the south or southwest, nothing can save the villages of Atco and Jackson from destruction. Late yesterday the fires reached the Maple Island district and came rapidly westward toward the *New Jersey Southern* railroad. A great effort was made to keep the flames from crossing the railroad track, and all the able-bodied men of Atco and Jackson, recruited with two car loads of section hands sent by the railroad company, ranged themselves along the track, at intervals, for eight miles, to fight the fast advancing flames. They were finally successful in confining the fire to the eastern side of the road."<sup>113</sup>

The following are the highest temperatures observed during the month of July 1885 in the *United States*:

<sup>113</sup>

Montgomery, Alabama	( 98.0° F, 36.7° C)	
Mobile, Alabama	( 94.0° F, 34.4° C)	
Prescott, Arizona	( 98.5° F, 36.9° C)	
Little Rock, Arkansas	(100.0° F, 37.8° C)	
Fort Smith, Arkansas	( 98.6° F, 37.0° C)	
San Francisco, California	( 78.0° F, 25.6° C)	
San Diego, California	( 81.8° F, 27.7° C)	
Denver, Colorado	( 97.3° F, 36.3° C)	
West Las Animas, Colorado	(105.2° F, 40.7° C)	
Pike's Peak, Colorado	( 57.0° F, 13.9° C)	
New Haven, Connecticut	( 93.5° F, 34.2° C)	
New London, Connecticut	( 92.4° F, 33.6° C)	
Fort Buford, Dakota	( 96.0° F, 35.6° C)	[now Fort Buford, Montana]
Fort Sully, Dakota	(104.5° F, 40.3° C)	[now Fort Sully, South Dakota]
Yankton, Dakota	(100.7° F, 38.2° C)	[now Yankton, South Dakota]
Cape Henlopen, Delaware	( 98.0° F, 36.7° C)	
Washington, D.C.	( 99.1° F, 37.3° C)	
Jacksonville, Florida	( 94.8° F, 34.9° C)	
Key West Florida	( 93.5° F, 34.2° C)	
Atlanta, Georgia	( 91.2° F, 32.9° C)	
Savannah, Georgia	( 95.2° F, 35.1° C)	
Boise City, Idaho	( 98.5° F, 36.9° C)	
Lewiston, Idaho	( 99.3° F, 37.4° C)

On 5 July 1885, a severe hailstorm struck many areas of New York in the *United States*. At Chatham, New York, the hailstones measured from one to three inches in diameter, fell thickly and banked up along fences like winter snowdrifts. Roofs were damaged, windows destroyed, trees stripped of their foliage, and small animals killed. The damage to roofs and windows was estimated at \$2,000. Total damage was estimated at \$50,000 [\$1.2 million in today's currency]. The hailstorm struck all parts of the Mohawk Valley at Canajoharie, New York causing great damage to windows and crops. At Oswego, New York, hailstones as large as pigeon's eggs fell, causing great damage to growing crops. At Port Jervis, New York, the hailstorm devastated a section, fifteen miles in length and ten miles in width, of grain, grass and vegetation. Hail fell to a depth of one foot.<sup>113</sup>

On 15 July 1885, a hailstorm struck an area four miles wide from Niagara to Reynolds, Dakota, in the *United States*. The damage to the wheat crop was estimated at \$200,000 [\$4.8 million in today's currency].<sup>113</sup>

On 24-25 August 1885, a hurricane struck South Carolina, Georgia and offshore North Carolina in the *United States* causing 25 deaths.<sup>141</sup>

On 23-25 August 1885, a storm of great strength moved along east Florida and south Atlantic coasts of the *United States*, causing great destruction on the south Atlantic coast, where the damage was estimated at \$1,500,000. [In present currency, that would be equivalent to \$36 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>119, 120</sup>

A storm [hurricane] passed over Charleston, South Carolina in the *United States* on 23-24 August 1885, where damage to the extent of nearly two millions of dollars was done, and twenty-one lives were lost. [In present currency, that would be equivalent to \$48 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>120</sup>

On 8 September 1885, a devastating tornado struck Washington Court House, Ohio in the *United States* almost completely destroying the city. The path of the tornado was about 250 feet in width. Of forty business establishments fronting Central Square, not one escaped destruction; besides these, about two hundred residences were demolished. (Another observer stated the tornado destroyed 300 buildings including many business houses, four railroad depots, three churches, and the gas works.) Six persons were killed, and more than one hundred seriously injured. Washington Court House is the county seat of Fayette County. Being the center of a rich agricultural district, with excellent railroad facilities, it had during the previous fifteen years, grown to be a business place of considerable importance. Its residents had beautified the town with tasteful dwellings, and its recently completed courthouse was one of the best in the state at that time. The damage caused by the tornado was about \$500,000. [In present currency, that would be equivalent to \$12 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>113</sup>

On 11 October 1885, a hurricane struck the coast of Labrador in Newfoundland, *Canada*. The storm extended over the whole length of coast from Battle Harbor, north to Cape Harrison. Eighty vessels were wrecked or driven ashore, and at least seventy men from the crews of the vessels lost their lives. (Another report estimated 300 lives lost to the storm.) Two thousand persons are now ashore in a destitute condition. Steamers were immediately dispatched to the scene of the disaster, with provisions, clothing and other comforts for the use of the castaways.<sup>113</sup>

On 12-15 October 1885, heavy storms struck the Labrador coast in *Canada* wrecking about 80 craft with about 300 lives lost.<sup>90</sup>

In 1885, Charleston, South Carolina in the *United States* was struck by a destructive hurricane.<sup>124</sup>

On 31 October 1885, a flood occurred at Charleston, West Virginia in the *United States* when the Kanawha River rose rapidly, sweeping away a large number of loaded barges along the river, causing the loss of about 500,000 bushels of coal. The losses are estimated at \$150,000 (approximately \$3.6 million in today's currency).<sup>113</sup>

On 6 November 1885, a tornado passed through Orrville, Frog Level, Logan's, and ended near Plantersville, Alabama in the *United States*. Thirty houses along with several mills and stables were destroyed, and the forests were leveled for miles. The path of the tornado was about one-half mile wide. Thirteen persons were killed and from forty to fifty injured. The storm appears to have been most severe in the vicinity of Plantersville, where a dwelling was blown to pieces with such violence that not even its foundation was left.<sup>113</sup>

On 27 November 1885, nineteen islanders from the island *Tristan da Cunha* set off in a boat in rough and stormy seas to intercept an iron barque *West Riding*, as it passed near the remote island. The settlement was low on supplies and at the verge of starvation and was hoping to obtain provisions from the ship. But a violent squall caused the boat to sink and 15 souls were lost at sea. The loss of these able bodied men (over 50%) to the small colony of 107 had a dramatic effect on the survival of this settlement. This was compounded by the fact that the following year, 1886, produced very poor crop yields driving the islanders to the brink of famine.<sup>105</sup>

Towards the end of November 1885, major floods occurred across almost the entire state of California in the *United States*. At San Luis Obispo, the storm produced heavy rainfall totaling 10.04 inches. All the bridges on the creek running through town, with one exception, were washed away. The city's water works was seriously damaged. In Los Angeles, washouts occurred on the *Southern Pacific* railroad, portions of the San Fernando tunnel caved in, the railroad bridge at Cajon Pass was carried away and it caused serious damage to other property. At Red Bluff, California, a portion of the track of the *California*

and Oregon railroad was washed away and the heavy rain dissolved 120,000 bricks in a kiln. Many bridges and other buildings were washed away at Santa Rosa, California. Then the heavy rainfall of 21 December caused parts of San Francisco to be underwater four feet deep. Cellars in the business part of the city were flooded damaging thousands of dollars of goods stored there.<sup>113</sup>

On 2 December 1885, a gale struck Colon, *Panama*, and its harbor. Approximately 100 lives were lost.<sup>197</sup>

A hurricane struck Colón, *Panama* in Central America on the 2<sup>nd</sup> and 3<sup>rd</sup> of December 1885. The damage to property was very heavy and the loss of life most serious. The following vessels were sunk with their crews: *Holden*, *Karnan*, *Blanche*, *Oataton*, *Atwood*, *Ariel*, *Veteran*, *Ocean*, *Lynton*, *Avelina*, *Stella*, *Catatina*, *Figri*, *Douglas*, and two others whose names could not be ascertained. The rain poured down in torrents, and there was a terrible gale of wind. The *Royal Mail's* new freight office was destroyed by the storm. Wharf number four, belonging to the *Panama* railroad, was almost demolished, the rails having been torn up and the earthworks destroyed by the force of the tornado.<sup>113</sup>

On 2 December 1885, a storm off Colon, *Panama* wrecked 15 vessels with 50 lives lost.<sup>90</sup>

In 1885 during the period between 13 June and 11 July, floods struck Shantung (now Shandong province) on the east coast of *China* at Hui-min and Chan-hua. Then during the period between 8 August and 8 November, a drought engulfed Hopei (now Hebei province) in northern *China* at Tung-kuang.<sup>153</sup>

---

**Winter of 1885 / 1886 A.D.** On 1-3 March 1886, heavy snowstorm struck northeast *England*. The storm stopped locomotion [made travel impossible].<sup>90</sup>

In the Atlantic Ocean, icebergs were very numerous together with thick field ice in April 1866 from N. 42° to N. 43°, between W. 49° and W. 50°. The icebergs, as a rule, were small. The southernmost iceberg was reported in N. 40° 51', W. 46° 59'. One iceberg was observed as far eastward as W. 30°; this is the most eastern limit of icebergs ever reported to this office during the month of April.<sup>134</sup>

The winter of 1885-86 in Bradford County, Pennsylvania in the *United States* was a peculiarly unseasonable one. During the last week of August, there was a light snowstorm at Barclay. On October 15<sup>th</sup>, the highlands were covered by a light fall of snow. On 23-25 November, snow fell to a depth from two to three feet [0.6 – 0.9 m]. But this snow soon disappeared. December was mild and New Year's was a beautiful summer-like day (but not so warm as 1 January 1876). It turned cold the second week in January and on the 13<sup>th</sup>, thermometers registered -12° F [-24° C]. The cold weather prevailed about two weeks with good sleighing. Most of February and March were mild. April was warm and spring remarkably early. By Easter time (25<sup>th</sup> April), cherry and peach trees were in bloom.<sup>178</sup>

---

**1886 A.D.** A destructive tornado struck Sauk Rapids, Saint Cloud, and Rice Station, Minnesota, and vicinity, on 14 April 1886. An eyewitness at Saint Cloud provided an account of the tornado formation: "The tornado must have formed rapidly, and just about over the lake, as it was there when first noticed. It was very black, and seemed to be constantly in motion. It was moving rapidly across the lake when first seen, was flat and oval in shape, with a sort of spiral at each of the extremities, one extending upward and the other downward. It was peculiar in appearance, and I watched it closely. After having passed across the lake it seemed to stop. The movement resembled that of a fan opening and closing, and it remained stationary for some seconds. Almost instantly the form changed. Instead of lying flat, it seemed to turn on end and the spirals that ran up from the other end formed a part of a big double spiral. It had a movement that was peculiar, as if there was a commotion within it. The course was rapid and as soon as the big spiral was formed it began moving at a terrific rate in a course that was somewhat zigzag. It dropped down to the ground, and I saw the entire work of ruin. The course of the tornado after crossing the river was rather sinuous, though hardly as much so as before. It swept across the country, and in five minutes from the time

of reaching Sauk Rapids the work of destruction was done. There were two clouds at first that came together directly over the lake, and then turned on end and swept onward.”

In the track of the tornado at Sauk Rapids, stood the Manitoba freight house and cars filled with freight. The tornado lifted the heavy cars from the tracks, and cast them in shapeless masses. The freight house was totally wrecked. Iron rails were torn from the track and twisted like wires; \$3,000 worth of freight was whirled through the air and thrown into heaps and scattered by piecemeal over an area of a quarter of a mile. Fifteen freight cars were demolished. Operators in the telegraph office and employees at the freight depot saw the tornado coming and fled to the cellars and thus escaped. Sauk Rapids was almost completely destroyed. Not a single business house was left standing in the main street, and many dwellings were demolished. The courthouse was left a heap of ruins, and several of the county officers killed. The Union School House, two churches, the post-office, a flourmill, and a large machine shop were completely destroyed in about forty seconds. The tornado caused 250 buildings to be destroyed; 74 persons killed and 133 wounded. The loss of property was estimated at \$400,000. [In present currency, that would be equivalent to \$10 million in damages based on the Consumer Price Index (CPI) inflation rates.] A heavy iron truss bridge across the Mississippi at Sauk Rapids was wrecked, and parts of it carried in the cloud a considerable distance before being dropped. Men, women, and children, as well as horses and cattle, were lifted into the air and dashed to the ground. Many of the bodies had a blackened appearance, as if they had been scorched, while frequently the clothing was completely torn from them. Every description of this tornado speaks of it as being accompanied by a roaring and peculiar crackling sound, which became deafening as it approached, also that the black, oval-shaped cloud with a tube turning on the ground was seen by a number of persons, whose lives were saved by retreating to cellars and other underground apartments. The track of the tornado was about twenty miles long and twenty rods (330 feet) wide; immense damage was done to farm property, orchards, forests, and stock. During the passage of the tornado, and afterwards, rain fell in torrents.<sup>134</sup>

Very heavy rainfalls occurred in the Southern States and Ohio Valley in the *United States* from the 26 March to 2 April 1886. The rains were excessively heavy in eastern Tennessee and northern Alabama, and caused unusually destructive floods:<sup>134</sup>

— At Montgomery, Alabama, the flood of the latter part of March and first of April is considered the most disastrous that has ever occurred in this vicinity. The Alabama River, its tributaries, and all of the numerous rivers and creeks of this state overflowed. On the 1<sup>st</sup> the city was completely surrounded by water, and all the low-lying part flooded. Much property was destroyed. Thousands of cattle, horses, mules, and hogs were swept away and corn, cottonseed, and provisions were destroyed. Nearly all the factories in the city stopped work on account of the flood. The only illumination in the city was by candles and oil. Viewed from the dome of the Capitol, the highest point in the city, was a lake of water to the north and west, fully seven miles square.

— In the Birmingham, Alabama region, the greatest disaster by flood in this state was along the Alabama and Coosa Rivers, in Coosa, Elmore, Montgomery, Autauga, and Dallas Counties. At Wetumpka, the county seat of Elmore County, the water was four feet deep in the business houses of the town, and the occupants were driven out of many of their residences. Many bridges and mills were destroyed in Elmore County, and large areas of the best farming country were underwater.

— At Augusta, Georgia, the river attained its maximum height at noon of April 1<sup>st</sup>. Hamburg, South Carolina, on the opposite side of the river, was entirely surrounded by water; railroad travel over the bridge crossing the Savannah was suspended; all the lower portions of the city were underwater. The railroad companies sustained heavy losses, while the damage suffered by the factories and other property in Augusta exceeded \$20,000.

— At Rome, Georgia, the gas-works were submerged on April 2<sup>nd</sup>. The estimated damage from this flood is placed at \$500,000. [In present currency, that would be equivalent to \$12 million in damages based on the Consumer Price Index (CPI) inflation rates.] The entire town, except on the hills, was underwater from one to eleven feet, and fifteen dwellings were washed away. The water came so rapidly that it was impossible for people to save furniture, and belongings.

— At Columbus, Georgia, the Chattahoochee River began falling on the April 1<sup>st</sup>, leaving behind mud throughout the city. Columbus received around \$50,000 damage from the flood. [\$1.2 million in today's currency] Plantations below [downstream of] Columbus were reported covered with water from five to eight feet deep.

— At Chattanooga, Tennessee: the river rose steadily on April 1<sup>st</sup>. The city was surrounded by water, the fifth ward being almost submerged; the water-works shut down owing to the flood extinguishing the fires. Several persons were drowned and many on the outskirts of the city had their homes washed away. On the 2<sup>nd</sup>, the water was fifty-three feet above low-water mark. At other places along the Tennessee River, the damage is reported very serious; more than fifty houses floated past Whitesburg, Alabama.

— At Nashville, Tennessee, the Cumberland River reached its highest stage on April 10<sup>th</sup>. The river-gauge marked forty-nine feet, being five feet below the high-water mark of 1882. Great loss was suffered by farmers; the destruction of the wheat crop in the Cumberland lowlands was estimated at half a million dollars [\$12 million in today's currency], necessitating a second plowing of the ground and the planting of corn or some other grain.

— At Cairo, Illinois, the Ohio River was very high from April 1<sup>st</sup> to the 27<sup>th</sup>, causing great suffering and loss of property. In Cairo, the *Illinois Central* Railroad was damaged by the track, near the river, being undermined and torn away. Traffic was suspended on this railroad for several days. Many families, between Cairo, Illinois and Paducah, Kentucky, were compelled to move their goods to the second story for safety. The backwater from the Ohio River inundated the land on the Missouri side for a distance of five miles, causing great loss to the farmers, their livestock being drowned, growing crops buried in mud, and fences carried away. Between Cairo, Illinois and Memphis, Tennessee, the country resembled a lake, the water spreading for miles through the bottoms, with all landings submerged, and at some points only roofs of houses being visible. At Metropolis, Illinois, many houses were submerged, being accessible only by water; the lowlands were flooded from ten to twenty feet.

— At Louisville, Kentucky during the first week of April, the Ohio River at all points was above the flood-line, caused by melting snow and continuous heavy rains. In the lowlands many houses were abandoned. Wharf boats were moored to brick houses that stand two hundred feet back from the wharf, and craft floated within a stones' throw of Main Street.

— At Montreal, *Canada*, floods struck the city from April 18-20. Businesses were at a complete standstill. Hundreds of wholesale and retail houses were closed, being inaccessible except by boats. The suffering of the residents in the flooded part of the city was intense. In the neighborhood of Griffintown, thousands of persons were forced to the upper part of their houses by the water. Twenty-four streets were reported covered with water to the depth of five feet.

On 17-18 April 1886, there was a great inundation of lower town of Montreal, *Canada*. The flood produced about 500,000 *l.* damage and much privation.<sup>90</sup>

On 12 May 1886, a storm struck Madrid, *Spain*. Approximately ninety lives were lost.<sup>197</sup>

On 12 May 1886, a destructive hurricane struck Madrid, *Spain*. Thirty-two lives were lost and 320 people were wounded.<sup>90</sup>

On 12-15 May 1886, destructive tornadoes struck southern Ohio, Indiana, and Illinois in the *United States*.<sup>90</sup>

On 16 June 1886 at Alexandria, Louisiana in the *United States*, 22.27 inches of rain fell.<sup>116</sup>

On 17-24 June 1886, a hurricane struck *Cuba*. Those that drowned were not a few.<sup>141</sup>

On 28-29 June 1886, a hurricane struck *Jamaica* and *Cuba*. At least 18 lives were lost in *Jamaica*. In *Cuba*, some people died at sea and others on land.<sup>141</sup>

In July 1886 two West Indies storms [hurricanes] advanced northward from the vicinity of *Cuba*, neither of which were very destructive in their character.<sup>120</sup>

On 10 August 1886, violent storm struck northeast *France*. The storm caused much damage at Rheims and Nancy.<sup>90</sup>

In August 1886, two severe storms of great strength moved northwest over the Caribbean Sea, one recurving northward over *Cuba* and the *Bahamas*, and the other passing into the Gulf of Mexico.<sup>119, 120</sup>

In August 1886, a storm [hurricane] appeared to the eastward of the *Barbados* on the 15<sup>th</sup>, and thence passed westward over the Caribbean Sea to about N. 14°, W. 76°, and during the 22<sup>nd</sup> passed northward over *Cuba*, in about W. 81°; it then moved northeastward along the course of the Gulf Stream to Newfoundland, *Canada* by the 28<sup>th</sup>. This storm was particularly severe, causing loss of life and destroying crops and property of immense aggregate value.<sup>121</sup>

On 16 August 1886, a hurricane struck at St. Vincent in the *Caribbean*. The hurricane caused great loss of life and property.<sup>90</sup>

On 16 August 1886, there was an inundation of Mandalay in central *Burma* from the Irrawaddy River. There was great loss of life and property. By 25 August, the waters were subsiding.<sup>97</sup>

On 18 August 1886, there was a great inundation at Mandalay, *Burma*.<sup>90</sup>

On 17-20 August 1886, a hurricane struck *Cuba* and Indianola, Texas in the *United States*. Some accounts claim more than 20 deaths, while others cite more than 28.<sup>141</sup>

On 19-20 August 1886, a very destructive storm in the west Gulf. At Indianola, Texas in the *United States*, not a building was left standing, and the barometer fell to about 28.00 inches (711 millimeters). [According to the barometric pressure, this hurricane would have been rated at least a Category 3 hurricane at this location.]<sup>119, 120</sup>

On 19-20 August 1886, a storm completely destroyed Indianola, Texas in the *United States* (which was nearly swept away in September, 1875 by an earlier hurricane). Not a house was left standing, and over twenty lives were lost. Galveston, Texas also suffered great damage.<sup>120</sup>

On 19-20 August 1886, the town of Indianola, Texas, in the *United States* was entirely destroyed by storm waves from the Gulf of Mexico.<sup>124</sup>

On 21-26 August 1886, a hurricane struck *Cuba*, crushing many of its inhabitants.<sup>141</sup>

In September 1886, a storm [hurricane] off the west Gulf coast moved northward to the middle Texas coast of the *United States* from the 22<sup>nd</sup> to 24<sup>th</sup>.<sup>120</sup>

In October 1886 a storm of pronounced strength advanced from the Caribbean Sea over the Gulf of Mexico, west of the 90<sup>th</sup> meridian.<sup>119</sup>

On 8-12 October 1886, a very destructive storm [hurricane] moved from south of *Cuba* to the west Gulf coast of the *United States*, and dissipated over the west Gulf states.<sup>120</sup>

On 12 October 1886, a violent gale struck Texas, in the *United States*. This gale caused an inundation in which over 250 persons were drowned.<sup>90</sup>

On 12-13 October 1886, a hurricane struck eastern Texas in the *United States* causing between 126 and 150 deaths.<sup>141</sup>

On 15-16 October 1886, severe gale [in *Great Britain*] caused very great destruction on sea and land.<sup>90</sup>

A great cyclone struck Bengal [*India and Bangladesh*] on October 31. A tidal wave (storm surge), extending, it was estimated, over 3,000 square miles, being in many places more than 20 feet deep. The loss of life was estimated at 215,000, while the destruction of property was incalculable.<sup>47</sup>

On 2 December 1886, a storm was central south of Nova Scotia, *Canada*, and moved thence to the British Isles by the 8<sup>th</sup>, on which latter date it was central near Aberdeen, *Scotland*. The fall of the barometer over England was probably without a parallel in the history of that country, the barometric minimum reported being 27.45 inches (697 millimeters) at Orme's Head, *Wales* and a reading of 27.48 inches (698 millimeters) was noted at Liverpool, *England*. At Leith, *Scotland*, the barometer fell with great rapidity during the day, reaching 27.65 inches (702 millimeters) at 19 hours 30 minutes. This was reported as being by far the lowest barometer reading that occurred at Leith since January 26, 1884, on which date the lowest reading ever made at that place, 27.45 inches (697 millimeters) was recorded at 10 p.m.<sup>120</sup>

On 8-9 December 1886, destructive gale and storm struck, especially in southern and western *England*. The storm caused many wrecks and loss of life.<sup>90</sup>

*Also refer to the section 1880 A.D. – 1886 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1886 / 1887 A.D.** On 26-27 December 1886, a destructive snowstorm struck, especially in eastern and southern *England*. The snowstorm caused many wrecks; stopped telegraphic and railway communications; and blew down trees.<sup>90</sup>

The following are the lowest temperatures observed during January 1887 in the *United States*:<sup>114</sup>

Montgomery, Alabama	( 12.9° F, -10.6° C)	
Mobile, Alabama	( 15.9° F, -8.9° C)	
Prescott, Arizona	( 11.2° F, -11.6° C)	
Fort Apache, Arizona	( 10.5° F, -11.9° C)	
Little Rock, Arkansas	( 7.0° F, -13.9° C)	
Fort Smith, Arkansas	( -4.0° F, -20.0° C)	
San Francisco, California	( 41.5° F, +5.3° C)	
San Diego, California	( 38.0° F, +3.3° C)	
Denver, Colorado	(-17.6° F, -27.6° C)	
Pike's Peak, Colorado	(-20.7° F, -29.3° C)	
New Haven, Connecticut	( -5.4° F, -20.8° C)	
New London, Connecticut	( -0.1° F, -17.8° C)	
Fort Buford, Dakota	(-45.2° F, -42.9° C)	[now Fort Buford, Montana]
Yankton, Dakota	(-29.1° F, -33.9° C)	[now Yankton, South Dakota]
Washington, D.C.	( 6.2° F, -14.3° C)

La Crosse, Wisconsin	(-28.9° F, -33.8° C)	

The depth that rivers and lakes froze in January 1887 in the *United States*:<sup>114</sup>

\* At Cairo, Illinois, the *Mississippi River* was frozen over from the 1<sup>st</sup> to the 19<sup>th</sup> with ice sufficiently firm to allow heavy wagons to cross. At La Crosse, Wisconsin; and Dubuque, Davenport and Keokuk, Iowa; and intervening points, the *Mississippi River* was frozen solid throughout the month.

\* At Cairo, Illinois and points north, heavy floating ice rendered navigation on the *Ohio River* impossible on the 2<sup>nd</sup>.

\* At Baltimore, Maryland, the harbor was covered with ice 2 to 5 inches thick on the 4<sup>th</sup>.

\* At Lynchburg, Virginia, the *James River* was frozen over on the 3<sup>rd</sup>.

\* At Leavenworth, Kansas, and points north, the *Missouri River* was frozen over the entire month.

The winter of 1886-87 in Bradford County, Pennsylvania in the *United States* was moderate. A total of

77 inches [2.0 m] of snow fell in many light storms. But there was little good sleighing, except for the first part of January. On November 12<sup>th</sup> snow fell to the depth of several inches but quickly disappeared. The coldest day was January 4<sup>th</sup>, when the temperature fell to -15° F [-26° C]. Bluebirds and robins appeared in the end of February. There were many warm days in February and March but most of April was cold with many showers and snow squalls. On April 18<sup>th</sup>, there was a big storm, snow falling to the depth of 14 inches [36 cm]. May began with warm temperatures.<sup>178</sup>

In northeastern and central Texas, southern and western Louisiana, southern Mississippi, southwestern Alabama, and the southwestern part of the Indian Territory in the *United States*, the rainfall during 1886 was over ten inches below the normal. This drought was especially severe in central Texas, and inflicted large losses on the agricultural and cattle interests. During the summer of 1886, when other parts of Texas were suffering from drought, copious rainfalls occurred at San Antonio, Texas and over the surrounding country, but since the first of October, 1886, very little rain fell at that station, the total precipitation of the four months from 1 October 1886, to 31 January 1887, being only 1.36 inches. Water pools have dried up and ranchmen were forced to drive their stock five to ten miles for water. Grass in some sections has become parched and innutritious. Cattlemen say that but for the abundant growth of cactus, large numbers of cattle would have starved. At Fort Elliott, in the "Panhandle" district, one of the great cotton and cattle-raising sections of the state, during the months of November, December, and January only 0.28 inch of rain fell. Reports from Dallas, Fort Worth, Sherman, and Waco, situated in the midst of the grain-growing districts of Texas, said the wheat fields were dry and dusty. The observer at Rio Grande City stated that a severe drought prevailed in that district during January. In some places the ground was entirely bare and very dusty, and during high winds which occurred there on the 17th, 19th, 20th, 21st, 23d, and 27th, very heavy clouds of dust and sand filled the atmosphere.<sup>114</sup>

At Fort Assiniboine, Montana in the *United States* on the night of the 2<sup>nd</sup> / 3<sup>rd</sup> of February 1887, the minimum thermometer registered -55.4° F (-48.6° C). Reports from the cattle ranges state that many cattle were dying from the effects of extreme cold weather. Stagecoaches were delayed three or four days on account of deep snow drifts. At Fort Maginnis, Montana, during the same night, the temperature fell to -42.0° F (-41.1° C). In the vicinity of Fort Maginnis, and over the entire territory, large numbers of cattle perished from cold and starvation. At Poplar River, Montana, the temperature on the February 2<sup>nd</sup> was -26.0° F (-32.2° C) and on the 3<sup>rd</sup> -44.6° F (-42.6° C). Numbers of cattle in that vicinity perished from the extreme cold. Fort Buford, North Dakota reported heavy snows and gale force winds on 1 February caused deep snowdrifts, which blockaded all roads. This was also true at Fargo and Jamestown, North Dakota and numerous other places throughout the territory. Great losses were incurred by cattlemen, the livestock perished from the effects of cold and lack of food, the dead grass upon which they feed during the winter being covered to a greater depth than usual with crusted snow. There was a continued succession of blizzards, deep snows and very low temperatures in this region during February. Around 17 February 1887, a large snow slide occurred in Las Animas Cañon between Durango and Silverton, Colorado, which completely filled the canyon and a railroad train passing through it under more than seven hundred feet of snow. At Marquette, Michigan, during the afternoon of the 17<sup>th</sup> and night of the 17-18<sup>th</sup> a heavy snowstorm, accompanied by high wind, prevailed. This was one of the worst storms of the winter, the snow drifting in places to a depth of from six to twelve feet. In Minnesota on the 26<sup>th</sup>, nearly all railroad lines in the state were blockaded by snow. At Roseburg, Oregon, cattlemen in the Umpqua Valley and surrounding country suffered considerable loss in sheep and cattle during February on account of the heavy snowfall, the total depth for the month at Roseburg being 27.2 inches which was abnormal for this area.<sup>114</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

The extremely low temperatures that prevailed in the Southern States of the *United States* on the March 18-19<sup>th</sup> and 29-30<sup>th</sup> were accompanied by frosts, which were destructive to vegetables and blossoms of fruit trees. South Carolina reported that the first frost did considerable damage to early vegetables and fruits, while the freeze on the 29-30<sup>th</sup> caused the fruit, which survived the first frost to succumb to the second. All the early varieties of peaches were killed. Plums and cherries suffered severely. Strawberries were set back two weeks. In some cases potatoes were injured, while beans, cucumbers and squashes were killed. The frost affected Georgia, North and South Carolina, Kentucky, Arkansas and Illinois. Also spotty frost damage was observed as far south as Manatee, Florida. "Several farmers have informed me of queer streaks in which frost is appearing. In one field, where tomatoes were planted, every plant was killed, excepting two rows in about the middle of the field. Another farmer noticed in a field of beans that frost killed in spots." <sup>114</sup>

A snowstorm on March 29-30<sup>th</sup>, 1887 dumped 12.4 inches of snow on Louisville, Kentucky in the *United States*. At Lexington, Kentucky the weight of the snow causes several roofs to cave in. <sup>114</sup>

---

### **1887 A.D. – 1889 A.D. China and Asia Minor. Famine**

In 1887-89, there was a famine in *China*.<sup>90</sup>

In 1887, there was a famine in *Asia Minor*.<sup>90</sup>

---

**1887 A.D.** On 5 March 1887, a cyclone struck the Gulf of Carpentaria off the coast of Queensland and Northern Territory in *Australia*. The cyclone flooded most of Burketown, where 7 of its 138 residents died. The cyclone caused an 18-foot (5.5 meter) storm surge at Albert River Heads.<sup>99</sup>

A protracted drought continued in Texas and other states in the *United States* during March 1887. <sup>114</sup>

— At New Ulm, Texas, the total precipitation for January, February, and March 1887, was 4.36 inches, which was 9.39 inches below the average of the same months during the past fifteen years.

— San Antonio, Texas reported that the drought in this section continued, little rain had fallen since the first frost which occurred 18 November 1886; cattle and horses were dying in large numbers, chiefly from want of water. Market reports indicate that the number of fallen hides (or hides from cattle that have died on the range) handled this year was unprecedentedly large. Several cattle owners in Atascosa and Frio Counties were shipping their herds to the Indian Territory for pasturage. The agricultural outlook for this section was decidedly gloomy. Corn was coming up slowly, but if rain did not fall soon it could not make a stand, while oats, barley, and all small grain were regarded as complete failures.

— Fort Grant, Arizona reported the total rainfall of the month was a few drops on March 22<sup>nd</sup>. The soil at the end of the month was exceptionally dry for the season and rain was badly needed. This section of the territory depends, from spring until early autumn, for its supply of water on the melted snow from the Graham Mountains, about five miles to the northeast. These mountains were usually covered with snow at this season of the year. The absence of unmelted snow in this range during March indicates a severe drought for the coming summer, which will greatly damage the extensive cattle interests of this vicinity.

— At Fort Smith, Arkansas at the end of the March and also throughout Arkansas and the Indian Territory, vegetation of all kinds was suffering from lack of rain. Farmers stated that the ground was too hard to plow, and that crops already planted would be a failure unless rain fell shortly. The Arkansas River was very low and the cotton and lumber industries of this town were at a standstill, awaiting a rise in the river. Navigation was practically closed at all river ports above this place. The Canadian River in the Indian Territory, a tributary of the Arkansas, was lower than it has ever been before within the memory of the oldest settlers.

— At Wellington, Kansas, March was exceedingly dry, the total precipitation being only 0.22 inch. The growth of vegetation of all kinds was greatly delayed by want of moisture. At Salina, Kansas, the total rainfall during March was only 0.01 inch, and crops were beginning to feel the effects of the drought.

— On 12 March 1887 at Key West, Florida a thunderstorm produced 1.36 inches of rainfall, which ended a drought that had prevailed for several months and relieved the people of many inconveniences and discomforts. It was the only heavy rainfall since 26 October 1886, and the majority of the cisterns of the town had become dry.

In April 1887, very little rain fell in the southeastern quarter of the *United States*. The region of greatest deficiency extended from central Texas eastward to the south Atlantic coast. Although a rainstorm crossed Texas, the Indian Territory, and Kansas on the April 18<sup>th</sup>, yet at the end of the month, the long drought was practically unbroken, except in Kansas, where the rainfall of the 18<sup>th</sup> was quite heavy. In Texas the drought extended from the western grazing country eastward to Louisiana, but decreased in severity as it approached the eastern boundary. In central and eastern Texas, embracing the principal cotton-growing counties of the state, only a few light showers fell during the month. Reports from places in Missouri, Iowa, and northern Illinois state that crops were suffering from the lack of rain; in central Missouri considerable rain fell during the latter half of the April.<sup>114</sup>

— At San Antonio, Texas, although light rain fell on several occasions, the total precipitation for the month was only 0.60 of an inch. Reports from adjoining counties indicate that their condition was even worse than the country immediately adjacent to San Antonio. The dry grass from last year was exhausted, and as none grew during the spring, the only forage for cattle was the prickly pear. Livestock were dying rapidly. Numbers of families deserted their homes and farms in search of a more favored locality. All hopes of making the usual grain crop that season were abandoned.

— New Ulm, Texas reported that all interests were suffering from the drought; cattle were in need of grass and water: corn and cotton were in bad condition and would have to be replanted if rain fell. The normal April rainfall for this section, as deduced from the observations of the past fifteen years, was 3.84 inches; the total of April 1887 was only 0.17 inch, and was the least that has fallen in any April up to that time. The normal rainfall of the seven months ending April 30<sup>th</sup> was 31.70 inches; the total amount of the corresponding months in 1886-'87 was 7.92, a deficiency of 23.78 inches.

— Belleville, Kansas reported that the first seventeen days of April were remarkable for dry weather and the frequency and force of dust storms. On the 3<sup>rd</sup> and 9<sup>th</sup>, during windstorms, dust filled the air to such an extent that buildings one hundred feet distant were visible only at intervals.

— Independence, Kansas reported that the first heavy rain in this section since 4 September 1886, fell on the 16<sup>th</sup> and 17<sup>th</sup>. They also reported that on the 3<sup>rd</sup> that during a windstorm, the sky was obscured by dust.

— Salina, Kansas reported April was unusually dry. The total precipitation, 2.06 inches, was the least that had fallen in any April during the past five years.

— Grand Coteau, Louisiana reported that the total amount of rainfall for the five months from December 1886 to April 1887, inclusive was 12.20 inches, less than one-half of the normal amounts. The soil was dry and crops late.

— At Tucson, Arizona cattle were dying in large numbers from want of water and food; the Rillito River was dry for the first time in many years.

[In general, I have excluded meteors from this weather chronology because basically they are not weather phenomena. But I felt inclined to make an exception in this case because the account was really rather remarkable. Captain. C. D. Swart, of the Dutch bark *J. P. A.*, made the following report observed by him at 5 p.m. on 19 March 1887, in the Atlantic Ocean at 37° 39' N., and 57° 00' W. “During a severe storm saw a meteor in the shape of two balls, one of them very black and the other illuminated. The illuminated ball was oblong, and appeared as if ready to drop on deck amidships. In a moment it became as dark as night above, but below, on board and surrounding the vessel, everything appeared like a sea of fire. The ball fell into the water very close alongside the vessel with a roar, and caused the sea to make tremendous breakers, which swept over the vessel. A suffocating atmosphere prevailed, and the perspiration ran down every person's face on board and caused everyone to gasp for fresh air. Immediately after this solid lumps of ice fell on deck, and everything on deck and in the rigging became iced, notwithstanding that the thermometer registered 19° Centigrade [66° F]. The barometer during this time oscillated so as to make it impossible to obtain a correct reading. Upon an examination of the vessel and rigging no damage was noticed, but on that side of the vessel where the meteor fell into the water the ship's side appeared black and the copper plating was found to be blistered. After this phenomenon the wind increased to hurricane force.”]<sup>114</sup> {I would interpret these observations as follows: As the fragment from a comet struck Earth's outer atmosphere, it exploded into two masses, the fast moving leading fragment which appeared as a bright ball of fire and the trailing slower moving debris field. The leading fragment struck first, causing impact effects by producing a blast of light and thermal radiation (heat), tsunami type waves and an atmospheric blast wave. This caused scorching on one side of the ship, waves that washed over the ship

and hurricane force winds. The trailing debris field was large enough and dense enough to block out light (dark as night) near the vicinity of the ship. When the comet debris field struck the ship, it caused clumps of ice to fall on the ship's deck and ice the rigging. Comets are composed of water ice and volatile ices including carbon monoxide, carbon dioxide, methane and ammonia. The volatile ices would sublimate and quickly transition from ice to gas and essentially disappear. The blast wave and reflected blast waves from the atmospheric and ocean impacts would register as pressure waves causing the ship's barometer to oscillate wildly.}

On 21 April 1887, a severe hailstorm struck Yazoo, Mississippi in the *United States*. Hailstones fell for a few minutes as large as hens' eggs, breaking windows and beating leaves and young fruit from trees. Much damage was done to growing crops. At Rolling Fork, Mississippi, several hailstones were found that measured five inches in circumference. Holes were broken in roofs, and trees were partly stripped of foliage.<sup>114</sup>

On 22 April 1887, a cyclone struck off the coast of *Western Australia*. The cyclone struck a pearling fleet off what was then called Ninety Mile Beach. It killed 140 people, and destroyed four schooners and eighteen luggers.<sup>99</sup>

On 23 May 1887, a destructive cyclone at Calcutta [now Kolkata], *India*.<sup>90</sup>

The following are the highest temperatures observed during July 1887 in the *United States*:<sup>114</sup>

Montgomery, Alabama	(100.4° F, 38.0° C)
Mobile, Alabama	( 97.5° F, 36.4° C)
Fort Grand, Arizona	( 98.5° F, 36.9° C)
Yuma, Arizona	(114.0° F, 45.6° C)
Little Rock, Arkansas	(100.0° F, 37.8° C)
Fort Smith, Arkansas	(103.8° F, 39.9° C)
Lead Hill, Arkansas	(109.0° F, 42.8° C)
San Francisco, California	( 69.9° F, 21.1° C)
Los Angeles, California	( 98.1° F, 36.7° C)
Red Bluff, California	(112.0° F, 44.4° C)
Denver, Colorado	( 92.1° F, 33.4° C)
Pike's Peak, Colorado	( 54.8° F, 12.7° C)
New Haven, Connecticut	( 90.2° F, 32.3° C)
Washington, D.C.	(102.8° F, 39.3° C)
Cedar Keys, Florida	( 92.1° F, 33.4° C)
Pensacola, Florida	( 98.6° F, 37.0° C)
Atlanta, Georgia	(103.8° F, 39.9° C)
Boise City, Idaho	(100.3° F, 37.9° C)
Chicago, Illinois	( 99.8° F, 37.7° C)
Cairo, Illinois	( 97.5° F, 36.4° C)
Sandwich, Illinois	(103.0° F, 39.4° C)
Indianapolis, Indiana	(100.8° F, 38.2° C)
Vevay, Indiana	(105.0° F, 40.6° C)
Terre Haute, Indiana	(102.0° F, 38.9° C)
Fort Sill, Indian Territory	(105.2° F, 40.7° C) [now Fort Sill, Oklahoma]
Dubuque, Iowa	(100.6° F, 38.1° C)
Clinton, Iowa	(104.0° F, 40.0° C)
Des Moines, Iowa	(101.7° F, 38.7° C)
Leavenworth, Kansas	(101.7° F, 38.7° C)
Dodge City, Kansas	( 99.4° F, 37.4° C)
Louisville, Kentucky	(101.7° F, 38.7° C)
New Orleans, Louisiana	( 95.8° F, 35.4° C)
Shreveport, Louisiana	(103.8° F, 39.9° C)

Eastport, Maine	( 83.8° F, 28.8° C)	
Portland, Maine	( 95.8° F, 35.4° C)	
Baltimore, Maryland	(101.8° F, 38.8° C)	
Boston, Massachusetts	( 95.1° F, 35.1° C)	
Marquette, Michigan	( 97.0° F, 36.1° C)	
Grand Haven, Michigan	( 89.7° F, 32.1° C)	
Saint Vincent, Minnesota	( 88.6° F, 31.4° C)	
Saint Paul, Minnesota	( 93.9° F, 34.4° C)	
Vicksburg, Mississippi	( 95.3° F, 35.2° C)	
Saint Louis, Missouri	(100.0° F, 37.8° C)	
Fort Assiniboine, Montana	( 93.1° F, 33.9° C)	
Helena, Montana	( 91.5° F, 33.1° C)	
North Platte, Nebraska	( 99.4° F, 37.4° C)	
Omaha, Nebraska	(103.3° F, 39.6° C)	
Winnemucca, Nevada	( 95.2° F, 35.1° C)	
Mount Washington, New Hampshire	( 66.0° F, 18.9° C)	
Atlantic City, New Jersey	( 97.0° F, 36.1° C)	
Santa Fe, New Mexico	( 86.8° F, 30.4° C)	
Buffalo, New York	( 92.1° F, 33.4° C)	
New York City, New York	( 94.0° F, 34.4° C)	
Charlotte, North Carolina	(102.2° F, 39.0° C)	
Wilmington, North Carolina	(100.0° F, 37.8° C)	
Kitty Hawk, North Carolina	(107.0° F, 41.7° C)	
Bismarck, North Dakota	( 95.6° F, 35.3° C)	
Cincinnati, Ohio	(101.2° F, 38.4° C)	
Sandusky, Ohio	( 98.0° F, 36.7° C)	
North Lewisburg, Ohio	(102.0° F, 38.9° C)	
Roseburg, Oregon	( 93.1° F, 33.9° C)	
Portland, Oregon	( 93.0° F, 33.9° C)	
Pittsburg, Pennsylvania	(101.1° F, 38.4° C)	
Philadelphia, Pennsylvania	( 99.9° F, 37.7° C)	
Block Island, Rhode Island	( 83.4° F, 28.6° C)	
Charleston, South Carolina	( 97.9° F, 36.6° C)	
Columbia, South Carolina	(104.0° F, 40.0° C)	
Deadwood, South Dakota	( 89.8° F, 32.1° C)	
Memphis, Tennessee	( 99.0° F, 37.2° C)	
Knoxville, Tennessee	(100.2° F, 37.9° C)	
Fort Elliott, Texas	( 98.7° F, 37.1° C)	
Brownsville, Texas	( 91.6° F, 33.1° C)	
Salt Lake City, Utah	( 97.9° F, 36.6° C)	
Lynchburg, Virginia	(101.8° F, 38.8° C)	
Norfolk, Virginia	(102.5° F, 39.2° C)	
Olympia, Washington Territory	( 86.2° F, 30.1° C)	[now Olympia, Washington]
Spokane Falls, Washington Territory	( 94.2° F, 34.6° C)	[now Spokane Falls, Washington]
Milwaukee, Wisconsin	( 99.9° F, 37.7° C)	
La Crosse, Wisconsin	( 98.4° F, 36.9° C)	
Cheyenne, Wyoming	( 89.5° F, 31.9° C)	

On 11-15 June 1887, a hurricane struck *Cuba*. Some people drowned.<sup>141</sup>

On 12 June 1887, a severe 3-hour hailstorm struck Nicolaus, California in the *United States*. Whole fields of barley were stripped entirely clean of the heads, and nothing was left standing but the bare straw. With wheat fields the effect was the same, except that the destruction was not quite so complete, owing, most likely because it was not as advanced as the barley. Any fruit that was not pounded off the trees was picked full of holes, so that it resembled the effect of a charge of [buck]shot. Corn was stripped as with a

knife, and every sort of vegetable suffered. Chickens, birds, rabbits, gophers, young pigs, etc., were found lifeless in quantities after the storm. The hail was 3 inches thick on the ground. It varied in size from peas to walnuts, and was of all shapes, and generally bearing the characteristic, noticed before, of being frozen solid on one side and imperfectly congealed on the other. Damage was estimated at \$50,000. [In present currency, that would be equivalent to \$1.2 million in damages based on the Consumer Price Index (CPI) inflation rates.] The hailstorm was the product of two great clouds at different elevations merging, one on top the other.<sup>114</sup>

Destructive floods struck Pennsylvania in the *United States* during June 1887.<sup>114</sup>

— A very heavy rainfall occurred to the west of Hooversville, Pennsylvania on the June 7<sup>th</sup>. That village was entirely underwater and more than twenty residences were washed from their foundations. The flood reached Johnstown about noon, and during the afternoon the streets and a number of cellars were flooded. Much damage was done by the flood at Conemaugh, Morrillville, Grubtown, Cambria City, and Coopersdale, Pennsylvania and at Minersville, several bridges were washed away. The damage was estimated at \$150,000 (\$3.6 million in today's dollars).

— Very heavy rain storm occurred at Nanticoke and vicinity, in Pennsylvania, on the afternoon of the 9<sup>th</sup>, flooding the streets and cellars and causing a large amount of damage. The first floors of a number of houses were submerged, and in some instances the buildings were undermined. Considerable injury was also done to the railroads in this vicinity. The losses were estimated at \$100,000 (\$2.4 million in today's dollars).

On 14 June 1887, a heavy gale struck Atlantic City, New Jersey in the *United States*. But the weather was so dry that the wind caused the sand to form deep drifts, resembling snow drifts; at some street corners the sand accumulated to such a depth as to impede travel.<sup>114</sup>

The high temperatures experience in the *United States* in July 1887 caused hardship. Several towns reported cases of heat stroke (prostration of heat) or sunstroke, many proved fatal including at Cairo, Illinois; Davenport, Iowa; Louisville, Kentucky; Saint Louis, Missouri; Baltimore, Maryland; Charleston, South Carolina; Columbus, South Carolina; Norfolk, Virginia; and Cincinnati, Ohio.<sup>114</sup>

In July 1887, several areas in the *United States* reported a severe drought. These included:<sup>114</sup>

— Forty localities in Illinois reported a severe drought, including Greenville, Xenia, Chatham, Centralia, Charleston, Mattoon, Riley, Sandwich, and Windsor. The terrific heat of the sun, burning day after day from an almost cloudless sky, and the short nights that bring no dew, destroyed the hopes of the farmers. Some areas of Illinois received heavy rainfall on the 21<sup>st</sup>, the first rain in 50 days, that helped but it was feared that the early crop was blighted beyond saving. In Henry County on the 26<sup>th</sup>, it was reported that farmers had disposed of their livestock at great sacrifice [monetary loss], on account of poor pasturage and scarcity of feed. At Windsor on the 31<sup>st</sup>, they reported that wells that never failed before were becoming dry

— Many areas of Indiana were affected by the drought. These included Huntington, Wabash, Laconia, and Terre Haute. The Eel River Valley district in the northern part of Wabash County on the 29<sup>th</sup> reported that the corn was burning up from the excessive hot weather and long continued drought. This area was the most fertile district in the county. The Eel River had not been so low in 25 years and watermills had to cease operations because of lack of water.

— Many areas of Iowa were affected by the drought including: Independence, Carson, Hamburg, McGregor, New Hampton, Dubuque, Fort Madison, Cedar Rapids, Oskaloosa and Des Moines. New Hampton reported on the 22<sup>nd</sup> that due to the drought, only 1/3 of the average crop of hay was produced. Dubuque reported on the 25<sup>th</sup>, fruit and potatoes were a complete failure and grass was dead. Fort Madison reported on the 31<sup>st</sup>, that the month was the driest ever known there. Des Moines on the 31<sup>st</sup> reported that wells and small rivers had dried up.

— Many areas of Kansas were affected by the drought including: Manhattan, Leavenworth, Wellington, Independence, Parsons, Salina, Wakefield, Topeka, Elk Falls, and East Norway. Manhattan on the 15<sup>th</sup> reported wells and creeks were drying up. Wakefield and Topeka on the 31<sup>st</sup> reported that farmers were cutting up their corn for fodder, the ears being shriveled. Elk Falls reported on the 31<sup>st</sup> that cattle had to be driven long distances for water.

— A drought prevailed in the Southern parts of Michigan. It injured corn and potatoes beyond the hope of recovery. In many locations corn was being cut and either being fed to livestock or cured for winter fodder. In Michigan the

areas around Battle Creek, Kalamazoo, Thornville, Swartz Creek, Hudson, Mottville and Birmingham were affected by the drought.

— In Wisconsin a very severe drought prevailed in the Counties of Fond du Lac, Winnebago, Green Lake, Marquette, Dodge and Columbia. The vegetation over open prairies was literally burned up. The marshes and beds of creeks were completely dry.

At Palo Alto, Mississippi in the *United States*, a violent lightning storm struck on the afternoon of July 10<sup>th</sup>. The electrical display was remarkable. Three miles southwest of Palo Alto, over a small area of two acres (0.8 hectares), about one hundred large trees were struck by lightning.<sup>114</sup>

The Saint Louis *Globe-Democrat* reported that on 14 July 1887 “A terrific cloud-burst occurred in Tucker Canyon, near Golden [Colorado in the *United States*], twenty miles from Denver, this afternoon. The canyon was full of campers, ore-haulers, etc. A slight rain storm succeeded peals of thunder, and suddenly a wave nearly twenty feet high swept down the narrow canyon, which for weeks had been completely dry. Everything was swept before it. The sides of the gulch, which is only sixty feet wide, were swept away, as were also the trail and carriageway for miles up the canyon. Those who were caught out, so far as is known, left their teams and fled to the mountains. All the latter part of the afternoon people have been walking into Golden from the hills. They report the loss of their teams and vehicles, and all give exciting accounts of their narrow escapes from death. They fear that many lives have been lost, as many people who went up into the mountains have not yet been heard from. The huge wave in the canyon was the result of a cloud-burst, which may have occurred far up in the canyon. The loss to ranchmen in the valley has been heavy.”<sup>114</sup>

On 16 July 1887, the temperature reached 103° F [39° C] in Bradford County, Pennsylvania in the *United States*. On 26 July, the inhabitants of Wysox valley who live between Rome and the mouth of the creek experienced the highest water known there since the flood of 1865. So rapid was the rise of water that many were of the opinion that a cloud burst or the meeting of two storms up the valley towards Rome must have occurred. The rapidity with which the waters came up over the flats was unprecedented. Rome reported that the main streets were navigated by boats; cellars were flooded; nearly every bridge in this section of the county swept away; the county iron bridge known as Gillett's bridge was carried away; the Rome township voting place was swept down the creek a distance of half a mile [0.8 km] and was crushed. The Wysox, Bullard, Bear and Johnson creeks were the highest ever known. Cattle, sheep and poultry were swept away. The losses in the vicinity of Myersburg and North Orwell were also very heavy.<sup>178</sup>

In Wabash, Indiana in the *United States* during the night of July 18<sup>th</sup>/19<sup>th</sup>, a severe hailstorm passed through the county doing immense damage. The hailstones were unusually large, and fell in great quantities. Apples, melons, grapes, and all small fruit and vegetables were cut to pieces. The damage is estimated at \$50,000.<sup>114</sup> [In present currency, that would be equivalent to \$1.2 million using CPI inflation.]

The hurricane of July 1887 advanced from *Barbados Island* westward over the Caribbean Sea and thence northward over the Gulf of Mexico to the east Gulf States of the *United States* from the 20<sup>th</sup> to the close of the month. This storm was very severe at Barbados Island on the 20<sup>th</sup>, and several vessels were wrecked. Several vessels were wrecked on the west coast of Florida and the north Cuban coast, and very heavy rainfall occurred in the Gulf States, in connection with high winds and swollen rivers, caused great destruction to the growing crops and the public highways.<sup>120</sup>

At Philadelphia, Pennsylvania in the *United States*, the heavy rainfall on July 23<sup>rd</sup> and 24<sup>th</sup> (around 4 inches) caused much damage to city streets and sewers. The heavy rainfall on the night of the 26-27<sup>th</sup> caused a heavy damage at Falls of the Schuylkill, where, on many streets, the lower floors of houses were

submerged. The damage was estimated at \$100,000 (approximately \$2.4 million in today's dollars). At Manayunk, the streets were washed out and houses and mills were flooded.<sup>114</sup>

In July 1887, there were great floods in southern *United States*.<sup>90</sup>

Towards the end of July 1887, Georgia and Alabama in the *United States* experienced heavy rainstorms and floods.<sup>114</sup>

— At Augusta, Georgia, the heavy rains at the close of the month caused the Savannah River to rise to a height, which has not been equaled since 1865; the river reached its greatest height, 34.5 feet, about 9 a.m. on the 31<sup>st</sup>. A considerable portion of the city was inundated, and in some places the water was ten feet deep. Travel on railroads was interrupted and the operations of mills were suspended. The rainfall on the 29<sup>th</sup> amounted to 4.50 inches, which was the largest daily rainfall on the records of the Signal Office at this place. In but three instances since 1840 has the river reached a greater height than during the freshet of July 1887, viz.: in 1840, 37.3 feet; 1852, 36.8 feet; and 1865, 36.4 feet. During the freshet of 1864, the river reached a height of 33.8 feet.

— At Milledgeville, Georgia, the precipitation for the month, 16.09 inches, was unprecedented at this station for the month of July; the first rainy season occurred from the 4<sup>th</sup> to the 12<sup>th</sup>, when 5.75 inches of rain fell; and the second from the 27<sup>th</sup> to the 31<sup>st</sup>, when 9.98 inches of rain fell. This latter rainfall caused a freshet similar to that in 1840. Great damage was done in this county to crops, bridges, fences, etc.

In August 1887, two energetic and destructive storms moved from the vicinity of the Windward Islands, north of the *West Indies*, to the *Bahamas*, where they recurved north and northeast.<sup>119, 120</sup>

On 16 August 1887, a destructive hurricane struck Bordeaux and southern *France* causing loss of life.<sup>90</sup>

On 17 August 1887, beginning about 5.30 p.m., a violent thunderstorm struck London, *England*, causing destruction of property. Several persons were killed. The thunderstorm lasted about 4 hours. On that day there were many storms throughout the country.<sup>90</sup>

On 18 August 1887, there was a windrush from the southwest, or a western tornado which struck Northfield, Massachusetts in the *United States*.<sup>138</sup>

On 9 September 1887, heavy rains struck Tucson, Arizona in the *United States* causing floods on the Santa Cruz and Rillito Rivers. Several miles of the *Southern Pacific* Railroad track and some bridges in the vicinity of Pantano, Arizona were washed away. The extent of the destruction to the railroad by the washouts was very great. One filling fifty-feet high on the Dragoon grade was washed out for eight miles. It took approximately three weeks to repair the washed out places between Benson and Tucson so that trains could pass over the road. This was the most destructive washout yet suffered by the *Southern Pacific* Road, and costs exceeded \$200,000 to repair the damage (\$4.8 million in today's dollars). Heavy rains on 12 September extended into Sonora, where five miles of track and three bridges were washed out on the Sonora Road. The streets of Tucson, Arizona were flooded along with perishable freight for the eastern market.<sup>114</sup>

In September 1887, one storm [hurricane] advanced from east of the *Windward Islands* on the 11<sup>th</sup> westward over the Caribbean Sea and northwest over the Gulf of Mexico to the Texas coast of the *United States* by the 21<sup>st</sup>, and another one moved northeast from the western extremity of *Cuba* over the *Bahamas*.<sup>120</sup>

A hurricane struck near the *Mexico / United States* border on 21 September 1887.<sup>114</sup>

— A great storm [hurricane] struck Matamoras, *Mexico* on the night of the September 21<sup>st</sup> and the morning of the 22<sup>nd</sup>. This storm caused extensive damage in Matamoras and for twenty miles south and forty miles west along the Rio Grande. Telegraph wires were prostrated, preventing early accounts of the storm. The wind reached the velocity of a hurricane, blowing eighty-five miles an hour, as registered at the headquarters of the Mexican troops

located there. The hurricane drove the sea into the mouth of the Rio Grande, causing it to overflow its bank on the Mexican side for a distance of nearly a hundred miles from its mouth. The principal streets in Matamoras were submerged to a depth of three feet. Many old houses in the city collapsed and were carried away by the wind and flood. Notwithstanding the great destruction to property, no lives were yet known to have been lost, but many people were wounded by flying debris and falling houses. Narrow escapes from death were recounted by hundreds. The hurricane was so powerful that not a single metal roof remains in the city. They were all curled up like so much paper and hurled to the ground. All fences in the city and for miles surrounding disappeared. In many instances not a single board was left on the ground—nothing but the naked posts. It was thought that every frame house in the city was moved more or less from its foundation or otherwise damaged.

— During, and immediately following, the progress of the storm rescuing parties were organized and sent out to relieve people in the lagoon districts of Matamoras, where the flood was dangerously deep. The rain poured down in blinding sheets for several hours, adding terror to the hurricane and the raging river. The government troops were all called out to assist the police in the work of rescue. The public school and government buildings were crowded with refugees, whose homes had disappeared. Not less than a hundred small houses (jacals) were destroyed, while all of the larger buildings and residences were damaged. The *Matamoras and Rio Grande* Railroad sustained serious loss. Its tracks were swept away for many miles along the river, and its depots demolished. The federal and state authorities feed the homeless victims of the storm.

— In the *United States*, the greatest damage reported occurred from the effects of the heavy rains and the flooding of the Rio Grande River. The riverbanks were overflowed and the flats and bottoms filled with water, although the streets were not flooded. The roads leading into Brownsville, Texas became impassable and remained so till after October 6<sup>th</sup>. At Point Isabel the sloop *Romp*, the schooner *Mignonette*, and the yacht *Maud B* were lost sight of and had not been heard from since. The *Mignonette* was a Government lighthouse boat, and had a crew of fourteen persons. Around and about Brownsville no great damage was sustained either to property real or personal, and this fact was largely due to the warnings issued by the Signal Service, as the inhabitants were busily engaged in nailing up their windows and fences, bracing their houses, and taking other precautions against damage, when the storm was reported as coming toward southwest Texas. The greatest damage especially from Brownsville eastward on the Rio Grande River to the coast, however, was probably due to the heavy rains and the floods in the river and adjacent lowlands, which destroyed cattle and other livestock and materially injured cotton, sugar cane, and exposed products.

In September 1887, several areas in the *United States* reported severe drought conditions. These included:<sup>114</sup>

— In Illinois, the drought conditions of July and August carried over into September. These conditions prevailed until the daily rainfalls began on September 26<sup>th</sup>. Tolono, Illinois reported on the 16<sup>th</sup> that nearly all wells were exhausted, and farmers were compelled to haul water for livestock. At Philo, Sadorus, and other towns in Champaign County, the same conditions exist. Hillsborough and Galesburg reported severe drought conditions and a great scarcity of water on the 16<sup>th</sup>. Monmouth, Illinois reported on the 16<sup>th</sup> that nearly half of the wells in the county had failed, and there was but one running stream left in the county.

— Many of the interior towns in Iowa, Missouri, and Illinois were suffering from an inadequate water supply. The continued prevalence of the drought dried up the creeks and wells. Until there was a rainfall in the middle of September, there had been no rain for six or seven weeks and water was at a decided premium. Crops were damaged, the meadows parched by the sun, and livestock suffered. Relief was afforded for a short time by the limited rainfalls, but then the supply again became almost exhausted. The creeks and small streams in southwestern Iowa were nearly dry by September 24<sup>th</sup>. At Pella, Iowa on the Rock Island Road, the water supply was nearly gone, and water was hauled on the trains from Keokuk, Iowa. Within a radius of ten miles of Keokuk the water supply was short in several localities and insufficient for livestock.

— Many other states suffered similar drought conditions, partially relieved by September rainfalls. These included: Indiana, Kentucky, Mississippi, Ohio, West Virginia and Tennessee. But in some places the drought continued unabated including San Antonio, Texas; Newport, Vermont; Virginia; and Milledgeville, Georgia.

In September, the Yellow River (Huang He River) in *China* overflowed its dikes and caused a massive flood. Floodwaters covered an estimated 50,000 square miles of land in Northern China. The flood killed 900,000 people and left 2 million people homeless. Following the flood, the resulting pandemic and lack of basic essentials claimed as many lives as those lost directly by the flood itself.<sup>45</sup>

In September-October 1887, there was a great overflow of the Hoang-Ho or Yellow River in *China*.<sup>90</sup> [During this catastrophic flood event, between 900,000 to 2 million people died.]

In 1887 during the period between 19 August and 16 September, a drought engulfed Kansu (now Gansu province) in northwest *China* at Ching-yüan and Hopei (now Hebei province) in northern *China* at Tung-kuang. During the period between 8 August and 8 November, floods struck Hopei province at Luan and Kansu province at Lin-t'an.<sup>153</sup>

A severe gale started rolling through the Great Lakes region of the *United States* on 2 October 1887.<sup>114</sup>

— At Lansing, Michigan, the high smokestack of the State Printing House was blown over.

— At Buffalo, New York on the 3<sup>rd</sup>, the lake at this port was very rough, submerging both breakwaters, and at times the water was forced above both lighthouses; the breakwaters sustained heavy injuries. Buffalo River rose seven feet during the storm, flooding a number of houses, and on the island and along the waterfront numerous families were obliged to vacate their homes. The *New York Central* Railroad was compelled to keep trucks on the tracks in order to protect them from destruction. The barge *C. L. Hutchinson* ran ashore about ten miles from Buffalo with a cargo of 35,000 feet of lumber. The vessel was a total wreck, but the crew was saved. Considerable damage was done to trees, signs, fences, cornices, chimneys, and roofs, which were carried away by the wind. Sea captains stated that this was the most severe and destructive storm that has ever visited the Lake region so early in the season.

— The schooners *City of Green Bay* and *Havannah*, from the port of Escanaba, Michigan, were lost in the gale on the 4<sup>th</sup>, along with nine seamen. The vessels and cargo was valued at \$30,000 (\$700,000 in today's dollars).

— The propeller ship *California* bound from Chicago, Illinois to Montreal, Canada foundered off the island of Saint Helena on the 4<sup>th</sup>. She was laden with 700 barrels of pork and 20,000 bushels of corn, and went down in about fifty feet of water. Nine lives were lost. The vessel broke in pieces.

— On the 4<sup>th</sup> a coal-laden schooner *Pulaski* traveling between Sandusky, Ohio and Manitowoc, Wisconsin went ashore during the storm and was a total loss. The schooner had been run close to shore and anchored, but the heavy wind dragged her ashore, where the heavy seas soon tore her to piece.

— Near Erie, Pennsylvania, a two-masted schooner went ashore at Ripley shortly before dark on the 4<sup>th</sup>. When last seen, there were six men in the rigging of the schooner. Other ships were unable to go to its immediate rescue because of the severe weather and darkness.

In 1887, a very serious drought prevailed from May to October in the *United States* in Michigan, Wisconsin, Iowa, Ohio, Indiana, Illinois, Kentucky, and Missouri and parts of Minnesota and Dakota, and eastern Nebraska and southeastern Kansas.<sup>114</sup>

— The drought began in April, when less than 50% of the average precipitation fell in southern Michigan and Wisconsin, northern Illinois, the southwestern part of Iowa, and the northwestern part of Missouri.

— During May, a precipitation slightly above the average fell over a belt of country about sixty miles wide, extending from Cincinnati, Ohio, and Frankfort, Kentucky, westward to Indiana and Illinois, including the Missouri River valley as far as Jefferson City; elsewhere in the states previously named, the precipitation was largely deficient, especially in Iowa, Illinois, and the northern half of Michigan, which saw only 20% to 60% of the average rainfall.

— In June the area over which less than half the usual rain fell comprised Iowa, Illinois, southern Wisconsin, southwestern Michigan, and northwestern Indiana. Throughout the section many areas saw only 10% to 20% of the usual rainfall for June.

— During July a slight excess of rainfall fell over the northern half of the lower peninsula of Michigan and central Wisconsin, but throughout the rest of the drought-stricken states, the precipitation generally ranged from 50% to 80% of average, except in Ohio, southern Indiana, southeastern Illinois, and the western parts of Iowa and Missouri, where the amount of rain in some cases was only from 15% to 30% of the mean.

— During August slight excesses fell in western Iowa, western Wisconsin, and the northern part of Illinois: throughout the rest of the drought district the rainfall was generally from 50% to 75% of average, but in the greater part of Michigan, as well as in the southern part of Illinois, the amount was less than 50%.

— In September the greater part of Iowa, Wisconsin, and northern Illinois, and the extreme southern part of Michigan, was relieved by rainfall slightly in excess of the average, but the remaining states still suffered from a deficiency, which in the northern part of Michigan ranged from one-sixth to one-half the usual amount.

— The condition had improved in Wisconsin during October, where a slight excess of precipitation has fallen. But in Michigan, Iowa, the greater part of Illinois, and Indiana the drought remains, as the precipitation has only been

from one-third to three-fourths of the usual amount, while in the valley of the Ohio and of the Mississippi, from Cairo to Quincy, the amount of rainfall has been exceedingly small, not averaging more than 20% for those districts.

The following drought conditions in the *United States* were noted in October 1887:<sup>114</sup>

— At Wash Woods, North Carolina on the 9<sup>th</sup>, the wells were drying up, cisterns had long been exhausted, and cattle were suffering for water. There was a great deal of sickness prevailing at this locality, which was attributed to the long and severe drought.

— At Huntington, Indiana on the 15<sup>th</sup>, farmers were compelled to go great distances for water both for cattle and domestic use.

— At Charleston, Illinois on the 31<sup>st</sup>, creeks were all dry, and stock suffering for water.

— Garrettsville, Ohio reported on the 31<sup>st</sup>, most of the brooks and swamps were dry and water in wells was at a lower stage than at any previous time this year.

— Elyria, Ohio reported on the 31<sup>st</sup>, the severe drought, which prevailed since June, continues and its effects were becoming more alarming. Streams were all dry, many wells have failed, and farmers have to haul water for stock.

— Indiana reported a scarcity of water. "Creeks and surface wells have become dry; wheat either has not come up at all or has turned yellow in many fields, and cattle were suffering from want of water, which had to be brought to many farms from great distances. The observer at Vevay reports that the Ohio River had been lower than noted for many years."

On 11 October 1887, a storm [hurricane] was central over the Caribbean Sea, whence it moved to the west Gulf by the 17<sup>th</sup>; recurved to the Gulf coast of the *United States* near New Orleans, Louisiana; thence moved to the south Atlantic states, skirted the middle Atlantic and New England coasts, and reached the Saint Lawrence Valley in *Canada* the night of the 23<sup>rd</sup>, attended throughout by gales of great violence and general and heavy rain.<sup>120</sup>

In October 1887 a storm of pronounced strength advanced from the Caribbean Sea over the Gulf of Mexico, west of the 90<sup>th</sup> meridian.<sup>119</sup>

On 30 October 1887 there was a west gale, which caused destruction of life and property in *France*, the *English Channel*, and southern *England*. Another gale on 31 October - 1 November struck on the west coast of *Great Britain* causing destruction at Holyhead, Liverpool and in the Bristol Channel. Then another gale on 3 November 1887 struck the southeast coast of *Great Britain*.<sup>90</sup>

The following drought conditions in the *United States* were noted in November 1887:<sup>114</sup>

— Little Rock, Arkansas reported on the 4<sup>th</sup> that rain was badly needed in all sections of the state; wells were becoming dry and cattle suffered for water.

— Paris, Missouri reported that light rains on the 9<sup>th</sup>. Streams were nearly dry and water was very scarce. The typhoid fever that prevailed in this section was attributed to the use of impure water.

— Marshall, Missouri reported that the heavy rain on the 9<sup>th</sup> was greatly needed throughout this county. Ponds were nearly dry, and stock suffered for water.

— Carbondale, Illinois reported that the rain of the 9<sup>th</sup> broke the drought and put out the forest fires, which had been burning in this and adjoining counties for several days.

— Centralia, Illinois reported that the protracted drought was broken by the rain of the 9<sup>th</sup>; the scarcity of water caused much inconvenience.

— Nashville, Tennessee reported on the 18<sup>th</sup> that a severe drought prevailed over the entire state; only 0.45 inch of rain fell at this station since October 25<sup>th</sup>.

— Sunman, Indiana reported: "The rains from the 22<sup>nd</sup> to the 27<sup>th</sup> terminated the severest drought of the last fifty years."

— Charleston, Illinois reported on the 22<sup>nd</sup> that the creeks were all dry, cisterns and wells nearly exhausted, and cattle suffering for water; on that date rain began and continued until the 27<sup>th</sup>; during the last two days of the storm 5.21 inches of rain fell.

— Milan, Tennessee reported the protracted drought was broken on the 23<sup>rd</sup>; streams and wells had dried up, and water had to be hauled long distances.

- Laconia, Indiana reported that the rain of the 23<sup>rd</sup> replenished cisterns, ponds, etc. The Ohio River at Laconia was lower than known for past forty years.
- Tiffin, Ohio reported: "The long and memorable drought was broken by the rains from the 24<sup>th</sup> to 27<sup>th</sup>. A special feature of the drought of November 1887 was that old settlers say that it was the most severe of any in their recollection. Wheat has suffered severely; many wells, which were never dry before and cisterns, which were never empty, failed, so that farmers were obliged to dig their wells much deeper or drive their stock three to five miles for water. A water train loaded at the *Baltimore and Ohio* Railroad well connecting with the Sandusky River was run from this city to different points, almost daily, to supply engines, or for household use."
- Mottville, Michigan reported that the drought was partly relieved by the rains from the 24<sup>th</sup> to the 27<sup>th</sup>; winter wheat was greatly retarded.
- Wauseon, Ohio reported that the long and disastrous drought was broken by the rains from the 24<sup>th</sup> to the 27<sup>th</sup>.
- Elgin, Illinois on the 24<sup>th</sup> reported the entire season of 1887 throughout the dairy district of this portion of Illinois had been unfavorable not only regarding dairy, but general farming. The fall of rain was light and winter set in without the usual fall rains, consequently, in many instances, there was a scarcity of water for livestock. Again, owing to the drought, all kinds of grain were a light crop, and hay a complete failure. Farmers had to buy more or less grain for their dairy cattle each year, but this season many had to buy all their feed.
- Hermann, Missouri reported on 24 November that the drought very injured the wheat crop. Last Saturday, the 19<sup>th</sup>, Hermann experienced a northern blizzard, very cold, and the wind traveling at a fearful velocity, which was more detrimental to the wheat than the drought. Stock water, and with many families, water for ordinary and other purposes, had to be hauled from the river or some creek and had caused the farmers great inconvenience. The drought so completely withered and dried up the grass and the deposit of leaves from the trees was so heavy that forest fires prevailed and inflicted great damage.
- Carmi, Illinois reported the rain of the 26<sup>th</sup> ended the protracted drought and extinguished the forest fires, which had been burning in that vicinity.
- Windsor, Illinois reported on the 27<sup>th</sup> that the drought, which prevailed during the past two months, was broken by three days of rain.
- Cairo, Illinois reported on the 28<sup>th</sup> that the late rains broke the drought in that vicinity, which had become very severe. Over a large area there was little or no rain since the beginning of July. The rivers continued at a low stage longer than ever known since any systematic gauging of the western rivers was begun. The Ohio River was so low that navigation, except for the smallest of boats (which were ordinarily used on the small tributaries), was practically suspended. The crops were below the average and the supply of water scant, the bad condition of the latter caused much sickness.
- Livingston, Alabama reported that November was one of the driest months on record at Livingston, the total precipitation, 0.35 inch, fell on one day, the 28<sup>th</sup>.
- Middlebrook, West Virginia reported on the 30<sup>th</sup> that the drought continued, though somewhat relieved by the November rains. The watermills were still without water.
- Dale Enterprise, Virginia reported on the 30<sup>th</sup> that the effect of the drought was severely felt in the lack of water for livestock; the streams were very low.
- Elk Falls, Kansas reported on 30 November that the month was very dry and water was scarce, the main supply had to be hauled in from the Elk River.
- Mattoon, Illinois reported on 10 December 1887 that from 1 June to 23 November (175 days), they had 145 dry days and the rest only produced 9½ inches of rain. With the exception of August 4<sup>th</sup> and 11<sup>th</sup> which produced 2¼ inches of rain and the last week of September which produced 2¾ inches of rain, the rest of the period produced a total of 4¾ inches of rain. These minor rainfalls were spread out on 30 different occasions producing showers with only a few drops and never over ½ inch. The temperature in the shade during the summer season of 1887 was above 100° F on 17 different days, and above 90° F on 59 different days. The highest being 108° F on July 29<sup>th</sup> and 30<sup>th</sup>. The season was only about 18 per cent, cloudy. In contrast, the rainfall during one-half of the 11 days immediately following November 23<sup>rd</sup> was nearly equal to the entire rainfall of the previous 175 days, being 8½ inches (of which 5 inches fell on November 26<sup>th</sup>).
- Sunman, Indiana reported that the severity of the drought was not altogether due to the deficiency of the rainfall, but was in a great measure intensified by the high temperature of the three summer months and the unusual very light rainfalls that could not penetrate the soil to any considerable depth but was solely confined to the surface, and was quickly evaporated by the intense heat.

Owing to the dry weather of November and previous months in the Mississippi, Missouri, and Ohio valleys in the *United States*, forest fires became very prevalent, especially during November. This

resulted in loss of much property and at times navigation on rivers had been rendered dangerous on account of the prevalence of dense smoke. The following were some of the many reports received: <sup>114</sup>

— Butlerville, Indiana reported extensive forest fires in this county from the 3<sup>rd</sup> to the 8<sup>th</sup>, doing much damage to fences and timber.

— Little Rock, Arkansas reported very extensive forest fires raging throughout the State from the 5<sup>th</sup> to 7<sup>th</sup>, 12<sup>th</sup> to 15<sup>th</sup>, and from the 18<sup>th</sup> to 22<sup>nd</sup>, causing much damage to crops and fences; the smoke was so dense that at times it was impossible to see objects one hundred yards distant.

— Cairo, Illinois reported dense smoke overspread this region during the 5<sup>th</sup>, caused by extensive fires in what was known as the "cypress swamps" in Missouri. The fires reached from Commerce, Missouri, thirty-five miles north of Cairo, Illinois to New Madrid, Missouri, seventy-five miles to the south. In the surrounding country the fires had spread rapidly through "Cashé" bottom until the greater part of its area was swept by the flames. The smoke was so dense after 6 p.m. that the navigation on the rivers was partially suspended for a distance of forty miles along the Ohio River and for one hundred miles along the Mississippi River. Similar conditions prevailed on the 6<sup>th</sup>, 7<sup>th</sup>, and 8<sup>th</sup>; on the last date the fires reached what was known as the "Island," to the northeast of the city, and extended along the trestle of the *Mobile and Ohio* Railroad. On the 11<sup>th</sup> the forest fires were still burning in many places, though not so widespread as previously, rains having checked them somewhat, and the smoke did not interfere with navigation. On the 16<sup>th</sup> the fires again increased and light smoke prevailed during the entire day and night; on this date the transfer steamers were retarded in making their trips on account of smoke, and like conditions prevailed on the 16<sup>th</sup>, 17<sup>th</sup>, 18<sup>th</sup>, 21<sup>st</sup>, and 22<sup>nd</sup>. The forest fires were extinguished by the snow on the 28<sup>th</sup>.

— Bismarck, North Dakota reported that extensive prairie fires were observed in the north on the 4<sup>th</sup> and 6<sup>th</sup>, and in the northeast and south on the 6<sup>th</sup>.

— Fort Yates, North Dakota reported that extensive prairie fires occurred to the west and northwest on the 5<sup>th</sup>, 6<sup>th</sup>, and 16<sup>th</sup>.

— Fort Supply, Indian Territory [now Oklahoma] reported large prairie fires raging to the south on the 6<sup>th</sup>.

— Valentine, Nebraska reported large prairie fires about ten miles to the southwest on the evening of the 6<sup>th</sup>.

— Middlebrook, West Virginia reported the atmosphere was very smoky on the 7<sup>th</sup>, due to extensive forest fires, which were burning about six miles to the west.

— Erie, Pennsylvania reported that the forest fires in this section were extinguished by the rain of the 10<sup>th</sup>, on which date the air was filled with smoke from the smothered fires.

— Memphis, Tennessee reported that during the 15<sup>th</sup>, 16<sup>th</sup>, and 17<sup>th</sup> the atmosphere was filled with dense smoke from forest fires in Arkansas; the rain of the 25<sup>th</sup> was reported to have subdued the fires.

— Milan, Tennessee reported on the 16<sup>th</sup> that the surrounding country has been enveloped in smoke since the 4<sup>th</sup> caused by fires; farmers sustained heavy losses.

— Grand Haven, Michigan reported several forest fires started to the east on the 16<sup>th</sup> and made considerable progress; by the 18<sup>th</sup> the fires were burning fiercely over an area of about three miles, but the rain and snow on the 19<sup>th</sup> quenched the flames.

— Shreveport, Louisiana reported extensive forest fires prevailed in Bosier Parish, northeast of the city, on the 18<sup>th</sup>; reports from the burning district received on the 19<sup>th</sup> stated that several houses and barns had been destroyed.

— Nashville, Tennessee reported on the 18<sup>th</sup> that destructive forest fires prevailed in southwest Tennessee and Arkansas during the past five days, and on that date were still raging fiercely; many houses and much valuable livestock and timber were destroyed by the flames.

— Louisville, Kentucky reported the atmosphere was filled with smoke during the 18<sup>th</sup>, caused by forest fires, which were burning to the south of the city. On the morning of the 19<sup>th</sup>, it was so dark as to render artificial light necessary.

— Laconia, Indiana reported that the forest fires in various localities and the high westerly winds on the 19<sup>th</sup> resulted in the smoke becoming so dense as to cause darkness to such a degree that it was difficult to see even a short distance, and steamers on the Ohio River were compelled to stop running at midday. Forest fires were of almost daily occurrence prior to the 23<sup>rd</sup>; several houses, barns, fences, and much timber were burned. The rain, which fell on the 23<sup>rd</sup>, soon checked the progress of the fires.

— Lamar, Missouri reported forest fires on the 18<sup>th</sup> and 19<sup>th</sup> to the west; the telegraph poles were burned interrupting communication.

— Oxford, Mississippi reported on the 20<sup>th</sup> that the smoky condition of the atmosphere during the past few days was due to forest fires in western Tennessee and eastern Arkansas.

— Fort Smith, Arkansas reported the atmosphere on the 21<sup>st</sup> was filled with smoke from extensive forest fires in the adjoining states.

— Springfield, Missouri reported on the 22<sup>nd</sup> that dense smoke enveloped this section during the past few days, due to the extensive forest fires, which have prevailed south of this city.

— Lead Hill, Arkansas reported on the 30<sup>th</sup> that dense smoke from forest fires filled the air on the 5<sup>th</sup>, 13<sup>th</sup>, 18<sup>th</sup>, 21<sup>st</sup>, 22<sup>nd</sup> and 23<sup>rd</sup>; it was reported that several farm houses were burned and much other damage done by forest fires in various sections of the state.

— Wauseon, Ohio reported on the 30<sup>th</sup> that the prairies about five miles to the southwest were on fire during the greater part of the month; forest fires prevailed about the 15<sup>th</sup> in the timber lands fifteen miles to the northeast.

On 29-30 November 1887, the path of a depression was approximately located north of the *West Indies*, and from the 28<sup>th</sup> to 30<sup>th</sup> heavy gales, attaining hurricane force, were reported in that region.<sup>119, 120</sup>

During December 1887, severe weather prevailed over the *West Indies Islands* attending the passage of three cyclones. This was very unique for the month of December. Two of these moved northwest to the vicinity of Bermuda, and thence recurved northeastward, and one advanced westward over the Caribbean Sea.<sup>114</sup>

On 1 December 1887, a storm [hurricane] was central about midway between *Bermuda* and the *Windward Islands*, whence it moved irregularly northward to the Banks of Newfoundland, *Canada* by the 6<sup>th</sup>, attended by heavy gales. On the 4<sup>th</sup>, a depression [a second storm] was central east of the *Windward Islands*, whence it moved northeast and recurved to the northeastward north of the *Windward Islands* on the 5<sup>th</sup>. This storm, together with the depression which preceded it, was attended by a heavy "norther" over the *West Indies* during the first four days of the month, during which many vessels were wrecked. On the 4<sup>th</sup>, during a violent gale, an immense wave struck the beach at Baracoa, *Cuba*, broke and flowed inland, destroying nearly three hundred houses and huts without, however, an attendant loss of life.<sup>120</sup>

A heavy storm pounded Los Angeles, California in the *United States* on 13 and 14 December 1887. The storm produced winds with a peak velocity of 50 miles per hour. Although the damage in this city was slight, reports from the surrounding country state that the storm was very destructive, especially along the line of the Sierra Madre foothills, where many buildings were demolished and orchards in many places were badly injured. At La Crescenta & La Cañada, California, small towns twelve miles north, a hotel was destroyed, resulting in the death of two persons. At Glendora, several cottages were blown down; no one injured. At Paquima [Pacoima], in the San Fernando Valley, the new hotel was almost demolished; loss \$5,000. At Lordsburg [La Verne], the hotel recently erected was torn to pieces; loss \$10,000. At Rialto, three houses were destroyed. At Pasadena, several houses were blown down on exposed points, and quite a number of persons injured. At Cucamonga, the [railroad] depot was almost totally destroyed; also the new hotel and several stores and buildings; loss about \$50,000 (\$1.2 million in today's dollars). At San Bernardino, several cottages were wrecked. At San Fernando, the roof of the brick warehouse was blown off and deposited on the middle of the *Southern Pacific* track. Between Cucamonga and Colton the cab was blown off the engine of a special eastbound freight train. At Colton the channel of the water ditch was so filled with sand, which had drifted from the fierce winds and that it was impossible to obtain any water. At Riverside much damage was done in exposed districts.<sup>114</sup>

In 1887 in *Australia*, severe floods took place in Victoria.<sup>101</sup>

During the six years [1882-1887] at Colón, *Panama*, the highest observed temperature was 98.9° F (37.2° C) and the lowest was 57.6° F (14.2° C). During the same period at Gamboa, *Panama* [except the records of 1882-1883 were partial], the highest observed temperature was 98.9° F (37.2° C) and the lowest was 57.2° F (14.0° C). During the same period at Naos, *Panama*, the highest observed temperature was 98.9° F (37.2° C) and the lowest was 64.4° F (18.0° C).<sup>123</sup> [Colón is on the Caribbean Sea coast of *Panama*. Gamboa is in the Canal zone. Naos is near the Pacific entrance of the Panama Canal.]

Also refer to the section **1887 A.D. – 1889 A.D.** for information on the famine in China and Asia Minor during that timeframe.

---

**Winter of 1887 / 1888 A.D.** In December 1887, heavy snowstorms of the 18-20<sup>th</sup> struck New York and Pennsylvania in the *United States*, and those of the 29-30<sup>th</sup> struck Illinois, Iowa, Dakota, Minnesota, Wisconsin, and Michigan, causing blockades on railroads. The snowstorms of the 15<sup>th</sup> and 24<sup>th</sup> in Texas were of unusual severity for that region, producing snowfalls of 6 to 9 inches.<sup>114</sup>

The winter of 1887-88 in Bradford County, Pennsylvania in the *United States* was noted for blizzards. There was good sleighing from the middle of December until the end of February. It was intensely cold during the middle of February then turned warm and the ice in the Susquehanna River passed out. Following the great blizzard of March 12 & 13, there were some warm days in March. On 16 April, 6 inches [15 cm] of snow fell on Barclay Mountain.<sup>178</sup>

The *Baltic Sea* froze.<sup>37</sup>

During the winter of 1887-88, the *Baltic Sea* was completely covered with ice.<sup>68</sup> January 1888 may be rated as an unusually cold month over the greater part of the *United States*, particularly on the Pacific coast, in the plateau region, and in all northern districts, the mean temperatures generally ranging from 6° F to 12° F below the normal.<sup>121</sup>

From 6-12 January 1888, low temperatures were experienced throughout California in the *United States*. Killing frosts occurred, and ice formed in some places to the thickness of four inches.<sup>121</sup>

On 12 January 1888, a strong blizzard with snow, winds between thirty and fifty miles per hour and a 24 hour temperature drop of 30° to 60° F struck Montana, the Dakotas and Nebraska in the *United States*. During this storm many lives were lost and large number of cattle perished. On the morning of the 13<sup>th</sup> the area spread farther to the southeast over Iowa, Missouri, and Kansas, carrying the cold wave with it. At midnight it had extended more to the northeast carrying with it the intensely cold wave, during which the fall in temperature in twenty-four hours was from 30° to 50° F over Minnesota, Wisconsin, Illinois, Indiana, and western Michigan.<sup>121</sup>

— At Helena, Montana on the 12<sup>th</sup>: between 2:30 a.m. and 7 a.m. the exposed thermometer read +40.5° F. At 10 p.m. the minimum thermometer reading was -26.0° F, making a total fall of 66.5° F in less than twenty-four hours.  
— At Poplar River, Montana on the 12<sup>th</sup>, cold, high northwest wind; snow all blown into drifts and temperature -22° F and falling.

— At Fort Custer, Montana on the 12<sup>th</sup>, the snow was accompanied by high northerly winds, which began at 2:42 a.m. and ended 9:30 a.m., with maximum velocity of forty-nine miles per hour. This storm, commonly known as a "blizzard," was the severest of the season. No lives in this immediate vicinity were reported lost. Travel on the *Northern Pacific* [railroad] was completely blocked, owing to the drifting snow and intense cold.

— At Bismarck, North Dakota on the 12<sup>th</sup>, northwest gale with winds as high as fifty-four miles per hour. Then the wind shifted direction and increased in force, drifting the snow which had already fallen and that which was falling to depths of five to twenty feet. This, with rapidly falling temperature, constituted a well-defined "blizzard". The trains on the *Northern Pacific Railroad* were delayed and travel in small conveyances suspended. On the 14<sup>th</sup>, the minimum temperature was -37° F.

— At Saint Vincent, Minnesota on the 12<sup>th</sup>, a blizzard struck with wind speeds between 36 and 48 miles per hour. On the 13<sup>th</sup>, temperatures fell to -40° F.

— At Crete, Nebraska on the 12<sup>th</sup>: light, moist snow commenced in the early morning, and at 9 o'clock heavy snow was falling, which continued till 4:30 p.m. There was but little wind. At 4:10 p.m. the wind suddenly sprang into a gale, shifting from south to northwest. The temperature fell 18° F in less than three minutes. The snow drifted so badly as to render all travel extremely difficult and dangerous.

— At Topeka, Kansas on the 12<sup>th</sup> from 6 to 10 p.m., the temperature fell from +84° F to +2° F.

— At Omaha, Nebraska on the 12<sup>th</sup>, the temperature fell 88° F in seven hours.

— At Denver, Colorado on the 12<sup>th</sup>, there was very high wind during the day, reaching a velocity of sixty miles per hour. The instrument shelter was blown down, tearing some of the roof with it.

— At Des Moines, Iowa on the 13<sup>th</sup>, the high wind during the night continued causing immense snowdrifts in the railroad cuts.

— At Saint Paul, Minnesota on the 13<sup>th</sup>, railway trains over the roads extending in every direction from here (except the *Wisconsin Central* to Chicago and the short line trains from here to Minneapolis) neither arrived nor departed during the day. On the 14<sup>th</sup>, the minimum temperature was -24° F.

The blizzard of 12 January 1888 was very memorable at Huron, South Dakota in the *United States*. The blizzard was preceded by unusually mild conditions, which tempted farmers to travel long distances to water stock and procure fuel and other necessities, after having been confined closely to home by preceding severe weather. The storm was accompanied by rapidly falling temperature that occurred so suddenly that those away from home in the country had no opportunity to seek shelter, even the nearest. Suddenly the air was at once filled with fine, dry and blinding snow, with a severe gale. At Huron, South Dakota on 12 January at 12:42 p.m. in the afternoon, the sky was obscured in patches by nimbus clouds and the air was perfectly calm for about one minute; the next minute the sky was completely overcast by heavy black clouds, which for a few minutes previously had hung along the western and northwestern horizon, and the wind veered to the northwest and blew with such force as to render the position of the observer on the roof unsafe. The air was immediately filled with snow as fine as sifted flour. In three minutes the wind attained gale force with a velocity of 40 miles an hour. At noon of the 12<sup>th</sup>, the temperature was 20° F and at 10 p.m. -17° F, and fell to -28° F during the night. The wind averaged from 45 to 50 miles and attained an extreme velocity of 60 miles per hour. The number of lives lost in Beadle County, South Dakota was 11, and a considerable number were injured.<sup>137</sup>

But this storm was more widespread and Huron was only a small piece of a storm that produced a great number of casualties in the Northwest. On the morning of the 12 January 1888, an area of high pressure appeared north of Montana. At the same time a well-defined area of low pressure central near Cheyenne, Wyoming, the subsequent course of which moved to the southeast until the center neared Concordia, Kansas at 3 p.m., then rapidly to the northeast. At 10 p.m. of the 12<sup>th</sup>, the area of high pressure had extended to the southeast over Montana, Dakota, and Nebraska, while the pressure at its center had increased to 30.60 inches, the center of the area of low pressure before mentioned being located at La Crosse, Wisconsin, and bounded by an isobar of 29.60 inches, there being a difference of pressure of 1.3 between the centers of the two areas, separated by about 1,200 miles. This marked difference in pressure caused winds of from 30 to 50 miles an hour, accompanied at some stations in Montana, Dakota, and Nebraska, by snow, which, with a fall of from 30° to 60° F in temperature during 24 hours helped to make a violent storm in which many lives were lost and large numbers of cattle perished.<sup>137</sup>

On 11-13 January 1888, a snowstorm (blizzard) struck the northwest of *United States*. About 235 persons perished along with many cattle. Another snowstorm struck New York on 26 January 1888.<sup>90</sup>

On the 14<sup>th</sup>, the cold wave extended over the southern slope of the Rocky Mountains and the west Gulf states of the *United States*.<sup>121</sup>

— At Fort Elliott, Texas on the 14<sup>th</sup>, a "norther" struck the [weather] station. Temperatures fell to -7° F, the coldest day on record. On the 15<sup>th</sup>, the "norther" continues. The cold wave produced the coldest temperature since the establishment of station, -14° F in the morning with a gale of forty miles per hour.

— At Abilene, Texas on the 15<sup>th</sup>, the temperature fell to -5° F, which was the coldest of which there is any record, and colder than the oldest residents have ever seen it.

— At Galveston, Texas on the 15<sup>th</sup>, a veritable "blizzard" was raging in Galveston. The temperature was below freezing, the wind blowing at the rate of 36-40 miles per hour, with fine snow, or frozen mist, which cuts like drifting sand. By the evening, every object out of doors coated with ice an inch thick.

— At Rio Grande City, Texas on the 15<sup>th</sup>, a terrific "norther" came on with freezing rain. On the 16<sup>th</sup>, the "norther" continued. All small receptacles filled with water froze solidly. There was general suffering and sickness among the Mexican inhabitants.

— At Brownsville, Texas on the 16<sup>th</sup>, there was a severe "norther" producing a minimum temperature of 21.4° F. Trees, houses, and fences covered with ice an inch thick; coldest weather since 31 December 1880 / 1 January 1881, when minimum temperature was 18° F. Cattle and people suffered greatly.

Unusually low temperatures were observed throughout California in the *United States* from the 14-18 January 1888, and frost and ice were formed at places where they are of very rare occurrence.<sup>121</sup>

— At Red Bluff, California on the 14<sup>th</sup>: clear weather, with high northwest wind; minimum temperature, 18° F, the lowest since the establishment of the [weather] station. On the 16<sup>th</sup>, light snow fell from 5 to 5:35 p.m., melting as soon as it reached the ground. On the 17<sup>th</sup>, a killing frost was observed in the morning.

— At Sacramento, California on the 14<sup>th</sup>: high northerly winds, clear and cold; minimum temperature in the morning was the lowest recorded by the Signal Service at this [weather] station since 1 July 1877, and the coldest known since 21 January 1854, when Dr. Logan recorded 19° F, which was the same as the minimum temperature today. Ice on water in a tub on the roof measured 1.1 inches in the center of the tub. The average temperature was 28° F, and ice was forming all day in the shade. Slush ice was floating down the Sacramento River, the first time since 1854 that such a thing had happened. On the 15<sup>th</sup>, clear and cold, minimum temperature being the same as yesterday. On a small pond back of the railroad company's roundhouse, ice was thick enough to bear a man weighing one hundred and eighty pounds, and boys were skating upon it. On the 16<sup>th</sup>, clear and cold; killing frost observed in the morning; ice on the roof was three inches thick; boys were still skating on the pond. On the 17<sup>th</sup>, clear and cold, with killing frost; China Slough partially frozen over. On the 18<sup>th</sup>, killing frost.

— At San Francisco, California on the 14<sup>th</sup>: weather continued clear and cold throughout the day, not a cloud being visible; the wind attained a velocity of forty miles per hour in the early morning, doing considerable damage to shipping and wharves in the northern section of city front; a pile-driver, valued at \$4,000, was capsized in Mission Bay; a number of vessels in different parts of the harbor parted their lines and coming into collision were damaged to some extent; water pipes were frozen in various parts of the city; ice in the gutters this morning was fully ½ inch in thickness. On the 15<sup>th</sup>, water in pipes frozen this morning, resulting in the usual damage by bursting; this was a thing of very rare occurrence in this city; the minimum thermometer read 29° F in the morning, being 4° F lower than any previous record since the establishment of the station in 1871; the bottle of water kept in the instrument shelter was frozen solidly and did not thaw out until after 3 p.m.; ice was seen this morning fully 4 inches in thickness. On the 16<sup>th</sup>, light snow began falling at 10:20 p.m. and continued till 11:40 p.m., at which time it was 0.1 inches deep. On the 17<sup>th</sup>, snow remained unmelted in the western part of the city until after 3 p.m.

— At Fresno, California on the 14<sup>th</sup>: no frost was visible as on other mornings but the ground was frozen hard. Orange growers in the country say it was the worst weather ever experienced here, but they did not think oranges were injured; a personal inspection of those in town showed no damage. Old residents say that nothing like this winter was ever known in the valley. On the 15<sup>th</sup> and 16<sup>th</sup>, killing frosts. On the 17<sup>th</sup>, water pipes in the building froze and burst; heavy frost in the morning; a light fog from 11 a.m. to 11:40 a.m. froze on the trees, presenting a beautiful appearance. On the 18<sup>th</sup>, killing frost.

— At San Diego, California on the 17<sup>th</sup>: light frost this morning, also a thin film of ice on shallow pools of water on the street; no damage done to vegetation.

— At Los Angeles, California on the 16<sup>th</sup>: minimum temperature 32° F; heavy frost and ice formed this morning. An individual who was duck shooting at Balona [Ballona], on the coast near Santa Monica, reported that ice formed on the sloughs was thick enough to bear the weight of a small dog he had with him, and the ice remained until midday before melting. On the 16<sup>th</sup>, very cold this morning, minimum temperature 31° F; heavy frost and ice formed; water pipes in many places froze solid. An eastern mail arrived today, the first received for a week, on account of the trains having been blockaded by snow in the mountains.

On 27-31 January 1888 at Upper Mattole, California in the *United States*, 31.68 inches of rain fell.<sup>116</sup>

The *United States* suffered from unusually cold temperatures during the winter of 1887-88. The following are the lowest temperatures observed during January 1888:<sup>121</sup>

Fort Keogh, Montana	(-65.0° F, -53.9° C)	(now Miles City, Montana)
Poplar River, Montana	(-56.8° F, -49.3° C)	
Saint Vincent, Minnesota	(-53.5° F, -47.5° C)	

Delano, Minnesota	(-52.0° F, -46.7° C)
Fort Custer, Montana	(-45.1° F, -42.8° C)
Fond du Lac, Wisconsin	(-44.0° F, -42.2° C)
Moorhead, Minnesota	(-44.0° F, -42.2° C)
Cresco, Iowa	(-43.0° F, -41.7° C)
La Crosse, Wisconsin	(-42.0° F, -41.1° C)
Fort Bridger, Wyoming	(-42.0° F, -41.1° C)
Fort Washakie, Wyoming	(-42.0° F, -41.1° C)
Minneapolis, Minnesota	(-42.0° F, -41.1° C)
Fort Totten, North Dakota	(-41.4° F, -40.8° C)
Saint Paul, Minnesota	(-41.2° F, -40.7° C)
Helena, Montana	(-41.0° F, -40.6° C)
Fort Maginnis, Montana	(-39.2° F, -39.6° C)
Fort Klamath, Oregon	(-39.0° F, -39.4° C)
Fort Assiniboine, Montana	(-38.0° F, -38.9° C)
Laramie, Wyoming	(-38.0° F, -38.9° C)
Fort Duchesne, Utah	(-37.6° F, -38.7° C)
Bismarck, North Dakota	(-37.0° F, -38.3° C)
Green Bay, Wisconsin	(-36.4° F, -38.0° C)
Huron, South Dakota	(-36.0° F, -37.8° C)
North Platte, Nebraska	(-34.6° F, -37.0° C)
Valentine, Nebraska	(-34.6° F, -37.0° C)
Fort Sherman, Idaho	(-34.0° F, -36.7° C)
Fort Yates, North Dakota	(-32.4° F, -35.8° C)
Fort Sully, South Dakota	(-31.7° F, -35.4° C)
Dubuque, Iowa	(-30.5° F, -34.7° C)
Spokane Falls, Washington	(-30.5° F, -34.7° C)
Escanaba, Michigan	(-29.0° F, -33.9° C)
Berlin Mills, New Hampshire	(-29.0° F, -33.9° C)
Winnemucca, Nevada	(-28.0° F, -33.3° C)
Boise City, Oklahoma	(-27.8° F, -33.2° C)
Yankton, South Dakota	(-27.5° F, -33.1° C)
Des Moines, Iowa	(-27.4° F, -33.0° C)
Cheyenne, Wyoming	(-27.2° F, -32.9° C)
Newport, Vermont	(-26.0° F, -32.2° C)
Omaha, Nebraska	(-25.2° F, -31.8° C)
Davenport, Iowa	(-24.5° F, -31.4° C)
Northfield, Vermont	(-24.1° F, -31.2° C)
Keokuk, Iowa	(-23.0° F, -30.6° C)
Pike's Peak, Colorado	(-22.8° F, -30.4° C)
Milwaukee, Wisconsin	(-22.7° F, -30.4° C)
Marquette, Michigan	(-21.2° F, -29.6° C)
Leavenworth, Kansas	(-21.1° F, -29.5° C)
Denver, Colorado	(-20.3° F, -29.1° C)
Lewiston, Idaho	(-20.0° F, -28.9° C)
Topeka, Kansas	(-19.5° F, -28.6° C)
Mackinaw City, Michigan	(-19.0° F, -28.3° C)
Dodge City, Kansas	(-18.0° F, -27.8° C)
Burlington, Vermont	(-18.0° F, -27.8° C)
Springfield, Illinois	(-17.0° F, -27.2° C)
Salt Lake City, Utah	(-16.7° F, -27.1° C)
Portland, Maine	(-12.3° F, -24.6° C)
Eastport, Maine	(-12.2° F, -24.6° C)
Saint Louis, Missouri	(-11.5° F, -24.2° C)
Chicago, Illinois	(-10.8° F, -23.8° C)
Terre Haute, Indiana	(-10.1° F, -23.4° C)

Albany, New York	( -9.9° F, -23.3° C)
Carson City, Nevada	( -9.6° F, -23.1° C)
Middlebrook, West Virginia	( -9.0° F, -22.8° C)
Boston, Massachusetts	( -6.2° F, -21.2° C)
Indianapolis, Indiana	( -6.0° F, -21.1° C)
Erie, Pennsylvania	( -6.0° F, -21.1° C)
Roseburg, Oregon	( -6.0° F, -21.1° C)
New Haven, Connecticut	( -4.4° F, -20.2° C)
Nantucket, Massachusetts	( -3.5° F, -19.7° C)
Detroit, Michigan	( -3.0° F, -19.4° C)
Block Island, Rhode Island	( -3.0° F, -19.4° C)
New London, Connecticut	( -3.0° F, -19.4° C)
Portland, Oregon	( -2.0° F, -18.9° C)
Santa Fe, New Mexico	( -2.0° F, -18.9° C)
Olympia, Washington	( -1.8° F, -18.8° C)
Moorestown, New Jersey	( -1.0° F, -18.3° C)
Cairo, Illinois	( -0.3° F, -17.9° C)
Fort Smith, Arkansas	( 1.2° F, -17.1° C)
New York City, New York	( 1.9° F, -16.7° C)
Nashville, Tennessee	( 2.0° F, -16.7° C)
Columbus, Ohio	( 2.2° F, -16.6° C)
Philadelphia, Pennsylvania	( 2.4° F, -16.4° C)
Lexington, Kentucky	( 5.2° F, -14.9° C)
Cincinnati, Ohio	( 6.0° F, -14.4° C)
Little Rock, Arkansas	( 7.0° F, -13.9° C)
Louisville, Kentucky	( 7.9° F, -13.4° C)
Washington, D.C.	( 9.2° F, -12.7° C)
Baltimore, Maryland	( 9.2° F, -12.7° C)
San Antonio, Texas	(11.4° F, -11.4° C)
Knoxville, Tennessee	(12.2° F, -11.0° C)
Lynchburg, Virginia	(14.0° F, -10.0° C)
Shreveport, Louisiana	(15.0° F, -9.4° C)

The depth that rivers, harbors and lakes froze in January and February 1888 in the *United States*:<sup>121</sup>

\* At Bar Harbor, Maine, the *Frenchman's Bay* contained much ice during the latter part of January. Navigation was closed on January 28<sup>th</sup>.

\* At Portland, Maine, the harbor at *Casco Bay* was frozen over with thin ice from January 24<sup>th</sup>.

At Rockland, Maine, the ice, which had closed up the harbor since 1 February departed on 14 February. The ice started leaving about noon, going out with the wind. The immense field of ice occupying the space from Owl's Head to Tillson's wharf, twelve to eighteen inches thick, started in a sheet and swung out in a body, taking all the fleet of vessels in winter quarters here that lay in its wake.

\* At Boston, Massachusetts, the *Boston Harbor* was almost entirely frozen over on January 23<sup>rd</sup> and broke up on February 3<sup>rd</sup>.

\* At Vineyard Haven, Massachusetts, the *Holmes Hole Harbor* was frozen over from January 17<sup>th</sup> to the 23<sup>rd</sup>.

\* At Nantucket, Massachusetts, the *Nantucket Harbor* was frozen over on January 21<sup>st</sup>, closing navigation.

\* At Wood's Hole (in Falmouth), Massachusetts, the *Wood's Hole Harbor* was blockaded with ice and frozen solid to Nantucket Island on January 21<sup>st</sup>. *Buzzard Bay* was also frozen for several hundred yards from shore; all navigation was suspended.

\* At Edgartown, Massachusetts, *Edgartown Harbor* was frozen over beginning on January 24<sup>th</sup>.

\* At New Haven, Connecticut, *New Haven Bay* froze over on January 17<sup>th</sup>.

\* At Burlington, Vermont, *Lake Champlain* froze over on January 22<sup>nd</sup>, seven days earlier than the average date for the last seventy years.

\* At New York City, New York, the *East River* was choked with ice beginning on January 19<sup>th</sup>. There was an unusual amount of drift ice in the upper bay on January 23<sup>rd</sup>.

\* At Port Jervis, New York, the *Delaware River* was gorged [with ice] for a distance of four miles on February 23<sup>rd</sup>. The backwater flooded cellars and basements.

\* At Starkey, New York, *Seneca Lake* froze over on January 22<sup>nd</sup>. It rarely occurs that this lake freezes over before February.

\* At Catawissa, Pennsylvania, the North Branch of the *Susquehanna River* was closed to navigation several times during the winter [due to the ice].

\* At Baltimore, Maryland, ice in the *Chesapeake Bay* and *Baltimore Harbor* rendered navigation difficult.

\* At Kitty Hawk, North Carolina, *Kitty Hawk Bay* was closed to navigation on January 30<sup>th</sup>.

\* At Pittsburg, Pennsylvania, there was floating ice on the *Alleghany* and *Monongahela Rivers* during January. On the 2 January, the ice carried away a span of the 30<sup>th</sup> Street Bridge.

\* At Erie, Pennsylvania, the ice in *Presque Isle Bay* was 20 inches thick on February 16<sup>th</sup>.

\* At Portsmouth, Ohio, there was floating ice in the *Ohio River* during the entire month of January and much of the time it was so heavy as to prevent navigation.

\* At Louisville, Kentucky, there was floating ice in the *Ohio River* and navigation was suspended on January 21<sup>st</sup>.

\* At Cairo, Illinois, there was floating ice in the *Ohio River* from January 17<sup>th</sup> to the 21<sup>st</sup>.

\* At Keokuk, Iowa and points north, the *Mississippi River* was frozen throughout January.

\* At Saint Louis, Missouri, there was a rapid rise on the *Mississippi River* due to an ice dam that formed in January a few miles south of the city at Carondelet.

\* At Boise City, Idaho, the temperature dropped to -26° F on January 15<sup>th</sup>. The frozen streams deprived the cattle of drinking water and the loss of livestock on account of the cold weather is already considerable.

\* At Cairo, Illinois, there was intermittent floating ice on the *Mississippi River*. An ice dam formed at Bird's Point, Missouri on January 15<sup>th</sup> and broke on January 31<sup>st</sup>.

\* At Leavenworth, Kansas and points north, the *Missouri River* was frozen throughout January.

\* At Fort Buford, Dakota, the *Missouri River* remained entirely frozen during January and February.

\* At Little Rock, Arkansas, there was floating ice on the *Arkansas River* beginning on January 17<sup>th</sup>.

\* At Mackinaw City, Michigan, the *Mackinaw Strait* froze over on January 1<sup>st</sup> and by the 2<sup>nd</sup> the ice was 2 inches thick.

\* At Port Huron, Michigan, the *Saint Clair River* was closed for navigation due to the ice on January 2<sup>nd</sup>. An ice bridge formed on January 20<sup>th</sup>.

\* At Grand Haven, Michigan, the *Grand River* was frozen over on February 7<sup>th</sup>. On February 12<sup>th</sup>, *Lake Michigan* was frozen for a distance of 40 miles from the shore.

\* At Milwaukee, Wisconsin, by the end of February the mouth of *Lake Michigan* was almost covered with ice, and the strong westerly gales had packed it in large quantities along the east shore. Fields of ice from ten to twelve feet thick interfered greatly with navigation off Ludington, Michigan. The five steamers, which ply between Milwaukee, Grand Haven and Ludington, were for eight days unable to enter either harbor or to get within eight miles of the east shore.

\* At Sacramento, California, there was floating ice on the *Sacramento River* on January 14<sup>th</sup>. The minimum temperature of 14° F was recorded on January 14<sup>th</sup>. This was the lowest temperature since 21 January 1854 when a

similar cold temperature was observed. Between the 15<sup>th</sup> and the 18<sup>th</sup> of January 1888, ice on streams was sufficiently strong to bear the weight of persons, an unusual occurrence in this region.

\* At San Francisco, California, the temperature dropped to 29° F on the morning of January 15<sup>th</sup>. Ice formed to a thickness of four inches.

\* At Portland, Oregon, the *Columbia River* was frozen over on January 9<sup>th</sup> closing navigation.

\* At Portland, Oregon, the *Willamette River* froze over on January 13<sup>th</sup>. People crossed on the ice on January 15<sup>th</sup>.

At Northfield, Massachusetts in the *United States* in 1888, the temperature dropped from a maximum of 49° F on February 14, to a minimum of -29° F on February 16 to a maximum of 39° F on February 17. There was, therefore, a fall of 78° in forty hours, followed by a rise of 68° in thirty-two hours.<sup>138</sup>

On 11-14 March 1888, the deepest snowfall was 2 feet 6 inches at Northfield, Massachusetts in the *United States*.<sup>138</sup>

The Great Blizzard of March 11 – March 14, 1888 was one of the most severe blizzards in *United States'* recorded history. The storm, referred to as the Great White Hurricane, paralyzed the East Coast from the Chesapeake Bay to Maine, as well as eastern Canada. Snowfalls of 40-50 inches (102-127 centimeters) fell in New York, Massachusetts, New Jersey and Connecticut, and sustained winds of over 45 miles per hour (72 kilometers/hour) produced snowdrifts in excess of 50 feet (15.2 meters). The highest drift (52 feet / 15.8 meters) was recorded in Gravesend, New York. Some snowdrifts were so high that they covered three-story houses. Fifty-eight inches of snow was reported in Saratoga Springs, New York; 48 inches in Albany, New York; 45 inches of snow in New Haven, Connecticut; and 22 inches of snow in New York City. Railroads were shut down, fire stations were immobilized, telegraph service was inoperative and people were confined to their houses for up to a week. Over 400 people died in the blizzard. When the snow finally melted, severe flooding occurred, especially in the Brooklyn, New York area.<sup>51</sup>

On 11-13 March 1888, New York City in the *United States* was battered by a destructive blizzard.<sup>97</sup>

On 11-13 March 1888, a destructive blizzard from the northwest desolated the eastern coast of *United States*. Communication between New York, Philadelphia and Boston was suspended. There were many [ship] wrecks; great loss of life (about 400 people) and property. Food rose to famine prices.<sup>94</sup>

On 11 & 12 March 1888, a great blizzard struck the Atlantic seaboard in the *United States*. New York City felt the effects of this storm in its fiercest form. For more than a day business in that city was entirely suspended, and communication between it and the rest of the country was entirely cut off. New York for about twenty-four hours got its news from Philadelphia by way of London. About 400 lives were lost in New York and the other towns afflicted and in wrecks on the ocean in the vicinity, which the gale caused, while the property loss was estimated at \$3,000,000, but New York City's share of this destruction was only about thirty lives and \$1,000,000 property. [In present currency, that would be equivalent to \$81.5 million in total damages of which New York City's share would be \$27 million based on the Consumer Price Index (CPI) inflation rates.]<sup>197</sup>

On 11-14 March 1888, a severe storm struck the Atlantic coast of the *United States*. The snowfall in some areas exceeded 40 inches and due to the winds, snowdrifts of twenty to forty feet high were measured.<sup>121</sup>

— At Hatteras, North Carolina on the 11<sup>th</sup>, the wind velocity reached sixty miles per hour at 10:30 p.m.; very high tide, nearly submerging the island.

— At Norfolk, Virginia on the 11<sup>th</sup>, a furious gale began at 6:45 p.m. and continued without abatement throughout the 12<sup>th</sup>, the wind reaching a maximum velocity of sixty miles per hour. This storm was one of the most violent that had occurred here since the memorable storm of 1879. Many vessels at anchor in this harbor were blown ashore and wrecked; at Hampton Roads a sloop was capsized and all on board perished.

- At Onancock, Virginia, the high tide during the severe storm of the 11<sup>th</sup> inundated a very large area along Chesapeake Bay, drowning cattle and causing other damage.
- At Baltimore, Maryland on the 11<sup>th</sup>, light rain changed to heavy rain, which changed to snow, accompanied by high northwest wind. In a short time telegraphic communication was cut off with nearly all points. The winds with a maximum velocity of 33 miles per hour caused the lowest tide for many years, the bottom of the harbor being exposed in many places. This severe storm caused an almost entire suspension of business on the 12<sup>th</sup>.
- At Atlantic City, New Jersey, during the gales of 11<sup>th</sup> to 14<sup>th</sup> March, the sloops *Neptune* and *Alert* were blown from their anchorage and sunk. The heavy snow caused delay of trains.
- At Philadelphia, Pennsylvania a storm began on the 11<sup>th</sup>. During the night the storm continued with great severity; the fierce north wind, blinding snow, and rapidly falling temperature causing suspension of street railway traffic. Throughout the next day the wind velocity ranged from 30 to 60 miles per hour. At the Breakwater, out of forty vessels in the harbor on the 11<sup>th</sup>, only thirteen escaped damage or destruction, and thirty or more lives were lost. The damage sustained by the Breakwater and to marine interests was estimated at half a million dollars [\$12 million in today's dollars], but vast as this sum was, it becomes inconsiderable when compared with the losses sustained by the several railroad companies, the least part of which, although great, being the prolonged interruption to travel. This storm was considered the most disastrous that had ever visited this locality.
- At New York City, New York on the 12<sup>th</sup>, rain changed to snow, which continued throughout the day, accompanied by high northwest winds, reaching a velocity of 48 miles per hour. Travel by street railway was entirely suspended by 7 a.m., and at some points the snowdrifts were from fifteen to twenty feet deep.
- At Albany, New York during the evening of the 11<sup>th</sup>/12<sup>th</sup>, heavy snow fell and drifted so as to render travelling difficult. At 7 p.m. snowdrifts were from three to four feet deep, and after 10 p.m. it was dangerous for persons to venture out of doors. The storm continued on the 13<sup>th</sup>, but with less violence, and ended on the morning of March 14<sup>th</sup>. Nearly forty-seven inches of snow fell during the storm.
- At New Haven, Connecticut, heavy snow fell throughout the 12<sup>th</sup> accompanied with high winds. Wind speeds were 36 miles per hour with gusts reaching 60 miles per hour. At Light-House Point the wind-velocity was estimated at seventy miles per hour. Telegraphic communication with New York City was cut off and travel of all kinds interrupted. The storm continued until the morning of the 13<sup>th</sup>, on which date the streets of New Haven were utterly impassable and business was suspended. The storm caused much suffering and the police rescued many exhausted persons from snowdrifts in the heart of the city. The total depth of snow during the storm was forty-four inches.
- At New London, Connecticut on the 12<sup>th</sup>, snow accompanied by furious gale, made travel almost impossible and very dangerous. On the 13<sup>th</sup>, all railroads to the west were blockaded in the morning and in the afternoon those to the east were also blockaded and telegraph lines were prostrated. On the 13<sup>th</sup>, some drifts were from eight to ten feet deep.
- At Eastport, Maine on the 13<sup>th</sup>, the winds reached 72 miles per hour. This was the most severe storm that occurred here since April 1873.

---

**1888 A.D.** On 17 February 1888 in *Australia*, a cyclone struck Mackay in Queensland. It damaged many of the buildings in the city and destroyed 2 steamers.<sup>101</sup>

On [17] February 1888, a cyclone struck Mackay in Queensland, *Australia*. Ships and homes were destroyed.<sup>99</sup>

On 18 February 1888, a tornado struck Mount Vernon, Illinois in the *United States*, almost completely destroying the city. Thirty-nine persons were killed and 125 injured, many of them fatally.<sup>197</sup>

On 19 February 1888, a cyclone [tornado] struck in Illinois, in the *United States* causing great destruction of life and property.<sup>90</sup> [This tornado cut a half mile wide path through Mount Vernon, Illinois and resulted in the death of 37 people with 300 injured and 450 homes and public buildings destroyed.]

On 19 February 1888, a tornado destroyed a large part of the town of Mount Vernon, Illinois (population about 8,000) in the *United States*. Eighteen persons were killed, and about three times that number were more or less seriously injured. About one hundred buildings were destroyed, among which was the county courthouse, a large and substantial structure of brick and stone. The starting point of the storm

which devastated Mount Vernon seems to have been near the old town of Kaskaskia, Illinois not far from the Chester Penitentiary. The storm caused damage as it passed through Steeleville, Perry County and between Duquoin and Pinckneyville before striking Mount Vernon.<sup>121</sup>

On 9-11 March 1888, there was a violent gale [in *Great Britain*]. Several vessels were wrecked causing loss of life.<sup>94</sup>

Around 26 March 1888, the Elbe River overflowed [in the *Czech Republic* and/or *Germany*]. About 100 villages were submerged. There was loss of life and destruction of property.<sup>90</sup>

On 27 March 1888, the town of Ninnescah, Kansas in the *United States* was destroyed by a gale.<sup>94</sup>

About 27 March 1888, the Vistula River [in *Poland*] overflowed. About 77 villages were submerged.<sup>90</sup>

On 28 March 1888, there was a great storm and a tidal wave causing much destruction near Wellington, *New Zealand*.<sup>94</sup>

On 7 April 1888, there was a destructive hurricane in Dacca [now Dhaka in central *Bangladesh*]. About 69 persons were killed.<sup>97</sup>

On 7 April 1888, a gale struck Dhaka, *Bangladesh*. Approximately 100 persons were killed.<sup>197</sup>

In 1888 in *India*, there was a storm of great violence on the Bareilly-Pilibhit railway. Eighteen miles of telegraph were demolished and several wagons [train cars] were blown off the line [tracks] and capsized [overturned]. Not long since, the residences in the civil station of Moradabad were almost completely destroyed by a hurricane [tornado].<sup>181</sup>

In 1888, 230 people are said to have lost their lives in a hailstorm in the Moradabad district in the state of Uttar Pradesh, *India*.<sup>181</sup>

In 1888 at Basti district in Uttar Pradesh state of India over 30 inches of rain fell in 24 hours and at Bijnor district 34 inches of rainfall was recorded.<sup>181</sup>

Towards the end of April 1888, heavy rains caused severe flooding in Texas and Oklahoma in the *United States*.<sup>121</sup>

— The northern cities of Texas report exceedingly heavy rains on the 27<sup>th</sup> and 28<sup>th</sup>, which swelled the rivers beyond their banks, inundated the bottoms, and almost swamped towns, causing a great deal of damage to property. The Washata River [Washita River] in the Chickasaw Nation flooded the lowlands, washing away Dougherty Station, Indian Territory [Oklahoma] and a mile of railroad track, including culverts and bridges. Extensive landslide from Arbuckle Mountain covered several hundred feet of track. The Red River was higher than ever known before. In Choctaw Bayou, a few miles from Sherman, Texas, people were compelled to take to the trees on Friday, and were not rescued until yesterday morning. The *Texas Pacific Railroad* has suffered great damage from washouts, and South Bonham has been overflowed to the depth of four feet in many places. Forty families near Atoka have been compelled to abandon their homes, and reports from Muskogee, Indian Territory, indicate much misfortune throughout the territory.

— At Piano, Texas, numerous bridges were washed away.

— At Denison, Texas, the heavy rains of the 27<sup>th</sup> and 28<sup>th</sup> caused a large amount of damage to crops, stock, and railroads. The *Missouri Pacific Railroad*, between this place and Fort Worth, had nearly all bridges washed out or damaged and twenty miles of the Missouri, Kansas, and Texas tracks between Atoka and Durant, Indian Territory, were underwater.

— At Rockwall, Texas, the East Fork of the Trinity River overflowed in this vicinity on the 29<sup>th</sup>.

— At Bonham, Texas on the 30<sup>th</sup> reported the Red River was higher than has been known for years, and all crops in the lowlands were destroyed.

— Navasota, Texas reported that the Brazos, Navasota, San Jacinto, and Saline Rivers flooded the districts to the south and east of Navasota, causing extensive damage to crops.

— At Burnet, Texas on the 30<sup>th</sup>, the recent heavy rains have caused a high stage of water in the Colorado River. Cattle, sheep, and driftwood were seen floating past the city.

Around 8 May 1888, there was a great flood in the Canton River [the extensive river system called Pearl River in southern *China*]. It is said that 3,000 people drowned.<sup>90</sup>

On 17 May 1888, there was a destructive freshet [flood caused by spring thaw] in the Mississippi River in the *United States*. Quincy, Hannibal, Alexandria and other towns on the Illinois coast overflowed.<sup>90</sup>

On 6 June 1888, a storm of unusual severity struck Quebec, Montreal, *Canada* in the afternoon. Damage estimated at \$100,000 [\$2.4 million in today's dollars] was done in the city and in surrounding parishes. In some sections scarcely a barn was left standing. On the same date, a storm struck Ontario, *Canada* causing a large amount of damage. The wind reached a velocity of 80 miles per hour and in the surrounding country blew down many buildings, among which were a number of school houses; several persons injured, some fatally.<sup>121</sup>

On 12 June 1888, severe rains caused the greatest flood ever known in northern Minnesota in the *United States*. Along the branches of streams tributary to the Saint Louis River, millions of acres of land were overflowed and loss of life was feared. At the village of Cloquet, Minnesota, a portion of the town, which is situated on the island, was completely engulfed by a raging torrent. Only the tops of houses were visible. Several dwellings were carried away, but the inhabitants were warned in time, and no loss of life occurred. The immense sawmills were flooded and abandoned, and in the booms 80 million logs were jammed yesterday morning, and the number reached 200 million, last night. All county bridges were carried away. Fond du Lac was underwater, and several buildings were carried down stream. From Fond du Lac to beyond Spring Lake, the tracks of the Saint Paul and Duluth Railway were underwater from two to three feet, and the stream was still rising. Indians and old settlers say this flood has never been equaled.<sup>121</sup>

During 17-20 June 1888, there were inundations in *Mexico* caused by heavy rains. These floods caused great loss of life.<sup>90</sup>

The following are the highest temperatures observed during July 1888 in the *United States*:<sup>121</sup>

Montgomery, Alabama	( 97.6° F, 36.4° C)
Mobile, Alabama	( 96.6° F, 35.9° C)
Phoenix, Arizona	(112.0° F, 44.4° C)
Yuma, Arizona	(113.7° F, 45.4° C)
Little Rock, Arkansas	( 97.3° F, 36.3° C)
Fort Smith, Arkansas	( 99.5° F, 37.5° C)
Fresno, California	(109.2° F, 42.9° C)
San Francisco, California	( 93.4° F, 34.1° C)
San Diego, California	( 77.2° F, 25.1° C)
Denver, Colorado	(103.0° F, 39.4° C)
Pueblo, Colorado	(102.7° F, 39.3° C)
Pike's Peak, Colorado	( 61.5° F, 16.4° C)
New Haven, Connecticut	( 89.8° F, 32.1° C)
New London, Connecticut	( 86.5° F, 30.3° C)
Washington, D.C.	( 93.7° F, 34.3° C)
Pensacola, Florida	( 94.0° F, 34.4° C)
Key West, Florida	( 90.5° F, 32.5° C)

Augusta, Georgia	(103.8° F, 39.9° C)
Savannah, Georgia	( 99.1° F, 37.3° C)
Chicago, Illinois	( 94.3° F, 34.6° C)
Cairo, Illinois	( 95.0° F, 35.0° C)
Indianapolis, Indiana	( 94.8° F, 34.9° C)
Terre Haute, Indiana	( 94.6° F, 34.8° C)
Des Moines, Iowa	( 99.0° F, 37.2° C)
Keokuk, Iowa	( 96.3° F, 35.7° C)
Topeka, Kansas	( 99.8° F, 37.7° C)
Dodge City, Kansas	(102.0° F, 38.9° C)
Louisville, Kentucky	( 95.6° F, 35.3° C)
Lexington, Kentucky	( 95.0° F, 35.0° C)
New Orleans, Louisiana	( 96.5° F, 35.8° C)
Shreveport, Louisiana	( 98.5° F, 36.9° C)
Eastport, Maine	( 77.3° F, 25.2° C)
Portland, Maine	( 87.1° F, 30.6° C)
Baltimore, Maryland	( 94.3° F, 34.6° C)
Boston, Massachusetts	( 88.0° F, 31.1° C)
Nantucket, Massachusetts	( 78.3° F, 25.7° C)
Marquette, Michigan	( 90.5° F, 32.5° C)
Detroit, Michigan	( 91.4° F, 33.0° C)
Saint Vincent, Minnesota	( 89.0° F, 31.7° C)
Saint Paul, Minnesota	( 94.0° F, 34.4° C)
Vicksburg, Mississippi	( 97.0° F, 36.1° C)
Saint Louis, Missouri	( 97.9° F, 36.6° C)
Helena, Montana	( 99.1° F, 37.3° C)
North Platte, Nebraska	(101.2° F, 38.4° C)
Omaha, Nebraska	(101.2° F, 38.4° C)
Winnemucca, Nevada	( 96.0° F, 35.6° C)
Carson City, Nevada	( 94.4° F, 34.7° C)
Santa Fe, New Mexico	( 96.6° F, 35.9° C)
Albany, New York	( 90.0° F, 32.2° C)
New York City, New York	( 89.9° F, 32.2° C)
Charlotte, North Carolina	( 99.6° F, 37.6° C)
Kitty Hawk, North Carolina	(100.2° F, 37.9° C)
Bismarck, North Dakota	( 96.0° F, 35.6° C)
Cincinnati, Ohio	( 95.4° F, 35.2° C)
Columbus, Ohio	( 90.8° F, 32.7° C)
Fort Sill, Oklahoma	( 99.0° F, 37.2° C)
Roseburg, Oregon	(100.0° F, 37.8° C)
Portland, Oregon	( 97.0° F, 36.1° C)
Erie, Pennsylvania	( 87.0° F, 30.6° C)
Philadelphia, Pennsylvania	( 93.8° F, 34.3° C)
Charleston, South Carolina	(100.2° F, 37.9° C)
Columbia, South Carolina	(100.6° F, 38.1° C)
Yankton, South Dakota	(101.8° F, 38.8° C)
Nashville, Tennessee	( 96.8° F, 36.0° C)
Knoxville, Tennessee	( 93.0° F, 33.9° C)
San Antonio, Texas	( 95.2° F, 35.1° C)
Galveston, Texas	( 91.3° F, 32.9° C)
Salt Lake City, Utah	( 97.9° F, 36.6° C)
Lynchburg, Virginia	( 95.0° F, 35.0° C)
Norfolk, Virginia	( 94.2° F, 34.6° C)
Olympia, Washington	( 92.0° F, 33.3° C)
Spokane Falls, Washington	( 96.1° F, 35.6° C)
Milwaukee, Wisconsin	( 90.8° F, 32.7° C)

La Crosse, Wisconsin  
Cheyenne, Wyoming

( 90.9° F, 32.7° C)  
( 97.2° F, 36.2° C)

On 6 July 1888, a very severe and destructive hailstorm struck Laramie City, Wyoming in the *United States*. Some of the hailstones were said to be 6 inches in diameter. Gardens were destroyed and much window glass broken.<sup>121</sup>

On 8-10 July 1888, a destructive flood in the *United States*, resulting from the heavy rains, occurred along the valley of the Monongahela River. The rivers of western Pennsylvania and West Virginia were swollen into torrents. At Grafton, West Virginia, the rise was unprecedented, and the lumber interests suffered severely, the loss to the town and section being estimated at \$250,000 [\$6 million in today's dollars]. The damage at Rowlesburg, West Virginia was also heavy. Wheeling, West Virginia reported that the freshet was the greatest ever known in that section, and that the destruction to property was beyond computation. Pittsburg, Pennsylvania reports the Monongahela River rose at the rate of nine inches per hour throughout the day of the 10<sup>th</sup>, carrying destruction along its shores from the headwaters to the mouth of the river. The damage done by the overflow at Pittsburg during the 10<sup>th</sup> and 11<sup>th</sup> was estimated at \$300,000 [\$7.2 million in today's dollars]. At Parkersburg, West Virginia, the Kanawha River rose thirteen feet on the 10<sup>th</sup>, washing away one bridge. A terrific rainstorm or cloudburst occurred at Wheeling, West Virginia, on the evening of the 19<sup>th</sup>. Many lives were lost; houses were wrecked; bridges carried away, and great damage done to property. At Triadelphia, West Virginia, the damage was particularly severe.<sup>121</sup>

On 21 July 1888, a very severe hail and rain storm passed eight miles southwest of Dysart, Iowa in the *United States*. The storm was very destructive from the northwestern part of Grundy County extending forty miles eastward, and its breadth varied from two to six miles. It is reported that the hailstones were of unusual size, and killed hogs, calves and smaller animals; trees were entirely stripped of their leaves and much damage was done to the outstanding crops; one schoolhouse was totally demolished and many barns wrecked. The damage is estimated from \$500,000 to \$1,000,000. [In present currency, that would be equivalent to \$12 million to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>121</sup>

During 30-31 July and 1 August 1888, heavy rains caused the rising of rivers in Essex and Kent in *England*. The flood formed lakes navigable by boats. It stopped railways; sweep away the crops from the soil, and created much calamity.<sup>90</sup>

In July and August 1888, there were great floods in *Germany*.<sup>90</sup>

On 6 August 1888 at Marshall, Missouri in the *United States*, a destructive hailstorm visited this county during the evening. It was estimated that the damage done to buildings and crops would reach \$400,000 [\$9.6 million in today's dollars].<sup>121</sup>

On 16 August 1888, there was a great storm in Ontario and Quebec, *Canada*. Many persons were killed by lightning and fright. Damage estimates in Quebec were 1,500,000 dollars.<sup>97</sup>

On 16-19 August 1888, a storm of great strength moved from the *Bahamas* to the west Gulf coast, with violent squalls and incessant rain.<sup>119, 120</sup>

On 20 August 1888, the whole city of New Orleans, Louisiana in the *United States* was inundated after nearly ten inches of rain fell. About one hundred coal barges on the river sunk, causing a loss of about \$250,000 [\$6 million in today's dollars]. The damage to sugarcane, cotton, and rice was estimated at about 25% of the total crop in the southern and eastern portions of the state.<sup>121</sup>

On 21 August 1888, tornadoes struck Delaware and Maryland in the *United States*.<sup>121</sup>

— At Wilmington, Delaware, a tornado caused great damage in this city and vicinity. The path of the storm was two hundred yards in width and about five miles in length. More than twenty persons were injured and one was killed. The damage caused by the tornado was variously estimated at from \$100,000 to \$200,000 [\$2.4 to \$4.8 million in today's dollars].

— A tornado swept through Prince George's, Anne Arundel, Cecil, and Kent counties in Maryland. This tornado appears to have developed in southern Maryland. The first severe damage was done at Jacobsville. It travelled in a zigzag course. The track varied from thirty feet to a quarter of a mile in width. When it moved across Chesapeake Bay, waterspouts were formed. About 3 p.m. it struck the village of Still Pond, destroying a cannery (where forty persons were employed), killing eleven persons. About eighteen or twenty persons were injured at other points in the tornado's track. Great destruction was done; houses, fences, trees, and outbuildings were blown down, and crops badly damaged, entailing a loss of many thousands of dollars.

On 21 August 1888 at Wheeling, West Virginia in the *United States*, a destructive freshet occurred. Many bridges in the surrounding country were washed away. At 6 p.m. the large stone bridge over Wheeling Creek gave way. This bridge was constructed in 1842 and was considered one of the landmarks of the city. At Elm Grove, about five miles from Wheeling, nearly all the buildings were flooded, the damage being estimated at \$25,000 [\$600,000 in today's dollars].<sup>121</sup>

On 18-20 August 1888, southeast gale struck Mobile, Alabama in the *United States*. It produced a very high tide [storm surge] about equal to that of 1860 hurricane.<sup>117</sup>

On 1-5 September 1888, a hurricane struck *Cuba*, *Puerto Rico*, and the *Turks Islands* causing 921 deaths.<sup>141</sup>

On 4 September 1888, there was a destructive cyclone in the *West Indies* and *Cuba*.<sup>97</sup>

In September 1888, one storm [hurricane] moved from north of *Puerto Rico* on the 1<sup>st</sup> westward over *Cuba* and Yucatan to the Mexican coast near Vera Cruz, *Mexico* by the 7<sup>th</sup>. This was a very unusual course. Another storm [hurricane] passed from the *Bahamas* westward over southern Florida in the *United States* where it recurved northward during the 8<sup>th</sup> and 9<sup>th</sup>.<sup>120</sup>

During 1-7 September 1888, a disastrous hurricane traversed the West Indies and the Gulf of Mexico. Captain Edwards, of the *S.S. Jamaican*, experienced a violent hurricane on the 31<sup>st</sup> of August, one hundred and fifty miles northeast of Sombrero Island, [Hat Island in the *Lesser Antilles*] and who calculated that its vortex had passed 120 miles north of the *Virgin Islands* and estimated its diameter at five hundred miles. At noon (Greenwich time) on 1 September, the hurricane center was located north of the western extremity of *Puerto Rico*. On the 2<sup>nd</sup>, a hurricane devastated *Turks Islands*, where the minimum [barometric] pressure fell to 28.95 inches (735.3 millimeters). Twenty-one lives were lost; more than two hundred and fifty houses of the peasantry and over 400,000 bushels of salt were entirely destroyed, and nearly every house left standing was more or less damaged. By noon on the 3<sup>rd</sup>, the center had moved to the northward of Great Inagua Island, [*the Bahamas*] where the barometer fell to about 28.70 inches (729.0 millimeters). At noon on the 4<sup>th</sup>, the center had arrived off the Cuban coast somewhat to the eastward of Sagua, *Cuba*, where the barometer fell to 28.90 inches (734.0 millimeters) and the wind attained a velocity of 120 miles per hour. The storm passed southward of Havana at about 2 a.m. on the 5<sup>th</sup>, and the storm center left the west extremity of the island of *Cuba* during the 5<sup>th</sup>. Attending the passage of the storm center over *Cuba* the losses by destruction of property and crops amounted to millions of dollars, and about eight hundred lives were lost. The principal buildings of the large cities were demolished, and whole towns situated near the seaboard were entirely destroyed by the gigantic waves that swept inland. After leaving *Cuba* the vortex moved to the northern coast of Yucatan [Yucatan Peninsula, *Mexico*], and reached the Mexican coast between Vera Cruz and Coatzacoalcos during the

night of the September 7<sup>th</sup>-8<sup>th</sup>, where it exhibited great strength and occasioned considerable damage to property and shipping.<sup>121</sup>

A severe frost struck Portland, Maine in the *United States* on 7 September 1888. Reports from all parts of the state show that this frost was very destructive. It was estimated that the damage done in Maine would exceed \$1,000,000 [\$24 million in today's dollars]. This frost also affected Connecticut, Massachusetts, Vermont, New Hampshire and New York.<sup>121</sup>

Heavy rainfall and flooding pounded the South in the *United States* in September 1888.<sup>121</sup>

— At Hot Springs, Arkansas on the 7<sup>th</sup>, a destructive cloudburst struck the city. The rain fell in torrents for two hours. Hotels were flooded to a depth of four feet; many buildings were torn down; five lives were lost, and several persons were missing. Damage to property estimated at \$100,000 [\$2.4 million in today's dollars].

— Columbus, South Carolina reported on the 8<sup>th</sup> that the crops along the Congaree River were damaged by the floods to the extent of \$1,000,000 [\$24 million in today's dollars]. The river rose twenty feet above the low water mark.

— At Augusta, Georgia on the 10<sup>th</sup>, a flood was desolating this city. The streets were filled with water to a depth of several feet, causing an entire suspension of business. In the freshet of 1840, the severest previously experienced, the water did not reach its present height by fifteen inches.

— At Danville, Virginia on the 10<sup>th</sup>, dangerous floods were reported along the Dan River.

— At Atlanta, Georgia: the rainstorm of the 15-16<sup>th</sup> caused the heaviest rainfall in twenty-four hours (6.23 inches) that has occurred since the establishment of the Signal Service station in 1878. Great damage was done to the cotton crop and by washing out of railroads.

In October 1888, there were great floods in *France* and *Switzerland*.<sup>90</sup>

On 10 October 1888 at Saint John's, New Brunswick, *Canada*, trains on the New Brunswick Railroad were delayed on the 8<sup>th</sup> by washouts resulting from the recent heavy rains. Reports from Fredericton state that four bridges crossing the Nashwaak River were swept away yesterday, together with 1,000,000 feet of logs. The water has caused great destruction to the hay and buckwheat crops in Queens and Carleton counties; barns were swept away and a number of saw mills flooded.<sup>121</sup>

In October 1888, prairie fires swept over the Dakotas in the *United States*. Jamestown, Bismarck, Fort Totten, Mandan, Fort Sully, and Fort Yates reported fires. At Fort Sully, South Dakota on the 28<sup>th</sup>, the whole western sky to an altitude of 30° was lighted up by prairie fires on the Sioux Indian reservation; prairie fires were also observed to the south and southwest of this station during the last four days of the month. At Fort Yates, North Dakota on the 31<sup>st</sup>, one of the largest prairie fires ever known in this locality swept over the country opposite here, east of the Missouri River, in the evening. The town of Winona was only saved by the persevering efforts of its inhabitants.<sup>121</sup>

On 15-16 November 1888, there was a destructive gale in *Scotland*, northern *England* and *Ireland*. The gale caused many shipwrecks. Forth bridge in eastern *Scotland* was damaged.<sup>97</sup>

A hurricane of tropical origin was first located northeast of the *Windward Islands* on 17 November 1888. From this position it pursued a path westward to the *Bahamas Islands*, where it arrived on the 22<sup>nd</sup>. On the 22<sup>nd</sup> and 23<sup>rd</sup>, the storm center recurved slowly to the northward, and pursuing an abnormal northerly course, advanced to the south New England coast of the *United States* by the night of the 25-26<sup>th</sup>, after which it moved slowly along the New England coast; over eastern Maine; New Brunswick, *Canada* and the southern part of the Gulf of Saint Lawrence to the vicinity of Cape Race, Newfoundland, by November 30<sup>th</sup>. This storm was attended by very destructive gales off the coast of the *United States* from the 21<sup>st</sup> to the 27<sup>th</sup>, inclusive. The storm attained its maximum energy when the center was south of New England and east of New Jersey.<sup>121</sup>

— At Norfolk, Virginia, a storm began on the 25<sup>th</sup> and continued throughout the following day; the maximum velocity of wind, fifty miles per hour. The storm was very destructive; telegraph lines were prostrated, vessels blown from their moorings, and much damage to other property resulted. The tide was very high, flooding the lower portion of the city.

— At Kitty Hawk, North Carolina on the 24<sup>th</sup>, the storm produced winds blowing steadily at about sixty miles per hour. The tide at Currituck Sound was lower than ever before known. At Kitty Hawk wharf, where there was usually enough water for small steamers and sailing vessels, the water receded about seventy-five feet from the wharf. Between Nag's Head and New Inlet, a distance of about 21 miles, the entire banks were flooded by the tide, and all cattle on this low beach perished.

— At Atlantic City, New Jersey on the 26<sup>th</sup>, the barometer was very low, falling to 28.96 inches; high tide caused much damage.

— At New York City, New York on the 26<sup>th</sup>, numerous houses along the coast were carried away by the wind, and hotels were flooded. The Coney Island railway was seriously damaged by washouts. The damage in this vicinity will amount to millions of dollars.

— At New London, Connecticut on the 26<sup>th</sup>, the tide in the afternoon was about four feet above the usual high water mark. In consequence, several of the wharves were partially submerged. This was the highest tide observed in the previous 25 years.

— At New Haven, Connecticut on the 25<sup>th</sup>, the gale winds attained a maximum velocity of fifty-one miles per hour. The storm caused much damage to property; two houses were blown over, and the telephone and telegraph wires sustained severe injury.

— At Block Island, Rhode Island on the 26<sup>th</sup>, the storm attained a maximum velocity of eighty-four miles per hour. The storm was very destructive to telegraph lines, and caused some damage to shipping. The barometer reached a minimum of 28.91 inches at about noon on the 27<sup>th</sup>.

— At Vineyard Haven, Massachusetts on 24-27 November as a result of the storm, all boats in the harbor dragged anchors; smaller craft were torn from their moorings and driven ashore, and numerous wrecks were reported.

— At Eastport, Maine on the 27<sup>th</sup>. The storm produced winds with a maximum velocity of sixty-four miles per hour. The gale was accompanied by snow, sleet, and heavy rain; much damage was caused to fences and buildings.

— At Boston, Massachusetts on 25-27 November, the storm mirrored the "great blizzard" of 11-13 March 1888. The following is the list of vessels wrecked during the storm according to the Boston Chamber of Commerce. The list does not include the names of vessels damaged or which went ashore and afterwards floated.

Steamship: *Allentown*. Barks: *Alexander Campbell*, *Hannah*. Brigs: *Wilhelmina*, *Golconda*, *Alice*. Schooners: *Amazon*, *Abbie S. Emerv*, *Albert H. Cross*, *Clara*, *E. L. Higgins*, *Elizabeth*, *Ethel M. Davis*, *Edward H. Norton* (fisherman), *Emma*, *G. W. Rawley*, *J. and J. Locke*, *John Mettler* (fisherman), *Lena Breed*, *Marshall O. Wells*, *Nellie Florence* (fisherman), *Robert Dority*, *Robert Ripley*, *Sasanoa*, *T. A. Lambert*, *William McLean*, *Mountain Fawn*.

On 25 November 1888, there was a severe storm on the East Coast of the *United States*. More than 50 vessels were wrecked and about 45 lives were lost.<sup>97</sup>

In 1888 in *Australia*, there was a brief national drought. Heavy livestock losses were experienced in New South Wales. The average wheat yield in New South Wales of 4.8 bushels per acre was the lowest since recordkeeping began in 1857. There were very dry conditions in Tasmania. The plum and apples dried out on the trees. In Queensland, the drought continued into 1889. Livestock losses were heavy. Even native animals and trees died. The cane crop failed entirely. In Victoria, the north and Gippsland were hit hard. The average wheat yield in Victoria dropped to 7.2 bushels per acre. In South Australia, the month of April was one of the driest years ever experienced. The average wheat yield dropped to 3.8 bushels per acre. In Western Australia, the central agricultural areas were greatly affected. The average wheat yield dropped to 10 bushels per acre, the lowest in a decade.<sup>101</sup>

*Also refer to the section 1887 A.D. – 1889 A.D. for information on the famine in China and Asia Minor during that timeframe.*

---

### **1889 A.D. – 1892 A.D. India, Russia, Japan, Hungary and Montenegro. Famine**

There was a famine in 1889-92 in Madras [Chennai], *India*.<sup>90</sup>

There was a famine in 1889-92 in *Montenegro*.<sup>90</sup> [*Montenegro* is in southeastern Europe on the northeast Adriatic coast.]

There was a famine in *Japan* in 1890.<sup>90</sup>

*Russia* suffered from a major famine in 1891-92.<sup>90, 96</sup> It is said that 35 million people starved during this famine.<sup>96</sup>

The famine in 1891-92 was initially caused by the bad weather in 1890 and 1891. In the spring of 1891, a serious drought caused crops to fail along the Volga and in many other grain-producing provinces. The dry autumn delayed the seeding of the fields, and the winter, which began early, was more severe than usual, with only light snowfall. (Heavy snow usually protects the seedlings from the cold. Melting snow and ice caused the spring floods of the Volga that spread over the plains whose grass is used as fodder.) But during the winter of 1891-92, the small amount of snow caused the ground to freeze. This killed the young plants because the late planting did not give them enough time to take root. The poor weather eliminated the main source of feed for the animals. The animals were crucial to the peasants because they provided the power needed to plow the fields. The cold weather lasted until mid-April, followed by a summer in 1892 that was extremely hot and dry. Five rainless months contributed to the smallest total grain harvest for European Russia in a decade.<sup>157</sup>

The Russian famine of 1891-92 affected an area of around 900,000 square miles in the Volga and central agricultural areas, once the most fertile and productive regions of Russia. This area included the provinces of Nizhni-Novgorod, Riazan, Tula, Kazan, Simbirsk, Saratov, Penza, Samara and Tambov. It affected between fourteen to twenty million people, of which 375,000 to 400,000 died, mostly of disease. The staple of the peasant diet during the famine was "hunger bread" made from weeds, chopped straw, cockle, tree bark, and sometimes sand. This bread was often described as "a lump of hard black earth covered with a coating of mold". Due to malnutrition caused by the famine, people were more susceptible to infection and a cholera epidemic took root.<sup>157</sup>

According to a Vienna, Austria news account of 2 March 1892, there was a famine in the County of Arva, in *Hungary* [now in northern *Slovakia* and southern *Poland*]. Many children have died in the Namszto district. Seventy-five case of death from starvation have been reported in two months. The peoples food consists of hominy mixed with tree bark, or maize mixed with chopped straw.<sup>95</sup>

**Winter of 1888 / 1889 A.D.** The following are the lowest temperatures observed during January 1889 in the *United States*:<sup>120</sup>

Montgomery, Alabama	( 26° F, -3.3° C)
Mobile, Alabama	( 31° F, -0.6° C)
Killisnoo, Alaska	( 21° F, -6.1° C)
Tucson, Arizona	( 30° F, -1.1° C)
Yuma, Arizona	( 35° F, +1.7° C)
Little Rock, Arkansas	( 20° F, -6.7° C)
Fort Smith, Arkansas	( 13° F, -10.6° C)
San Francisco, California	( 40° F, +4.4° C)
San Diego, California	( 36° F, +2.2° C)
Fresno, California	( 28° F, -2.2° C)
Denver, Colorado	( 4° F, -15.6° C)
Pueblo, Colorado	(-11° F, -23.9° C)
New Haven, Connecticut	( 11° F, -11.7° C)
New London, Connecticut	( 12° F, -11.1° C)
Washington, D.C.	( 23° F, -5.0° C)

Pensacola, Florida	( 33° F, +0.6° C)
Key West, Florida	( 54° F, +12.2° C)
Augusta, Georgia	( 24° F, -4.4° C)
Savannah, Georgia	( 29° F, -1.7° C)
Lewiston, Idaho	( 10° F, -12.2° C)
Chicago, Illinois	( 0° F, -17.8° C)
Cairo, Illinois	( 19° F, -7.2° C)
Indianapolis, Indiana	( 10° F, -12.2° C)
Lafayette, Indiana	( 1° F, -17.2° C)
Dubuque, Iowa	( -4° F, -20.0° C)
Keokuk, Iowa	( 1° F, -17.2° C)
Albion, Iowa	(-25° F, -31.7° C)
Topeka, Kansas	( 3° F, -16.1° C)
Dodge City, Kansas	( 11° F, -11.7° C)
Louisville, Kentucky	( 17° F, -8.3° C)
Lexington, Kentucky	( 16° F, -8.9° C)
New Orleans, Louisiana	( 34° F, +1.1° C)
Shreveport, Louisiana	( 25° F, -3.9° C)
Eastport, Maine	( -2° F, -18.9° C)
Portland, Maine	( 6° F, -14.4° C)
Baltimore, Maryland	( 20° F, -6.7° C)
Boston, Massachusetts	( 9° F, -12.8° C)
Nantucket, Massachusetts	( 16° F, -8.9° C)
Marquette, Michigan	( 3° F, -16.1° C)
Detroit, Michigan	( 7° F, -13.9° C)
Saint Vincent, Minnesota	(-36° F, -37.8° C)
Saint Paul, Minnesota	(-10° F, -23.3° C)
Pine River, Minnesota	(-34° F, -36.7° C)
Vicksburg, Mississippi	( 26° F, -3.3° C)
Saint Louis, Missouri	( 13° F, -10.6° C)
Fort Missoula, Montana	(-21° F, -29.4° C)
Helena, Montana	(-14° F, -25.6° C)
North Platte, Nebraska	( -9° F, -22.8° C)
Omaha, Nebraska	( -2° F, -18.9° C)
Winnemucca, Nevada	(-14° F, -25.6° C)
Carson City, Nevada	( -1° F, -18.3° C)
West Milan, New Hampshire	(-12° F, -24.4° C)
New Brunswick, New Jersey	( 18° F, -7.8° C)
Cape May, New Jersey	( 21° F, -6.1° C)
Santa Fe, New Mexico	( 0° F, -17.8° C)
Albany, New York	( 6° F, -14.4° C)
New York City, New York	( 17° F, -8.3° C)
Charlotte, North Carolina	( 22° F, -5.6° C)
Kitty Hawk, North Carolina	( 29° F, -1.7° C)
Bismarck, North Dakota	(-18° F, -27.8° C)
Grand Forks, North Dakota	(-31° F, -35.0° C)
Cincinnati, Ohio	( 19° F, -7.2° C)
Columbus, Ohio	( 16° F, -8.9° C)
Fort Supply, Oklahoma	( 12° F, -11.1° C)
Roseburg, Oregon	( 22° F, -5.6° C)
Portland, Oregon	( 24° F, -4.4° C)
Erie, Pennsylvania	( 12° F, -11.1° C)
Philadelphia, Pennsylvania	( 18° F, -7.8° C)
Block Island, Rhode Island	( 10° F, -12.2° C)
Charleston, South Carolina	( 29° F, -1.7° C)
Columbia, South Carolina	( 26° F, -3.3° C)

Yankton, South Dakota	(-12° F, -24.4° C)
Nashville, Tennessee	( 20° F, -6.7° C)
Knoxville, Tennessee	( 20° F, -6.7° C)
San Antonio, Texas	( 28° F, -2.2° C)
Galveston, Texas	( 32° F,  0.0° C)
Salt Lake City, Utah	(  5° F, -15.0° C)
Fort DuCheane, Utah	(-22° F, -30.0° C)
Burlington, Vermont	(  0° F, -17.8° C)
Lynchburg, Virginia	( 18° F, -7.8° C)
Norfolk, Virginia	( 24° F, -4.4° C)
Olympia, Washington	( 22° F, -5.6° C)
Helvetia, West Virginia	(  6° F, -14.4° C)
Milwaukee, Wisconsin	(  3° F, -16.1° C)
La Crosse, Wisconsin	( -7° F, -21.7° C)
Cheyenne, Wyoming	(  0° F, -17.8° C)

The following are the lowest temperatures observed during January 1889: <sup>120</sup>

Guanajuato, <i>Mexico</i>	( 39° F,  3.9° C)
La Logia, <i>Mexico</i>	( 37° F,  2.8° C)
Mexico City, <i>Mexico</i>	( 38° F,  3.3° C)
Topo Chico, <i>Mexico</i>	( 52° F, 11.1° C)
Mazatlan, <i>Mexico</i>	( 57° F, 13.9° C)
Leon, <i>Mexico</i>	( 38° F,  3.3° C)
Zacatecas, <i>Mexico</i>	( 23° F, -5.0° C)
Topolobampo, <i>Mexico</i>	( 57° F, 13.9° C)
New Westminster, British Columbia, <i>Canada</i>	( 24° F, -4.4° C)
Grand Turk Island, <i>West Indies</i>	( 75° F, 23.9° C)
Hamilton, <i>Bermuda</i>	( 54° F, 12.2° C)
Port au Prince, <i>Haiti</i>	( 64° F, 17.8° C)

During the winter of 1888-89, the rivers in the *United States* froze later in the season and to a much lesser degree than normal. The depth that rivers and lakes froze in January 1889: <sup>120</sup>

- \* At Albany, New York, the *Hudson River* froze over for the first time this season on 23 January.
- \* At Buffalo, New York, *Lake Erie* was covered with ice on the 28<sup>th</sup> as far as could be seen.
- \* At Alpena, Michigan, *Thunder Bay and Thunder Bay River*, were partly frozen over on the 12<sup>th</sup>.
- \* At Keokuk, Iowa, the *Mississippi River* was full of floating ice on the 17<sup>th</sup>.
- \* At Leavenworth, Kansas, there was floating ice intermittently in the *Missouri River* during January.

The winter of 1888-89 in Bradford County, Pennsylvania in the *United States* was open and mild. On 29 & 30 September, there was a snowfall that covered the ground over most parts of the county. This winter produced little snow and as a result there was almost no sleighing at Towanda all winter. October had been a month of notably bad weather and there were heavy rains in December. On 9 January 1889, a furious windstorm struck Athens, carrying away chimneys and roofs, uprooting trees, blowing in windows, scattering fences and doing much other damage. Most snow fell on February 18<sup>th</sup> but quickly disappeared. Considerable plowing was done in January and the farmers had their crops put in early. <sup>178</sup>

During February 1889, snow fell every day of the month in Vermont and New York in the *United States*. In Pennsylvania and Ohio, snow fell on every day of the month except one. Snow fell in Michigan on every day of the month except the 14<sup>th</sup> and 28<sup>th</sup>. In Montana, Dakota, Minnesota, Wisconsin, Kansas, Missouri, West Virginia, Massachusetts, New Hampshire and Maine, snow fell on 20 to 24 days during the month of February. The monthly snowfall of February exceeded twenty inches over a considerable portion of the Lake region and New England, and in a few cases some remarkably large falls were recorded. Stations in Michigan, northern New York, and northern New England report more than forty

inches, and extreme depths of 69.6 and 71.4 inches were recorded, respectively, at Barnes' Corners and Lowville, New York.<sup>120</sup>

At Augusta, Georgia in the *United States* on 21 February 1889, about 6 inches of snow fell and then quickly melted. On the same day, snow fell at Columbia, South Carolina. It was the heaviest fall of snow within the recollection of the citizens. At Gaffney City, South Carolina, the deepest snow in twenty years fell on the 21<sup>st</sup>; depth twelve to fourteen inches.<sup>120</sup>

Beginning on 21 February 1889 a blinding snowstorm struck Sault de Ste Marie, Michigan in the *United States*. The wind was measured at 132 miles per hour. Trains were blockaded by the drifting snow.<sup>120</sup>

In March 1889, there was a remarkable deficiency of Arctic ice. This was the first March in the last eight years for which large quantities of icebergs and field ice were notably absent over and near the Banks of Newfoundland, *Canada*. This deficiency first appeared in January and continued until April 1889.<sup>120</sup>

---

**1889 A. D.** On 9 January 1889, tornado struck in eastern *United States*, especially in Pennsylvania. There was great destruction and loss of life over an area about 200 miles in length. Cities especially damaged were Pittsburg (14 killed) and at Reading (24 killed), through collapse of a silk-mill; suspension bridge, Niagara was wrecked.<sup>97</sup>

On 9 January 1889, a tornado struck Pittsburg, Pennsylvania in the *United States*. Fifty-three lives were lost.<sup>197</sup>

On 9 January 1889, a massive storm plowed through the Middle Atlantic States and the Great Lakes region of the *United States*. The center of the storm passed almost directly northward from southwest Michigan to the northern portions of Lake Huron. Then the storm turned eastward, disappearing to the northwest of the Gulf of Saint Lawrence on the afternoon of the 11<sup>th</sup>.<sup>120</sup>

— At Toledo, Ohio, on the 9<sup>th</sup>, the maximum wind velocity approached 55 miles per hour. The water in Maumee River was lower on that day than ever before known, the riverbed from the Ohio Central dock to Pennsylvania Bridge was entirely dry during the storm.

— At Harrisburg, Pennsylvania on the 9<sup>th</sup>, the winds were so strong that it carried away and destroyed the anemometer. It was estimated that the winds reached 100 miles per hour. The storm struck the Susquehanna River, sweeping the water up in a wave thirty feet high.

— A violent gale struck Pittsburgh, Pennsylvania on the 9<sup>th</sup>. An unfinished structure of seven stories was completely demolished, carrying with it in its fall portions of other buildings. Forty-nine persons were injured and fifteen killed. An unfinished building in another portion of the city was also wrecked and one man killed. About twelve buildings in Allegheny City and Pittsburgh were unroofed or otherwise damaged; estimated loss from the storm, \$165,000. [In present currency, that would be equivalent to \$4 million in damages based on the Consumer Price Index (CPI) inflation rates.]

— A tornado struck Reading, Pennsylvania on the 9<sup>th</sup>. The cyclone swept across the city from west to east, unroofing factories, mills, and houses, uprooting trees, and overturning nearly everything in its course. The large paint shops of the *Philadelphia and Reading* railroad were demolished, and in a moment the combustible materials contained therein were a mass of flames. A few squares from there it struck the Reading Silk Mill, a large, new five-story building in which some 800 girls and boys were working, and crushed the huge building like an egg-shell before a single person could escape. The building was leveled to the foundations and all the people went down in the midst of a great heap of beams, bricks, and twisted machinery. The path of the cyclone was from 60 to 100 feet wide, and it was fortunate that it passed through a portion of the city that was not entirely built up, else the loss would have been well nigh incalculable. As it is, its path was strewn with wreckage. The Mount Penn Stove Works were unroofed and considerable damage done to the building. The cyclone struck the large nut and bolt works of J. H. Sternberg & Son with great force, carrying away the immense roof of the main building. On North Ninth Street it cut a clean swath through a row of new houses, unroofing nine of them. The storm's actions were most peculiar. In many cases the damage done was such as would be accomplished by an ordinary high wind, but in others it seemed to crash from above. This was notably the case at the silk mill. Witnesses of its demolition say that the

building went down all in a heap as if a huge weight had dropped upon and smashed it. A curious circumstance is, that the high stack of the mill, which was at one corner, was still standing, and was not even shattered. It was estimated that the number of people killed in this storm was 40.

— At Buffalo, New York, the storm, which began during the forenoon of the 9<sup>th</sup> continued through the 10<sup>th</sup>. The high wind caused the heavy falling snow to drift badly and the debris of outhouses, skylights, parts of roofs, fences, etc. were strewn over the streets, detaining the streetcars several hours. The actual velocity of the wind was seventy-eight miles per hour at 7:26 a.m. on the 10<sup>th</sup>. The lake which was free from ice rose 7.8 feet above high water mark, flooding the Island during night of 9/10<sup>th</sup> and rendering its entire population, about twenty families, homeless. The *New York Central Railroad* track near Porter Avenue was completely washed out as well as the "Belt Line" route.

— On the 9<sup>th</sup>, a tornado passed over New York City and then descended down and struck South Brooklyn with great violence, unroofing houses, completely demolishing several, and blowing down fences and trees. This tornado caused an explosion of one of the largest gas tanks in Brooklyn. The tornado path was well defined, and houses were unroofed over its entire course. It also damaged the Navy Yard. The total damage was estimated at \$500,000. [In present currency, that would be equivalent to \$12 million in damages based on the Consumer Price Index (CPI) inflation rates.]

On 2-3, 8 February 1889, there were destructive gales over *Great Britain*. The storm produced [ship] wrecks and loss of life.<sup>97</sup>

On 18 February 1889, a series of tornados struck in Alabama, Georgia and South Carolina in the *United States*. A storm swept over the lower end of Shelby County about thirty miles from Birmingham, Alabama. Many houses were blown down or unroofed; a number of persons were killed and many injured. The storm moved through a thickly populated region. A storm swept through Harmony Grove, Georgia. Houses and trees were driven before the wind like chaff; several persons were killed and a large number injured. Persons on the *Elberton Air-Line* railroad state that the tornado crossed that road between Bowersville and Toccoa, Georgia. It was a singular fact that this storm passed in the track of one, which occurred in 1846; a hurricane, as it was then called back then, swept through a large forest and tore up many trees. A storm struck Griffin, Georgia and did considerable damage along a track three hundred yards wide. At a farm two miles west of Griffin five houses were blown down, and a large barn filled with forage was twisted around. A funnel-shaped cloud did its greatest damage in the neighborhood of Nona, Georgia, on the *Milledgeville and Eatonton Railroad*, causing loss of life and considerable injury to property. A tornado passed about a half a mile from Pacolet, South Carolina and all houses, crops, and lumber over a stretch of country about one fourth of a mile wide suffered from its ravages.<sup>120</sup>

On 8-9 March 1889, there were destructive floods in the midland and southwestern *England*. Leicester, Bristol, Taunton and other places suffer much.<sup>90</sup>

On 15-16 March 1889, a violent hurricane struck at the Samoan Isles in the south Pacific Ocean. The great storm destroyed 3 German and 3 American warships, which were driven ashore at Apia on the island of Upolu in *Samoa* and destroyed. About 50 Americans and 96 Germans were drowned.<sup>97</sup> [Apia is a city in the north-central coast of Upolu, Samoa's second largest island.]

In March 1889, a storm along the Atlantic Coast of the *United States* caused very high tides.<sup>120</sup>

— On the 16<sup>th</sup> at Atlantic City, New Jersey: it has been many years since the tide has been as high here as today. The storm, which has prevailed on the coast, caused the high water, and for a few hours Atlantic City was cut off westward by the flooding of the railroad tracks, which cross the meadows. The water on the *Camden and Atlantic Railroad* this morning was so high that the fires in the railroad engines were extinguished. This afternoon the *Five-Mile Beach* branch railroad was underwater and the *Sea Isle City and Ocean City* branch was flooded. No trains were running beyond Sea Isle City. An unprecedented high tide occurred here on the 20<sup>th</sup>; it was very destructive to the boardwalk, bathhouses, pavilions, and even many of the larger houses. Building after building was quickly undermined by the rushing water and tumbled down into the sea. All along the beach was strewn debris.

— On the 16<sup>th</sup> at Cape May, New Jersey: the tide was the highest known for years; much damage was done here.

— On the 16<sup>th</sup> at Long Branch, New Jersey: the severe storm and high tides which have prevailed along the coast for the past twenty-four hours have caused a great amount of damage. The tide in the Shrewsbury River ran higher than in many years.

— At Sea Bright, New Jersey on the 16<sup>th</sup>: at high tide tonight the heavy sea broke over the beach and swept through the hollow almost in the center of the town. The piles of lumber from bulkheads were carried to Ocean Avenue, striking the fishermen's huts in the hollow and demolishing them. The water in some streets was three feet deep and running with great force.

— On the 17<sup>th</sup> at Asbury Park, New Jersey: the high tides of last night and this morning were very destructive along this part of the coast; the great board walk here was severely damaged, and the bluff was washed out in several places. At Elberon, several bulkheads were washed out. At Point Pleasant on March 17<sup>th</sup>, Bay Head bulkheads were washed away. In many places the surf ran over the beaches and did much damage. The railroad tracks from Absecon to Atlantic City were underwater, and no train could cross at high tide. All the lowlands were overflowed. The railroad from Atlantic City to Egg Harbor Inlet was broken up and trains cannot run. The railroad from Ocean City to the mainland was underwater, as was the railroad from Sea Isle to Avelon.

— Norfolk, Virginia: an unusually high tide occurred on the 15<sup>th</sup> and 20<sup>th</sup>, flooding the lower portions of the city; during the 15<sup>th</sup>, all streetcar travel was interrupted during the day by the high water.

— New York City, New York: it was reported that the tide at Coney Island on the morning of the 21<sup>st</sup> was the highest of the season; the whole distance in and about the bulkhead was a wreck, which \$100,000 will not make good [\$2.4 million in today's dollars]. A big tide prevailed on the 21<sup>st</sup> in the lower part of Elizabeth, New Jersey, and several of the lower stories of houses near the meadows were flooded. Communication with the factories along Staten Island Sound was completely cut off at high water. The tracks of the Newark and Elizabeth branch of the Central Railroad were flooded in places to the depth of nearly five inches, as also were the tracks of the Long Branch Railroad. The tide at South Beach, Staten Island, was the highest seen in many years and did considerable damage. The sea broke over the embankments and flooded the swamp for several miles.

— High tides also occurred as follows: Eastport, Maine on the 21<sup>st</sup>; Woods Hole, Massachusetts on the 16<sup>th</sup>; Cape Henry, Virginia on the 14<sup>th</sup>, 15<sup>th</sup>, 19<sup>th</sup>, 20<sup>th</sup>.

At Wilmington, North Carolina in the *United States* on 19 March 1889, the hail and thunderstorm in the evening was very severe in the northern section of the city. At the Wilmington Compress building nearly all the glass in the skylights was broken, and the hail drifted in places to a depth of twelve inches; the hail also caused much damage to plants and shrubbery. Beyond the city limits north and west the storm was still more severe. At Navassa Guano Works, one hundred and fifty panes of glass were broken and the drifts were three feet deep.<sup>120</sup>

At Fort Clark, Texas in the *United States* on 21 March 1889, a terrific hailstorm with lightning and high wind passed over this place; stones the size of pigeon eggs, and some larger, fell. An enormous quantity of fish, estimated at several wagonloads, were found dead on the banks of Las Moras Creek after the storm. The crops in the [U.S. Army] company gardens were destroyed.<sup>120</sup>

In March 1889, large prairie fires were observed in the *United States* at Poplar River, Montana; Yankton, South Dakota; Fort Sully, South Dakota; Bismarck, North Dakota; Fort Yates, North Dakota; Huron, South Dakota; Fort Reno, Oklahoma; and Fort Sill, Oklahoma.<sup>120</sup>

At Wolsey, South Dakota in the *United States*, a severe sand storm occurred on the 2 April 1889. The wind was very high during the day and drifted the sand three feet in places. At Yankton, South Dakota, the winds increased in force until it attained a maximum velocity of 48 miles per hour. The dust and sand in the air, raised by the wind, became so dense as to obscure the sky. At times the sun was entirely hidden from view by sand and dust, and it became so dark as to require artificial light. Sandstorms also struck Woonsocket, South Dakota. At Fort Sully, South Dakota on the 2<sup>nd</sup>, the winds increased in force and blew with great violence, attaining a maximum velocity of sixty miles per hour. These high winds raised heavy clouds of sand and small pebbles, causing the sky to appear as though covered by dense stratus clouds, and in the streets one could scarcely see one hundred yards. Huron, South Dakota experienced the same fierce winds. In the afternoon, atmospheric electricity was very strong,

necessitating the cutting out of all wires at the telegraph offices. The superintendent of the railway telegraph system found it impossible to remove the "ground" of one wire, although the battery was detached, efforts in that direction resulting in the ignition of the wood-work where the wire entered the office. Telegraphic communication was entirely cut off. Prairie fires started in the country, some from no known cause. It was asserted by trustworthy farmers that the barbs of fence wire emitted showers of sparks at intervals, and several report that fires started at the foot of posts supporting the wires. Many report that the flames rose fifty feet in the air. All combustible matter appeared to be highly susceptible to ignition; in many cases buildings protected by from fifty to one hundred rods [850-1700 feet] of ploughed ground were consumed. No perceptible interval of time elapsed from the moment the structures were on fire until their complete envelopment by flames. Huron was several times threatened, and only strict vigilance and hard work kept the fires from entering the corporation limits.<sup>120</sup>

At Rapid City, South Dakota in the *United States*, a prairie fire started at the northeastern limit of the city on 2 April 1889, and swept six miles down the valley before it was extinguished. The high wind caused the fire to travel at a fearful rate. Several ranches in the track of the fire were completely demolished; one person was burned to death and several injured. At Yankton, South Dakota during the high wind on the 2<sup>nd</sup>, smoldering prairie fires were fanned, and extended into the city, consuming several buildings near the boundary. Prairie fires also prevailed north of the city on the 1<sup>st</sup>, and to the north and east on the 2<sup>nd</sup> and 3<sup>rd</sup>. At Fort Sully, South Dakota, it was reported that very destructive prairie fires swept over the eastern portion of the county on the 2<sup>nd</sup> and 3<sup>rd</sup>. The fires were pushed onward before a gale, which at times blew at the rate of sixty miles per hour, and progressed fifteen to thirty miles per hour. Many farmers have been rendered entirely destitute by the fires, having lost all seed, farming implements, houses, and live stock. A careful estimate places the loss of property of all kinds, in this county, at from \$50,000 to \$75,000 [\$1.2 to \$1.8 million in today's dollars].<sup>120</sup>

On 3 April 1889, there was a black snowfall throughout the northern part of New York in the *United States*. The black snowfall took place in the following counties within New York: Lewis, northern Herkimer, southern Franklin, northwestern Essex, and probably Hamilton. From the reports of forty-nine towns it seems that the "black snow storm" extended from Ava over a distance of one hundred and twelve miles in a northeast direction to Wilmington, and from Pitcairn extending southward some thirty miles to Ava. The "black snow" fell soon after the passage of the storm center, which crossed the state. The area of snow of darkest color was nearly central over Lewis County. At Copenhagen "a pan full of snow, when melted, gave a teaspoonful of very fine ashes," and at Saranac Lake about one-half inch of "black snow" fell over the white snow which preceded it. A specimen of the "black snow" was examined microscopically, and it appears that the sediment collected was finely divided earth. A comparison of this sediment with that from ashes shows that the snow was not discolored by ashes, which was further confirmed by the large number of vegetable fibers in the black snow, the absence of forest fires to the windward of the region affected, and the close resemblance of the "black snow" sediment to an artificial sediment made from humus. These facts, together with those which obtained at the time of the passage of the storm center, make it probable that soil was excavated by some whirlwind, and, after being scattered by the storm, it was deposited over the counties mentioned as the snow was formed.<sup>120</sup> [Tornadoes occurred at Baltimore, Maryland and at Bridgeton, New Jersey on the 3<sup>rd</sup>.]

A violent storm struck the Atlantic Coast of the *United States* on 6-7 April 1889. The damage was especially severe at Virginia and North Carolina.<sup>120</sup>

— Norfolk, Virginia sustained significant damage on the 6<sup>th</sup> and 7<sup>th</sup>. On the 6<sup>th</sup>, the winds attained a maximum velocity of fifty-five miles per hour. The storm surpassed in violence any that have occurred in this section within the memory of man. Numerous buildings were unroofed, superstructures torn away, telegraph lines prostrated, etc. During the night of the 6<sup>th</sup>-7<sup>th</sup>, the situation in this city was appalling; the electric light wires broke and left the city in darkness, except when flames shot up from burning docks and storehouses which caught fire from the quicklime stored therein when reached by the rising water. Early on the morning of the 7<sup>th</sup>, the water from the harbor

overspread the city, damaging property to the estimated amount of one million dollars. [In present currency, that would be equivalent to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.] The Naval dry-dock was broken into by the rising water and the *U.S.S. Pensacola*, undergoing repairs therein, was sunk. Telegraphic communication with all points was severed; no mails arrived, owing to washouts on railroads, and no vessels ventured out on account of the storm. In this harbor vessels were torn from their moorings and cast upon the land total wrecks. The loss of life and damage to shipping in this vicinity, due to the storm, was unprecedentedly large.

— At Norfolk, Virginia during the storm of the 6<sup>th</sup>-7<sup>th</sup>, the northeasterly wind backed up the water into Chesapeake Bay and caused the tide to rise to an extraordinarily high point, flooding the lower streets in this city. The tide rose to a point higher than ever before seen here, being between six and seven feet higher than the ordinary high water mark, and twelve inches higher than the highest tide hitherto known—that during the great gale of August, 1879. The water was blown out of Albemarle Sound lowering the water in the canal until vessels got aground where they should have had two feet of water to spare. This was due to the gale being immediately followed by a strong westerly wind.

— At Cape Henry, Virginia during the morning of the 7<sup>th</sup>, the winds became so violent that the anemometer cups were blown from their position. At that time the wind was blowing at the rate of 115 miles per hour. It was estimated that it reached a velocity of one hundred and twenty miles per hour after the anemometer cups had been carried away.

— At Suffolk, Virginia, the storm of the 6<sup>th</sup> was the fiercest and most destructive ever known in this section. The tide in the Nansemond River was unprecedented, and on the 7<sup>th</sup> the river extended over its banks on each side for a hundred yards or more. Considerable damage was done to wharf property and to goods stored in warehouses along river. The track of the Suffolk and Carolina Railroad along river was washed from the roadbed and considerably damaged.

— Reports from Williamsburg, Ashland, West Point, Keswick, and Stanton show that the storm and flood at these places were unusually severe and destructive to property during these dates.

— A severe storm with heavy rains struck Kitty Hawk, North Carolina on 7 April 1889. The wind increased in force and attained a velocity of eighty miles per hour. The sea washed over the beach and around the buildings of the Signal Office and Life-Saving Station, the water being knee deep between the buildings. Telegraphic communication was cut off, as was also the telephonic communication north. Several fishing craft and other sailing vessels were reported wrecked.

— Reports from Nags Head, North Carolina stated that the storm was very destructive in that section; two large houses were washed away or blown into the sound; all bath houses were washed down and strewn along the beach; over sixty head of cattle were drowned between that point and Oregon Inlet, and the Oregon Inlet cable was washed away.

— At Hatteras, North Carolina the wind attained a maximum velocity of eighty miles per hour. Several vessels were blown ashore, and one, the schooner *Nellie Potter*, was a total loss. A very high tide submerged Hatteras Island on the 7<sup>th</sup>, and water entered many houses. Trees were uprooted, fences demolished, and gardens ruined. It was stated that this tide was the highest that has occurred since Hatteras Inlet was cut out in 1846.

In April 1889, the Torrens River in *Australia* flooded. Highest recorded flooding occurred in the Adeliade region. There was heavy damage to buildings, roads and crops.<sup>99</sup>

An unusual amount of hailstorms struck many areas of the *United States* in May 1889. Some of these storms were extreme.<sup>120</sup>

— On 12 May 1889, a very severe wind and hail storm passed through Concho and Menard Counties in Texas, killing a number of sheep and calves, and putting out the eyes of several horses. When the storm crossed over Brady Creek it killed hundreds of fish, from large sized catfish down. The destructive path of the storm was about three-fourths of a mile wide.

— On 12 May 1889, at Longview and Bennettstown, Kentucky, lumps of hail as large as goose eggs were picked up, and pieces of ice six inches long were seen. Crops suffered seriously. Tobacco plants were cut down, and fruit trees stripped of their leaves and blossoms. The heaviest loss was to wheat. It was estimated that 600 acres were entirely destroyed and as much more seriously damaged. The loss was estimated at \$6,000 to \$10,000 [\$144,000 to \$240,000 in today's dollars].

— On 13 May 1889, a severe hailstorm struck Lair, Kentucky. The hailstorm was but a few minutes duration. The hailstones were unusually large and fell in sufficient quantity to cover the ground, knocking down horses and injuring stock and crops seriously; limbs of trees from 1 to 1½ inches in diameter were broken off by the hail.

— On 16 May 1889, a severe hailstorm struck Cedar Rapids, Iowa. The hailstones were as large as hens' eggs and caused considerable damage to skylights, greenhouses, etc.

— On 16 May 1889, a report from Buckville, Arkansas states that the severest hailstorm known for years visited that section during the day. The hailstones were of unusual size and fell with terrific force, damaging the crops, and in many places crushing through the tops of houses. The fruit crop was damaged 50 per cent.

During May 1889, protracted droughts were observed in Florida, Georgia, Louisiana, Alabama, Georgia, Tennessee, Mississippi, Arizona, Utah and Michigan in the *United States*.<sup>120</sup>

Several forest fires raged in the *United States* during May 1889:<sup>120</sup>

— On 7 May 1889 at Duluth, Minnesota, destructive forest fires continued to rage in all directions, but in many localities they have burned themselves out. They attacked the heavy pinewoods in many places, and the loss of timber will be very large. Several hundred thousand ties, and thousands of cords of wood had been burned. Numerous buildings, hay, meadows, crops, and bridges have been burned in the western part of the county. Farmers and mill men in the country were fighting the fires. The air in the city was filled with smoke.

— On 4-6 May 1889 at La Crosse, Wisconsin, extensive forest fires prevailed in the northern part of the state and owing to the dry weather the fires burned fiercely. Railroad men arrived over the Omaha road on the 4<sup>th</sup> report that the forest from Ashland to Clear Lake, one hundred and fifty miles, was ablaze. Many thousands of ties were destroyed and some towns endangered. On the Fond du Lac Indian reservation \$50,000 worth of logs and skids were burned [\$1.2 million in today's dollars]. The heavy rain, which fell on the 7<sup>th</sup> in the northern section of the state, partially extinguished the fires.

— On 8 May 1889 at Mason City, Iowa, destructive fires were burning in the woods between Plymouth and Rock Falls, since the evening of the 4<sup>th</sup>. So far the farmers have been able to save their homes.

— On 8 May 1889 at Newburgh, New York, forest fires were burning in the Shallangunk [Shawangunk] Mountains and in the Catskills; also in the highlands below this city, and on the Fishkill Mountains. Passengers on the New York and New England road state that the fires were burning on the mountains in that vicinity and on the state line. A large amount of woodland has been seriously damaged. The fires were reported to be on the increase in all directions.

— At various points in the Upper Peninsula of Michigan, severe forest fires had progressed since about the 5 May 1889. Fences, cord wood [firewood], shingles, posts, and standing timber were consumed by the flames. It was estimated that half a million feet of logs have been burned, the crops ruined in many localities, and a large number of buildings destroyed. Reports also show that destructive fires were general at about the same time in the northern portion of the Michigan, and in Ottawa, Muskegon, Midland, Clare, Gladwin, and Osceola counties, in the middle portion; in Lenawee county, in the southeastern, and Allegan county in the southwestern portion of the Michigan. The light rain in the Upper Peninsula on the 8<sup>th</sup>, and in the southern half of the state on the 10<sup>th</sup>, and the general rain throughout the state from the 15<sup>th</sup> to the 22<sup>nd</sup> extinguished the fires.

— On 8 May 1889 at Custer City, Pennsylvania, a fierce forest fire was raging about the Moody tract, five miles south of the city all day. The tract was one of the most valuable oil properties in this county, and a large number of rigs and small tanks of oil were reported destroyed. A big forest fire was in progress in the lumber woods near Kane and was working its way rapidly towards Porter station. There are fires on all sides of here, and another large one is plainly seen to the northwest.

During the afternoon of 10 May 1889 at Wichita, Kansas in the *United States* during a thunderstorm, a shower of fishes, from one to four inches long, fell at the Burton Car Works, four miles north of this city. They covered the ground in thousands. One, brought to police headquarters, was a small catfish about three and three-fourths inches long, such as abound in the streams hereabouts.<sup>120</sup>

On 10 May 1889, a destructive storm struck on the east coast of the *United States*.<sup>97</sup>

On 17 May 1889, there was a great storm in southern *Germany*, especially in *Austria*, *Bohemia* [now western *Czech Republic*]. The storm produced a great loss of life and property. Then on 3-4 June 1889,

another storm struck *Switzerland*.<sup>97</sup>

On 25 May 1889, a great storm struck the coast of Sydney, *Australia* with much loss of life and property.<sup>97</sup>

In May 1889, there were floods in the Conemaugh Valley, Pennsylvania in the *United States*.<sup>90</sup>

Heavy rains during the end of May in Pennsylvania in the *United States* contributed to a major flood event called the Johnstown Flood. The area, which drained into the reservoir above the dam on the South Fork, which gave way and caused the disaster at Johnstown, Pennsylvania, was about fifty-two square miles. On the morning of May 30<sup>th</sup> the Johnstown river-gauge (7:44 a.m.) read 1.0 foot above low water. On the 31<sup>st</sup>, at the same time, it read fourteen feet; three hours later at 10:44 it read twenty feet. There was a subsequent observation of the creek at fourteen minutes after 12 o'clock, which reads as follows: "Water higher than ever known; can't give exact measurement." The dam on the South Fork gave way at 1 p.m., and the city of Johnstown was overwhelmed by the flood at 3 p.m. Mrs. H. M. Ogle, who held the position of [Weather] Signal Service observer there since 1 November 1884, was lost in this great catastrophe.<sup>120</sup>

It was estimated that the loss of life and property in the string of communities in the direct path of the Johnstown flood in Pennsylvania in the *United States* was about as follows:<sup>120</sup>

	<u>Lives Lost</u>	<u>Property Damage</u>
Johnstown and Millville	7,000	\$ 18,000,000
Pennsylvania Railroad	--	\$ 15,000,000
Franklin and East Conemaugh	38	\$ 1,200,000
Cambria	1,100	\$ 750,000
Woodvale	300	\$ 3,500,000
Kernville	600	\$ 300,000
Mineral Point	16	\$ 100,000
Minersville	8	\$ 15,000
Morrellville	1	\$ 10,000
Sheridan and Coopersdale	--	\$ 75,000
Total	9,063	\$ 38,950,000

Although the flood at Johnstown, Pennsylvania was the most destructive in the region both in life and property, probably no more than 1/16<sup>th</sup> of the water in that flood came from the heavy rains, but was rather due to the breaking of the dam and the overflow of the waters in the reservoir.<sup>120</sup>

The scope of the floods of 30 & 31 May and 1 June 1889 reached well beyond the Johnstown, Pennsylvania area. This flood event affected a broad area in Pennsylvania, Maryland and Virginia in the *United States*. The rainfall of 30, 31 May and 1 June 1889, in western and central Pennsylvania in the *United States* was unprecedented for that section of country. The following was the estimated amount of rainfall during this 3-day period: 1.895 cubic miles in the Susquehanna Valley, 1.005 cubic miles in the Potomac Valley, 0.837 cubic miles in the Allegheny and Monongahela Valley, 0.0615 cubic miles in the Johnstown Valley and 0.0065 cubic miles in the Valley above South Fork Dam.<sup>120</sup>

— At Washington, D.C. on 2 June, the waters of the Potomac River rose higher than ever before known. At about noon the water had risen until the tide-gauges were hidden, and was fully three feet above the 1877 flood mark, and that was fully eleven feet above spring-tide high water. The streets and reservations on the lower levels in the center of the city and all the wharves and streets along the riverfront were underwater. The flood caused great damage along the riverfront and on Rock Creek; the harbor improvements were injured and two spans of the Long Bridge were swept away. Serious, if not irreparable, damage was caused along the length of the Chesapeake and Ohio Canal; which was rendered entirely unnavigable throughout its entire length. Railroad communication with the south and west was cut off for two days. Considerable damage was caused to the machinery plants and material in the Navy Yard.

— At Lynchburg, Virginia, on 1 June in consequence of high water produced by the heavy rains during the last three days, northwest of here as well as in the immediate vicinity of this city, nearly all the industrial establishments suspended operation last night. The flood in James River was unprecedented in height and volume since the great flood of 1870. All the bridges at this place have been swept away and the amount of damage done was very large.

— At Harrisburg, Pennsylvania on 1 June, the disastrous rain, which prevailed throughout yesterday and last night ended at 4.40 a.m. today, 3.12 inches falling during the night. River rising rapidly, all bridges declared unsafe, travel suspended, and all the lower districts of the city were underwater, reaching the second stories of the houses in many places. Losses in this city will amount to at least \$1,000,000. All manufactories have stopped operations, and the iron works were underwater. The extreme height of the water in the Susquehanna River was reached at 9 p.m., rising in all 27.01 feet. This was 21.6 inches higher than the great flood of 1865, which was the highest point ever known here.

— At Lewisburg, Pennsylvania on 3 June, the water in the west branch of the Susquehanna River was four feet above high-water mark of the great flood of 1855. Every bridge on the Susquehanna River from Sunbury to Clearfield had been swept away. At Williamsport, from fifty to eighty persons were standing on the bridge at Market Street, which spans the Susquehanna River, when it gave away, plunging the people into the water. At Milton, the water stood five feet high in the streets. At Lewisburg, five spans of the railroad bridge were swept away. The gas works, water works, and mills were flooded. The loss will reach \$75,000. Every town along the west branch of the Susquehanna River was isolated from every other town and communication was difficult, and between some places impossible.

— At Elmira, New York, the water during the night of the 1<sup>st</sup>-2<sup>nd</sup> was from 12 to 18 inches higher than ever before known. The Erie railway bridge was anchored in its place by two trains of loaded freight cars. The water rose to the cars, which, with the bridge, acted as a dam and forced the water back through the city, on the north side of the Chemung River, where the principal business houses were located. The water covered the streets to a depth of two or three feet, and the basements of the stores were quickly flooded, causing thousands of dollars damage.

— At Charleston, West Virginia on 1 June, the Big Kanawha River was dangerously high, and the city was in danger of being submerged. The Chesapeake and Ohio railroad bridge had been swept away.

— At Tyrone, Pennsylvania on 1 June, the Juniata River overflowed its banks and flooded the southern portion of the city, causing great damage.

— The probable value of the property destroyed by these floods throughout the entire flooded district [including the Johnstown flood] has been variously estimated at from \$50,000,000 to \$60,000,000. [In present currency, that would be equivalent to \$1.2 to \$1.4 billion in damages based on the Consumer Price Index (CPI) inflation rates.]

Towards the beginning of June 1889, there was a tremendous 3-day downpour of rain, covering Northern and Western Pennsylvania and Southern New York in the *United States*. This caused most destructive floods, resulting in the breaking of the great Conemaugh dam and the terrible Johnstown disaster on June 1<sup>st</sup>. The rain in Bradford County, Pennsylvania was most extreme on May 31, and on June 1 and 2, a great flood followed in both branches of the Susquehanna River, that of the West Branch being the greatest inundation ever known. In the North Branch the high water nearly equaled that of March 17, 1865. At Athens, Pennsylvania where the Chemung River flowed into the Susquehanna River, the flats and lower part of the town were completely inundated. Buildings were carried away and significant damage was done. The larger creeks became raging torrents, carrying away bridges, buildings, fences and crops. In the valley of the Towanda Creek, the flood was the most destructive since that of July 1850. Great damage was done at Monroeton. The town flooded, streets cut, cellars flooded and gardens washed out, fences and outbuildings carried away. The county bridge at Powell was carried away. The Masontown Bridge made unsafe and the Barclay railroad bridge just below, so undermined that it went down. The State Line & Sullivan Bridge at Monroeton was undermined and went down. Several other bridges in the county were either damaged or carried away. Scores of people sustained loss and the damage to public and private property in Bradford County, Pennsylvania was probably \$200,000 [In present currency, that would be equivalent to \$5.0 million in damages based on the Consumer Price Index (CPI) inflation rates.]. The Susquehanna River attained its greatest height on the morning of June 2<sup>nd</sup> but rapidly receded in the afternoon.<sup>178</sup>

On 2 June 1889, a destructive storm struck Flintshire, Cheshire and Lancashire, *England*. Heavy rain and large hail caused floods. Crops were much injured, buildings struck [by lightning] and [caught] fire.<sup>97</sup>

The weather during June 1889, in the Caribbean Sea, and particularly at the *Windward Islands*, was unusually stormy, with extraordinary rainfall. On the Island of Dominica, on the Shawford Estate, the rainfall was 28.54 inches for eight consecutive days, with frequent squalls of hurricane violence. The total rainfall on the Island of Dominica for the month was 44.36 inches, and many of the other islands were not short of that amount. Much damage was done to plantations, roads, and bridges, owing to the swollen rivers and mountain streams. The trade winds during the month have been very strong, blowing from east to east-northeast, and attended with violent rainsqualls and rough sea.<sup>120</sup>

On 15-16 June 1889, a hurricane struck *Cuba*. Some people died.<sup>141</sup>

An unusual amount of hailstorms struck many areas of the *United States* in June 1889. Some of these storms were extreme.<sup>120</sup>

— On 3 June 1889 at Mesquite, Texas, the hailstones were mostly large, some of them being of enormous size; all of them were of a ragged appearance and of an almost infinite variety of shapes. The larger stones had protuberances one inch long. Reports show that the path of the hailstorm was about eight hundred yards wide, and about one mile long. The hail measured about four inches deep on a level, and about two feet in hollows. At 11 a.m. on the 4<sup>th</sup>, the hail was about eighteen or twenty inches deep in a field four miles northeast of Mesquite.

— On 3 June 1889 at Granbury, Texas, the most damaging wind and hailstorm that had ever been experienced at that place occurred in the evening. The Christian church, a new structure, was twisted about ninety feet out of its natural position. About fifteen hundred window glasses were broken by hailstones; the stones being as large as hens' eggs. The path of the storm was about one mile wide.

— On 5 June 1889 at Way Cross, Georgia, hailstones as large as goose eggs fell in large quantities.

— On 6 June 1889 at Dodge City, Kansas, the fall of hail was of short duration but some of the hailstones were as large as hens' eggs. The general shape was spheroidal, the larger ones having knobby protuberances, and when broken in half the sections presented a core resembling half-melted snow, around which were irregular coatings of ice. Reports show that the hailstorm was more severe in the surrounding country, where poultry was killed, window lights broken, and crops damaged.

— On 19 June 1889 forty miles west of Bingham, Nebraska, the hailstones were about four inches in diameter.

— On 26 June 1889 at Rushford, Minnesota, a severe storm gathered near Wiscoy, and passed through Houston County, then due south, curving slightly to the west through Yukatan and the eastern portion of the town of Norway. A belt two miles wide and thirty miles long was absolutely laid waste. Trees two feet in diameter were twisted off or uprooted by the wind. For two miles the hail pelted all growing crops and vegetation to the ground. It was reported that hailstones as large as a man's fist fell. On the *Southern Minnesota* Railroad about two hundred feet of track was covered with a drift of sand about three feet in depth, and one bridge was partly washed away.

In June 1889, a drought prevailed in several parts of the *United States* including Georgia, Idaho, South Dakota, and Montana.<sup>120</sup>

In June 1889, severe forest fires raged in several regions of the *United States*.<sup>120</sup>

— On 12 June 1889 at Two Harbors, Minnesota, forest fires were raging along the Iron Range Railroad. The city was enveloped in smoke. A strong wind has been blowing all day, and everything was as dry as tinder, which renders the conditions very favorable for the progress of the fires.

— On 12 June 1889 at Ely, Michigan, the most destructive fires of the season were burning in this section; twelve to fifteen houses had been destroyed, and much damage was done to railroad property.

— On 13 June 1889 at Superior, Wisconsin, a destructive fire was sweeping the forests south and west of the city. Already over \$500,000 worth of pine had been destroyed [\$12 million in today's dollars]. The districts tributary to Nemadji and Saint Louis rivers, in Wisconsin and Minnesota, were suffering terribly. The smoke from the burning districts obscures the sun and renders it difficult for vessels to enter the harbor. A strong wind was blowing from the southwest and several villages were threatened. The fires were raging from Saint Croix to the Northern Pacific Junction.

— On 17 June 1889 at Ellensburg, Washington, severe forest fires prevailed on the east side of the Cascade Mountains. The roar of the flames was heard for miles, and during the night the sky was illuminated with a glow. High wind prevails and the fires were expanding.

The summer of 1889 in Bradford County, Pennsylvania in the *United States* was noted for its wetness. July was as remarkable for its frequent rains as the month of June, although the precipitation was considerably less; there were only ten clear days during the whole month.<sup>178</sup>

The following are the highest temperatures observed during July 1889 in the *United States*:<sup>120</sup>

Montgomery, Alabama	( 99° F, 37.2° C)
Mobile, Alabama	( 95° F, 35.0° C)
Tucson, Arizona	(105° F, 40.6° C)
Little Rock, Arkansas	( 95° F, 35.0° C)
Fort Smith, Arkansas	( 98° F, 36.7° C)
San Francisco, California	( 83° F, 28.3° C)
San Diego, California	( 84° F, 28.9° C)
Denver, Colorado	(100° F, 37.8° C)
Pueblo, Colorado	(102° F, 38.9° C)
New Haven, Connecticut	( 88° F, 31.1° C)
New London, Connecticut	( 86° F, 30.0° C)
Washington, D.C.	( 92° F, 33.3° C)
Pensacola, Florida	( 94° F, 34.4° C)
Key West, Florida	( 89° F, 31.7° C)
Augusta, Georgia	(100° F, 37.8° C)
Savannah, Georgia	( 95° F, 35.0° C)
Boise Barracks, Idaho	(102° F, 38.9° C)
Lewiston, Idaho	(101° F, 38.3° C)
Chicago, Illinois	( 90° F, 32.2° C)
Cairo, Illinois	( 91° F, 32.8° C)
Indianapolis, Indiana	( 92° F, 33.3° C)
Lafayette, Indiana	( 95° F, 35.0° C)
Dubuque, Iowa	( 95° F, 35.0° C)
Keokuk, Iowa	( 91° F, 32.8° C)
Topeka, Kansas	( 94° F, 34.4° C)
Dodge City, Kansas	(105° F, 40.6° C)
Louisville, Kentucky	( 92° F, 33.3° C)
Lexington, Kentucky	( 90° F, 32.2° C)
New Orleans, Louisiana	( 95° F, 35.0° C)
Shreveport, Louisiana	( 96° F, 35.6° C)
Eastport, Maine	( 76° F, 24.4° C)
Portland, Maine	( 80° F, 26.7° C)
Baltimore, Maryland	( 93° F, 33.9° C)
Boston, Massachusetts	( 86° F, 30.0° C)
Nantucket, Massachusetts	( 79° F, 26.1° C)
Marquette, Michigan	( 88° F, 31.1° C)
Detroit, Michigan	( 91° F, 32.8° C)
Saint Vincent, Minnesota	( 94° F, 34.4° C)
Saint Paul, Minnesota	( 96° F, 35.6° C)
Vicksburg, Mississippi	( 94° F, 34.4° C)
Saint Louis, Missouri	( 93° F, 33.9° C)
Helena, Montana	( 91° F, 32.8° C)
North Platte, Nebraska	(102° F, 38.9° C)
Omaha, Nebraska	( 94° F, 34.4° C)
Winnemucca, Nevada	(102° F, 38.9° C)
Carson City, Nevada	(100° F, 37.8° C)
West Milan, New Hampshire	( 86° F, 30.0° C)
New Brunswick, New Jersey	( 87° F, 30.6° C)
Cape May, New Jersey	( 90° F, 32.2° C)

Santa Fe, New Mexico	( 90° F, 32.2° C)
Albany, New York	( 89° F, 31.7° C)
New York City, New York	( 88° F, 31.1° C)
Charlotte, North Carolina	( 96° F, 35.6° C)
Kitty Hawk, North Carolina	(100° F, 37.8° C)
Bismarck, North Dakota	( 95° F, 35.0° C)
Cincinnati, Ohio	( 92° F, 33.3° C)
Columbus, Ohio	( 92° F, 33.3° C)
Oklahoma City, Oklahoma	(100° F, 37.8° C)
Fort Sill, Oklahoma	(103° F, 39.4° C)
Roseburg, Oregon	( 97° F, 36.1° C)
Portland, Oregon	( 96° F, 35.6° C)
Erie, Pennsylvania	( 87° F, 30.6° C)
Philadelphia, Pennsylvania	( 94° F, 34.4° C)
Block Island, Rhode Island	( 81° F, 27.2° C)
Charleston, South Carolina	( 97° F, 36.1° C)
Columbia, South Carolina	( 96° F, 35.6° C)
Yankton, South Dakota	( 98° F, 36.7° C)
Nashville, Tennessee	( 93° F, 33.9° C)
Knoxville, Tennessee	( 92° F, 33.3° C)
San Antonio, Texas	( 98° F, 36.7° C)
Galveston, Texas	( 90° F, 32.2° C)
Salt Lake City, Utah	(102° F, 38.9° C)
Burlington, Vermont	( 88° F, 31.1° C)
Lynchburg, Virginia	( 96° F, 35.6° C)
Norfolk, Virginia	( 98° F, 36.7° C)
Olympia, Washington	( 90° F, 32.2° C)
Spokane Falls, Washington	( 96° F, 35.6° C)
Rivesville, West Virginia	( 98° F, 36.7° C)
Milwaukee, Wisconsin	( 90° F, 32.2° C)
La Crosse, Wisconsin	( 92° F, 33.3° C)
Cheyenne, Wyoming	( 95° F, 35.0° C)

The following are the highest temperatures observed during July 1889:<sup>120</sup>

Guanajuato, <i>Mexico</i>	( 83° F, 28.3° C)
Mexico City, <i>Mexico</i>	( 80° F, 26.7° C)
Topo Chico, <i>Mexico</i>	( 92° F, 33.3° C)
Mazatlan, <i>Mexico</i>	( 89° F, 31.7° C)
Leon de Aldamas, <i>Mexico</i>	( 88° F, 31.1° C) (now León, Guanajuato)
Zacatecas, <i>Mexico</i>	( 83° F, 28.3° C)
Montreal, <i>Canada</i>	( 88° F, 31.1° C)
New Westminster, British Columbia, <i>Canada</i>	( 90° F, 32.2° C)
Grand Turk Island, <i>West Indies</i>	( 84° F, 28.9° C)
Hamilton, <i>Bermuda</i>	( 83° F, 28.3° C)

In Fort Worth, Texas in the *United States* on 2 & 3 July 1889, heavy rain prevailed throughout the night, and on the evening of the 3<sup>rd</sup> the water which surrounded this place was the highest since 1866. The entire valley was flooded and covered with six feet of water. To the north the water extended two miles, and no railroads were above water except the Santa Fe. The loss to railroad and other property is at least \$1,500,000 [approximately \$36 million in present dollars using the Consumer Price Index (CPI)]. Crops have sustained serious damage. A small village, containing eighteen houses, four miles northeast Fort Worth, is completely washed away. In nearby Dallas, Texas, the rain of the past three days reached a climax on the afternoon of the 3<sup>rd</sup>, when for one hour the heaviest rain for three years occurred. The water, in tremendous volumes, rushed over the sidewalks and into the stores, causing large damage to stocks.<sup>120</sup>

In Rockport, West Virginia in the *United States* on 18 July 1889, a terrific thunderstorm, accompanied by torrents of rain and vivid lightning, passed over this section during the day. At Rockport 19.00 inches of rain was recorded in two hours and ten minutes, causing the Tygart Creek to rise at this point twenty-two feet in one hour. The village of Rockport was almost entirely swept away, and the estimated loss at this place alone reached \$75,000. The damage along Tygart Creek amounts to \$500,000, while the injury done on Tucker's Creek, Sandy and Slate Rivers was not less. A great many lives were reported lost in the flood. At Parkersburg, West Virginia owing to the heavy rains on the 18<sup>th</sup> and 19<sup>th</sup> the Little Kanawha River rose very rapidly during the 19<sup>th</sup> and 20<sup>th</sup>, carrying down the stream, during these two days, fully 50,000 logs and [railroad] crossties. Thirteen barges loaded with logs and [railroad] crossties sank at the mouth of the river on the 19<sup>th</sup>. Fourteen bridges, four of which were built of iron, were washed away in this county. The damage in this county alone is estimated at \$500,000, and this county has suffered less injury than Wirt, Jackson, or Roane counties. Morristown, a small village in Wirt County, was entirely swept away by the flood, leaving only the wreck of one house where the village once stood, and nineteen people are known to have been drowned.<sup>120</sup> [Overall the damage from these floods was around \$100 million in present dollars using CPI adjustments.]

Chicago, Illinois in the *United States* on 27 July 1889 was struck by a very destructive thunderstorm, accompanied by lightning and unusually heavy rain. From 7.06 p.m. to 10:40 p.m. a total of 4.02 inches of rain fell, which was the heaviest rainfall recorded here since the opening of the Signal Service station in 1870. Large hail fell in the southern and western portions of the city. The damage done by the storm in this city is estimated at over one million dollars [approximately \$24 million in present dollars using the Consumer Price Index (CPI)], and several lives were lost by falling buildings.<sup>120</sup>

A strong thunderstorm struck New Haven, Connecticut in the *United States* on 30 & 31 July 1889. The storm was accompanied by heavy rain, which continued at intervals from 1:35 p.m. on the 30<sup>th</sup> until 3:30 p.m. on the 31<sup>st</sup>. A total of 6.15 inches of rain fell during the 24 hours ending at 3:30 p.m. On the 31<sup>st</sup>, dams and bridges were carried away, and other casualties were caused by the flood in this region. Damage was estimated at \$1,000,000 [approximately \$24 million in present dollars using the Consumer Price Index (CPI)].<sup>120</sup>

In July and August 1889, there were destructive floods in *China* and *Japan*.<sup>90</sup>

During the summer of 1889 there was a drought in the western *United States*. The drought conditions can be observed by lack of rainfall, prevalence of forest fires, prevalence of sandstorms, and abnormally high summer temperatures.<sup>120</sup>

The following are reports of drought conditions in July 1889 in the western *United States*:<sup>120</sup>

\* Winnemucca, Nevada, on 19 July: reliable statements show that, in consequence of the prolonged drought, wheat sown last December yet remains in the ground plump and hard as when harrowed in. The ground was then dry, no rain having fallen for months, and it never has been moist enough since to sprout the grain. There are hundreds of acres sown to wheat and several acres sown to alfalfa, on the meadows, not one grain of which has sprouted, and the seed is apparently as sound as when it was sown. On the 30<sup>th</sup> there are distressing accounts of loss of cattle from the scarcity of water along the Humboldt River. From Humboldt House and this county, west, the water holes in the Humboldt River bed are lined with the decomposed carcasses of dead animals. The water in the sloughs and holes is impregnated with alkali, and when cattle, almost dying with thirst, reach there from the plains, they drink enough of poisonous water to kill them. A similar condition prevails on the Little Humboldt.

\* Fresno, California, on 31 July: the King's River, from where all the canals for irrigation in this section lead, is lower than it has been for seven years, and several of the large canals are closed. The water in this section is scarce.

\* Salt Lake City, Utah, on 31 July: the drought, which has prevailed during the entire month, continues. All vegetation in this section is withered, and the water is scarcely sufficient for household purposes.

\* Helena, Montana, on 31 July: the drought, which was already felt on the 30th of June last, has continued throughout this month, the amount of rainfall during the month being too small to be of any benefit. The crops in this section are completely ruined, some of them cannot even be cut for fodder, and the grass on the ranges has dried and blown away.

The following are reports of sandstorms in July 1889 in the western *United States*:<sup>120</sup>

\* San Carlos, Arizona: on 3 July there was a severe sandstorm that occurred between 7.25 a.m. and 11.30 a.m. The sand and dust were so thick as to obstruct the view, objects six feet distant were not discernible, and the furniture in closed houses were covered by a layer of sand and dust one-eighth inch in depth. Sandstorms were also reported at Fort McDowell, Arizona, on the 11<sup>th</sup>, and at Wilcox, Arizona, on the 6<sup>th</sup>, 12<sup>th</sup>, 28<sup>th</sup>, and 29<sup>th</sup>.

The following are reports of forest fires in July 1889 in the *United States*:<sup>120</sup>

\* Albina, Oregon, on 17 July: dangerous forest fires have been burning for the last week in this county and in the southern part of Washington Territory. The fires have caused losses, which will aggregate \$750,000. Showers of sparks and cinders are flying over this place.

\* Fort Assiniboine, Montana, on 28 July: forest fires are reported in the spurs of the Rocky Mountains west of this place.

\* Chico, California, on 29 July: forest fires are raging on the Humboldt Road, eighteen miles from this place. The fire has burned over a district four miles in length, and destroyed much valuable timber.

\* Fort Benton, Montana, on 29 July: forest fires are raging in the mountains and along the banks of the Missouri for many miles below here. The Northern Pacific track east of Livingston, Montana, was burned out for a short distance. Several mining camps have been deserted, and ranchers are plowing around their land to prevent the fire from spreading.

\* Glenwood Springs, Colorado, on 30 July: the forest fire which has been burning in this vicinity for several days past covers an area of over ten square miles. The air over the entire western slope is filled with smoke from the burning fires in the mountains.

\* Sierra City, California, on 30 July: large forest fires are raging in this region.

\* Gunnison, Colorado, on 30 July: for the last two or three days the mountains in this vicinity have been ablaze with burning timber. The fires are supposed to have started from sparks of locomotives.

\* Susanville, California, on 31 July: forest fires have been burning for the last two months to the north and west of this city, doing considerable damage to stock ranges and timber land.

\* Boise City, Idaho, on 31 July: extensive forest fires are reported in the mountains about forty-five miles north of this city. The fires have taken such proportions that the governor of the territory has requested aid from the Interior Department at Washington City [Washington D.C.] in extinguishing them.

\* Helena, Montana, on 31 July: there were extensive forest fires raging in this region for the past ten days, destroying what little grass was spared by the long and protracted drought.

\* Forest fires were also reported at: Red Bluff, California, northeast and west of this city, on the 12<sup>th</sup>, 13<sup>th</sup>; San Diego, California, on the 29<sup>th</sup>, 30<sup>th</sup>; Linkville, Oregon, on the 26<sup>th</sup>, 28<sup>th</sup>; Roseburg, Oregon, on the 27<sup>th</sup>, 31<sup>st</sup>; and Port Angeles, Washington, on the 19<sup>th</sup>.

The following are the highest temperatures observed during July 1889 in the western *United States*:<sup>120</sup>

Banghart's Stage Station, Arizona	(110° F, 43.3° C)
Casa Grande, Arizona	(116° F, 46.7° C)
Florence, Arizona	(111° F, 43.9° C)
Fort Lowell, Arizona	(111° F, 43.9° C)
Fort McDowell, Arizona	(117° F, 47.2° C)
Fort Mojave, Arizona	(120° F, 48.9° C)
Fort Verde, Arizona	(110° F, 43.3° C)
Gila Bend, Arizona	(112° F, 44.4° C)
Maricopa, Arizona	(115° F, 46.1° C)
Pantano, Arizona	(111° F, 43.9° C)
San Carlos, Arizona	(111° F, 43.9° C)
San Simon, Arizona	(110° F, 43.3° C)
Signal, Arizona	(114° F, 45.6° C)
Yuma, Arizona	(117° F, 47.2° C)

Anderson, California	(110° F, 43.3° C)
Athlone, California	(114° F, 45.6° C)
Bakersfield, California	(112° F, 44.4° C)
Beaumont, California	(113° F, 45.0° C)
Berendo, California	(113° F, 45.0° C)
Bishop Creek, California	(114° F, 45.6° C)
Borden, California	(114° F, 45.6° C)
Cactus, California	(122° F, 50.0° C)
Caliente, California	(112° F, 44.4° C)
Chico, California	(114° F, 45.6° C)
Colton, California	(114° F, 45.6° C)
Corning, California	(111° F, 43.9° C)
Delano, California	(112° F, 44.4° C)
Elmira, California	(110° F, 43.3° C)
Farmington, California	(110° F, 43.3° C)
Fort Gaston, California	(110° F, 43.3° C)
Fresno, California	(115° F, 46.1° C)
Fruto, California	(113° F, 45.0° C)
Goshen, California	(110° F, 43.3° C)
Indio, California	(114° F, 45.6° C)
Jolon, California	(114° F, 45.6° C)
Kingsburg, California	(112° F, 44.4° C)
La Grange, California	(110° F, 43.3° C)
Lemoore, California	(111° F, 43.9° C)
Lewis Creek, California	(110° F, 43.3° C)
Livingston, California	(110° F, 43.3° C)
Los Banos, California	(110° F, 43.3° C)
Mammoth Tank (Amos), California	(120° F, 48.9° C)
Mojave, California	(111° F, 43.9° C)
Needles, California	(119° F, 48.3° C)
Newhall, California	(112° F, 44.4° C)
Newman, California	(110° F, 43.3° C)
Orland, California	(112° F, 44.4° C)
Red Bluff, California	(110° F, 43.3° C)
Redding, California	(115° F, 46.1° C)
Rocklin, California	(113° F, 45.0° C)
Rumsey, California	(110° F, 43.3° C)
Sanger Junction, California	(116° F, 46.7° C)
San Fernando, California	(113° F, 45.0° C)
Seven Palms, California	(120° F, 48.9° C)
Susanville, California	(110° F, 43.3° C)
Tehama, California	(115° F, 46.1° C)
Traver, California	(111° F, 43.9° C)
Tulare, California	(113° F, 45.0° C)
Volcano Springs, California	(126° F, 52.2° C)
Williams, California	(115° F, 46.1° C)
Willow, California	(112° F, 44.4° C)
Winters, California	(110° F, 43.3° C)
Fort Lyon, Colorado	(109° F, 42.8° C)
Powder River, Montana	(106° F, 41.1° C)
El Dorado, Nevada	(119° F, 48.3° C)
Helleck, Nevada	(110° F, 43.3° C)
Hot Springs, Nevada	(115° F, 46.1° C)
Mill City, Nevada	(116° F, 46.7° C)
Palisade, Nevada	(110° F, 43.3° C)
Carlin, Nevada	(108° F, 42.2° C)

Blue Creek, Utah	(109° F, 42.8° C)
Kelton, Utah	(110° F, 43.3° C)
Saint George, Utah	(115° F, 46.1° C)

In August 1889, damaging drought was reported in sections of Montana, Dakota, Missouri, Kansas, Utah, Texas, Iowa, Michigan, Minnesota, Illinois, and Ohio in the *United States*.<sup>120</sup>

In August 1889, forest fires raged in California, Idaho, Washington, Michigan, Montana, Oregon and Wyoming in the *United States*. At Seattle, Washington, for several weeks, this region was clouded by smoke, caused by extensive forest fires in every direction. The entire eastern slope of the Cascade Mountains, from Natchez Pass north to the boundary was in flames. At Helena, Montana, destructive forest fires prevailed during the entire month of August. The fire consumed many million feet of lumber and thousands of acres of timber.

On 3 August 1889 near Mount Holly, New Jersey in the *United States*, the recent heavy rains which culminated in the terrific storms on the 1<sup>st</sup> and 2<sup>nd</sup> inflicted a great deal of damage on the farming community. The greatest injury was done in the valley of the Rancocas River, which had its source in the regions near Brown's Mills, and from that point to its mouth at Delanco River, the loss was heavy. Hundreds of acres of corn have either been washed out entirely or rendered worthless. A lake covering about ten or twelve acres spread south of Monroe Street, in Mount Holley, and in the business portion a ferry was established to convey people to dry places. At 2 a.m. the water reached the engine room of the electric light works, extinguishing the fires, and leaving the city in total darkness. A record of flood at this place, which has been kept for nearly one hundred years, shows that during this flood, the water rose ten inches higher than ever before known. The total loss to Burlington County, will exceed \$150,000 [\$3.6 million in today's dollars].<sup>120</sup>

On 6 August 1889 at Staunton, Virginia in the *United States*, the damage done by continuous rain, from Roanoke to Winchester, was distressing. Three quarters of the wheat crop was caught by the rain in the fields, causing it to sprout and grow in the shocks. Altogether these have been the most disastrous rains in the valley for twenty years, and the loss amounts to millions of dollars. Three-quarters of the hay was also been lost, and most of the oats sprouted as they stood unreaped.<sup>120</sup>

On 7 August 1889, a severe hailstorm struck near Aberdeen, South Dakota in the *United States* cutting a swath several miles through unharvested grain and causing great damage. The hailstones were 8 inches in circumference. On 14 August, at Woolwich, Pennsylvania, hailstones as large as hen's eggs fell, doing great damage to crops.<sup>120</sup>

On 9 August 1889, a very destructive rain storm visited Florence, Colorado in the *United States*, in the evening and continued over two hours, causing the Arkansas River to rise higher than ever before known. The streets in Florence were turned into rivers and people living in the northern portion were forced to leave their houses. The ranchmen living along the river suffered the loss of all their crops, besides horses and cattle, and many buildings have been wrecked. Every bridge spanning the river within ten miles of Florence has been washed away. Two miles below this place over three hundred yards of the *Atchison, Topeka, and Santa Fe Railway* were washed out, and the *Denver and Rio Grande* track was almost obliterated in places. Many dead horses and cattle, and thousands of railroad ties, were floating down the river. The loss to this locality was estimated at \$75,000 [\$1.8 million in today's dollars]. On the same evening at Pueblo, Colorado, a severe storm was the worst ever experienced in this vicinity. The water rose very rapidly in the Arkansas River during the night and on the morning of the 10<sup>th</sup>, a large portion of the city was flooded. Estimated damage in this city \$100,000 [\$2.4 million in today's dollars].<sup>120</sup>

On 21 August and 5-7 October 1889, there were great storms over the *United Kingdom* producing [ship]

wrecks with loss of life.<sup>97</sup>

The storm [hurricane] of 25-27 August 1889 off the coast of the *United States* apparently originated over or north of *Bahamas* and thence moved north of the thirty-fifth parallel where it dissipated. The storm was attended by gales of great violence.<sup>120</sup>

In September 1889, there was a great overflow of the Hoang-Ho or Yellow River [now called the Huang He River] in northern *China*.<sup>90</sup>

A storm advanced from the Windward Islands, West Indies, to the middle Atlantic coast of the *United States* from 3-12 September 1889. The storm produced very high tides and caused considerable damage along the New Jersey and western part of the Long Island coast.<sup>120</sup>

On 9-12 September 1889, a hurricane struck the mid-Atlantic coast of the *United States* causing 40 deaths.<sup>141</sup>

On 11-12 September 1889, there were easterly gales on the Atlantic coast of the *United States*. The storm produced many [ship] wrecks with loss of life off Long Island and New Jersey.<sup>97</sup>

A West Indian hurricane moved westward over the Caribbean Sea from 13-17 September 1889 and then apparently passed over Yucatan and recurved to the north central coast of the Gulf of Mexico by the 22<sup>nd</sup>. On the 18<sup>th</sup>, the storm devastated the coast of Campeche, *Mexico*. "A full report of the great cyclone on Carmen Island, off the coast of Campeche has been received. The cyclone started about 2 o'clock on the afternoon of the 18<sup>th</sup> ultimo, and was heralded by a rapidly falling barometer. It did not, however, gain its full strength until night. The wind then shifted from the west to due south with an impetuosity that caused the vessels in the Carmen harbor to drag their anchors. Masts were snapped and sails torn in shreds. The following morning the shores were strewn with wreckage, there being only one vessel, the *Jova Del Lobregat* that weathered the great gale out of thirty-five vessels of all kinds in the port. When the storm commenced all of the schooners that had sought refuge at a point called Quintilla were also wrecked. The hurricane uprooted great trees, which fell upon houses in Carmen, destroying in all over one hundred and damaging two hundred and fifty others. The big extract factory, the Parochial Church, and the new hospital were seriously damaged. The authorities are now busily engaged in removing the trees from the streets and searching the ruins for dead bodies. So far only one death from the storm is reported, the captain of the brigantine *Enrique*, Mr. R. Alcali, who was killed on the shore. The losses occasioned in the city by the storm are estimated at \$500,000. News of great destruction to other towns near Carmen is now coming Pariscada and Partido have suffered the loss of many houses. In the vicinity of the last named town all crops are a complete loss. In Aquada de Porto Real, all the houses, with the exception of four, were destroyed by trees falling upon them. With the reports so far received the loss will not fall short of \$1,000,000." [In present currency, that would be equivalent to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>120</sup>

In September 1889, droughts were reported in Iowa, South Dakota, Maine, Alabama, Ohio and Michigan in the *United States*. On the 17<sup>th</sup> at Montgomery, Alabama: the weather for some days has been very dry and hot. Through the country there was considerable complaint on account of the scarcity of water. The mills operated by steam and water power were unable to make full time for lack of water. The drought seems to be particularly severe in the country along the Western Railroad, as the passenger trains on the road were delayed quite frequently because of the shortage in the water supply.<sup>120</sup>

In September 1889, forest fires were reported in South Dakota, Michigan, Colorado, Montana, California and Washington in the *United States*. Prairie fires were reported in North and South Dakota.<sup>120</sup>

— On the 4<sup>th</sup> at East Saginaw, Michigan reported fires raging in the pine forests, and that some of the lumber camps were in danger. About 1,000,000 feet of standing pine have been consumed.

— On the 10<sup>th</sup> at Breckenridge, Colorado, severe forest fires were raging in this county. The entire town of Chihuahua, in the northeastern portion of this county, was consumed by fire.

— On the 11<sup>th</sup> at Helena, Montana, extensive forest fires were reported in the vicinity of Georgetown, Deer Lodge County. Hundreds of men were fighting the fires, but so far they had been unable to check the flames.

— On the 26<sup>th</sup> at Santa Ana, California, fires were burning for the past two days and still continue in the canyons. The burned and burning district now extends one hundred miles from north to south, and was from ten to eighteen miles in width. Over \$1,000,000 worth of pasturage and timber was destroyed [\$24 million in today's currency].

— On the 26<sup>th</sup> at Santa Barbara, California in the upper part of Santa Barbara County, it was estimated that \$200,000 worth of property [\$5 million in today's dollars], including timber and feed, were destroyed during the past week.

On 23 September 1889, 29 vessels were wrecked in Delaware Bay in the *United States*, about 31 lives lost.<sup>97</sup>

During October 1889, damaging drought was general throughout Alabama, Louisiana, Michigan, and Minnesota, in east-central Texas, northern South Carolina, northeastern Indiana and Illinois, northern Iowa, and northwestern Ohio and Wisconsin in the *United States*. In many areas the ground was too dry and hard for planting; wells and cisterns were drying up; the stages of water in rivers were very low and some rivers were completely dry; farmers were driving cattle several miles to obtain water or buying barrels of water for their stock.<sup>120</sup>

On 7 October 1889, destructive gales prevailed over and near the *British Isles*, and the barometer fell to 28.70 inches (729 millimeters) over *Scotland*. On the 7<sup>th</sup>, many shipwrecks were reported and the coasts were strewn with wreckage. From this date until the 10<sup>th</sup>, stormy weather prevailed in that region, and on the 9<sup>th</sup>, the barometer fell below 28.80 inches over the more northern parts of Great Britain.<sup>120</sup>

On 7 October 1889, terrific gales swept over the *British Isles*, causing many shipwrecks. In the northern parts of England and Ireland many houses were demolished and numerous trees uprooted, and the barometer fell below 28.70 inches (729 millimeters) over *Scotland*.<sup>119</sup>

On 7 October 1889, there was a great storm on the island of Sardinia off the west-central coast of *Italy*.<sup>97</sup>

On 14-16 October 1889, gales of great violence, attaining hurricane force at sea occurred along and off the Atlantic coast from the south New England coast to the Carolinas in the *United States*. This storm caused considerable loss and damage to shipping.<sup>120</sup>

On 26-27 October 1889, there was a destructive storm on the coast of Carolina, in the *United States*.<sup>97</sup>

On 11-13 November 1889, a severe storm on the North Atlantic Ocean prevailed over and near the Banks of Newfoundland, *Canada*, and over mid-ocean on the 14<sup>th</sup>, when gales of hurricane force were reported.<sup>120</sup>

In December 1889, heavy and continuous rains caused destructive floods in California and parts of Nevada and Arizona in the *United States*. On the 12<sup>th</sup>, the Sacramento River at Sacramento, California, was the highest ever known, the gauge reading being twenty-six feet eleven and one-half inches. The levee opposite Sacramento broke, flooding a great part of Yolo County. Colusa County sustained greater damage than any of the surrounding sections, on account of the extensive grain fields in that county, which were washed out. At Los Angeles, California, the heavy rains previous to the 15<sup>th</sup> caused considerable damage to the railroads, and the train service of the *Southern Pacific* and *Santa Fe* systems was interrupted by washouts. The *Southern Pacific Railroad* suffered severely on the deserts west of

Yuma, Arizona, where a storm of unusual severity prevailed. Traffic was interrupted on the Santa Fe road by landslides in Cajon Pass, and all communication was cut off from San Diego, on the coast line, by washouts. The bridges on the *California Southern Railroad* between Santa Ana and Los Angeles were washed away on the 23<sup>rd</sup>. At Los Angeles the heavy rains from the 22<sup>nd</sup> to 26<sup>th</sup> caused considerable damage; streets were badly washed and the railroad bridges were generally destroyed. The Los Angeles River changed its channel south of the city, flooding the surrounding country. At Red Bluff, California, the high water, resulting from continuous rains previous to the 14<sup>th</sup>, was very destructive to bridges, etc. Reports state that in Tehama County the damage to public property will amount to \$40,000, while individual losses will aggregate \$250,000 [\$6 million in today's dollars], and that adjoining counties to the south suffered even greater injury from high water. The Rio Virgin River rose so high in the southern part of Lincoln County, Nevada, under the unprecedented rainfall, that it overflowed its banks in many places and changed its course, washing away everything in its path. Lake Tahoe was reported as having risen twelve inches. On the 5<sup>th</sup> the Salt and Verde rivers, in Arizona, rose very rapidly, and at Fort McDowell the Verde River overflowed its banks, flooding the adjacent lowlands. On the 6<sup>th</sup>, at Fort Verde, Arizona, the Verde River was higher than it has been during the last fifteen years, and considerable damage was caused along the river by the inundation of alfalfa fields, washing out of dams, etc.<sup>120</sup>

In 1889 in *Australia*, severe floods took place in Victoria.<sup>101</sup>

*Also refer to the section 1887 A.D. – 1889 A.D. for information on the famine in China and Asia Minor during that timeframe.*

*Also refer to the section 1889 A.D. – 1892 A.D. for information on the famine in India, Russia, Japan, Hungary and Montenegro during that timeframe.*

---

**Winter of 1889 / 1890 A.D.** East of the Rocky Mountains in the *United States* and south of the Great Lakes, December 1889 was one of the warmest and driest Decembers in the history of the Signal Service, while in parts of southern California, the reverse of these conditions occurred with great rainfalls and low mean temperatures.<sup>120</sup>

The winter of 1889-90 over the greatest part of the *United States* east of the Mississippi River was one of the warmest on record.<sup>119</sup>

The winter of 1889-90 in Bradford County, Pennsylvania in the *United States* was open and warm. At Christmas, grass was as green as in summer. There was not a cold day until the 22<sup>nd</sup> of January. There was a snowstorm on the 7<sup>th</sup> of February. But there was no sleighing until the first week in March, when it turned cold, freezing the Susquehanna River over and a poor crop of ice was harvested. This was the only week of real winter. Bluebirds appeared on the 27<sup>th</sup> of February. Gardening and farming began early, although during the first two-thirds of May, it rained continually with little sunshine.<sup>178</sup>

On 4-6 November 1889, a heavy snowstorm prevailed in eastern Colorado, western Kansas, northeastern New Mexico, and extreme northern Texas in the *United States*. The snow was attended by low temperature and high wind, and caused loss of life and considerable damage to livestock. The snowfall was variously reported from one to two feet deep in northeastern New Mexico and adjacent parts of Colorado and Texas, and the drifts were sufficiently deep to seriously interfere with railroad traffic. Mr. M.A. Upson, describes this storm:<sup>120</sup>

— The snow storm and blizzard along the line of the Pan Handle of Texas and the eastern line of New Mexico, on the 4<sup>th</sup>, 5<sup>th</sup>, and 6<sup>th</sup> of November, 1889, although giving the heaviest fall of snow ever known this far south in the valley of the Rio Pecos, was comparatively light at this place, and there was but one portion of the day, on the 7<sup>th</sup>, that was excessively cold, the temperature falling to 12° F. The weight of the storm in New Mexico fell on Colfax and Mora counties, in the extreme northeast of the territory, though it was more severe across the line in Texas. Crossing the Rio Pecos, east, the first bench of the plains, some fifty miles, like our valley, is protected by

mountains on the north and west, and by the San Juan Range. As you reach the second bench the ascent is rapid until you reach an extensive flat "mesa" (table) where commences the Staked Plains (Llano Estacado). This "mesa" is literally unprotected from north, east, and northeast winds for hundreds of miles. Blasts from the north and east gather force, and, by the time they reach the thirty-seventh parallel of latitude, they are often charged with frost, sleet, hail, and snow, killing to men and stock. In the storm of November the cowboys lost their lives at a point over two hundred miles from this place. Stock drifted before the storm and hundreds were driven in on to the Pecos. However, this year they were in good condition and the loss was not as heavy as was anticipated. Stock is always fat on the plains, and stock belonging on the river, which had strayed to the plains, fared the worst. As I said before, although severe, the severity and results of this storm have been very much exaggerated in public reports. The men who lost their lives were brave; they were holding beef cattle for shipment only a few miles from settlements when the herds commenced to drift, and it would have been easy to leave them to their fate and seek their own safety; but faithful to their employers, they tried to hold the stock together, and stayed with them until all trails were obliterated; blinding snow, driven with all the velocity of a Texas "norther", obscured air, earth, and sky, and experienced plainmen as they were, they were as helpless as babes. The courage and devotion of cowboys in the interests of their employers is little appreciated in the East. Hundreds of them have died at their posts within my twenty-six years experience in New Mexico.

On 26 November 1889, a storm appeared on the Texas coast of the *United States*, moved northeastward to the lower Great Lake region by the 27<sup>th</sup>, attended in the Mississippi and Missouri valleys by rain or snow. During the 27<sup>th</sup> and 28<sup>th</sup>, the storm increased in strength and swept eastward over the lower lake region, New York, and the Saint Lawrence Valley, attended by snow in the Lake region and the Ohio Valley and Tennessee, heavy rain in New York and New England, destructive gales on the lakes and in the Saint Lawrence Valley and New England, and a heavy snow storm, the first of the season, in the Province of Quebec, *Canada*. A number of vessels were wrecked near Sault de Sainte Marie, Michigan. At Green Bay, Wisconsin, many disasters were reported on the lake because the wind reached speeds of 60 miles per hour combined with snow. The winds caused very high seas on Lake Michigan and as a result a large number of vessels, with valuable cargoes, were ashore near "the straits", and several serious disasters occurred off Chicago, Illinois.<sup>120</sup>

The greatest depth of snowfall reported in the *United States* in December 1889 was 81 ½ inches at Tuscarora, Nevada. In northeastern California and northwestern Wyoming it exceeded sixty inches; in extreme northern Idaho, forty inches; in southwestern Colorado, extreme northern Michigan, and east-central Washington, thirty inches; in northwestern Minnesota, extreme western Montana, southwestern Utah, and northeastern Wisconsin, twenty inches. In the Sierra Nevada Mountains the railroads were blockaded for several days by snow, which drifted to a depth of eighteen to twenty six feet, and in some of the canyons of Ormsby, Washoe, Lander, and Humboldt counties, Nevada, snow was reported packed in depths from twenty to over one hundred feet.<sup>120</sup>

On 12 January 1890, a storm passed over Saint Louis, Missouri in the *United States*. The storm was preceded by thunder and lightning, and accompanied by heavy rain which lasted about three minutes. In the path of the storm three persons were killed, several injured, and about one hundred houses blown down or damaged. Crossing the Mississippi River the storm reached Brooklyn, Illinois where it caused considerable damage. At about the same time, a storm struck Clinton, Kentucky, killing ten persons, injuring upward of fifty others, and doing immense damage to buildings, many of the smaller of which were lifted bodily from their foundations. The path of the storm at Clinton was about three hundred yards wide. Great destruction was also caused at other places in western Kentucky, notably at Wickliffe and Moscow.<sup>119</sup>

On 12 January 1890 a heavy snow storm, with high wind and falling temperature, prevailed over Minnesota, the Dakotas, Nebraska, Kansas, and Iowa in the *United States*, and caused a general blockade of the railroads from Minnesota and the Dakotas southwestward over Kansas. On the 12<sup>th</sup> and 13<sup>th</sup>, the storm along the lower lakes and on Lake Huron was one of the severest in many years, and was attended

by fatalities and great destruction of property. The heaviest snow blockade ever known on the *Central Pacific Railroad* occurred during the latter half of January, when about 120 miles of the railroad crossing the summit of the Sierra Nevada Mountains was blockaded. In the northern counties of Nevada the excessive snowfall caused great loss of livestock. At stations in north Montana, north Nevada, and California the month was the coldest January on record. In the early part of the month floods destroyed millions of dollars worth of property in south Missouri, east Arkansas, and north and east Texas. In the latter part of the month floods, resulting from melting snow, caused great damage in north California. A remarkable feature of the month was the enormous quantity of Arctic ice encountered near Newfoundland and the Grand Banks, where, as a rule, but little ice is encountered in January.<sup>119</sup>

On 13 January 1890, a very severe storm struck Buffalo, New York in the *United States*. The wind attained a maximum velocity of ninety miles per hour. Great damage was caused to property in the city and vicinity, and the water in Lake Erie reached a height 7.6 feet above the mean water mark at 2:30 p.m. on the 13<sup>th</sup>, flooding that portion of the city called "the Island." [Grand Island?]<sup>119</sup>

The following are the lowest temperatures observed during January 1890 in the *United States*:<sup>119</sup>

Montgomery, Alabama	( 29° F, -1.7° C)
Mobile, Alabama	( 33° F, +0.6° C)
Juneau, Alaska	( -4° F, -20.0° C)
Tucson, Arizona	( 24° F, -4.4° C)
Yuma, Arizona	( 30° F, -1.1° C)
Little Rock, Arkansas	( 21° F, -6.1° C)
Fort Smith, Arkansas	( 14° F, -10.0° C)
San Francisco, California	( 36° F, +2.2° C)
San Diego, California	( 35° F, +1.7° C)
Fresno, California	( 24° F, -4.4° C)
Denver, Colorado	( -8° F, -22.2° C)
Pueblo, Colorado	( -2° F, -18.9° C)
Gunnison, Colorado	(-39° F, -39.4° C)
New Haven, Connecticut	( 10° F, -12.2° C)
New London, Connecticut	( 14° F, -10.0° C)
Kirkwood, Delaware	( 18° F, -7.8° C)
Washington, D.C.	( 19° F, -7.2° C)
Pensacola, Florida	( 36° F, +2.2° C)
Key West, Florida	( 65° F, +18.3° C)
Augusta, Georgia	( 29° F, -1.7° C)
Savannah, Georgia	( 32° F, 0.0° C)
Soda Springs, Idaho	(-31° F, -35.0° C)
Lewiston, Idaho	( -9° F, -22.8° C)
Chicago, Illinois	( -5° F, -20.6° C)
Cairo, Illinois	( 17° F, -8.3° C)
Indianapolis, Indiana	( 4° F, -15.6° C)
Lafayette, Indiana	( -3° F, -19.4° C)
Dubuque, Iowa	(-16° F, -26.7° C)
Keokuk, Iowa	( -5° F, -20.6° C)
Topeka, Kansas	(-10° F, -23.3° C)
Dodge City, Kansas	( -3° F, -19.4° C)
Louisville, Kentucky	( 14° F, -10.0° C)
Lexington, Kentucky	( 14° F, -10.0° C)
New Orleans, Louisiana	( 36° F, +2.2° C)
Shreveport, Louisiana	( 26° F, -3.3° C)
Eastport, Maine	(-18° F, -27.8° C)
Portland, Maine	( -3° F, -19.4° C)
Baltimore, Maryland	( 20° F, -6.7° C)

Boston, Massachusetts	( 8° F, -13.3° C)
Nantucket, Massachusetts	( 17° F, -8.3° C)
Marquette, Michigan	( -6° F, -21.1° C)
Detroit, Michigan	( 5° F, -15.0° C)
Saint Vincent, Minnesota	(-38° F, -38.9° C)
Saint Paul, Minnesota	(-22° F, -30.0° C)
Pokegama Falls, Minnesota	(-38° F, -38.9° C)
Vicksburg, Mississippi	( 28° F, -2.2° C)
Saint Louis, Missouri	( 8° F, -13.3° C)
Martindale, Montana	(-42° F, -41.1° C)
Helena, Montana	(-23° F, -30.6° C)
North Platte, Nebraska	(-12° F, -24.4° C)
Omaha, Nebraska	(-14° F, -25.6° C)
Winnemucca, Nevada	(-23° F, -30.6° C)
Carson City, Nevada	(-22° F, -30.0° C)
West Milan, New Hampshire	(-21° F, -29.4° C)
New Brunswick, New Jersey	( 21° F, -6.1° C)
Cape May, New Jersey	( 18° F, -7.8° C)
Santa Fe, New Mexico	( 2° F, -16.7° C)
Albany, New York	( 6° F, -14.4° C)
New York City, New York	( 15° F, -9.4° C)
Charlotte, North Carolina	( 25° F, -3.9° C)
Highlands, North Carolina	( 11° F, -11.7° C)
Bismarck, North Dakota	(-35° F, -37.2° C)
Gallatin, North Dakota	(-40° F, -40.0° C)
Cincinnati, Ohio	( 10° F, -12.2° C)
Columbus, Ohio	( 9° F, -12.8° C)
Fort Sill, Oklahoma	( 12° F, -11.1° C)
Roseburg, Oregon	( 21° F, -6.1° C)
Portland, Oregon	( 12° F, -11.1° C)
Erie, Pennsylvania	( 13° F, -10.6° C)
Philadelphia, Pennsylvania	( 19° F, -7.2° C)
Block Island, Rhode Island	( 14° F, -10.0° C)
Charleston, South Carolina	( 36° F, +2.2° C)
Columbia, South Carolina	( 27° F, -2.8° C)
Yankton, South Dakota	(-22° F, -30.0° C)
Nashville, Tennessee	( 20° F, -6.7° C)
Knoxville, Tennessee	( 24° F, -4.4° C)
San Antonio, Texas	( 25° F, -3.9° C)
Galveston, Texas	( 35° F, +1.7° C)
Salt Lake City, Utah	( -2° F, -18.9° C)
Burlington, Vermont	(-12° F, -24.4° C)
Lynchburg, Virginia	( 23° F, -5.0° C)
Norfolk, Virginia	( 25° F, -3.9° C)
Olympia, Washington	( 7° F, -13.9° C)
Spokane Falls, Washington	(-23° F, -30.6° C)
Pleasant Hill, West Virginia	( 6° F, -14.4° C)
Milwaukee, Wisconsin	(-10° F, -23.3° C)
Neillsville, Wisconsin	(-36° F, -37.8° C)
La Crosse, Wisconsin	(-23° F, -30.6° C)
Cheyenne, Wyoming	( -2° F, -18.9° C)

The following are the lowest temperatures observed during January 1890: <sup>119</sup>

Guanajuato, <i>Mexico</i>	( 38° F, 3.3° C)
La Logia, <i>Mexico</i>	( 41° F, 5.0° C)
Topo Chico, <i>Mexico</i>	( 54° F, 12.2° C)

Leon de Aldamas, <i>Mexico</i>	( 41° F, 5.0° C ) (now León, Guanajuato)
Zacatecas, <i>Mexico</i>	( 31° F, -0.6° C )
Grand Turk Island, <i>West Indies</i>	( 78° F, 25.6° C )
Hamilton, <i>Bermuda</i>	( 50° F, 10.0° C )

Vast fields of Arctic ice and enormous icebergs were encountered over and near the Grand Banks of *Newfoundland* north of the forty-third parallel throughout a greater part of January 1890. By March it became apparent that the enormous and probably unparalleled quantity of Arctic ice encountered to the eastward and southeastward of Newfoundland during the past winter indicates that there was an abnormally heavy flow of ice from Greenland waters and an unusually open season in the Arctic regions during the summer of 1889. The winter was unusually cold in Newfoundland and vicinity, which condition resulted in an enormous accumulation of field ice along the Newfoundland and Labrador coasts, which was broken away by heavy gales, and the formation of unusually heavy ice in the Gulf of Saint Lawrence.<sup>119</sup>

During the winter of 1889-90, the rivers in the *United States* froze later in the season and to a much lesser degree than normal. The depth that rivers and lakes froze in January 1890:<sup>119</sup>

- \* At Alpena, Michigan, *Thunder Bay and Thunder River* froze over on the 16<sup>th</sup>.
- \* At Machias, Maine, the *Machias River* was closed to navigation by ice on the 12<sup>th</sup>.
- \* At Biddeford, Maine, the *Saco River* was closed to navigation by ice during the night of 31 December 1889. The shipping season was reported the longest ever known at that place.
- \* At Sault Sainte Marie, Michigan, the *Saint Mary's River* froze over for the first time this season on the 9<sup>th</sup>.
- \* At Davenport, Iowa, the *Mississippi River* froze over on the 16<sup>th</sup>.
- \* At Kansas City, Missouri: an ice gorge in the *Missouri River* at, and above, Saint Joseph during the early part of the month, lowered the stage of the water at Kansas City to a point about two feet below the record, exposing the main suction pipe of the water works. Floating ice in river, 28<sup>th</sup>, 29<sup>th</sup>, and 30<sup>th</sup>.

In January 1890, vast fields of ice and enormous icebergs were encountered over and near the Grand Banks, north of the forty-third parallel [off Newfoundland, *Canada*].<sup>116</sup>

On 12 January 1890, there were destructive storms in the western *United States*. These storms struck Canada on 14 January 1890.<sup>97</sup>

On 17-27 January 1890, there was a destructive gale with loss of life in the Atlantic and on British coast, especially southern and southwestern *England*. This gale produced high tides and floods.<sup>97</sup>

On 23-24 January 1890, there was a destructive storm on the continent from Paris, *France* to Vienna, *Austria*. [There were 68 British wrecks and 67 lives lost in January 1890.]<sup>97</sup>

February 1890 was the warmest February on record in the Atlantic coast and Gulf States, and in areas in the Ohio Valley and Tennessee in the *United States*. A cold wave the latter part of the month caused great loss of livestock on the ranges in east Oregon and northeast Nevada. The great depth of snow in the cuts along the hue of the *Central Pacific Railroad* crossing the summit of the Sierra Nevada Mountains caused serious interruption to the train service. [Because of the unseasonably warm temperatures,] Lakes Erie and Lake Huron were reported practically open to navigation.<sup>119</sup>

In March 1890, cold waves of unprecedented seasonal severity swept over the southern and southeastern states of the *United States* during the first and middle parts of March, and on the 2<sup>nd</sup>, the heaviest snowstorm in the history of that weather station occurred at Charleston, South Carolina.<sup>119</sup>

---

#### 1890 A.D. – 1900 A.D. South Africa. Drought

During 1890-1900, *South Africa* experienced drought conditions.<sup>167</sup>

— On 12 February 1896, the Standard Bank Archives recorded, “A severe and protracted Drought has prevailed [1890-1896], affecting Namaqualand, portions of the T.V.L. (Transvaal), the Free State and nearly the whole of Cape Colony.” “The disastrous effects of drought combined with the serious havoc wrought by locust, have impoverished large areas of the country, and distress in some districts is already acute.”

— At Herschel Area, “Between 1895 and 1899, peasant production in this district was disrupted by droughts, locusts and rinderpest. Here, as elsewhere, numerous Africans were reduced to the most severe poverty – thousands left the district in search of work, while others stayed, living on edible weeds.”

— In 1895 at Cape Colony, “A severe and protracted Drought has prevailed affecting Namaqualand, portions of the T.V.L., the Free State and nearly the whole of Cape Colony, and although partial rains have fallen, they came to late to prevent distress and disaster. Sheep and cattle are generally in poor condition, and in several districts insolvencies among the farming community are already occurring on an unusual scale.”

— In 1897 at Shiloh, “for seven months not enough rain has fallen to lay the dust.”

— In 1899 at Cape Colony, “King Williamstown, Maraisburg, Victoria West and many other parts of the Cape Colony, have also suffered severely from Drought, and in the generally fertile district of Oudtshoorn, the crops are not only in consequence far below average but the inhabitants are in serious straits for want of water.”

— In 1899 at Cape Colony, “The Beaufort West, Oudtshoorn, George, Swellendam and King Williamstown districts have suffered somewhat from Drought, and those of Jansenville, Alice and Fort Beaufort very severely. In the Alice district, the crops are entirely lost, the drought being reported as the worst since 1877, while at Fort Beaufort, the Kat River ceased flowing for the first time in 50 years.”

**1890 A. D.** In early February 1890, there were disastrous floods on the upper River Severn in *Wales*, which caused much suffering.<sup>90</sup>

In February 1890, destructive floods occurred in west Oregon and north California in the *United States* in the early part of the month. Great damage was caused by the overflow of streams in Ohio and west Kentucky. The Verde and Gila Rivers in Arizona, overflowed their banks, and a large storage dam on the Hassayampa River, Arizona, gave way, causing loss of life and destruction of property.<sup>119</sup>

In March 1890 in *Australia*, there were several floods. Brisbane in Queensland experienced severe floods. In New South Wales, the north coastal rivers flooded, along with the Darling River and the rivers in southwest regions of Western Australia.<sup>101</sup>

The Mercury Newspaper of 17 March 1890 reported, “During the time the Brisbane River was in high flood, many of the wharves were submerged, and boats were plying along Stanley Street, the main thoroughfare of South Brisbane, Australia. The suburbs were mostly under water. On Monday a terrific sea was running off Cape Moreton, and fears were entertained for the safety of the Comtoyuroa Lighthouse. At Moreton Bay the floods, which lasted through Monday, Tuesday, Wednesday, and Thursday, were the most disastrous ever known. Almost the whole of South Brisbane has been submerged to a depth of 10 feet, and hundreds of houses were utterly submerged. Boats were plying in the streets day and night to render assistance.”<sup>158</sup>

In March 1890, a great flood prevailed in the lower Mississippi valley of the *United States*, and at most of the important points along the lower Mississippi river the water was the highest ever known. Flood conditions also prevailed along the Ohio River and its tributaries.<sup>119</sup>

About 13 March 1890, there were destructive floods caused by heavy rains in the Mississippi valley and Southern States in the *United States*.<sup>90</sup>

In March 1890, there was a great flood in the lower Mississippi valley in the *United States*.<sup>119</sup>

In March and April 1890, the Mississippi River in the *United States* flooded. The Mississippi valley suffered much by frequent inundations. This flood was very disastrous. Thousands of square miles were

submerged, many towns isolated, and communications cutoff. Louisiana suffered much in April 1890.<sup>97</sup>

On 27 March 1890, There were tornadoes in the Ohio valley in the *United States*, from Cincinnati to Cairo; very great destruction at Louisville, where about 93 persons perished; many places in Illinois, Missouri and Indiana, suffered greatly; total loss of life about 175 people.<sup>97</sup>

On 27 March 1890, a tornado struck Louisville, Kentucky in the *United States*. Louisville's loss of life was placed at 125 at the time, and its property loss at \$2,500,000. [In present currency, that would be equivalent to \$68 million in damages based on the Consumer Price Index (CPI) inflation rates.] The tornado cut a broad path through the city, its width, in the course of greatest destructiveness, being fully 1,000 feet [305 meters].<sup>197</sup>

On 27 March 1890, a group of tornadoes struck Kentucky, southern Indiana, southern Illinois, and southeastern Missouri in the *United States*. The most destructive of this group occurred in Kentucky, where upwards of one hundred lives were lost, and property to the value of about \$4,000,000 was destroyed [approximately \$100 million in present dollars using the Consumer Price Index (CPI)]. In Louisville alone, the loss of life was seventy-six, and many persons were injured, and the losses to property aggregated about \$2,500,000. In Indiana the severest storms occurred in the extreme southern part of the state at Jeffersonville. This tornado then crossed over the Ohio River and struck Louisville. In Illinois seven lives are known to have been lost, many persons were injured, and the damage to property amounted to at least \$200,000. In southeastern Missouri four lives were lost, while the reported damage to property was not heavy. In Tennessee severe windstorms caused the loss of several lives, and the damage to property was very great. Destructive wind and hailstorms prevailed on this date from the Rocky Mountains eastward over the Ohio Valley and Lake region, but no lives were lost west of the Missouri River.<sup>119</sup>

In April 1890, the great flood in the lower Mississippi valley in the *United States* continued. Among the more important crevasses [levee breaks], which occurred were those at Catfish Point, Mississippi, at the Opossum Fork levee, and at the great Morganza levee. At the close of the month not less than 15 parishes, or about one-fourth of the state of Louisiana, had been affected by the flood; about 10,000 acres had been inundated in Mississippi by the Austin crevasse which occurred March 30<sup>th</sup>: and on the Arkansas side of the river about 10,000 acres had been inundated. Water from the Nita crevasse, which occurred March 13<sup>th</sup>, had found its way into Lake Pontchartrain by means of the Manchac Passes.<sup>119</sup>

On 18-20 April 1890, the town of Bourke in *Australia* was temporarily submerged by the rising of the Upper Darling River. This flood was caused by heavy rainfall. There was much property damaged but no loss of life.<sup>97</sup>

From April to October 1890, there were widespread floods in Queensland, New South Wales and South Australia regions of *Australia*. Very high flood levels were recorded along the Darling River and its tributaries and the Murray River. Nine people were drowned and 50 people injured. Approximately ten thousand sheep were lost. Transport and communications were severely disrupted in western New South Wales and South Australia for months.<sup>99</sup>

In May 1890, the flood along the lower Mississippi River in the *United States* subsided gradually. A rise in the Red River caused the overflow of a considerable extent of country in northwest Louisiana and southwest Arkansas. Damaging floods occurred in Ontario, *Canada*; along the Brazos River, Texas; in central New York and northeast Pennsylvania; along the Willamette River, Oregon; along the upper Potomac River; in Fresno and Tulare counties, California; and along the Carson River, Nevada. A noteworthy tornado occurred at Akron, Ohio, on May 10<sup>th</sup>.<sup>119</sup>

On 4 May 1890, there was a cyclone [tornado] in Texas in the *United States*, much destruction, 15 persons killed.<sup>97</sup>

On 28-29 May 1890, a hurricane struck *Cuba*. There were a good number of drownings. Firemen, marines, and civil guard teams were sent from the capital. A good number of these [rescue] crews lost their lives.<sup>141</sup>

In June 1890, the lower Mississippi river fell below the danger line at New Orleans, Louisiana in the *United States*, on the 12<sup>th</sup>, and continued to fall slowly during the month. Floods were reported along the Carson River, Nevada, in Ontario, *Canada*, in central New York, northern Illinois, and southern Wisconsin. Drought injured crops and vegetation in areas in the south Atlantic and Gulf states, and in the lower Missouri valley. Destructive tornadoes occurred at Bradshaw, Nebraska, and at Lee, Livingston, and Pratt counties in Illinois.<sup>119</sup>

In June 1890, Kansas in the *United States* experienced very warm temperatures including: Collyer (120° F), Eureka Ranch (116° F), Freemont (110° F), Gove City (111° F), Grinnell (112° F), Havensville (110° F), Monument (110° F), Oakley (110° F), Quinter (110° F), and Weskan (110° F).<sup>119</sup>

On 3 June 1890, a tornado struck Bradshaw, Nebraska in the *United States*. Twelve persons were killed and many more injured. The damage to property was estimated at \$108,800 [\$2.6 million in today's dollars], not including the loss in livestock.<sup>119</sup>

On 7 June 1890, a tornado with large hail and heavy rain struck Lebanon, South Dakota in the *United States*, causing great destruction to buildings and crops. During the storm, the Little Cheyenne River rose 25 feet in 30 minutes, drowning 9 persons and destroying considerable property.<sup>119</sup>

On 20 June 1890, a tornado struck Lee County, Illinois in the *United States* about 3½ miles south of West Brooklyn. Twelve persons were killed and the loss of property was estimated at \$200,000 [\$4.8 million in today's dollars].<sup>119</sup>

On 20 June 1890, a tornado struck in Lee County, Illinois in the *United States*, 15 deaths.<sup>97</sup>

The following are the highest temperatures observed during July 1890 in the *United States*:<sup>119</sup>

Montgomery, Alabama	( 97° F, 36.1° C)
Mobile, Alabama	( 96° F, 35.6° C)
Tucson, Arizona	( 99° F, 37.2° C)
Yuma, Arizona	(115° F, 46.1° C)
Little Rock, Arkansas	( 97° F, 36.1° C)
Fort Smith, Arkansas	(101° F, 38.3° C)
San Francisco, California	( 80° F, 26.7° C)
San Diego, California	( 80° F, 26.7° C)
Fresno, California	(111° F, 43.9° C)
Denver, Colorado	( 97° F, 36.1° C)
Pueblo, Colorado	(100° F, 37.8° C)
New Haven, Connecticut	( 91° F, 32.8° C)
New London, Connecticut	( 88° F, 31.1° C)
Washington, D.C.	( 98° F, 36.7° C)
Pensacola, Florida	( 97° F, 36.1° C)
Key West, Florida	( 89° F, 31.7° C)
Augusta, Georgia	( 99° F, 37.2° C)
Savannah, Georgia	( 94° F, 34.4° C)
Payette, Idaho	(113° F, 45.0° C)
Lewiston, Idaho	(104° F, 40.0° C)

Chicago, Illinois	( 93° F, 33.9° C)
Cairo, Illinois	( 95° F, 35.0° C)
Indianapolis, Indiana	( 97° F, 36.1° C)
Lafayette, Indiana	( 96° F, 35.6° C)
Dubuque, Iowa	( 98° F, 36.7° C)
Keokuk, Iowa	(104° F, 40.0° C)
Topeka, Kansas	(102° F, 38.9° C)
Dodge City, Kansas	(104° F, 40.0° C)
Louisville, Kentucky	( 96° F, 35.6° C)
Lexington, Kentucky	( 94° F, 34.4° C)
New Orleans, Louisiana	( 96° F, 35.6° C)
Shreveport, Louisiana	( 99° F, 37.2° C)
Eastport, Maine	( 82° F, 27.8° C)
Portland, Maine	( 93° F, 33.9° C)
Baltimore, Maryland	( 98° F, 36.7° C)
Boston, Massachusetts	( 95° F, 35.0° C)
Nantucket, Massachusetts	( 82° F, 27.8° C)
Marquette, Michigan	( 91° F, 32.8° C)
Detroit, Michigan	( 96° F, 35.6° C)
Saint Vincent, Minnesota	( 95° F, 35.0° C)
Saint Paul, Minnesota	( 94° F, 34.4° C)
Vicksburg, Mississippi	( 99° F, 37.2° C)
Saint Louis, Missouri	( 98° F, 36.7° C)
Glendive, Montana	(105° F, 40.6° C)
Helena, Montana	( 96° F, 35.6° C)
North Platte, Nebraska	(103° F, 39.4° C)
Omaha, Nebraska	(105° F, 40.6° C)
Winnemucca, Nevada	( 99° F, 37.2° C)
Carson City, Nevada	( 92° F, 33.3° C)
West Milan, New Hampshire	( 88° F, 31.1° C)
New Brunswick, New Jersey	( 98° F, 36.7° C)
Cape May, New Jersey	( 96° F, 35.6° C)
Santa Fe, New Mexico	( 90° F, 32.2° C)
Albany, New York	( 98° F, 36.7° C)
New York City, New York	( 95° F, 35.0° C)
Charlotte, North Carolina	( 96° F, 35.6° C)
Kitty Hawk, North Carolina	( 96° F, 35.6° C)
Bismarck, North Dakota	( 98° F, 36.7° C)
Steele, North Dakota	(108° F, 42.2° C)
Cincinnati, Ohio	( 95° F, 35.0° C)
Columbus, Ohio	( 96° F, 35.6° C)
Fort Sill, Oklahoma	(106° F, 41.1° C)
Roseburg, Oregon	( 93° F, 33.9° C)
Portland, Oregon	( 95° F, 35.0° C)
Erie, Pennsylvania	( 94° F, 34.4° C)
Philadelphia, Pennsylvania	( 97° F, 36.1° C)
Block Island, Rhode Island	( 85° F, 29.4° C)
Charleston, South Carolina	( 92° F, 33.3° C)
Columbia, South Carolina	( 95° F, 35.0° C)
Yankton, South Dakota	( 98° F, 36.7° C)
Nashville, Tennessee	( 98° F, 36.7° C)
Knoxville, Tennessee	( 95° F, 35.0° C)
San Antonio, Texas	( 99° F, 37.2° C)
Galveston, Texas	( 92° F, 33.3° C)
Salt Lake City, Utah	( 98° F, 36.7° C)
Burlington, Vermont	( 91° F, 32.8° C)

Lynchburg, Virginia	( 97° F, 36.1° C)
Norfolk, Virginia	( 96° F, 35.6° C)
Olympia, Washington	( 89° F, 31.7° C)
Spokane Falls, Washington	(102° F, 38.9° C)
Tyler Creek, West Virginia	( 98° F, 36.7° C)
Milwaukee, Wisconsin	( 94° F, 34.4° C)
La Crosse, Wisconsin	( 97° F, 36.1° C)
Cheyenne, Wyoming	( 92° F, 33.3° C)

The following are the highest temperatures observed during July 1890: <sup>119</sup>

Guanajuato, <i>Mexico</i>	( 81° F, 27.2° C)
La Logia, <i>Mexico</i>	(102° F, 38.9° C)
Mexico City, <i>Mexico</i>	( 78° F, 25.6° C)
Puebla, <i>Mexico</i>	( 82° F, 27.8° C)
Mazatlan, <i>Mexico</i>	( 88° F, 31.1° C)
Leon de Aldamas, <i>Mexico</i>	( 87° F, 30.6° C) (now León, Guanajuato)
Zacatecas, <i>Mexico</i>	( 83° F, 28.3° C)
Montreal, <i>Canada</i>	( 89° F, 31.7° C)
New Westminster, British Columbia, <i>Canada</i>	( 84° F, 28.9° C)
Saint John's, New Foundland, <i>Canada</i>	( 76° F, 24.4° C)
Grand Turk Island, <i>West Indies</i>	( 85° F, 29.4° C)
Hamilton, <i>Bermuda</i>	( 82° F, 27.8° C)
Port au Prince, <i>Haiti</i>	( 97° F, 36.1° C)

A report from Parkersburg, West Virginia in the *United States*, dated 5 July 1890, stated that heavy rain had caused immense damage in that region, and the loss by flood in the Muskingum Valley, Ohio, was estimated at \$500,000 [approximately \$12 million in present dollars using the Consumer Price Index (CPI)].<sup>119</sup>

In July 1890, damaging drought prevailed generally in Kansas, Nebraska, and Iowa, and in areas in the Ohio Valley and Tennessee, the Lake region, and the Atlantic coast states from Massachusetts to Alabama in the *United States*. Navigation was suspended on the upper Ohio River, and on the Cumberland River, at Nashville, Tennessee, on account of low water. The Arkansas River, at Fort Smith, Arkansas, was lower than at any time since April 1887.<sup>119</sup>

On 7 July 1890, a very violent thunderstorm struck Moorhead, Minnesota in the *United States*. The damage at Moorhead was estimated at \$25,000. At Fargo, North Dakota, 7 persons were killed by the storm and 13 injured and the damage was estimated at \$75,000. [\$2.4 million in total damage in today's dollars.]<sup>119</sup>

In July 1890, there was a terrible cyclone [tornado] in Minnesota in the *United States*.<sup>97</sup>

On 8 July 1890, a severe thunderstorm struck Cleveland, Ohio in the *United States* causing an estimated \$100,000 in damages. [\$2.4 million in today's dollars.]<sup>119</sup>

On 9 July 1890, a great cyclone at Muscat [Masqat], *Oman* caused floods. It was reported that about 700 persons perished.<sup>97</sup>

On 13 July 1890, a tornado swept through New Canada Township, Minnesota in the *United States*. The tornado killed 6, injured 23 persons and caused an estimated \$10,000 in damages. [\$240,000 in today's dollars.] Hailstones large enough to kill chickens fell to the north of the tornado path. Foliage was stripped from trees and plants, and near the ruined buildings the trees were stripped of bark. The area of destruction was ½ mile in length and 400 to 800 feet in width. On the same day, a violent storm passed

over Lake Pepin (50 miles southeast of Saint Paul, Minnesota) and overturned the excursion steamer Red Wing with over 200 persons aboard; 100 of these were drowned. The estimated loss to buildings in Lake City, a few miles from the scene of the disaster was \$10,000.<sup>119</sup>

On 20 July 1890, there was a destructive cyclone at Slonim, Russia [now *Belarus*], 19 lives lost.<sup>97</sup>

On 26 July 1890, there was a cyclone in south Lawrence, Merrimac valley, Massachusetts in the *United States*. There were 100 buildings destroyed and 9 deaths.<sup>97</sup>

On 24 July 1890, a tornado struck Lawrence, Massachusetts in the *United States*. The tornado was at times as wide as 300 feet [91 meters]. Seventy dwellings were destroyed or seriously damaged. Eight people were killed outright. But several other people were seriously injured and died later from their injuries. The damage was estimated at \$150,000. [In present currency, that would be equivalent to \$3.8 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>199</sup>

On 26 July 1890, a tornado struck Lawrence, Massachusetts in the *United States*. Eight persons were killed, 63 injured and 35 houses demolished. The city sustained \$60,000 in damages [\$1.4 million in today's dollars].<sup>119</sup>

In August 1890, there were destructive storms in *Austria, France, Switzerland* and in the *United States*.<sup>97</sup>

In August 1890, there were destructive floods in *China*.<sup>90</sup>

In August and September 1890, there were destructive floods in *Austria, Bohemia* [now western *Czech Republic*], *central Europe* and *France*.<sup>90</sup>

In August 1890, considerable damage was caused by flood along the Gila River in Arizona in the *United States*.<sup>119</sup>

On 3 August 1890, a thunderstorm with heavy rain and large hail began at Sioux City, Iowa in the *United States*. Hail continued about 40 minutes; the stones were irregular in shape, some being 1 inch long and  $\frac{3}{4}$  inch thick; the outside of the stones was composed of rough, clear ice and the centre of white, soft ice. Next, the hailstorm passed about  $3\frac{1}{2}$  miles north of Sibley, Iowa. The width of the path of hail was about 6 miles, the path of greatest destruction being  $1\frac{1}{2}$  miles wide, and the path was known to be at least 75 miles in length, and extended over Lyons, Osceola, Dickinson, Emmet, and Winnebago counties in Iowa. The hailstones varied in size from  $\frac{3}{4}$  inch in diameter to the size of hens' eggs. A number of persons were badly injured by hail, and the damage to trees, crops, and property was estimated at \$150,000 [\$3.6 million in today's dollars].<sup>119</sup>

On 12 August 1890, [due to the drought] the Arkansas River was lower at Fort Smith, Arkansas in the *United States*, than at any time since 1856.<sup>119</sup>

On 19 August 1890, a series of tornadoes struck Pennsylvania in the *United States*. The total loss of life in all the towns was 28. Wilkes-Barre was the hardest hit. At Wilkes-Barre 16 persons were killed and the damage was estimated at \$600,000 [\$14.4 million in today's dollars]. Other cities sustained loss. At New Milford, one boy was killed. At Bloomingdale, three were killed. At Register, one individual was fatally injured. At Harveyville, one was killed and the city sustained \$60,000 in damages. At Silkworth, three were killed. At Shickshinny, a girl was killed. At Sinking Spring, one individual was killed. At Reading, one was killed.<sup>119</sup>

A West Indies hurricane moved east of the *Windward Islands* to northwest of *Bermuda* from the 27-31 August 1890. The winds were of hurricane force and caused loss of life and shipping.<sup>119</sup>

On 28-30 August 1890, a hurricane struck the western *Atlantic Ocean*. On one ship there were 10 deaths and on another there was loss of life.<sup>141</sup>

In September 1890, a notable feature was the severe cold wave, which advanced from the northwest over the central valleys west of the Mississippi River in the *United States* on the 13<sup>th</sup>, attended by unprecedentedly low temperature for the season and early frost. Destructive floods prevailed in central and western New York, central and western Pennsylvania, West Virginia, Ohio, and Connecticut from September 10<sup>th</sup> to 15<sup>th</sup>.<sup>119</sup>

On 16-17 September 1890, the Orinoco River and its tributaries in *South America* overflowed causing great destruction.<sup>90</sup> [About 76.3% of the Orinoco River lies in *Venezuela* and the remainder in *Colombia*.]

In October 1890, a tornado struck Richmond and Robeson counties, North Carolina in the *United States*, on the 16<sup>th</sup>. Considerable damage was caused by freshets in the Monongahela and Little Kanawha rivers in West Virginia and a freshet in the Wyoming Valley, Pennsylvania. Cape Fear River flooded its banks near Wilmington, North Carolina. Very dry weather prevailed in parts of Nebraska, Kansas, Missouri, South Dakota, and south Minnesota. Destructive prairie fires occurred along the Cannon Ball, Heart, and Knife rivers in North Dakota during the early part of October.<sup>119</sup>

November 1890 was the driest and warmest November on record in the middle, south Atlantic, and east Gulf states, and generally along the Pacific coast in the *United States*. A tornado occurred near Erie, Pennsylvania on the 17<sup>th</sup>. On the 30<sup>th</sup>, a heavy gale caused damage at Bermuda Island. High water and floods were reported along the Gila and Colorado rivers in western Arizona.<sup>119</sup>

On 7 November 1890, a violent gale struck *Great Britain* and *Ireland*. There was great destruction of life and property, especially at sea. There were 114 lives saved by lifeboats. Viscount Cantelupe drowned and his yacht was wrecked in Belfast Lough in *Northern Ireland*.<sup>97</sup>

On 23 November 1890, a violent northwest gale struck the *English Channel*. There were several wrecks on the southern coast [of *England*].<sup>97</sup>

On 23-25 November 1890, violent gales struck throughout *Europe*.<sup>97</sup>

On 23-25 November 1890, there were destructive inundations caused by violent gales throughout *Europe*, especially in *Germany*, *Austria*, *Mecklenburg*, *Baltic Coast*, *Belgium*, and *Denmark*.<sup>90</sup>

On 29 November 1890, a heavy gale, attended with squalls of almost hurricane force and unusually high seas, caused considerable damage to the shipping interests in Newfoundland, *Canada*.<sup>119</sup>

A notable feature of December 1890 was the unusually low temperature, which prevailed over the extreme northeast part of the *United States* and the abnormally warm weather in the north-central districts. Precipitation was deficient over a greater part of the country, the regions of greatest excess being the north Pacific coast and Cape Breton Island. A tornado passed over Jersey, Georgia on December 8<sup>th</sup>.<sup>119</sup>

On 3 December 1890, a gale was reported in the Gulf of St. Lawrence in *Canada*. Forty vessels said to be wrecked. There was much destruction to shipping and buildings at Newfoundland on 8 December

1890.<sup>97</sup>

On 24 December 1890, violent storms struck the *North Atlantic*. Over 60 vessels were reported lost.<sup>97</sup>

On 28 December 1890 at Deniliquin, *Australia*, 200 houses were damaged by a severe thunderstorm and tornado.<sup>99</sup>

In 1890 during the period between 5 February and 8 August, a drought engulfed Kansu (now Gansu province) in northwest *China* at Lanchow.<sup>153</sup>

*Also refer to the section 1889 A.D. – 1892 A.D. for information on the famine in India, Russia, Japan, Hungary and Montenegro during that timeframe.*

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

**Winter of 1890 / 1891 A.D.** The frost in *Britain* began on 25 November 1890 and continued with intermissions till 22 January 1891.<sup>90</sup>

On 16 January 1891, a trap with a tandem team drove across the ice on the Serpentine in Hyde Park [London], England.<sup>90</sup>

The winter of 1890-91 in Bradford County, Pennsylvania in the *United States* was a long one of deep snow. The total winter snowfall was 97 inches [2.5 m]. The first snow fell on Election Day, November 4<sup>th</sup>. But there was no sleighing until December. There were heavy snowstorms during the end of December, which covered the ground on the highlands and in the woods to a depth of 3½ feet [1.1 m]. The big drifts on the roads and the deep snow in the woods made it difficult for travel and lumbering operations. There was abundance of good sleighing for many weeks. Bluebirds appeared during the last week in February. March saw wind, snow and rain. Unfavorable weather continued until the first of May. As a result, farm operations were late.<sup>178</sup>

On 24-25 January 1891, New York City in the *United States* was struck by a great snowstorm. Electric lights, telegraph, and telephone communications stopped.<sup>97</sup>

On 7 February 1891, there were violent blizzard in Nebraska and South Dakota in the *United States*, many perished.<sup>97</sup>

On 8-9 March 1891, a blizzard struck Minnesota, Iowa, Illinois and Wisconsin in the *United States*.<sup>97</sup>

On 9-13 March 1891, there was a great snowstorm, or blizzard, throughout *England*, especially in the south and west. Railway traffic, post and telegraph were greatly impeded. In some places totally stopped. There were many wrecks and loss of life in the *English Channel*. There were hurricanes near Dover and Plymouth; [ship] wrecks of fishing boats at Hastings and other places. The *Victoria* (Captain Shirley) had a long dangerous passage from Dover to Calais. Great Western and South-Western railways were disorganized. Fourteen ships were lost; about 60 lives lost.<sup>97</sup>

The minimum temperatures observed in Alaska in the *United States* by month is given below: <sup>137</sup>

For Nuklukayet, Alaska (a few miles below the junction of the Yukon and Tanana rivers) from August 1882 to May 1886

November (-53° F) December (-68° F) January (-76° F) February (-60° F) March (-38° F)

For Tchatowklin, Alaska (also known as Johnny's village, Klat-ol-Klin, Schwatka) from October 1882 to May 1886

November (-50° F) December (-68° F) January (-75° F) February (-74° F) March (-56° F)  
 For Fort Reliance, Canada (on the Yukon River 8.1 miles downstream from Dawson City) from  
 September 1882 to May 1886

November (-50° F) December (-69° F) January (-80° F) February (-72° F) March (-36° F)  
 For Camp Davidson, Alaska (a station at the intersection of the one hundred and forty-first meridian and  
 the Yukon) from September 1889 to June 1891

November (-35° F) December (-49° F) January (-60° F) February (-55° F) March (-45° F)  
 For Camp Colonna, Alaska (a station on the Porcupine River at its intersection with the one hundred and  
 forty-first meridian) from October 1889 to June 1890

November (-36° F) December (-43° F) January (-49° F) February (-47° F) March (-48° F)

**1891 A. D.** In January 1891, there were serious floods in Kent, *England* caused by the spring thaw, after the long frost. Also there were floods in many places on the [*European*] Continent.<sup>90</sup>

On 12-13 February 1891, there was a destructive cyclone over the *Fiji* and *Navigation Isles*, great loss of life and shipping.<sup>97</sup> [Fiji is an island in the South Pacific Ocean. The Navigation Isles are the Navigator Islands now the Samoan Islands.]

On 17 February 1891, there were destructive inundations in West Virginia, Ohio, and the Alleghany [mountain range] in the *United States*. There were floods in Arizona around 2 March and in Tennessee and Mississippi about 8 March.<sup>90</sup>

In February 1891, a flood at Yuma, Arizona in the *United States* caused private property damage estimated at \$300,000. [In present currency, that would be equivalent to \$7 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>135</sup>

On 21-24 February 1891 at Stonewall Mine, California in the *United States*, 23.9 inches of rain fell. On 21-23 February 1891 at Santa Rosa Ranch, California, 15.33 inches of rain fell. On 22-23 February 1891 at Cuyamaca, California, 22.4 inches of rain fell.<sup>116</sup>

In March 1891, nineteen persons were drowned on the North Carolina coast, and 7 persons on the Virginia coast in the *United States* by shipwreck.<sup>135</sup>

On 20 May 1891, a tornado struck in Boone and Audrian [Audrain] counties in Missouri in the *United States*, killing 4 persons, injuring 35 or more and destroying property estimated at \$100,000 [\$2.4 million in today's dollars].<sup>135</sup>

In May 1891, high water in the Rio Grande River caused great destruction of property in New Mexico and western Texas in the *United States*, and the Pecos River was the highest ever known.<sup>135</sup>

During June 1891, the peak temperature observed at the Pacific railroad stations [Ogilby, now a ghost town] in the Colorado Desert, California in the *United States* was 126° F. During July 1891, the temperature at Seven Palms, California reached 123° F.<sup>135</sup>

On 2 June 1891, there was a destructive cyclone [tornado] in South Dakota in the *United States*.<sup>97</sup>

On 10 June 1891, a cyclone destroyed the village of Ponikwa in Galicia [a historic region in Eastern Europe, currently divided between *Poland* and the *Ukraine*] and killed about 30 persons.<sup>97</sup>

About 24 June 1891, a destructive storm struck Iowa, Minnesota, and other states in the *United States*.<sup>97</sup>

On 24-29 June 1891, the Queanbeyan River in *Australia* flooded and was said to be the worst in memory. Floodwater went over the Queanbeyan Bridge and houses were swept away. At the same time the Murrumbidgee River was at record flood stage, just below the level of the 1852 flood at Cavan.<sup>99</sup>

On 26 June 1891, there was a destructive storm and cloudburst in the Rhine provinces. On 1 July the storm was over a large part of *Germany*, chiefly in the Krefeld district and in Brunswick. On 9 July 1891 it was at Salzburg.<sup>97</sup> [The Rhine provinces are in northwestern *Germany* bordering *Luxembourg*, *Belgium* and *the Netherlands*. The Krefeld district is northwest of Düsseldorf in west-central *Germany*. Brunswick is in central *Germany*. Salzburg is in west-central *Germany*.]

The following were the highest temperatures observed during the summer of 1891 in the *United States*:<sup>135</sup>

Montgomery, Alabama	( 99° F, 37.2° C)	on 5 June
Mobile, Alabama	( 96° F, 35.6° C)	on 29 June
Tucson, Arizona	(109° F, 42.8° C)	in June
Yuma, Arizona	(116° F, 46.7° C)	on 29 June
Little Rock, Arkansas	( 96° F, 35.6° C)	on 26 June
Fort Smith, Arkansas	( 97° F, 36.1° C)	on 22 July
San Francisco, California	(100° F, 37.8° C)	on 29 June
San Diego, California	( 89° F, 31.7° C)	on 7 September
Fresno, California	(114° F, 45.6° C)	on 1 July
Denver, Colorado	( 94° F, 34.4° C)	on 13 August
Pueblo, Colorado	( 98° F, 36.7° C)	on 15 August
New Haven, Connecticut	( 93° F, 33.9° C)	on 16 June
New London, Connecticut	( 92° F, 33.3° C)	on 10 August
Dover, Delaware	( 94° F, 34.4° C)	in June
Washington, D.C.	( 95° F, 35.0° C)	on 10 August
Pensacola, Florida	( 95° F, 35.0° C)	on 28 June
Key West, Florida	( 92° F, 33.3° C)	on 4 August
Augusta, Georgia	( 98° F, 36.7° C)	on 4 June
Savannah, Georgia	( 97° F, 36.1° C)	on 27 June
American Falls, Idaho	( 98° F, 36.7° C)	in July
Boise Barracks, Idaho	(109° F, 42.8° C)	in July
Chicago, Illinois	( 96° F, 35.6° C)	on 9 August
Cairo, Illinois	( 93° F, 33.9° C)	on 3 June
Indianapolis, Indiana	( 94° F, 34.4° C)	on 10 August
Lafayette, Indiana	( 97° F, 36.1° C)	in August
Dubuque, Iowa	( 96° F, 35.6° C)	on 8 & 9 August
Keokuk, Iowa	( 95° F, 35.0° C)	on 8 & 9 August
Topeka, Kansas	( 97° F, 36.1° C)	on 18 August
Dodge City, Kansas	( 99° F, 36.7° C)	on 12 July
Louisville, Kentucky	( 95° F, 35.0° C)	on 27 June
Lexington, Kentucky	( 92° F, 33.3° C)	on 9 August
New Orleans, Louisiana	( 94° F, 34.4° C)	on 24 & 30 June
Shreveport, Louisiana	( 97° F, 36.1° C)	on 2 June and 21 August
Eastport, Maine	( 79° F, 26.1° C)	on 13 June
Portland, Maine	( 95° F, 35.0° C)	on 16 June
Baltimore, Maryland	( 94° F, 34.4° C)	on 11 August
Boston, Massachusetts	( 96° F, 35.6° C)	on 16 June
Nantucket, Massachusetts	( 84° F, 28.9° C)	on 10 August
Marquette, Michigan	( 94° F, 34.4° C)	on 14 June
Detroit, Michigan	( 96° F, 35.6° C)	on 9 August
Saint Vincent, Minnesota	( 92° F, 33.3° C)	on 7 May
Saint Paul, Minnesota	( 95° F, 35.0° C)	on 7 & 8 August
Vicksburg, Mississippi	( 98° F, 36.7° C)	on 25 June
Saint Louis, Missouri	( 96° F, 35.6° C)	on 10 August

Fort Assinaboine, Montana	( 92° F, 33.3° C)	on 6 May
Helena, Montana	( 89° F, 31.7° C)	on 25 July and 30 August
North Platte, Nebraska	( 97° F, 36.1° C)	on 8 August
Omaha, Nebraska	( 97° F, 36.1° C)	on 8 August
Winnemucca, Nevada	( 98° F, 36.7° C)	on 24 July
Carson City, Nevada	( 92° F, 33.3° C)	on 30 June
West Milan, New Hampshire	( 90° F, 32.2° C)	in June
New Brunswick, New Jersey	( 98° F, 36.7° C)	on 16 June
Atlantic City, New Jersey	( 91° F, 32.8° C)	on 26 June
Santa Fe, New Mexico	( 87° F, 30.6° C)	on 22 July
Albany, New York	( 95° F, 35.0° C)	on 16 June
New York City, New York	( 94° F, 34.4° C)	on 15 June and 10 August
Charlotte, North Carolina	( 95° F, 35.0° C)	on 26 & 27 June
Wilmington, North Carolina	( 95° F, 35.0° C)	on 27 June
Bismarck, North Dakota	( 94° F, 34.4° C)	on 5 August
Fort Buford, North Dakota	( 97° F, 36.1° C)	on 18 August
Cincinnati, Ohio	( 92° F, 33.3° C)	on 9 August
Columbus, Ohio	( 94° F, 34.4° C)	on 10 August
Oklahoma City, Oklahoma	( 99° F, 37.2° C)	on 20 August
Fort Sill, Oklahoma	(101° F, 38.3° C)	in August
Roseburg, Oregon	(102° F, 38.9° C)	on 23 July
Portland, Oregon	(102° F, 38.9° C)	on 23 July
Erie, Pennsylvania	( 89° F, 31.7° C)	on 9 August
Philadelphia, Pennsylvania	( 97° F, 36.1° C)	on 10 August
Block Island, Rhode Island	( 85° F, 29.4° C)	on 10 August
Charleston, South Carolina	( 95° F, 35.0° C)	on 4 July
Columbia, South Carolina	(100° F, 37.8° C)	on 23 May
Fort Sully, South Dakota	(109° F, 42.8° C)	in August
Nashville, Tennessee	( 97° F, 36.1° C)	on 26 June
Knoxville, Tennessee	( 93° F, 33.9° C)	on 3 June
San Antonio, Texas	(104° F, 40.0° C)	on 7 July
Galveston, Texas	( 92° F, 33.3° C)	on 18 July
Salt Lake City, Utah	( 98° F, 36.7° C)	on 17 July
Burlington, Vermont	( 94° F, 34.4° C)	in June
Lynchburg, Virginia	( 94° F, 34.4° C)	on 10 August
Norfolk, Virginia	( 97° F, 36.1° C)	on 17 June
Olympia, Washington	( 96° F, 35.6° C)	on 23 July
Spokane, Washington	( 97° F, 36.1° C)	on 24 July
Walla Walla, Washington	(108° F, 42.2° C)	on 24 July
Parkersburg, West Virginia	( 94° F, 34.4° C)	on 10 August
Milwaukee, Wisconsin	( 96° F, 35.6° C)	on 9 August
La Crosse, Wisconsin	( 97° F, 36.1° C)	on 8 August
Cheyenne, Wyoming	( 89° F, 31.7° C)	on 13 August

On 6 July 1891, a tornado struck Baton Rouge, Louisiana in the *United States*, killing 10 persons and injuring many others.<sup>135</sup>

On 6 July 1891, there was a destructive storm at Baton Rouge, Louisiana in the *United States*, with loss of life.<sup>97</sup>

About 21 July 1891, there were destructive floods by the rising of the Yang-tse-Kiang River [Yangtze River]; great loss of life at Foochoo [Fuzhou or Foochow on the southeast coast of *China*].<sup>90</sup>

About 26 July 1891, there were great floods in Posen [region in *Poland*]. There was loss of life and destruction of property.<sup>90</sup>

On 5 August 1891, there was a violent hurricane and rain in lower *Austria*, *Moravia*, and upper *Hungary*. The season's vintage [grapes for wine] was destroyed.<sup>94</sup>

On 13-14 August 1891, there were heavy rains and destructive floods in east Lancashire in *England*.<sup>90</sup>

On 18 August 1891, there was a cloudburst at Kollmann [a city that lies on the right bank of the Eisack River], between Botzen and Brixen (Tyrol). The lowlands were flooded. This flood caused about 60 deaths.<sup>94</sup> [Kollmann may be in *Italy* or *Austria*.]

On 18-22 August 1891, a hurricane struck the *Caribbean Islands* of *Martinique*, *Turks Islands* and *Puerto Rico* causing approximately 700 deaths.<sup>141</sup>

During the night of the 18 August 1891 a hurricane devastated the Island of *Martinique*, *Windward [Islands]*, *West Indies*, and reports indicated about seven hundred persons were killed, many injured, and that property to the value of about \$10,000,000 was destroyed. [In present currency, that would be equivalent to \$240 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>135</sup>

On the night of the 18<sup>th</sup>, one of the most disastrous of the type of storms known as West India cyclones devastated the Island of *Martinique*, in the *Windward [Islands]*, *West Indies*. The storm struck the east side of the island of *Martinique* about 6 p.m. and continued for four hours. Incessant lightning, unaccompanied by thunder, continued throughout the storm, and at its conclusion two distinct shocks of earthquake occurred at intervals of about five seconds. In the vicinity of *Caraval Rock [Caravelle Rock]* at 10 a.m., two immense waves passed from the direction of *Saint Lucia*, the sea in the vicinity being quite calm. Another notable feature was the deafness experienced by every person in *Martinique* during the passage of the storm. The loss of life at *Martinique* was reported at 700; many persons were injured; property was destroyed to the value of about \$10 million; and all vessels about the island, some 50 sail of all classes, were wrecked. Pursuing a west-northwest course the storm passed north of *Grand Turk*, *Turks Islands*, *West Indies*, about midnight of the 21<sup>st</sup>. At *Grand Turk*, three persons drowned, and the loss to property was confined to small houses and sailing vessels. From *Grand Turk* the storm center passed to the *Islands of the Bahamas*, a south hurricane being reported over *Crooked Island*, *Bahamas*, the evening of the 22<sup>nd</sup>. A ridge of high barometer occupied the ocean off the south Atlantic coast of the *United States*. This distribution of pressure had the apparent effect of preventing the cyclone from making the usual recurve to the north and northeast, and reports indicated that the hurricane moved westward with diminished energy over extreme south *Florida* during the 24<sup>th</sup>, and passed thence into the *Gulf of Mexico*.

On 24-26 August 1891, there were destructive storms and floods in *Great Britain*, especially on the northwest coast.<sup>94</sup>

In the *United States* during August 1891, the maximum temperature was highest in the *Colorado Desert*, *California*, and in the lower *Gila valley*, *Arizona*, where it rose above 120° F. It was above 110° F in adjoining parts of southeast *California* and west *Arizona* and in the *San Joaquin* and *Sacramento valleys*, *California*. The maximum temperature observed was 129° F at *Volcano Springs*, *California*; 122° F at *Seven Palms*, *California*; 120° F at *Needles*, *California*; 120° F at *Fort Mohave*, *Arizona*; 120° F at *Maricopa*, *Arizona*; and 119° F at *Indio*, *California*.<sup>135</sup>

Several areas of the *United States* suffered from drought conditions in August 1891. In southeast *Massachusetts*, drought seriously affected crops, and many wells went dry. Fruit was injured about *Micco*, *Florida*, and cotton was reported damaged about *Livingston*, *Alabama*. Crops suffered about *Fayette*, *Mississippi*, and *Lead Hill*, *Arkansas*. Drought and cold weather during the latter part of August injured cotton in parts of *Louisiana*. The month was unusually dry and vegetation was damaged by

drought in Brazos County, Texas; Socorro County, New Mexico; Cochise County, Arizona; northwest and east Kansas; and central and northwest Wisconsin. In Polk County, Wisconsin, lakes and ponds were reported lower than ever before observed, and low water in the upper Wisconsin River prevented milling and logging operations. On the 1<sup>st</sup>, rain broke a drought that had been very destructive to livestock and vegetation along the Rio Grande River, Texas, from Presidio to Cameron counties. In the early part of the month crops were badly damaged in southeast Illinois; in Miami and Pulaski counties, Indiana; in Fond du Lac County, Wisconsin; and in western Michigan. In parts of Rhode Island and Connecticut mills were stopped on account of insufficient water.<sup>135</sup>

Several areas of the *United States* suffered from drought conditions in September 1891. Navigation on the middle and lower Mississippi River and tributaries was rendered difficult by low water. In New England, a scarcity of water caused the closing of mills, and in a number of the Southern and Western States, drought injured crops and caused a suspension of farm work. Crops of all kinds were damaged and farming operations were almost entirely suspended in Tennessee and Arkansas. Drought was general in Illinois. In Ohio, fall pasturage and the water supply were seriously affected. Streams were low and wells were failing in parts of Iowa.<sup>135</sup>

Around 9 September 1891, there was a destructive storm off Nova Scotia, *Canada*. There were about 20 vessels wrecked, with loss of life.<sup>94</sup>

On 11-13 September 1891, there was a great storm throughout southern *Spain*.<sup>94</sup>

On 13 September 1891, there were heavy rains and destructive inundations in *Spain*.<sup>90</sup>

On 20-21 September 1891, there were violent storms with loss of life in midland and northern *English counties*, and parts of *Scotland*.<sup>94</sup>

During October 1891, damaging drought prevailed in the southern and southwestern states, and in parts of New England and the middle and western states in the *United States*. Rivers and streams in the south-central valleys and the Southern States were very low. On the Tennessee, Red, and Chattahoochee rivers traffic was practically suspended, and navigation on the Ohio and Mississippi rivers was rendered difficult on account of low water. At Augusta, Maine on the 5<sup>th</sup>, the Kennebec River was lower than at any time during the previous 38 years.<sup>135</sup>

On October 5<sup>th</sup> and 6<sup>th</sup>, a cyclonic area developed west of the *British Isles*, and on the 6<sup>th</sup>, destructive gales prevailed over Ireland and along the west and south coasts of Great Britain. Under the influence of the Iceland area of low pressure, which had apparently assumed a position more to the eastward than usual, and of areas of low pressure, which advanced from the ocean, stormy weather continued over the British Isles until the 23<sup>rd</sup>. On the 13<sup>th</sup> and 14<sup>th</sup> immense damage was caused to coast and inland property in England, Ireland, and the south of Scotland, and gales of destructive violence continued during the 15<sup>th</sup> and 16<sup>th</sup>.<sup>135</sup>

On 13-15 October 1891, there was a violent cyclone over the *British Isles*. This storm caused much destruction of houses, shipping, and trees and a moderate loss of life.<sup>94</sup>

About 22 October 1891, there were disastrous floods in *Spain, France, Italy, and England* (especially in the south and west of *England*).<sup>90</sup>

About 25 October 1891, floods at Limoux in southwestern *France* caused the collapse of buildings and about 20 persons killed.<sup>90</sup>

On 2 November 1891, there was a destructive cyclone in the *Bay of Bengal*, with loss of life.<sup>94</sup>

Beginning on the night of the 10<sup>th</sup> of November and continuing into 11 November 1891, there was a destructive gale in England, especially on the south and west coasts. There were many [ship] wrecks, with loss of life, off Sandgate, Dover, Folkestone, St. Leonards, and Brighton. Telegraphic communication was greatly suspended.<sup>94</sup>

On 11 November 1891, there was great damage from a gale at Boulogne, Paris, Le Havre, Roubaix, and Rouen in *France*; and Bilbao and Madrid in *Spain*.<sup>94</sup>

On 11 November 1891, there was a violent gale at Liverpool, *England* and on the *Irish coasts*, with loss of life.<sup>94</sup>

On 23 November 1891, storms of exceptional severity occurred over the Middle Atlantic states and the lower lake region in the *United States*, resulting in loss of life and destruction of property.<sup>135</sup>

In November 1891, there were great floods in Somersetshire, *England*, which caused the destruction of buildings and crops. Travel was impeded and there was much distress.<sup>90</sup>

On 7-11 December 1891, there were violent gales in the *English Channel* causing [ship] wrecks and loss of life.<sup>94</sup>

On 8-9 December 1891, there were violent gales, which caused [ship] wrecks and loss of life in the *English Channel* and *France*.<sup>94</sup>

On 10-13 December 1891, there were violent gales over northwestern *Europe* and the *British Isles*.<sup>94</sup>

In 1891 in *Australia*, the Murrumbidgee River overflowed its banks.<sup>101</sup>

In 1891, a drought engulfed Kansu (now Gansu province) in northwest *China* at Ching-ning and Ho-shui.<sup>153</sup>

*Also refer to the section 1889 A.D. – 1892 A.D. for information on the famine in India, Russia, Japan, Hungary and Montenegro during that timeframe.*

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

---

**Winter of 1891 / 1892 A.D.** On 19 January 1892 in Sioux City, Iowa, in the *United States*, the low temperature was -28° F (-33.3° C).<sup>111</sup>

A "pogonip" [a storm of rare long prism diamond dust ice crystals] struck Winnemucca, Nevada in the *United States* in January 1892, and lasted from the 22<sup>nd</sup> to the 25<sup>th</sup>, and deposited a coating of ice needles to a depth of two inches upon trees, bushes, fences, buildings, men, and cattle. "Pogonip" is an Indian word, applied to a mist of ice crystals or frozen fog particles that occurs most frequently in the southeastern part of White Pine County, Nevada. In Virginia City an observer, looking down into the layer of mist stated that:<sup>116</sup>

It came suddenly; appeared in its greatest beauty on the morning of January 22; filled up the valleys and rolled up the mountain sides, leaving the tops of the largest hills like islands and rocky headlands; its waves tumbled over each other and rolled over its shores; late in the afternoon its surface was much agitated by some unknown impulse causing its great waves to roll to the westward; they took on a yellow hue, where they tumbled over the eastern mountain rim of the city; Sugar Loaf Mountain became a cone-shaped island, with falls on each side of it. The

canyons were slowly filled and the vapor surged up the sides of Mount Davidson, partly covering the city, and causing intense cold where there had been sunshine and warmth before. It soon receded to its first situation, where it remained until broken up after four days of beautiful existence.

Heavy storms of snow, sleet, and rain swept over the Southwestern and Southern States in the *United States* on 15-17 March 1892. In Oklahoma and Indian territories and Texas the loss of cattle was very great, and early corn and oats were killed and damaged. Snow fell in northern Louisiana. The storm struck Arkansas on the 16<sup>th</sup> and Mississippi on the 17<sup>th</sup>. It prevailed over Tennessee and central and southern Kentucky during the 16<sup>th</sup> and 17<sup>th</sup> as a heavy snowstorm, the depth of snowfall in central and southwest Tennessee, 7 to 25 inches, being the greatest on record for this area. (This snow was beneficial, as it protected wheat, oats, and clover from the severe cold of that period.) At Lexington, Kentucky, the average depth of snowfall was about 7 inches, and in places the snow drifted to a depth of 4 feet. The snowstorm extended over the Ohio Valley on the 16<sup>th</sup> and 17<sup>th</sup> and reached New England on the 18<sup>th</sup>. From the 17<sup>th</sup> to 19<sup>th</sup> low temperature and frost seriously injured crops and early vegetation from the southeastern slope of the Rocky Mountains over the Gulf and south Atlantic states and the northern half of the Florida Peninsula. Over a great part of the Ohio Valley the snowfall was insufficient to afford protection to grain.<sup>136</sup>

During the winter of 1891-92 in Bradford County, Pennsylvania in the *United States*, most of December was very mild. There was good sleighing the first week in January but then there was rain. Sleighing resumed again after January 18<sup>th</sup> when it again turned cold, the temperature fell to -7° F [-22° C] on the 20<sup>th</sup>. It was very cold on 2 & 3 February. In some places, the temperature dropped to -14° F [-26° C]. A big snowfall, two feet [0.6 m] deep, fell from February 29 to March 2 and snowdrifts were numerous on the hill roads until the first of April. March produced significant snowfalls and good sleighing. April was cold and windy. Spring was late and people were unable to plant their gardens until the middle of May.<sup>178</sup>

---

### 1892 A.D.

There were disastrous floods in Andalusia, Murcia, and Estremadura in *Spain*, about 12 March 1892.<sup>90</sup> [Andalusia and Murcia are located in southern *Spain*. Estremadura is in west-central *Spain*.]

In 1892, there was a famine in Bombay [now Mumbai in the west coast of *India*] and Rajputana [now the state of Rajasthan in northwest *India*].<sup>94</sup>

Disastrous floods in upper *Italy* about 31 March 1892; railway communications stopped.<sup>90</sup>

On 31 March 1892, there was a destructive tornado in the northwestern *United States*. Over 30 persons were killed.<sup>94</sup>

On 31 March 1892, heavy gales and destructive tornadoes and thunderstorms struck Nebraska, Kansas, Oklahoma and Indian territories, Texas, Missouri, and Iowa in the *United States*. In Kansas, 34 lives were lost, and property to the estimated value of about \$150,000 was destroyed. [In present currency, that would be equivalent to \$3.6 million in damages based on the Consumer Price Index (CPI) inflation rates.] In Texas two lives were lost.<sup>136</sup>

— At Nelson, Nebraska, a tornado, about ¼ mile wide, struck the town. Five persons were injured, and considerable damage was caused to buildings.

— A tornado moved across Adgar [Edgar], Nebraska injuring several persons.

— At Smolan, Kansas, a tornado about 1,300 feet wide moved through the area. The storm destroyed property estimated at \$4,000 [Approximately \$100,000 in today's dollars].

— A tornado visited Oak Hill, Kansas. Following its passage, 2 children were killed and 12 buildings valued at \$6,000 were destroyed.

- At Towanda, Kansas, a tornado cut a path about ¼ mile wide, killing 8 persons, and destroying buildings valued at \$15,000 [\$360,000 in today's dollars].
- At Strong City, Kansas, a tornado killed 4 persons and caused property damage estimated at \$10,000.
- At Kiowa, Kansas, a heavy thunderstorm began 8.30 p.m. and continued until after midnight, damaging property to the extent of about \$15,000.
- A tornado about ¼ mile wide struck Wellington, Kansas. Six persons were killed.
- One person was killed at Liberty, Kansas.
- Near Salina, Kansas, a tornado with a clearly defined funnel-shaped cloud caused property damage estimated at \$100,000 [\$2.4 million in today's dollars].
- At Vine Creek, Kansas, a destructive storm caused the death of one person.
- About midnight a tornado about 700-foot wide struck Wamego, Kansas, destroying everything in a path and killing 5 persons.
- A tornado moved across Florence, Kansas in a path 150-foot wide, killing 2 persons.
- A tornado, approximately 700 feet wide, moved through Rose Hill, Kansas, killing one person; then South Haven killing another person; and then struck Augusta, where it killed 3 more people.
- A tornado passed through Bangs, Texas, cutting a path about one-half mile in width. One person was killed, and the damage to property in the county was about \$10,000.
- A tornado passed through Santa Anna, Texas. The storm first appeared like a column of smoke, then assumed a funnel shape, and struck the outskirts of the town, destroying a number of buildings. One person was killed and 13 were injured. A second tornado passed along a parallel track about the same time, destroying a number of buildings, and injuring several persons.

On 1 April 1892, a storm moved through the central *United States* causing major wind damage. High winds and local storms prevailed from Kansas, Nebraska, and Texas to the western lake region.<sup>136</sup>

- At Valentine, Nebraska, a violent windstorm, with velocity 40 to 58 miles per hour, continued 24 hours, unroofing houses, etc.
- At Lawrence, Kansas, the wind maintained a velocity of 70 to 79 miles per hour for 5 hours with a peak of 90 miles per hour.
- The estimated damage caused by high wind at Leavenworth, Kansas was \$50,000 [\$1.2 million in today's currency].
- A tornado moved over the west part of Harvey County, Kansas, destroying one house and prostrating a large number of trees.
- High wind destroyed small buildings at Wakefield, Shields, Seneca, and Manhattan, Kansas.
- At Kansas City, Missouri, a destructive gale injured 6 persons, one seriously, and property was destroyed to the value of about \$15,000.
- At Warrensburg [Warrensburg], Missouri, a church was blown down and other buildings were damaged.
- At Des Moines, Iowa, the winds reached an extreme velocity of 100 miles per hour, which was the highest ever noted at that station.
- At Chicago, Illinois, the wind reached a velocity of 54 miles per hour. Several buildings were blown down; a 7-story building was blown upon a 2-story tenement, killing at least 6 persons, and injuring many others. The estimated loss to property by the storm was \$40,000 [\$1 million in today's currency].
- At Hinesborough [Hindsboro], Illinois, two tornadoes struck the city; one person was injured and the damage to property was placed at \$2,000.

About 13 April 1892, there were destructive floods on the Mississippi River in the *United States*. There was a great loss of life. The flood resulted in around 250 lives lost. About 1,500 square miles [3,885 square kilometers] of land were covered by floodwaters near St. Louis. The estimated loss was 11 million dollars. [In present currency, that would be equivalent to \$263 million in damages based on the Consumer Price Index (CPI) inflation rates.] The floods abated around 25 May 1892.<sup>97</sup>

In April 1892, floods in the Tennessee River and tributaries caused great damage in Tennessee and northern Alabama in the *United States*. The Yallobusha River [Yalobusha River] was reported the highest ever known at Grenada, Mississippi. High water caused great damage in northern Mississippi. Large areas were submerged in Alabama by the overflow of the Coosa River. In east-central Mississippi great

destruction to life and property resulted from the overflow of the Tombigbee River and tributaries. The flooding drowned about 100 people and carried away much livestock.<sup>136</sup>

On 29 April 1892, there was a disastrous hurricane in *Mauritius* Island.<sup>94</sup>

On 29 April 1892, a hurricane struck *Mauritius*, an island nation in the Indian Ocean, killing 150 persons.<sup>197</sup>

Several regions of the *United States* were suffering from a drought during April 1892. In Florida the month was exceptionally dry. Oranges and small fruits were greatly damaged, and the oat crop was reported a complete failure. A very severe drought prevailed in southern and extreme western Texas. Corn and cottonseed failed to germinate, garden vegetables were a failure, and the outlook for wheat and oats was poor. Owing to absence of grass and water, a great loss of livestock occurred. Continued dry weather and hot winds, with heavy dust storms, severely injured vegetation about Fort Stanton, New Mexico. Grass on the ranges was backward and a great loss of livestock was reported. The month was very dry generally over Oklahoma Territory.<sup>136</sup>

About 6 May 1892, floods caused a rise of the rivers in Illinois in the *United States*; 15 towns flooded.<sup>90</sup>

In May 1892 destructive floods occurred in the middle and lower Mississippi River and tributaries in the *United States*. The most important Mississippi levees held firm. About 60,000 acres of cultivated land in the American Bottom, opposite Saint Louis, Missouri were submerged when the Mississippi River rose to 36 feet. Water from crevasses inundated plantations in various parts of Louisiana. The Missouri River flooded low-lying parts of Kansas City, Missouri. Great devastation by floods was reported along the Illinois River. On the 18<sup>th</sup>, a flood in the Floyd Valley, Iowa, resulted in the loss of about 20 lives and the destruction of property estimated at \$1 million. [In present currency, that would be equivalent to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.] One thousand families were rendered homeless; 3,000 people were reported destitute; 167 buildings were swept away and 700 were rendered unlivable. The Arkansas River reached the highest stage ever known at Fort Smith, Arkansas (30.9 feet) and overflowed about 10,000 acres of cultivated land. At Little Rock, Arkansas, the stage of water (27.9 feet) was the highest reached since 1844, and the plantations above and below Little Rock were reported underwater. The flooding near Little Rock caused an estimated \$200,000 damage [\$5 million in today's dollars]. Destructive floods occurred along the Red River in Texas and Louisiana. At Shreveport, Louisiana, the river reached the highest stage ever noted at that port, and large areas in Bossier Parish were submerged.<sup>136</sup>

On 26 May 1892, seven months of drought in New South Wales, *Australia* was relieved by rain.<sup>97</sup>

On 27 May 1892, a tornado struck Wellington, Kansas in the *United States*. Twelve persons were killed and property damage was estimated at \$200,000 [\$5 million in today's currency].<sup>136</sup>

On 9-11 June 1892, a hurricane struck *Cuba*. There were 16 deaths in Matanzas and large number in its vicinity. There was 1 death in Havana.<sup>141</sup>

On 14 June 1892, a heavy thunderstorm rolled through Greenfield, Massachusetts in the *United States*. Hailstones 2 to 2½ inches in diameter fell for 3 minutes; 8 persons were killed and property damage was estimated at \$15,000 [\$360,000 in today's dollars].<sup>136</sup>

On 15 June 1892, heavy thunderstorms and tornadoes moved through Minnesota in the *United States* causing destruction and loss of life. Approximately 29 lives were lost and damage exceeded \$133,000.

[In present currency, that would be equivalent to \$3.2 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>136</sup>

- A tornado struck 5 miles south of New Richland, Minnesota. The storm path was about 40 rods [660 feet] in width. Two persons were killed, and 20 buildings were destroyed.
- At Spring Valley, Minnesota, an unusually severe rain and thunderstorm damaged 2 buildings, which were struck by lightning, and caused about \$50,000 of flood damage [\$1.2 million in today's dollars].
- At Linden, Minnesota, lightning killed one person.
- At Easton, Minnesota, a destructive storm cut a path one-eighth to one-fourth mile in width; 14 persons were reported killed, and property damage was estimated at \$15,000.
- Near Minnesota Lake, Minnesota, a tornado cut a ¼ mile path moved through the area. Heavy timbers were carried 2 and 3 miles; debris was thrown in all directions; 4 persons were killed, and the damage to property was estimated at \$16,000.
- Near Winnebago City, Minnesota, a destructive storm with large hail destroyed several buildings.
- At Wells, Minnesota, a tornado cut a 300-500 foot path through buildings and trees; 2 persons were killed, and the damage to property was about \$20,000.
- Near Fairmount, Minnesota, a tornado cut a path about 10 rods in width. Two persons were killed, and the damage to property in Martin County was placed at \$20,000.
- A heavy thunderstorm moved through Albert Lea, Minnesota; 2 persons were killed.
- At Hartland, Minnesota, a thunderstorm, with hail and heavy rain struck; one person was killed, houses and trees were destroyed.
- At Freeborn, Minnesota, a tornado with hail, heavy rain, and sharp lightning, cut a ¼ mile path; one person was killed, and the damage to buildings was estimated at \$10,000.
- Near Blooming Prairie, Minnesota, a tornado cut a 300-foot path; several persons were injured, and heavy articles were carried long distances.
- At Saint Paul, Minnesota, 1.00 inch of rain fell in 10 minutes.
- At Nashville Center, Minn., a thunderstorm, with funnel-shaped cloud, caused damage to the extent of \$2,000 to \$3,000.

On 15-16, June 1892, there were destructive storms in Minnesota in the *United States* and in *Canada*, which caused great loss of life.<sup>94</sup>

On 26 June 1892, a destructive storm struck Bunceton, Missouri in the *United States*. Large hail fell. Damage to crops and property was estimated at over \$200,000 [\$5 million in today's dollars].<sup>136</sup>

July 1892 was noted as a period of persistent and exceptionally high temperatures in the *United States*. From the 18<sup>th</sup> to the 24<sup>th</sup> the daily maximum temperature in Kansas and Nebraska was 100° F or above. In the Atlantic coast and Southern States the period of greatest heat extended from the 24<sup>th</sup> to the 28<sup>th</sup>. At Philadelphia, Pennsylvania, a maximum temperature of 101° F was recorded on the 26<sup>th</sup>, and 99° F was the maximum reading at Baltimore, Maryland, and Washington D.C. On the 27<sup>th</sup> the temperature reached 100° F at Lynchburg, Virginia. These temperatures were the highest ever recorded at the respective stations for the previous third decade for the month of July.<sup>136</sup>

The following were the highest temperatures observed during July 1892 in the *United States*:<sup>136</sup>

Montgomery, Alabama	( 95° F, 35.0° C)
Mobile, Alabama	( 93° F, 33.9° C)
Tucson, Arizona	(106° F, 41.1° C)
Yuma, Arizona	(112° F, 44.4° C)
Little Rock, Arkansas	( 95° F, 35.0° C)
Fort Smith, Arkansas	( 99° F, 37.2° C)
San Francisco, California	( 90° F, 32.2° C)
San Diego, California	( 75° F, 23.9° C)
Fresno, California	(110° F, 43.3° C)
Denver, Colorado	( 97° F, 36.1° C)
Pueblo, Colorado	(100° F, 37.8° C)

New Haven, Connecticut	( 96° F, 35.6° C)
New London, Connecticut	( 92° F, 33.3° C)
Kirkwood, Delaware	(102° F, 38.9° C)
Washington, D.C.	( 99° F, 37.2° C)
Pensacola, Florida	( 92° F, 33.3° C)
Key West, Florida	( 88° F, 31.1° C)
Augusta, Georgia	( 97° F, 36.1° C)
Savannah, Georgia	( 97° F, 36.1° C)
Ruthburg, Idaho	(101° F, 38.3° C)
Boise Barracks, Idaho	(109° F, 42.8° C)
Chicago, Illinois	( 94° F, 34.4° C)
Cairo, Illinois	( 94° F, 34.4° C)
Indianapolis, Indiana	( 97° F, 36.1° C)
Vevay, Indiana	(100° F, 37.8° C)
Dubuque, Iowa	( 95° F, 35.0° C)
Keokuk, Iowa	( 94° F, 34.4° C)
Topeka, Kansas	(100° F, 37.8° C)
Dodge City, Kansas	(102° F, 38.9° C)
McAllaster, Kansas	(110° F, 43.3° C)
Louisville, Kentucky	( 98° F, 36.7° C)
Lexington, Kentucky	( 97° F, 36.1° C)
New Orleans, Louisiana	( 93° F, 33.9° C)
Shreveport, Louisiana	( 97° F, 36.1° C)
Eastport, Maine	( 88° F, 31.1° C)
Portland, Maine	( 90° F, 32.2° C)
Baltimore, Maryland	( 99° F, 37.2° C)
Boston, Massachusetts	( 96° F, 35.6° C)
Nantucket, Massachusetts	( 87° F, 30.6° C)
Marquette, Michigan	( 92° F, 33.3° C)
Detroit, Michigan	( 96° F, 35.6° C)
Saint Vincent, Minnesota	( 88° F, 31.1° C)
Saint Paul, Minnesota	( 90° F, 32.2° C)
Vicksburg, Mississippi	( 95° F, 35.0° C)
Saint Louis, Missouri	( 96° F, 35.6° C)
Fort Keogh, Montana	(107° F, 41.7° C)
Camp Poplar River, Montana	(102° F, 38.9° C)
Theford, Nebraska	(113° F, 45.0° C)
North Platte, Nebraska	(102° F, 38.9° C)
Omaha, Nebraska	(100° F, 37.8° C)
Winnemucca, Nevada	( 96° F, 35.6° C)
Carson City, Nevada	( 90° F, 32.2° C)
West Milan, New Hampshire	( 90° F, 32.2° C)
New Brunswick, New Jersey	( 99° F, 37.2° C)
Camden, New Jersey	(105° F, 40.6° C)
Santa Fe, New Mexico	( 86° F, 30.0° C)
Albany, New York	( 95° F, 35.0° C)
New York City, New York	( 96° F, 35.6° C)
Charlotte, North Carolina	( 97° F, 36.1° C)
Chapel Hill, North Carolina	(103° F, 39.4° C)
Kitty Hawk, North Carolina	( 95° F, 35.0° C)
Bismarck, North Dakota	( 90° F, 32.2° C)
Medora, North Dakota	(108° F, 42.2° C)
Cincinnati, Ohio	( 98° F, 36.7° C)
Columbus, Ohio	( 97° F, 36.1° C)
Oklahoma City, Oklahoma	( 98° F, 36.7° C)
Fort Sill, Oklahoma	(104° F, 40.0° C)

Roseburg, Oregon	( 89° F, 31.7° C)
Portland, Oregon	( 88° F, 31.1° C)
Erie, Pennsylvania	( 90° F, 32.2° C)
Philadelphia, Pennsylvania	(101° F, 38.3° C)
Block Island, Rhode Island	( 88° F, 31.1° C)
Charleston, South Carolina	( 95° F, 35.0° C)
Columbia, South Carolina	(101° F, 38.3° C)
Yankton, South Dakota	(101° F, 38.3° C)
Nashville, Tennessee	( 96° F, 35.6° C)
Knoxville, Tennessee	( 95° F, 35.0° C)
San Antonio, Texas	( 97° F, 36.1° C)
Galveston, Texas	( 88° F, 31.1° C)
Salt Lake City, Utah	( 96° F, 35.6° C)
Burlington, Vermont	( 92° F, 33.3° C)
Lynchburg, Virginia	(100° F, 37.8° C)
Norfolk, Virginia	( 99° F, 37.2° C)
Olympia, Washington	( 86° F, 30.0° C)
Spokane, Washington	( 96° F, 35.6° C)
Charleston, West Virginia	( 98° F, 36.7° C)
Milwaukee, Wisconsin	( 95° F, 35.0° C)
La Crosse, Wisconsin	( 93° F, 33.9° C)
Cheyenne, Wyoming	( 93° F, 33.9° C)

The following were the highest temperatures observed during July 1892: <sup>136</sup>

Fort Francis, Ontario, <i>Canada</i>	( 92° F, 33.3° C)	
La Logia, <i>Mexico</i>	(100° F, 37.8° C)	
Leon de Aldamas, <i>Mexico</i>	( 87° F, 30.6° C)	(now León, Guanajuato)
Mazatlan, <i>Mexico</i>	( 90° F, 32.2° C)	
Mexico City, <i>Mexico</i>	( 79° F, 26.1° C)	
Puebla, <i>Mexico</i>	( 80° F, 26.7° C)	
Topolobampo, <i>Mexico</i>	( 96° F, 35.6° C)	
Vera Cruz, <i>Mexico</i>	( 89° F, 31.7° C)	
Hamilton, <i>Bermuda</i>	( 86° F, 30.0° C)	

On 6-8 July 1892 at Edwards, Mississippi in the *United States*, 16.7 inches of rain fell. <sup>116</sup>

On 26 July 1892, heavy rains at Minneapolis, Minnesota in the *United States*, flooded sewers and interrupted street traffic. In Saint Paul, Minnesota, the damage from heavy rains was estimated at \$250,000 [\$6 million in today's dollars]. <sup>136</sup>

On 4 August 1892, a severe wind and hailstorm passed through Burlington, North Towanda, Ulster, Sheshequin, Rome, Orwell and Pike in Bradford County, Pennsylvania in the *United States*, and did much damage to buildings, fences, tobacco and other crops. <sup>178</sup>

On 22 August 1892, a destructive cloudburst was reported at Roanoke, Virginia in the *United States*. One man was drowned. The streets were flooded to a depth of 3 to 5 feet. And the damage to property was estimated at \$100,000 [\$2.4 million in today's dollars]. <sup>136</sup>

On 30 August 1892, the Great Lakes in the *United States* encountered a severe gale. A schooner was capsized 14 miles north of Manistee, Michigan. The crew consisting of 8 persons was drowned and the vessel was a total loss. A large steamer was lost 60 miles west of Whitefish Point, Michigan. The passengers and crew, numbering 28 persons were, with one exception, drowned. Disasters were also reported at other points on the upper lakes. <sup>136</sup>

On 12 September 1892, there was a cyclone on the *Cape Verde Islands*. Houses, shipping, plantations, and cattle were destroyed.<sup>94</sup>

A "norther" [tropical storm] prevailed along the Mexican coast about Vera Cruz, *Mexico*, from 24-27 September 1892. The maximum wind velocity was reached on the 25<sup>th</sup>, when it continued with undiminished strength for 6 hours. It blew continually in whirls, carrying away roofs of small houses in the vicinity of Vera Cruz, *Mexico*, dashed the American brig *Bazanes* upon the coast, interrupted telegraphic communication, and caused serious damage to the Mexican Railroad. In the southern part of the state of Vera Cruz, even on the frontier, including Oaxaca, the storm was terrible in character and disastrous in its effects, and lightning was an attendant phenomenon. In that section, 5 brick and more than 200 wooden houses were thrown down, a large number of cattle were killed, crops were ruined, trees were uprooted in great numbers, and, what was still worse, many persons were killed and many others were injured. At Pachuca and to the north of Vera Cruz the storm was very severe.<sup>136</sup>

In the Atlantic coast states from New England to Florida and in parts of the Ohio and upper Mississippi valleys and Tennessee, October 1892 was the driest October on record up to that time in the *United States*. In many localities, serious inconvenience and suffering were caused by the failure of cisterns, wells, and streams.<sup>136</sup>

On 13 October 1892, there were great floods in *Italy*. Near Genoa, bridges were destroyed and there were several deaths. Lake Como overflows its banks. On 15 October 1892, railway communication between Rome and Genoa stopped.<sup>97</sup> [Genoa is located along the coast of northwestern *Italy*. Lake Como is inland in northern *Italy*.]

On 13-15 October 1892, there were great floods through heavy rains in northeastern Yorkshire in *England*. There was much damage in York, Leeds, and other places; several persons, and cattle and sheep drowned.<sup>97</sup>

On 13 October 1892, there were destructive floods in Derbyshire, *England* and *Wales*.<sup>97</sup>

Heavy gales prevailed over the Great Lakes in the *United States* during 28-29 October 1892. About 40 vessels were wrecked or damaged, and much damage was caused in the interior. At Milwaukee, Wisconsin, fire driven by high storm winds destroyed property estimated at \$5 million [\$120 million in today's dollars] on the 28<sup>th</sup>. A schooner was wrecked 9 miles south of Manistee, Michigan. At Alpena, Michigan, a number of wrecks were reported. During the 29<sup>th</sup>, a schooner was wrecked near Muskegon, Michigan, and the captain was drowned. The wind lowered the water in the river at Detroit 4 feet and the water in Lake Saint Clair was lowered 2 feet. At Sandusky, Ohio, the gale lowered the water in the bay 5 feet, grounding several vessels. At Cleveland, Ohio, the wind reached a velocity of 60 miles per hour on the 29<sup>th</sup>; 3 steamers, 5 barges, and 2 schooners went ashore in the harbor.<sup>136</sup>

In October 1892, there were disastrous floods in the island of Sardinia, *Italy* and *Venezuela*.<sup>97</sup>

Around 7 November 1892, there was a great storm in the *Black Sea*. Eight ships said to have been wrecked, including the *Lord Byron*.<sup>94</sup>

On 17 November 1892, a well-defined tornado visited Red Bud, Illinois in the *United States*, killing 2 persons, injuring 7, and destroying 82 buildings.<sup>136</sup>

In December 1892, a destructive storm struck the *Black Sea*. The loss of 30 steamers was reported, including the *City of Manchester*.<sup>94</sup>

In 1892 during the period between 24 June and 23 July, floods struck Hopei (now Hebei province) in northern *China* at Nan-yüeh and Kansu (now Gansu province) in northwest *China* at Lin-t'an. Also during the same period (between 24 June and 23 July), a drought engulfed Chekiang (now Zhejiang province) on the east coast of *China* at Chin-hua and Kansu province at Lanchow, Ching-ning, Lin-t'an, T'ung-wei, and Ch'ing-yang.<sup>153</sup>

*Also refer to the section 1889 A.D. – 1892 A.D. for information on the famine in India, Russia, Japan, Hungary and Montenegro during that timeframe.*

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

---

**Winter of 1892 / 1893 A.D.** At Red Wing, Minnesota in the *United States*, the Mississippi River froze over on the 10 December 1892. On the 19<sup>th</sup>, teams [horses, oxen, wagons] were crossing on the ice. At Davenport, Iowa, the Mississippi River was frozen over on the 23<sup>rd</sup> and by the 28<sup>th</sup>, teams were crossing on the ice. At Muscatine, Iowa, the Mississippi River was frozen over on the 22<sup>nd</sup>. At Saint Louis, Missouri, the Mississippi River was frozen and navigation closed on the 28<sup>th</sup>. At Santee Agency, Nebraska, the Missouri River was frozen over on December 11<sup>th</sup> and teams were crossing the ice on the 22<sup>nd</sup>. At Glasgow, Missouri, teams were reported crossing on the ice on the Missouri River on the 25<sup>th</sup>.<sup>136</sup>

During 20-25 December 1892, exceptionally severe storms prevailed over the Pacific coast states of the *United States*. Heavy snow prevailed over Washington from the 21<sup>st</sup> to the 23<sup>rd</sup>, causing damage to property and interrupting railroad traffic. At Tatoosh Island, Washington, a gale prevailed from the 21<sup>st</sup> to the 23<sup>rd</sup>, reaching a maximum velocity of 83 miles per hour. At Olympia, Washington, 2 feet of snow fell from the 20<sup>th</sup> to 22<sup>nd</sup>. At Port Angeles, Washington, the depth of snow exceeded one foot. At Portland, Oregon, about 2 feet of snow fell on the 22<sup>nd</sup> and 23<sup>rd</sup>, this was the heaviest snowfall on record up to that time.<sup>136</sup>

During the winter of 1892-93 in Bradford County, Pennsylvania in the *United States*, December was very mild until the last week when it turned cold. The temperature fell to -8° F [-22° C] on December 27<sup>th</sup>. There were some light snow squalls in December but no sleighing on the hills until the first week in January. Most of January was severe with good sleighing generally. On February 15<sup>th</sup>, it snowed all day without any breaks, but it turned warm on the 16<sup>th</sup> and the snow soon disappeared. The night of February 19<sup>th</sup> was one of terror. The wind blew a constant gale and the weather was intensely cold. There was good sleighing until about the middle of March when heavy rains fell. April was cold and boisterous with snow and hail on the 6<sup>th</sup>, thunderstorm on the 8<sup>th</sup> and a terrific windstorm on the 20<sup>th</sup>. Bluebirds appeared on March 13<sup>th</sup>. Nevertheless spring was very late and there were no planting gardens until the middle of May. On May 7<sup>th</sup> in many places, it froze ice.<sup>178</sup>

On 22-24 December 1892 at Upper Mattole, California in the *United States*, 16.93 inches of rain fell.<sup>116</sup>

The River Thames in London, *England* froze between Maidenhead and Windsor.<sup>29</sup>

There was a frost from 24 December 1892 to 8 January 1893. The frost was severe in *Britain* and the [*European*] Continent from 1-8 January 1893. Many deaths were reported.<sup>94</sup>

The *Baltic Sea* froze during the winter of 1892-93. (In modern times, the *Baltic Sea* also froze during the winters of 1939-40, 1941-42, and 1946-47.) [A partial freezing of the *Baltic Sea* occurred during the winter of 2009-10. This was the coldest winter of the XXI century and the *Baltic Sea* was frozen to the depth of 2/3 feet (20 centimeters) for the length of 10.6 miles (15 kilometers) from the beach line.]<sup>37, 68</sup>

During the winter of 1892-93, the *Baltic Sea* was completely covered with ice.<sup>68</sup>

The following are the lowest temperatures observed during January 1893 in the *United States*:<sup>117</sup>

Montgomery, Alabama	( 17° F, -8.3° C)
Mobile, Alabama	( 22° F, -5.6° C)
Tucson, Arizona	( 23° F, -5.0° C)
Yuma, Arizona	( 33° F, +0.6° C)
Little Rock, Arkansas	( 11° F, -11.7° C)
Fort Smith, Arkansas	( 6° F, -14.4° C)
San Francisco, California	( 36° F, +2.2° C)
San Diego, California	( 38° F, +3.3° C)
Denver, Colorado	( 13° F, -10.6° C)
Pueblo, Colorado	( 10° F, -12.2° C)
New Haven, Connecticut	( -3° F, -19.4° C)
New London, Connecticut	( -4° F, -20.0° C)
Millsboro, Delaware	(-17° F, -27.2° C)
Washington, D.C.	( -6° F, -21.1° C)
Pensacola, Florida	( 23° F, -5.0° C)

Olympia, Washington	( 6° F, -14.4° C)
Spokane, Washington	(-19° F, -28.3° C)
Morgantown, West Virginia	( -4° F, -20.0° C)
Milwaukee, Wisconsin	(-14° F, -25.6° C)
La Crosse, Wisconsin	(-26° F, -32.2° C)
Cheyenne, Wyoming	( 0° F, -17.8° C)

The following are the lowest temperatures observed during January 1893: <sup>117</sup>

Fort Francis, Ontario, <i>Canada</i>	(-38° F, -38.9° C)
St. John, Newfoundland, <i>Canada</i>	( -7° F, -21.7° C)
Leon de Aldamas, <i>Mexico</i>	(35° F, +1.7° C) (now León, Guanajuato)
Puebla, <i>Mexico</i>	(37° F, +2.8° C)
Topolobampo, <i>Mexico</i>	(48° F, +8.9° C)
Hamilton, <i>Bermuda</i>	(49° F, +9.4° C)

In the *United States* at Woods Hall and Nantucket, Massachusetts; Block Island, Rhode Island; New London and New Haven, Connecticut; New York City, Plattsburg Barracks, Rochester, and Buffalo, New York; Atlantic City, New Jersey, Philadelphia, Pittsburg, Erie, Dyberry, Grampian, and Wellsboro, Pennsylvania; Baltimore and Cumberland, Maryland; Washington, D. C.; Norfolk and Lynchburg, Virginia; Raleigh, Charlotte, Hatteras, Kitty Hawk, Wilmington, Southport, and Lenoir, North Carolina; Stateburg, South Carolina; Augusta and Savannah, Georgia; Jacksonville, Florida; Louisville, Kentucky; Parkersburg, West Virginia; Cincinnati, Columbus, Cleveland, and Toledo, Ohio; Indianapolis and Lafayette, Indiana; Springfield and Chicago, Illinois; and Davenport and Dubuque, Iowa, the mean

temperature for January 1893 was the lowest January mean temperature since observations began [by the Weather Bureau].<sup>117</sup>

Ice formed in rivers, lakes and harbors, and caused the closing of navigation at many locations in January 1893 in the *United States*:<sup>117</sup>

- \* At Portland, Maine, ice formed in the lower bay on the 14<sup>th</sup> for the first time since 1884.
- \* Great floes of ice interfered with navigation in *Boston Harbor* in Massachusetts from the 11<sup>th</sup> to the 13<sup>th</sup>.
- \* At Vineyard Haven, Massachusetts, the harbor was frozen on the 12<sup>th</sup>.
- \* At New London, Connecticut, the *Connecticut River* was frozen over on the 11<sup>th</sup>.
- \* Ice in the rivers and harbor at New York City interfered with navigation at intervals during the month.
- \* At Baltimore, Maryland, ice seriously interfered with navigation from the 17<sup>th</sup> to the 22<sup>nd</sup>.
- \* Heavy ice was encountered about the Delaware Breakwater, in the *Delaware River* and in the *Delaware Bay*.
- \* A report from Norfolk, Virginia, dated the 24<sup>th</sup>, stated that navigation in that vicinity had been stopped for two weeks, large steamers, only, being able to cut their way through.
- \* At New Brunswick, New Jersey, ice in the *Raritan River* was 14 inches in thickness on the 20<sup>th</sup>.
- \* At Penns Grove, New Jersey, the *Delaware River* was closed during the month, except the west channel, which was kept open by iceboats.
- \* Heavy ice interfered with navigation at Philadelphia, Pennsylvania, on the 12<sup>th</sup>.
- \* At Washington, D. C., navigation on the *Potomac River* was closed by ice from the 16<sup>th</sup> to the 28<sup>th</sup>. During the cold spell which began December 20, 1892, and continued with little interruption until about January 23, 1893, the mean temperature was 21.2° F, and ice formed on the *Potomac River* to a thickness of 13.5 inches at a point in mid-stream about one half mile above the Aqueduct bridge.
- \* At Clarksville, Virginia, the *Roanoke River* was frozen from the 8<sup>th</sup> to the 26<sup>th</sup>.
- \* At Richmond, Virginia, the *James River* was frozen from the 7<sup>th</sup> to the 26<sup>th</sup>.
- \* At Kitty Hawk, North Carolina, *Albemarle Sound and Bay* were frozen over from the 3<sup>rd</sup> to the 28<sup>th</sup>, suspending navigation.
- \* At Hatteras, North Carolina, navigation was suspended on account of heavy ice.
- \* At Tarboro, North Carolina, the *Tar River* was frozen over on the 19<sup>th</sup>; from the 20<sup>th</sup> to the 23<sup>rd</sup> persons were crossing on the ice.
- \* At Fayetteville, North Carolina, the *Cape Fear River* was frozen over on the 19<sup>th</sup>.
- \* At Cheraw, South Carolina, the *Pee Dee River* was frozen over from the 14<sup>th</sup> to the 26<sup>th</sup>.
- \* At Saint Stephens, South Carolina, floating ice was reported in the *Santee River*, on the 21<sup>st</sup> and 22<sup>nd</sup>.
- \* At Resaca, Georgia, the *Oostanaula River* was frozen over from the 14<sup>th</sup> to the 24<sup>th</sup>.
- \* At Rome, Georgia, the *Oostanaula River* was frozen on the 16<sup>th</sup> for the first time since January 1857. On the 23<sup>rd</sup> the ice was 4 inches thick and people were crossing the river on the ice.
- \* At Whitesburg, Georgia, the *Chattahoochee River* was frozen over from the 19<sup>th</sup> to the 21<sup>st</sup>.
- \* At Cordova, Alabama, floating ice was reported in the *Big Warrior River* on the 16<sup>th</sup>. On the 17<sup>th</sup> the river was partly frozen.
- \* At Wilsonville, Alabama, the *Coosa River* was frozen on the 20<sup>th</sup>.
- \* At Florence, Alabama, there was floating ice in the *Tennessee River* from the 11<sup>th</sup> to the 19<sup>th</sup>.
- \* At Charleston, West Virginia, floating ice was reported in the *Kanawha River* on the 1<sup>st</sup> and the river was closed to navigation on the 7<sup>th</sup>.
- \* At Freeport, Pennsylvania, the *Alleghany River* was closed on the 7<sup>th</sup>.
- \* In New York on the 17<sup>th</sup>, the south end of *Seneca Lake* was frozen over for the first time since 1885.
- \* At Greensboro, Pennsylvania; Morgantown and Fairmont, West Virginia, the *Monongahela River* was frozen during different periods of the month.
- \* At Pittsburg, Pennsylvania, the *Ohio River* was frozen from the 11<sup>th</sup> to the 25<sup>th</sup>.
- \* At Parkersburg, West Virginia, the *Ohio River* was frozen on the 1<sup>st</sup>.
- \* At Wheeling, West Virginia, the *Ohio River* was frozen in January.
- \* At New Cumberland, West Virginia, the *Ohio River* was frozen in January.
- \* At Cincinnati, Ohio, the *Ohio River* was frozen on the 6<sup>th</sup>. On the 8<sup>th</sup>, an ice gorge broke at 2 p.m. and the river was filled with a mass of grinding, crushing ice 4 to 10 feet in thickness, which caused great destruction to river property.
- \* At Shawnee Town, Ohio, the *Ohio River* was frozen from the 13<sup>th</sup> to 26<sup>th</sup>.
- \* At Maysville, Kentucky, teams crossed on the ice on the *Ohio River*.

- \* At Louisville, Kentucky, navigation on the *Ohio River* was nearly suspended on account of heavy ice from the 1<sup>st</sup> to the 6<sup>th</sup>. On the 7<sup>th</sup> the river was full of floating ice. On the 8<sup>th</sup> and 9<sup>th</sup>, the river above the city was gorged with ice. On the 10<sup>th</sup>, the gorge above city broke and caused considerable damage to a coal fleet anchored at Louisville.
- \* At Mount Vernon, Indiana, the *Ohio River* was closed on the 15<sup>th</sup>.
- \* At Louisa, Kentucky, navigation on the *Big Sandy River* was closed on the 1<sup>st</sup>.
- \* At Nashville, Tennessee, a thin ice covered the *Cumberland River* on the 13<sup>th</sup> for the first time since 1877. By the 16<sup>th</sup>, the ice was 2 to 3 inches thick on the river.
- \* At Knoxville, Tennessee, the *Tennessee River* was frozen over on the 16<sup>th</sup>.
- \* At Chattanooga, Tennessee, the *Tennessee River* was frozen from the 17<sup>th</sup> to the 22<sup>nd</sup>.
- \* At Paducah, Kentucky, the *Tennessee River* was frozen over on the 16<sup>th</sup>.
- \* At St. Louis, Missouri, the *Mississippi River* was closed for navigation on the 21<sup>st</sup>.
- \* At Cairo, Illinois, the *Mississippi River* was frozen from shore to shore on the 10<sup>th</sup>, and the *Ohio River* was full of floating ice.
- \* At Memphis, Tennessee, heavy floating ice was reported on the *Mississippi River* from the 12<sup>th</sup> to the 19<sup>th</sup>.
- \* At Helena, Arkansas, ice was reported in the *Mississippi River* on the 15<sup>th</sup>.
- \* On the 22<sup>nd</sup>, the ice in the bay at Erie, Pennsylvania was 17 to 18 inches in thickness.
- \* At Detroit, Michigan, the river was frozen over and people were crossing on the ice on the 10<sup>th</sup>. On the 23<sup>rd</sup> people and teams crossed on the ice from the mainland to many of the islands of the northwest part of *Lake Erie* for the first time in many years.
- \* At Saint Ignace, Michigan, an ice bridge formed to Mackinac Island.
- \* At Grand Haven, Michigan, the harbor was blocked by ice on the 17<sup>th</sup>.
- \* At Miles City, Montana, the *Yellowstone River* was frozen during the beginning of January.
- \* At the Dalles, Oregon, ice was reported in the *Columbia River* from the 1<sup>st</sup> to 3<sup>rd</sup>, and 16<sup>th</sup> to 31<sup>st</sup>.

From January 17<sup>th</sup> to the 19<sup>th</sup> in the *United States*, an exceptionally heavy snowstorm extended eastward over the Gulf and south Atlantic states. The depth of the snowfall in Southern States during 17-19 January: <sup>117</sup>

Raleigh, North Carolina	12.0 inches
Lillington, North Carolina	11.5 inches
Louisburg, North Carolina	12.0 inches
Pittsboro, North Carolina	12.0 inches
Greenville, South Carolina	8.5 inches
Anderson, South Carolina	9.0 inches
Longshore, South Carolina	8.0 inches
Atlanta, Georgia	9.5 inches
Lafayette, Georgia	10.0 inches
Athens, Georgia	10.0 inches
Adairsville, Georgia	11.0 inches
Dahlonega, Georgia	12.0 inches
Gillsville, Georgia	11.0 inches
Toccoa, Georgia	10.0 inches
Canton, Georgia	10.0 inches
Tuscumbia, Alabama	10.0 inches
Gadsden, Alabama	13.5 inches
Decatur, Alabama	10.0 inches
Florence, Alabama	10.5 inches
Fayette, Alabama	10.0 inches
University, Mississippi	11.0 inches
Okolona, Mississippi	10.0 inches
Clarksdale, Mississippi	10.0 inches
Pontotoc, Mississippi	12.0 inches
Corinth, Mississippi	10.0 inches
Little Rock, Arkansas	13.0 inches
Fort Smith, Arkansas	10.5 inches
Kirby, Arkansas	12.0 inches

Stuttgart, Arkansas	12.0 inches
Brinkley, Arkansas	11.0 inches
New Gascony, Arkansas	10.0 inches
Dallas, Arkansas	10.0 inches
Pine Bluff, Arkansas	11.0 inches
Conway, Arkansas	10.2 inches
Madding, Arkansas	11.0 inches

On 14-15 January 1893 at Fort Canby, Washington in the *United States*, powerful squalls struck. The winds on the 14<sup>th</sup>, reached an extreme velocity of 110 miles. The gale continued until about noon of the 15<sup>th</sup>, and reached an extreme velocity of 120 miles per hour at 2.20 a.m. Several houses were blown down, trees were uprooted and broken off, and telegraph lines were prostrated. At Tatoosh Island, Washington, the maximum wind velocity was 72 miles on the 14<sup>th</sup>, and 76 miles per hour on the 15<sup>th</sup>.<sup>117</sup>

In January 1893, a succession of severe cold waves visited the east Gulf and south Atlantic states in the *United States*. In Florida the severest frosts of the month were noted on the 7<sup>th</sup>, 14<sup>th</sup>, and 17<sup>th</sup>.<sup>117</sup>

— On the 7<sup>th</sup>, ripening strawberries, oranges, and some orange trees were frozen at Flatwood [today near Pine Meadows Conservation Area], 2 miles northeast of Eustis, Florida; frost was reported at Jupiter; ice 1/8 inch in thickness and frost were noted at Titusville; and tender vegetation about Tampa was injured by cold. Light frost killed tender vegetation about Jupiter on the 11<sup>th</sup> and 13<sup>th</sup>.

— On the 14<sup>th</sup>, orange trees were frozen at Flatwood, and heavy frost killed many plants about Jupiter; pineapples were not seriously damaged. At Titusville, heavy frost and ice ¼ inch in thickness formed; oranges on trees back from the river were reported frozen solid. At City Point, all tender vegetation and bananas and oranges exposed to the westerly wind were killed. Thin ice was reported at Fort Pierce, 92 miles south of Titusville. At Tampa, the temperature fell to 31° F without causing material damage to fruit.

— On the 17<sup>th</sup>, the temperature fell to 24° F at Jacksonville, the lowest temperature noted at that station since 4 January 1887. At Titusville a large number of young fish were reported killed by cold. About Jupiter, tender vegetation and pineapples in exposed places were injured, and damaging frost was reported to the southern extremity of the "**Everglades**." At Tampa, the minimum temperature, 29° F, was the lowest noted at that place since 1886, and oranges in exposed places were slightly injured. On the 19<sup>th</sup>, heavy frost injured tender vegetation about Galveston, Texas.

February 1893 was unusually cold over the greater part of the *United States*. On the 1<sup>st</sup>, weather stations in the Dakotas, Montana, and eastern Washington reported the lowest temperature on record for February. On that date a severe "norther" was attended by a fall in temperature of 40° F to 60° F in the Western and Southwestern States. The temperature fell 20° F to 30° F in one hour in northern Texas. In Montana, the cold of the first four days of February was unprecedented; at regular stations of the Weather Bureau the temperature ranged -28° F to -45° F; and along the line of the Great Northern Railroad in western Montana, temperature -50° F to -60° F was reported. A second severe cold wave overspread the West and Southwest on the 6<sup>th</sup>, with a fall in temperature of 40° F to 50° F from the middle Mississippi valley to Oklahoma. Frost was reported in the interior of Florida as far south as Jupiter on the 23<sup>rd</sup>, to the middle Gulf coast on the 8<sup>th</sup>, 13<sup>th</sup>, 20<sup>th</sup>, and 23<sup>rd</sup>, and near Corpus Christi and San Antonio, Texas, on February 8<sup>th</sup>.<sup>117</sup>

The following were the lowest temperatures observed during February 1893 in the *United States*:<sup>117</sup>

Camp Poplar River, Montana	( -54° F, -47.8° C)
Willow City, North Dakota	( -54° F, -47.8° C)
Forman, North Dakota	( -53° F, -47.2° C)
Martinsdale, Montana	( -52° F, -46.7° C)
Gallatin, North Dakota	( -52° F, -46.7° C)
Woodbridge, North Dakota	( -50° F, -45.6° C)
Lakota, North Dakota	( -50° F, -45.6° C)
Bottineau, North Dakota	( -49° F, -45.0° C)
Powder River, Montana	( -49° F, -45.0° C)

Power, North Dakota	( -48° F, -44.4° C)
Milton, North Dakota	( -48° F, -44.4° C)
Sykeston, North Dakota	( -47° F, -43.9° C)
Yule, North Dakota	( -47° F, -43.9° C)
Medora, North Dakota	( -47° F, -43.9° C)
Glendive, Montana	( -47° F, -43.9° C)
Ashley, North Dakota	( -46° F, -43.3° C)
Fort Logan, Montana	( -46° F, -43.3° C)
Fort Buford, North Dakota	( -46° F, -43.3° C)
Havre, Montana	( -45° F, -42.8° C)
Miles City, Montana	( -45° F, -42.8° C)
Reynolds, North Dakota	( -45° F, -42.8° C)
Crookston, Minnesota	( -45° F, -42.8° C)
Grafton, North Dakota	( -44° F, -42.2° C)
Grand Forks, North Dakota	( -44° F, -42.2° C)
Grand Rapids, North Dakota	( -44° F, -42.2° C)
Kelso, North Dakota	( -44° F, -42.2° C)
Napoleon, North Dakota	( -44° F, -42.2° C)
Wahpeton, North Dakota	( -44° F, -42.2° C)
Hogan, Montana	( -43° F, -41.7° C)
Ada, Minnesota	( -43° F, -41.7° C)
Pine River, Minnesota	( -43° F, -41.7° C)
Dickinson, North Dakota	( -43° F, -41.7° C)
Churchs Ferry, North Dakota	( -43° F, -41.7° C)
Fort Stevenson, North Dakota	( -43° F, -41.7° C)
Minto, North Dakota	( -43° F, -41.7° C)
Corbin, Montana	( -43° F, -41.7° C)
Great Falls, Montana	( -42° F, -41.1° C)
Choteau, Montana	( -42° F, -41.1° C)
Fort Keogh, Montana	( -42° F, -41.1° C)
Aberdeen, South Dakota	( -42° F, -41.1° C)
Bozeman, Montana	( -42° F, -41.1° C)
Webster, South Dakota	( -42° F, -41.1° C)
Long Prairie, Minnesota	( -42° F, -41.1° C)
Saint Vincent, Minnesota	( -42° F, -41.1° C)
Bismarck, North Dakota	( -41° F, -40.6° C)
Helena, Montana	( -41° F, -40.6° C)
Park Rapids, Minnesota	( -41° F, -40.6° C)
Ellendale, North Dakota	( -41° F, -40.6° C)
Fargo, North Dakota	( -41° F, -40.6° C)
Sandy Lake Dam, Minnesota	( -41° F, -40.6° C)
Ashcroft, South Dakota	( -40° F, -40.0° C)
Jamestown, North Dakota	( -40° F, -40.0° C)
Alexandria, Minnesota	( -40° F, -40.0° C)
Stofiel, Nevada	( -40° F, -40.0° C)
Lake Winnibigoshish, Minnesota	( -40° F, -40.0° C)
Britton, South Dakota	( -40° F, -40.0° C)
Mellette, South Dakota	( -40° F, -40.0° C)

On 22 February 1893, heavy snow fell in New England, New York, and Pennsylvania in the *United States*. In parts of Maine, snow drifted to a depth of 9 to 11 feet, blockading railroads. Along the coast high wind and snow delayed vessels, and a number of wrecks were reported. Heavy drifting snow delayed trains in New York and Pennsylvania. A schooner went ashore near Kitty Hawk, North Carolina.<sup>117</sup>

A severe cold wave overspread the Southwest in the *United States* on the 3 March 1893, and extended to the south Atlantic coast on the 4<sup>th</sup>, with a fall in temperature of 30° F to 40° F in the Gulf and south Atlantic States, freezing weather to Charleston, South Carolina; Montgomery, Alabama; and Meridian, Mississippi and the lowest temperature on record for March at points in Tennessee and Arkansas. The morning of the 5<sup>th</sup>, the temperature fell below the freezing point over the northern part of the Florida Peninsula, and reached 32° F at New Orleans, Louisiana.<sup>117</sup>

Over the period from 1892-1896 in Merzifon in north-central *Turkey*, the coldest temperature observed was -2.2° F (-19.0° C) on 10 February 1893 and the hottest temperature was 99.5° F (+37.5° C) on 6 August 1895.<sup>137</sup>

---

**1893 A.D.** From January 30 to February 18, 1893, three cyclones struck southeast Queensland and northern New South Wales in *Australia*. These storms caused flooding from Rockhampton to Grafton and as far inland as Toowoomba. Many people only survived by clinging to the roofs of their homes. The storm tossed three ships into Brisbane's Botanical Gardens. It swept away the Victoria Bridge. The cyclones took 11 lives and caused £1,000,000 damage. For Brisbane, this was the worst flood until 1974.<sup>101</sup>

On 1-15 February 1893, there were floods at Brisbane, Ipswich and Maryborough in Queensland, *Australia*. The 'Mooloolah rainfall event' was the highest recorded extreme rainfall – 67.5 inches (1715 millimeters) in 72 hrs. At Crohamhurst the rainfall was 35.7 inches (907mm) in 24 hrs. The heavy rainfall occurred when three tropical cyclones struck southeast Queensland and northern New South Wales in quick succession. The storm left a total of 35 people dead and approximately 300 injured and 5,000 homeless. Two major bridges collapsed in Brisbane - the Victoria, and the Indooroopilly Railway Bridge. [At Brisbane] over 600 houses were destroyed (150 washed away, many out to sea). Thousands of other homes were flooded and damaged. Approximately 128,500 acres (52,000 hectares) were flooded when the Brisbane River rose 10 feet (3 meters) or more above normal levels. The floods destroyed the suburb of Indooroopilly. Ipswich was also severely flooded. Three ships (the *Paluma*, the *Elamang* and the *Mary Evans*) moored near the Brisbane Botanic Gardens were swept away after being stranded by an earlier flood. Several of the 35 deaths occurred as houses were swept away and others as individuals tried to use boats in the torrent. Seven miners drowned when the Eclipse Colliery near Ipswich flooded. At Maryborough, the Mary River Bridge was washed away with 130 houses on 5 February and numerous others suffered the same fate at Gympie adding further to the number of homeless.<sup>99</sup>

On 5 February 1893 there were destructive floods in Queensland, *Australia*. And then on 9 March 1893, there were destructive floods in New South Wales, *Australia*.<sup>97</sup>

On 10 February 1893, a destructive gale caused loss of life, throughout the *United Kingdom*, the *English Channel*, and the *North Sea*.<sup>94</sup>

On 28 February 1893, there were floods in *Hungary*. On 14 August 1893, there were destructive floods in upper *Hungary*; more than 30 lives reported lost.<sup>97</sup>

On 4 March 1893, there were violent cyclones [tornadoes] in the *United States*, with great destruction of property and loss of life, especially in Mississippi and Georgia. Another cyclone, reported on 24 March 1893, struck in the Mississippi valley.<sup>94</sup>

On 3 March 1893 in the evening, severe local storms including thunder and hail storms and tornadoes occurred in the east Gulf States of the *United States*. The more destructive storms of this group visited Lauderdale and Clarke counties, in extreme east-central Mississippi, the adjoining counties of Sumter and

Choctaw, in Alabama, and Troup, Meriwether, Pike, and northern Upson counties, in extreme west-central Georgia.<sup>117</sup>

— At Toomsba, Mississippi, a funnel-shaped cloud moved eastward in a path 250 to 300 yards in width, attended by heavy thunder, vivid lightning, heavy rain, and small hail. Articles were carried up in the funnel, and property was destroyed to the estimated value of \$30,000 to \$40,000 [\$700,000 - \$950,000 in today's dollars].

— At Pachuta, Mississippi, a storm moved southeast in a path about 200 yards in width, with heavy rain, continuous vivid lightning, and some hail. One person was killed; trees were torn up by the roots or twisted off, and were piled in and to the right of the center of the path, and a number of buildings were torn to pieces. The value of property destroyed at Pachuta was placed at \$12,000 to \$15,000.

— A heavy thunder and hail storm moved northeast in a path  $\frac{1}{4}$  to  $\frac{1}{2}$  mile in width near Cuba, Alabama, killing one person and leveling timber.

— At Odessa, Georgia, 6 persons were killed, and only 3 houses were left standing.

— At Woodbury, Georgia, 2 persons were killed. At that place heavy rain, a straight wind, thunder, lightning, and hail were reported.

— At Greenville, Georgia, the path of destruction was about one quarter mile wide, and the storm was attended by incessant thunder and lightning, large hail, and heavy rain. At that point one person was killed and 74 buildings were wrecked; the aggregate value of property destroyed was placed at \$150,000 [\$3.6 million in today's dollars].

— At Molena, Georgia, a thunderstorm moved east in a path about  $\frac{1}{2}$  mile wide, killing one person and destroying property to the value of about \$7,000.

— At Piedmont, Georgia, a thunder, rain, and hail storm moved east with a whirling motion in a path  $\frac{3}{4}$  mile in width, killing 1 person, injuring 30, and destroying or damaging a large number of houses.

— One person was reported killed near Barnesville, Georgia.

— A violent storm passed through the southern edge of Forsyth, Georgia, destroying about 20 houses. The storm was attended by very brilliant, incessant lightning.

— A violent, whirling storm, with thunder, lightning, and heavy rain moved east at The Rock, Georgia, in a path  $\frac{1}{2}$  to  $\frac{3}{4}$  miles in width. A number of persons were reported killed, and many were injured. Within a distance of 6 miles, 75 to 100 houses, mostly outbuildings were destroyed, and many large trees were broken off 10 to 12 feet above the ground.

On 9-11 March 1893, there were floods caused by the rising of the Hunter River. Newcastle, *Australia* and other places submerged.<sup>97</sup>

A hurricane was reported on 20 March 1893 over *New Caledonia* and the *New Hebrides* islands. There was great damage to property and loss of 18 lives.<sup>94</sup> [New Caledonia is located in the southwest Pacific Ocean. The New Hebrides islands is an island group in the South Pacific that now forms the nation of Vanuatu.]

On 23 March 1893, severe storms occurred in the evening from Arkansas, northern Louisiana, and northern Mississippi, over western Kentucky and southern and central Indiana in the *United States*. Nineteen persons were killed. The total damage was estimated at \$730,000. [In present currency, that would be equivalent to \$17.5 million based on the Consumer Price Index (CPI) inflation rates.]<sup>117</sup>

— A tornado struck Oklahoma City, Oklahoma causing \$15,000 in damages.

— At Crawfordsville, Arkansas, a severe storm, with thunder, lightning, and rain, moved northeast in a path  $\frac{1}{4}$  to  $\frac{1}{2}$  mile in width, destroying and damaging buildings to the extent of about \$10,000.

— A destructive storm moved through a sparsely settled district between Mangham and Archibald, Louisiana, seven persons were reported killed, and a number of buildings were destroyed. The damage was estimated at \$25,000.

— A storm moved through a thinly settled district,  $1\frac{1}{2}$  mile north of Shubuta, Mississippi with heavy rain and vivid lightning, killing 3 persons and fatally injuring one. Prostrated trees showed a right to left whirling motion.

— A thunder and hail storm moved over Kelly, Mississippi, the path of destruction was  $\frac{1}{4}$  mile in width; 3 or 4 people were reported killed, and the loss of property in that section was placed at \$150,000 [\$3.6 million in today's dollars].

— A tornado struck Olive Branch, Mississippi causing \$150,000 in damages [\$3.6 million in today's dollars].

— A storm struck Vossburg, Mississippi causing several deaths.

- In the northern portion of Nashville, Tennessee, 15 to 20 buildings were demolished, one person was killed, and many were injured.
- A severe thunder and rain storm passed northeast over Murray, Kentucky. An infant was injured, and property to the estimated value of \$30,000 was destroyed. A small, dark, smoky-looking column [tornado] attended the passage of the storm at Murray.
- At Henderson, Kentucky, a thunder, rain, and hail storm moved northeast in a path about 200 yards in width damaging property to the estimated value of \$75,000 [\$1.8 million in today's dollars].
- A thunder and rain storm, with hail, passed over Bowling Green, Kentucky, damaging buildings to the extent of about \$20,000.
- A thunder and hail storm moved over Rowland, Kentucky, in a path about 300 feet in width, destroying property to the value of \$10,000.
- At Hopkinsville, Kentucky, the storm caused \$50,000 in damages.
- At Pembroke, Kentucky, the storm caused \$50,000 in damages.
- A destructive storm moved in a northerly direction over Chandler, Indiana, with heavy thunder, lightning, rain, and hail. The storm apparently had two paths, one west and the other east of Chandler. Within 4 miles of that place 2 persons were injured, one fatally, and one church, 4 residences, and 10 barns were destroyed. The damage was estimated at \$70,000.
- A thunderstorm, with heavy rain and small hail, moved northeast over Bedford, Indiana, destroying and damaging buildings to the extent of \$30,000 to \$50,000.
- A thunderstorm passed northeast over McCordsville, Indiana, within a radius of 15 miles property was damaged to the estimated value of \$10,000.
- At Brooklyn, Indiana, the loss to property was estimated at \$5,000.
- A thunder and rain storm moved over Alexandria, Indiana, one person was killed, and a building was damaged to the extent of \$3,000.
- The storm was destructive in the northwest suburbs of Indianapolis, Indiana, where a squall of wind from the southwest wrecked a number of frail buildings, damaged others, and broke or uprooted 30 to 40 trees in a path about 250 yards in width. The storm caused \$6,000 in damages.

On 7 April 1893, hotels and other buildings destroyed by a great wave [from Lake Michigan] in Chicago, Illinois in the *United States*.<sup>97</sup>

On 11 April 1893 there were destructive cyclones [tornadoes] in Iowa, Illinois, Indiana, Nebraska, Kansas, and Missouri in the *United States* causing many deaths. On 25-28 April 1893, there were cyclones [tornadoes] in Illinois, Texas, and Oklahoma.<sup>94</sup>

April 1893 was marked by exceptionally destructive tornadoes and thunderstorms in the Western and Southwestern States of the *United States*. One hundred and fourteen lives were known to have been lost, and property to the estimated value of over \$1,000,000 was destroyed. [In present currency, that would be equivalent to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.] The first group of storms visited Missouri, Iowa, and the lower Ohio Valley on the 11<sup>th</sup>, and extended over southern Lower Michigan during the 12<sup>th</sup>. On those dates, 38 persons were reported killed, and the property loss was placed at over \$500,000. The tornadoes that visited Oklahoma and northeastern Texas on the 25<sup>th</sup> caused the loss of 34 lives, of which number 30 were credited to Cleveland County, Oklahoma. During the morning of the 28<sup>th</sup>, Cisco, Texas was struck by a tornado, in which 22 lives were lost and property to the value of \$400,000 was destroyed.<sup>117</sup>

On 7 April 1893:

- At Romeoville, Illinois, a destructive storm, with rain and hail, moved northeast in a path about 40 rods (660 feet) wide; 9 persons were reported killed and the destruction to property was placed at \$26,000.
- A thunder, rain, and hail storm moved over Chicago, Illinois in a path about one mile in width; the damage to glass, by hail, was placed at \$100,000.
- During the day several structures near the World's Fair grounds were demolished by wind; loss about \$30,000.
- A thunderstorm, with rain and hail, moved 3 miles south of South Haven, Michigan. A number of persons were injured, and property was destroyed to the value of \$10,000 to \$20,000.

On 11 April 1893:

- A storm at Akron, Iowa, the damage to buildings by wind was placed at \$50,000.
- A tornado 300 yards wide struck about 3 miles east of Fonda, Iowa, with heavy rain and some hail. A child was killed, and a number of small buildings valued at \$6,000 were destroyed.
- A tornado 100 yards wide struck Newton, Iowa. The storm had a whirling motion, and was preceded by rain and hail. Several persons were injured, and the value of property destroyed was placed at \$10,000.
- At Davenport, Iowa, a thunder and rain storm caused \$20,000 in damages.
- A tornado appeared about ¼ mile northeast of Mayview, Missouri, and moved in an irregular northeasterly course about 12 miles, destroying buildings in its path. The storm cloud presented a black funnel-shaped mass, with the point down; the crest of the cloud appeared to be ablaze, and the path of destruction varied in width from 70 feet to 500 yards.
- The loss of life in Lafayette County, Missouri, by a tornado was placed at 6; a number of persons were injured; and 15 buildings, valued at \$10,000 were destroyed.
- A tornado struck 6 miles northwest of Salem, Missouri, with thunder and lightning and heavy rain, killing 10 persons, and destroying buildings valued at \$20,000.
- At Saint Louis, Missouri, lightning was observed in the northwest and southwest at 6:50 p.m., and increased in frequency and intensity until 7:55 p.m., when thunder was heard and heavy rain began to fall, with hail from 9:15 to 9:30 p.m. About midnight the wind increased to a gale from the southeast. At 1 a.m., a heavy, dark cloud was observed approaching from the southwest, and passed directly over the city, with torrents of rain, and wind 54 miles per hour from the southwest. The pressure oscillated 0.20 inch, as shown by the barograph record, apparently first increasing 0.15 and then decreasing 0.20 inch from the highest point. The storm was exceptionally sudden and severe and caused considerable damage in and about the city and on the Mississippi River.
- At Cedar Creek, Nebraska, a thunder, rain, and hail storm moved over the city damaging property to the estimated value of \$5,000.
- A heavy thunder and hail storm, with light rain, struck near Inman, Nebraska seriously injuring one person and blowing down 19 small buildings.
- A destructive storm passed across the southeast part of Holt County, Nebraska, injuring a number of persons and destroying farm buildings.
- A violent thunder, rain, and hail storm visited Muscotah, Kansas injuring several persons, and destroying property valued at \$10,000.
- At Everest, Kansas, a thunderstorm, with rain and hail, moved over the city; one person was killed near Everest, and some damage was caused by hail.
- During a thunderstorm, which visited Altoona, Kansas hailstones the size of walnuts fell.
- A tornado, with thunder, lightning, and hail, moved over Parker, Kansas cutting a path 300 to 400 feet wide, destroying property to the extent of \$100,000.
- A thunder, rain, and hail storm moved over Paris, Texas damaging property to the value of \$10,000.
- A rain and hail storm visited Petty, Texas injuring 3 persons and damaging property.
- A rain, hail, and thunder storm moved eastward over Oak Cliff, Texas destroying property valued at \$10,000.
- On 12 April 1893:
- A rain and hail storm struck 4 miles south of Newellton, Louisiana; killing one person, injuring several, and destroying property valued at \$10,000.
- A violent thunder, rain, and hail storm struck Baldwin, Mississippi; killing one person and destroying property to the extent of \$15,000.
- A thunder and hail storm struck Robinsonville, Mississippi; killing 12 persons and destroying property to the extent of \$25,000.
- A heavy thunderstorm, with rain and small hail struck Terre Haute, Indiana, damaging buildings to the extent of \$5,000.
- At Kokomo, Indiana, a storm cut a path 150 feet wide killing one person and damaging property to the value of \$5,000.
- A destructive storm passed over Dundee, Michigan; killing one person, and destroying 50 buildings valued at \$50,000 to \$75,000.
- At Rea, Michigan, a storm cut a path 10 rods (165 feet) wide, with sharp lightning and heavy thunder, rain and hail. At Rea one person was reported killed, and many buildings were blown over.
- A tornado struck Ypsilanti, Michigan, cutting a path 200 to 500 feet wide, attended by vivid lightning, continuous thunder, and heavy rain; the value of property destroyed in Ypsilanti was placed at \$100,000.
- A thunderstorm passed near Redford, Michigan damaging property to the extent of \$6,000.

— A violent thunder, hail, and rain storm passed northeast over Royal Oak, Michigan, cutting a path 80 rods (1/4 mile) wide, killing 2 persons, and destroying property to the value of \$50,000.

— At Utica, Michigan, 40 buildings were injured or destroyed by a thunder, rain, and hail storm.

On 20 April 1893:

Unusually severe storms prevailed over the Great Lakes region; a number of marine disasters were reported and heavy rain flooded streams and damaged crops. At Detroit, Michigan, the wind reached a velocity of 72 miles per hour. At Milwaukee, Wisconsin, a shed on a crib, which extended into the Lake was washed away and 15 men were drowned.

On 25 April 1893:

— A tornado visited Cleveland County, Oklahoma on the evening of April 25<sup>th</sup>: At Oklahoma City, 14 miles north of the section visited by the tornado, the afternoon was warm and sultry, with barometer low and unsteady, and wind fresh from the southeast. Heavy rain began 6:46 p.m. (75<sup>th</sup> meridian time), and ended 8:20 p.m., the depth of rainfall being 0.68 inch. At 10:30 p.m. the wind veered to south-southwest, and then to northwest. Before the sky became obscured by nimbus clouds from the southeast, cirrus and cirrocumulus clouds were observed moving rapidly towards the southeast. At Norman, Oklahoma, light rain, with small hail, began 5 p.m. (90<sup>th</sup> meridian time), and was followed at 5:35 p.m. by a sudden heavy fall of rain and strong southeast wind. Immediately following the heavy rain the tornado was distinctly visible south of Norman, moving rapidly northeast. The storm was in view about 10 minutes, and broke up when about due east of the town, without having caused material damage. The funnel or center appeared like a spout lowered from the clouds, and was of a peculiar gray color. But little lightning was observed. About the time the first storm disappeared another cloud formed in the west. This cloud increased rapidly in size, and at 6:25 p.m. moved rapidly in a northeast direction, causing great loss of life and destruction of property. The appearance of the clouds attending this storm was remarkable. The outer clouds seemed to be driven furiously in to the center. No spout or funnel, and but little lightning, was observed, and no roaring sound was noted. In about 20 minutes the storm had disappeared in a northeast direction. About 6 p.m. a heavy, dark cloud was observed 5 or 6 miles southwest of Moore, Oklahoma. The cloud appeared to remain almost stationary, and was joined by other clouds, which advanced from the northwest and southeast. These clouds appeared to dart quickly into the top, and become a part, of the larger cloud. About 6:30 p.m. the cloud began to revolve slowly from right to left and moved north of east with a sullen roar. The edges of the cloud seemed luminous, although no lightning was seen nor thunder heard. After crossing the Canadian River several "twisters" descended from the main cloud. These spouts, except one long one, which trailed 50 to 100 yards behind the main cloud and swung to and fro, would disappear and others would replace them. The tornado was preceded by heavy rain, and a few large hailstones fell at Moore, 1½ miles from the path of the storm, and one hailstone struck a child on the head, breaking its skull. The first house struck by the storm contained 13 persons, 11 of which were killed. The house was torn to pieces and the debris scattered over several acres of ground to the southeast. The few fence posts left standing were covered with mud. The supposition is that in crossing the river the storm sucked up quantities of water and sand or mud and deposited them on the edges of its path. An orchard northeast of the house was stripped of every twig and branch and many of the trees were completely stripped of bark. The orchard looked as though a fire had burned over it. About one-half mile south of this house, a house and barn were scattered over several acres toward the northeast, and four persons were killed. About one mile northeast of the last mentioned house, a house was torn to pieces and the debris thrown southeast and northwest, and 6 persons were killed. A house one-half mile north of that point was demolished and the debris thrown south. In wheat field between the points last named, the wheat was blown close to the ground and lay pointing southeast, while debris from a house to the southeast was scattered over the field. In many places pieces of boards and scantling from the house to the southeast were driven deep into the ground. Two houses one half mile south of the wheat field were scattered toward the north and northeast. The path of destruction was about one-half mile in width. Wire fences were rolled up into great balls. In a number of instances spokes were torn from wagon hubs, and in each instance, save one, the hubs were torn from the axle. In that instance the spokes and tire were carried away. Harrows with their teeth in the ground were undisturbed. The observer states, on the authority of a physician who had examined 14 dead bodies that the persons killed were invariably injured on the left side of the face and body, and some had the appearance of having been burned. Thirty persons, in all, were killed by this storm and many were injured. Many of the houses destroyed were small, frail structures, and probably \$25,000 would cover the loss to buildings in Cleveland County.

— A tornado one mile north of Perkins, Oklahoma cut a path 10 miles in length and averaging 80 rods (1/4 miles) wide; 60 buildings were torn to pieces, 2 persons were killed, and two fatally injured; debris was thrown in all directions, limbs and bark were stripped from trees, and an ordinary square spade was carried 150 feet and driven into a solid oak tree one-half the length of the blade.

— At Langston, Oklahoma, a heavy thunder, rain, and hail storm struck the city killing two persons.

— A tornado struck near Bonita, Texas, with sharp lightning, rain, and hail. In a path 75 to 250 yards in width, 11 houses were torn to pieces, and 2 children were killed.

On 28 April 1893:

— A tornado struck Cisco, Texas, cutting a path about three-fourths of a mile in width and 13 miles in length, with forked lightning, heavy rain, and large hail, killing 22 persons, and destroying property to the estimated value of \$400,000.

— A large funnel-shaped cloud formed near Ponca, Oklahoma, where 6 persons and a quantity of livestock were killed.

The year 1893 in Bradford County, Pennsylvania in the *United States* was remembered for the unequalled, terrible and destructive storms.<sup>178</sup>

\* On 20 April 1893, one of the most persistent gales, ever remembered, blew in from the southeast, struck Bradford County with hurricane force. The gale was most severe in Towanda and vicinity where great damage was done. Several buildings were blown over, many unroofed, fences thrown down and other property damaged.

\* On 3 May 1893, a heavy rain caused a rapid rise in the creeks and the Susquehanna River to the highest, since the June flood of 1889. Along the Schrader, Towanda and Sugar Creeks much damage was done.

\* On 23 May 1893, a heavy windstorm passed over a considerable section of Bradford County on May 23, doing much damage in unroofing and demolishing buildings.

\* On 5 July 1893, a terrific wind and hailstorm passed over Southern Bradford, destroying gardens, damaging fruit, grain and buildings.

\* On 7 September 1893, a tornado struck Bradford County in its northwestern corner and continued diagonally across the northwestern townships, leaving in its trail death and devastation. The storm had its start in Western New York and from the South Mountain it moved in a straight line through Lawrenceville, Jackson, Wells, Columbia, Troy, West Burlington, Granville, Franklin, Monroe, Albany, Terry and Wilmot. "People's attention was called to the rapid advance of a huge black cloud that spanned the sky and was lit up by lurid flashes of lightning. The black pall of the cloud stretched from horizon to horizon and when it had shut down it was dark almost as midnight and caused lamps to be lit, while flashes of lightning, the deep boom of thunder, the steady downpour of rain, interspersed with hail and an orange light that seemed diffused in the air, gave peculiar features to this frightful visitation." Every township in the county was more or less affected by this terrible storm of wind, rain and hail. The damage wrought, besides the killing of four persons, amounted to several hundred thousand dollars. So furious was the wind that huge oak and hickory trees were twisted off at the trunk.

\* Other destructive storms in 1893 occurred on 19 February, 18 August, 28 August and October 13.

In May 1893, there was a great rising [flood] of the Mississippi River in the *United States*.<sup>97</sup>

In May 1893, there were inundations in *Romania*. Railways were stopped and villages destroyed.<sup>97</sup>

On 16 May 1893, severe storms continued near Lake Erie in the *United States*; streams overflowed their banks, causing washouts and landslides on railroads. At Erie, Pennsylvania, rain ended in the morning. In that city the estimated damage to property was \$250,000. In Erie County the damage to property, including railroads, was placed at \$500,000 [\$12 million in today's dollars]. In many instances the water reached the second floors of houses in Erie.<sup>117</sup>

On 21 June 1893, a tornado swept over the region near Perry and Williamstown, Kansas in the *United States*, killing ten persons and destroying considerable property whose value was estimated at \$20,000 [\$480,000 in today's dollars].<sup>117</sup>

On 23 June 1893, a hailstorm struck Concordia, Kansas in the *United States*. The larger hailstones measured 13 to 16 inches in circumference.<sup>117</sup>

On 26 June 1893, heavy rains fell on Pueblo, Colorado in the *United States*. The Arkansas River rose rapidly above the north levee and the levee broke in several places, causing flood damage estimated at \$200,000 [\$4.8 million in today's dollars.]<sup>117</sup>

The following are the highest temperatures observed during July 1893 in the *United States*:<sup>117</sup>

Montgomery, Alabama	( 99° F, 37.2° C)
Mobile, Alabama	( 96° F, 35.6° C)
Tucson, Arizona	(107° F, 41.7° C)
Yuma, Arizona	(109° F, 42.8° C)
Little Rock, Arkansas	( 97° F, 36.1° C)
Fort Smith, Arkansas	( 98° F, 36.7° C)
San Francisco, California	( 74° F, 23.3° C)
San Diego, California	( 79° F, 26.1° C)
Fresno, California	(108° F, 42.2° C)
Denver, Colorado	( 96° F, 35.6° C)
Pueblo, Colorado	( 98° F, 36.7° C)
New Haven, Connecticut	( 92° F, 33.3° C)
New London, Connecticut	( 89° F, 31.7° C)
Millsboro, Delaware	( 97° F, 36.1° C)
Washington, D.C.	( 97° F, 36.1° C)
Pensacola, Florida	( 97° F, 36.1° C)
Key West, Florida	( 91° F, 32.8° C)
Augusta, Georgia	( 98° F, 36.7° C)
Savannah, Georgia	(100° F, 37.8° C)
Payette, Idaho	(104° F, 40.0° C)
Boise Barracks, Idaho	(102° F, 38.9° C)
Chicago, Illinois	( 94° F, 34.4° C)
Cairo, Illinois	( 94° F, 34.4° C)
Indianapolis, Indiana	( 97° F, 36.1° C)
Lafayette, Indiana	( 99° F, 37.2° C)
Dubuque, Iowa	( 96° F, 35.6° C)
Keokuk, Iowa	( 93° F, 33.9° C)
Topeka, Kansas	( 97° F, 36.1° C)
Dodge City, Kansas	(103° F, 39.4° C)
Louisville, Kentucky	( 97° F, 36.1° C)
Lexington, Kentucky	( 95° F, 35.0° C)
New Orleans, Louisiana	( 94° F, 34.4° C)
Shreveport, Louisiana	(101° F, 38.3° C)
Eastport, Maine	( 87° F, 30.6° C)
Portland, Maine	( 93° F, 33.9° C)
Baltimore, Maryland	( 96° F, 35.6° C)
Boston, Massachusetts	( 91° F, 32.8° C)
Nantucket, Massachusetts	( 80° F, 26.7° C)
Marquette, Michigan	( 91° F, 32.8° C)
Detroit, Michigan	( 93° F, 33.9° C)
Saint Vincent, Minnesota	( 90° F, 32.2° C)
Saint Paul, Minnesota	( 98° F, 36.7° C)
Vicksburg, Mississippi	( 96° F, 35.6° C)
Saint Louis, Missouri	( 94° F, 34.4° C)
Glendive, Montana	(117° F, 47.2° C)
Helena, Montana	(102° F, 38.9° C)
North Platte, Nebraska	( 96° F, 35.6° C)
Omaha, Nebraska	( 97° F, 36.1° C)
Winnemucca, Nevada	( 97° F, 36.1° C)
Carson City, Nevada	( 94° F, 34.4° C)

West Milan, New Hampshire	( 88° F, 31.1° C)
New Brunswick, New Jersey	( 97° F, 36.1° C)
Cape May, New Jersey	( 96° F, 35.6° C)
Santa Fe, New Mexico	( 89° F, 31.7° C)
Albany, New York	( 92° F, 33.3° C)
New York City, New York	( 93° F, 33.9° C)
Charlotte, North Carolina	(100° F, 37.8° C)
Kitty Hawk, North Carolina	( 95° F, 35.0° C)
Bismarck, North Dakota	( 98° F, 36.7° C)
Williston, North Dakota	(104° F, 40.0° C)
Cincinnati, Ohio	( 95° F, 35.0° C)
Columbus, Ohio	( 95° F, 35.0° C)
Oklahoma City, Oklahoma	( 97° F, 36.1° C)
Fort Sill, Oklahoma	(103° F, 39.4° C)
Roseburg, Oregon	( 96° F, 35.6° C)
Portland, Oregon	( 92° F, 33.3° C)
Erie, Pennsylvania	( 90° F, 32.2° C)
Philadelphia, Pennsylvania	( 94° F, 34.4° C)
Block Island, Rhode Island	( 81° F, 27.2° C)
Charleston, South Carolina	( 99° F, 37.2° C)
Columbia, South Carolina	(102° F, 38.9° C)
Yankton, South Dakota	( 97° F, 36.1° C)
Nashville, Tennessee	( 96° F, 35.6° C)
Knoxville, Tennessee	( 94° F, 34.4° C)
San Antonio, Texas	( 99° F, 37.2° C)
Galveston, Texas	( 92° F, 33.3° C)
Salt Lake City, Utah	( 99° F, 37.2° C)
Burlington, Vermont	( 87° F, 30.6° C)
Lynchburg, Virginia	( 97° F, 36.1° C)
Norfolk, Virginia	( 95° F, 35.0° C)
Olympia, Washington	( 86° F, 30.0° C)
Spokane, Washington	( 99° F, 37.2° C)
New Cumberland, West Virginia	( 98° F, 36.7° C)
Milwaukee, Wisconsin	( 92° F, 33.3° C)
La Crosse, Wisconsin	( 96° F, 35.6° C)
Cheyenne, Wyoming	( 91° F, 32.8° C)

The following are the highest temperatures observed during July 1893: <sup>117</sup>

Saint John, New Brunswick, <i>Canada</i>	( 85° F, 29.4° C)
Ciudad Porfirio Díaz, <i>Mexico</i>	(100° F, 37.8° C) (now Piedras Negras, Coahuila)
Leon de Aldamas, <i>Mexico</i>	( 84° F, 28.9° C) (now León, Guanajuato)
Puebla, <i>Mexico</i>	( 80° F, 26.7° C)
Hamilton, <i>Bermuda</i>	( 84° F, 28.9° C)

Probably the most destructive tornado that ever visited Iowa in the *United States* swept over the northwestern portion of the state in the evening of 6 July 1893. The storm passed about 2 miles north of Quimby then about 3 miles south of Alta and then arrived at Storm Lake, and south of Newell and then reached Pomeroy, Iowa. The storm track varied from 15 to 20 rods (250-330 feet, 75-100 meters) to ½ mile in width. About 50 persons were killed, upward of 100 injured, and property to the estimated value of about \$200,000 was destroyed. [In present currency, that would be equivalent to \$4.8 million using CPI inflation.] The greatest destruction occurred at Pomeroy, where 44 persons were killed and about 100 buildings valued at \$175,000 were destroyed or badly wrecked in a path about 80 rods (¼ mile, 0.4 kilometers) in width. While passing south of Alta the storm was attended by intensely sharp forked lightning, large hail, and heavy rain. In Buena Vista County 6 persons were killed, and the loss to

property was placed at \$20,000. At Storm Lake the path of the tornado was 20 to 40 rods in width, and water in the lake was lifted high into the air.<sup>117</sup>

On 6 July 1893, there were destructive cyclones [tornadoes] in northwest Iowa in the *United States*. About 100 persons were killed and much property destroyed. On 23-24 August 1893, a destructive storm struck on the coast of New Jersey. There were many [ship] wrecks with loss of life. On 28-29 August 1893, a storm struck Georgia, North and South Carolina and Virginia.<sup>94</sup>

In the *United States* in July 1893, damaging drought prevailed in parts of the middle Atlantic and New England states, North Carolina, eastern Florida, Alabama, the Ohio Valley and Tennessee, southeastern Missouri, Arkansas, central Texas, southern Kansas, western Nebraska, southwestern South Dakota, Utah, and Idaho.<sup>117</sup>

On 6 August 1893, severe thunderstorms struck New England in the *United States*. Much damage was done in Boston, Massachusetts and vicinity. In Lynn, Massachusetts, the damage was estimated at nearly \$100,000 [\$2.4 million in today's dollars].<sup>117</sup>

On 15 August 1893, a hurricane passed north of *Bermuda* recurved and touched Newfoundland, *Canada* on the 18<sup>th</sup>.<sup>117</sup>

On 15 August 1893 a hurricane passed near Martinique. On the 16<sup>th</sup>, the hurricane passed near Saint Thomas, *West Indies* and *Puerto Rico*. The hurricane tracked midway between the Bahamas and Bermuda. It recurved and touched Cape Hatteras on the 20<sup>th</sup> and Cape Cod in the *United States* on the 21<sup>st</sup>. The hurricane was centered over the Bay of Funda, *Canada* during the evening of the 21<sup>st</sup> and then passed over Newfoundland, *Canada*.<sup>117</sup>

On 15 August 1893, Madrid, *Spain* reached a high temperature of 112° F (44.4° C).<sup>97</sup>

On 18 August 1893, the temperature in the shade at Camden-Square in London, *England* reached a peak of 93.6° F (34.2° C).<sup>97</sup>

On 20 August 1893, a hurricane was at latitude 22° N, longitude 63° W. It recurved at latitude 35° N, longitude 75° W; passed near Cape Hatteras and Atlantic City and over New York City in the *United States* on the 24<sup>th</sup>, and thence to the mouth of the Saint Lawrence in *Canada*. Much destruction was done on the middle Atlantic coast.<sup>117</sup>

On 24 August 1893, a hurricane was at latitude 23° N, longitude 67° W. It recurved at latitude 35° N, longitude 81° W, in North Carolina in the *United States*, and passed over Newfoundland, *Canada* on the 30<sup>th</sup>. This storm did much destruction in the South Atlantic states. Its center passed over or near Jacksonville, Florida; Savannah, Georgia; Charleston, South Carolina; Augusta, Georgia; Charlotte, North Carolina; Lynchburg, Virginia; Harrisburg, Pennsylvania; Ithaca and Oswego, New York; Northfield, Vermont; and Saint John, New Brunswick, *Canada*. The destruction to property on shore may be estimated as approximately \$3,000,000. [In present currency, that would be equivalent to \$72 million in damages based on the Consumer Price Index (CPI) inflation rates.] The loss of human life, nearly 2,000, was due principally to drowning by high water on the coast.<sup>117</sup>

On 27-28 August 1893, Charleston, South Carolina in the *United States* was struck by one of the most destructive hurricanes.<sup>124</sup>

On 27-28 August 1893, a great Atlantic hurricane struck South Carolina and Georgia in the *United States* causing between 2,000 and 2,500 deaths.<sup>107</sup>

On 28 August 1893, a great storm struck the South Atlantic coast, which committed havoc in Charleston, South Carolina and Savannah, Georgia in the *United States* and with the shipping on the ocean in their vicinity, the aggregate loss of life being about 1,000.<sup>197</sup>

The hurricane of 27 August 1893 destroyed over 2,000 lives and approximately \$1,000,000 of property in the *United States*. [In present currency, that would be equivalent to \$24 million in damages based on the Consumer Price Index (CPI) inflation rates.] The highest record of storm tide above ordinary high water was measured at 8.2 feet in Fort Pulaski, Georgia. Winds gust at Charleston, South Carolina exceeded 120 miles per hour. The center of the hurricane passed about 80 miles west of Charleston.<sup>118</sup>

On 27-28 August 1893, a hurricane struck South Carolina and Georgia in the *United States*. [One account places the number of deaths at 2,000-2,500; another account provides 1,000-2,000 deaths; and a third list greater than 1,000 deaths.]<sup>141</sup>

On 5 September 1893, a storm was centered in the Gulf of Mexico. On the 6<sup>th</sup>, increasing northwest winds could be felt along the coast of Louisiana and Texas in the *United States*. During Thursday, the 7<sup>th</sup>, the center moved northward over the southeastern portion of Louisiana, doing much damage over a small area, but rapidly breaking up as it moved inland. The course of the center was quite irregular. On the afternoon of the 8<sup>th</sup> it was central in southeastern Alabama, and the area of revolving winds with rain continued to remain south of Tennessee until the 11<sup>th</sup>, by which time pressure had become nearly normal and the storm center had disappeared.<sup>117</sup>

On 7 September 1893, strong storms broke out in New York in the *United States*. At Friendship, New York, the hailstones were the size of hickory nuts. In the Chemung Valley in southern New York, heavy hail caused \$250,000 damage to crops [\$6 million in today's dollars]. It was reported that a hailstone 9¼ inches long was found on the 7<sup>th</sup> in Bath, New York; the attending storm was remarkable for the darkness.<sup>117</sup>

On 7 September 1893, a destructive storm with a funnel-shaped cloud with whirling motion struck Lockport, Louisiana in the *United States*. Five persons were killed, 17 injured, and property was destroyed to the estimated value of \$40,000 [\$1 million in today's dollars].<sup>117</sup>

About 15 September 1893, there were destructive inundations in *Spain*. Then on 1-2 October 1893, there were inundations caused by heavy rains in Naples and in northern *Italy*.<sup>97</sup>

Great damage and dense smoke were caused by forest fires throughout the latter half of September 1893 in Wisconsin in the *United States*. Navigation on Lake Michigan was sometimes interfered with.<sup>117</sup>

On 2 October 1893, a hurricane struck the Gulf of Mexico, on the coast of Louisiana in the *United States*. As a result 2,000 lives were lost.<sup>197</sup>

A gulf hurricane advanced suddenly and unexpectedly northeastward over southeastern Louisiana in the *United States* on the afternoon of 1 October 1893. It was said that over 1,500 lives were lost on the Gulf coast by drowning; there was considerable destruction of property, and the orange, rice, and other crops were completely devastated.<sup>117</sup>

— The observer at New Orleans, Louisiana reports: October 1<sup>st</sup>, a severe and destructive storm began about 6:30 p.m., continuing through the night. Much damage was caused throughout the city. About 2,000 lives were lost along the Gulf coast south and east of this section. The storm was severest in the Louisiana Delta and in the Plaquemines Parish, where it was attended with great loss of life and property. A velocity of 48 miles per hour was

recorded in the city at 8:20 p.m., after which the record was lost, owing to the anemometer getting out of order. A velocity of 65 miles per hour was attained at West End, when the instrument became unserviceable.

— The Secretary of the Louisiana State Weather Service reports: No complete record of the wind velocity or rainfall of the storm can be obtained, since all instruments in the path of the hurricane were blown down, and in the case of Port Eads destroyed. It is evident, however, that the wind must have blown at the rate of 100 miles per hour in the vicinity of Pointe-à-la-Hache, Louisiana and along the islands on the coast. While the wind worked great havoc, yet the immense wave of water that swept over the devastated section engulfed and swept away everything in its path. It is probable that the center of this hurricane passed midway between New Orleans and Port Eads on its northeast course, since the path of greatest destruction was in that neighborhood.

— The water at Mobile, Alabama rose 4 inches above the [storm surge] flood line of 1852, and all recognize it as the worst that has hitherto been experienced there. The extreme velocity of the wind several times reached 80 miles per hour. Great damage was done to property. In the marsh truck farm section nearly every house was swept away, and farms were destroyed in Mobile County. Seven lives were reported lost.

— The storm crossed Louisiana in a northeasterly direction; the center struck the coast of Mississippi a little west of the Alabama boundary line.

— The hurricane center moved slowly northeast over Georgia to Cape Hatteras, and dissipated on the October 5<sup>th</sup>.

On 1-2 October 1893, a great Atlantic hurricane struck Louisiana in the *United States* causing approximately 2,000 deaths.<sup>107</sup>

On 1-2 October 1893, a hurricane struck Louisiana in the *United States* causing between 1,800-2,000 deaths.<sup>141</sup>

On 2 October 1893, a destructive storm struck at New Orleans, and along the southeast coast of the *United States*. About 1,200 people lost their lives.<sup>94</sup>

The hurricane of 2 October 1893 caused the loss of over 1,000 lives on the coast of Louisiana in the *United States*.<sup>118</sup>

On 2 October 1893, a destructive storm struck New Orleans, Louisiana in the *United States*. There were 1,200 deaths. Buildings and works destroyed.<sup>97</sup>

On 11-13 October 1893, a hurricane struck South Carolina and Florida in the *United States* causing 28 deaths.<sup>141</sup>

The hurricane was barely felt in the West Indies, as its track lay to the north of those islands. At Nassau in the *Bahamas* on 11 October 1893, the wind attained a storm velocity. On the coasts of Georgia, Florida, and South Carolina in the *United States*, the storm was very severe and the ocean water rose to an unusual height; after reaching the lower lake region on the 14<sup>th</sup>, the storm was again very severe, being in most places considered as the severest that has been experienced on the Great Lakes for many years.<sup>117</sup>

— At Jupiter, Florida the storm struck beginning on October 11<sup>th</sup>. The wind reached a maximum velocity of 72 miles from the west at midnight. Great damage was done to docks, vessels, crops, and houses. Three bodies were washed ashore in this vicinity. For many miles along the Indian River the sea broke over the peninsula, raising the river to a point never before attained. Orange groves on Indian River were injured and great damage was done to farms. From Titusville to Lake Worth, a distance of 150 miles, nearly all docks were washed away.

— At Titusville, Florida, the continued north and northwest winds drove the water back from the western shore of the Indian River farther than ever before. At the end of the steamboat dock, where there is generally 6 to 8 feet of water, the bed was perfectly dry for about ¼ mile. One house was blown down and several small buildings moved from their foundations, and there was great damage to electric wires. The orange crop was badly damaged, and in some localities the ground was covered with the green fruit; two small steamers and a sailing vessel were wrecked and several docks blown away. Great damage was done to shipping.

— At St. Augustine, Florida, the water level on the October 12<sup>th</sup> reached 12 inches above the sea wall. At Saint Augustine, the waters of the Matanzas and the San Sebastian rivers reached were united, a phenomenon that has not occurred

since the great flood of 22 years previous. Many houses flooded, the cypress blocks of the street pavement floated away, and railroad traffic totally suspended. The tide during this storm rose higher than any known since 1824, and as the city was not guarded by a sea wall the present high water must be considered as the highest known. Mr. J. S. Masters, one of the oldest residents, said that the tide was the highest that he has known since 1824, when he rowed a boat into the hallway of the old Mickler house on Charlotte street.

— At Georgetown, South Carolina, records of high water in previous gales have been preserved by means of notches on trees, and by comparison it appears that the high water of 13-14 October 1893 exceeded that of September 1822, and also that of 28 August 1881, by nearly 3 feet. It exceeded that of 27 August 1893, by at least 2 feet 4 inches. A level was taken from the inside of the North Island lighthouse tower, where the water mark is least likely to be obscured by wave action, and the level reached was 11.3 feet on the U.S. Engineer's tide gauge (or 6.8 feet above ordinary high water mark). The popular report was that the water rose on Magnolia Beach, a sandy peninsula about 25 miles northeast of Georgetown, 6 feet above the August gale. As a result of the two gales, August and October, and one or two freshets in the river, the average production of rice in the entire region was expected to hardly exceed one-sixth or one-seventh of the estimated crop. The total loss of life in this vicinity of Georgetown in the October storm is 22 and the loss of property at least \$250,000 [\$6 million in today's dollars]. Almost worse than the physical losses to the fisherman were their demoralization and discouragement, and loss of confidence. They were prepared to believe all sorts of absurd predictions of more storms coming, which were circulated among them without any one knowing who was responsible for them.

— At Wilmington, North Carolina the storm arrived during the evening of October 13<sup>th</sup>. The tide and overflow were the highest ever known here, and were much worse than that of August 1893 hurricane. At Wilmington, some vessels were lost and all the low lands submerged. At Southport the wind velocity reached 80 miles per hour. At Southport, the wharves were damaged and a three-masted schooner went ashore. At Hatteras, North Carolina, the barkentine *Ravenscraft* went ashore.

— The center passed west of Washington D.C., about 9 p.m. on the 13<sup>th</sup>. At Washington D.C., the wall of a church in the course of erection was blown down.

— By the morning of the 14<sup>th</sup>, the storm crossed Pennsylvania and western New York, and was centered north of Lake Ontario. In Pennsylvania, the storm was felt at Chester, Stroudsburg, Westtown, Lewisburg, Kilmer, Mifflington [Mifflintown], Bethlehem, Carlisle, Chambersburg, Reading, Huntington, Norristown, Easton, Columbia, Pine Grove, Harrisburg, West Chester, Pittsburg, and Erie, where trees were blown down, houses unroofed, telegraphic communication interrupted, and railroad traffic delayed. While the center of this storm passed nearly as far west as Pittsburg the damage along the New Jersey coast was much greater than might have been expected. Several branch lines of the West Jersey Railroad were washed out, telegraph wires were blown down, and many small vessels were washed ashore.

— The storm in New York State began about midnight of the 13<sup>th</sup> and did little damage except in the western portion and on the Lakes. On Lake Erie, off Dunkirk, the *Dean Richmond* foundered with 18 persons. Smaller vessels were wrecked all along the coast. The total known loss on the Lakes was 13 vessels, 54 lives, and \$676,000 [\$16 million in today's dollars]. At New London, Connecticut, the wind reached a maximum velocity of 63 miles per hour and Light Ship [60 foot schooner fitted like a portable lighthouse] *Martha Emma* was wrecked.

— During the November 15<sup>th</sup>, the storm disappeared in the direction of Labrador.

A continuous gale, sometimes of hurricane force prevailed over *Great Britain* and the neighboring portion of *Europe* on the 16-19 November 1893. This storm was one of the most severe on record.<sup>117</sup>

On 16-19 November 1893, violent gales struck over the *British Isles* and the *European Continent*. There was much property damage and shipping destroyed. 293 deaths were reported. A *Hampshire* steamship was wrecked on 18 November; the *Princess of Sunderland* was sunk off the coast of Flamboro with all [hands] lost on 18 November. There were many French fishing smacks off Calais, *France* that were lost and as a result more than 300 lives lost on 18 November 1893.<sup>94</sup>

On 12 December 1893, a destructive gale struck London, England and southern and western coasts.<sup>94</sup>

In 1893-94 in Chhindwara, *India*, the weather was good and a bumper crop was reaped.<sup>180</sup>

In 1893 during the period between 14 June and 12 July, a drought engulfed Anhwei (now Anhui

province) in eastern *China* at T'ai-p'ing.<sup>153</sup>

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

Over the period from 1864-1894, the year 1893 was the coldest on record in *India*, and the rainfall was much greater than in any preceding year. The figures show that during the three years [1892-1894], *India* had experienced a period of heavy rainfall, such as it had not experienced for at least 30 years.<sup>115</sup>

### Annual Rainfall in India

Year	Number of provinces that reported the rainfall as being			Average departure from the normal for the Indian area only	
	Excessive	Normal	Deficient	Excess	Deficiency
1864	4	--	16	--	- 5.52 inches
1865	8	1	11	--	- 0.77 inches
1866	6	--	14	--	- 2.09 inches
1867	8	2	10	+ 2.77 inches	--
1868	5	--	16	--	- 6.63 inches
1869	8	1	13	+ 0.40 inches	--
1870	14	--	10	+ 1.49 inches	--
1871	12	1	11	+ 0.93 inches	--
1872	14	3	7	+ 2.31 inches	--
1873	3	1	20	--	- 4.46 inches
1874	15	3	6	+ 4.64 inches	--
1875	16	--	8	+ 2.38 inches	--
1876	6	--	18	--	- 4.49 inches
1877	10	--	14	--	- 4.28 inches
1878	17	1	6	+ 6.34 inches	--
1879	16	2	6	+ 1.69 inches	--
1880	13	1	10	--	- 1.56 inches
1881	15	--	9	+ 0.10 inches	--
1882	17	1	6	+ 2.64 inches	--
1883	11	1	12	--	- 0.12 inches
1884	12	--	10	+ 1.49 inches	--
1885	15	--	7	+ 1.17 inches	--
1886	14	--	8	+ 2.77 inches	--
1887	11	--	11	+ 2.04 inches	--
1888	10	--	12	--	- 1.13 inches
1889	15	--	8	+ 1.92 inches	--
1890	14	1	8	+ 0.46 inches	--
1891	6	--	17	--	- 0.30 inches
1892	15	--	8	+ 4.55 inches	--
1893	22	--	1	+ 8.94 inches	--
1894	17	--	6	+ 6.48 inches	--

---

**Winter of 1893/ 1894 A.D.** On 21 November 1893, the first blizzard of the season occurred in Minnesota and advanced southeastward into Illinois in the *United States*. At Detroit, Michigan the snowflakes were of enormous size, the diameter being a little smaller than a silver dollar [In 1893, the U.S. silver dollar had a diameter of 1.5 inches or 38.1 millimeters].<sup>117</sup>

During the winter of 1893-94 in Bradford County, Pennsylvania in the *United States* - October, November, December and January were unusually warm with scarcely a cold day. Around the beginning of February the weather turned cold and this continued several days. On February 17<sup>th</sup>, temperature in the

county ranged from -12° F to -16° F [-24° C to -27° C]. Mild weather followed. But then there was another cold snap on the 25<sup>th</sup> when the temperature dropped from -13° F to -24° F [-25° C to -31° C] (the latter at Camptown). There was good sleighing during the end of February and the beginning of March. On 8 March, bluebirds and robins appeared and the boys began to shoot marbles. Nearly all March, it was warm and delightful spring-like weather. April came in cold and on the 10<sup>th</sup> produced a notable snowstorm lasting three days. Snow fell to a depth varying between 16 and 24 inches [41 – 61 cm]. Following the storm there was good sleighing for three days but then the snow melted.<sup>178</sup>

The following are the lowest temperatures observed during January 1894 in the *United States*:<sup>116</sup>

Montgomery, Alabama	( 21° F, -6.1° C)
Mobile, Alabama	( 24° F, -4.4° C)
Tucson, Arizona	( 18° F, -7.8° C)
Yuma, Arizona	( 28° F, -2.2° C)
Little Rock, Arkansas	( 1° F, -17.2° C)
Fort Smith, Arkansas	( -7° F, -21.7° C)
San Francisco, California	( 36° F, +2.2° C)
San Diego, California	( 32° F, 0.0° C)
Denver, Colorado	( -7° F, -21.7° C)
Pueblo, Colorado	( -7° F, -21.7° C)
Pikes Peak, Colorado	(-26° F, -32.2° C)
New Haven, Connecticut	( 11° F, -11.7° C)
New London, Connecticut	( 8° F, -13.3° C)
Milford, Delaware	( 19° F, -7.2° C)
Washington, D.C.	( 17° F, -8.3° C)
Pensacola, Florida	( 27° F, -2.8° C)
Key West, Florida	( 61° F, +16.1° C)
Augusta, Georgia	( 26° F, -3.3° C)
Savannah, Georgia	( 32° F, 0.0° C)
Lake, Idaho	(-26° F, -32.2° C)
Chicago, Illinois	( -9° F, -22.8° C)
Cairo, Illinois	( -4° F, -20.0° C)
Indianapolis, Indiana	( -7° F, -21.7° C)
Lafayette, Indiana	(-17° F, -27.2° C)
Dubuque, Iowa	(-22° F, -30.0° C)
Keokuk, Iowa	(-16° F, -26.7° C)
Topeka, Kansas	(-14° F, -25.6° C)
Dodge City, Kansas	(-15° F, -26.1° C)
Louisville, Kentucky	( -5° F, -20.6° C)
Lexington, Kentucky	( -6° F, -21.1° C)
New Orleans, Louisiana	( 28° F, -2.2° C)
Shreveport, Louisiana	( 13° F, -10.6° C)
Eastport, Maine	( -9° F, -22.8° C)
Portland, Maine	( -8° F, -22.2° C)
Baltimore, Maryland	( 18° F, -7.8° C)
Boston, Massachusetts	( 2° F, -16.7° C)
Nantucket, Massachusetts	( 8° F, -13.3° C)
Marquette, Michigan	( -9° F, -22.8° C)
Detroit, Michigan	( -3° F, -19.4° C)
Saint Vincent, Minnesota	(-38° F, -38.9° C)
Saint Paul, Minnesota	(-25° F, -31.7° C)
Leach Lake, Minnesota	(-49° F, -45.0° C)
Vicksburg, Mississippi	( 16° F, -8.9° C)
Saint Louis, Missouri	(-11° F, -23.9° C)
Mingusville, Montana	(-38° F, -38.9° C) (now Wibaux)
Helena, Montana	(-26° F, -32.2° C)

North Platte, Nebraska	( -26° F, -32.2° C)
Omaha, Nebraska	( -22° F, -30.0° C)
Valentine, Nebraska	( -38° F, -38.9° C)
Winnemucca, Nevada	( -8° F, -22.2° C)
Carson City, Nevada	( -7° F, -21.7° C)
West Milan, New Hampshire	( -24° F, -31.1° C)
New Brunswick, New Jersey	( 10° F, -12.2° C)
Cape May, New Jersey	( 19° F, -7.2° C)
Santa Fe, New Mexico	( 3° F, -16.1° C)
Albany, New York	( 5° F, -15.0° C)
New York City, New York	( 17° F, -8.3° C)
Charlotte, North Carolina	( 24° F, -4.4° C)
Kitty Hawk, North Carolina	( 31° F, -0.6° C)
Bismarck, North Dakota	( -33° F, -36.1° C)
Williston, North Dakota	( -36° F, -37.8° C)
Cincinnati, Ohio	( -4° F, -20.0° C)
Columbus, Ohio	( -4° F, -20.0° C)
Oklahoma City, Oklahoma	( -8° F, -22.2° C)
Fort Sill, Oklahoma	( -5° F, -20.6° C)
Roseburg, Oregon	( 21° F, -6.1° C)
Portland, Oregon	( 27° F, -2.8° C)
Erie, Pennsylvania	( 9° F, -12.8° C)
Philadelphia, Pennsylvania	( 17° F, -8.3° C)
Block Island, Rhode Island	( 7° F, -13.9° C)
Charleston, South Carolina	( 30° F, -1.1° C)
Columbia, South Carolina	( 27° F, -2.8° C)
Yankton, South Dakota	( -26° F, -32.2° C)
Nashville, Tennessee	( -2° F, -18.9° C)
Knoxville, Tennessee	( 12° F, -11.1° C)
San Antonio, Texas	( 16° F, -8.9° C)
Galveston, Texas	( 24° F, -4.4° C)
Salt Lake City, Utah	( -1° F, -18.3° C)
Burlington, Vermont	( -5° F, -20.6° C)
Lynchburg, Virginia	( 20° F, -6.7° C)
Norfolk, Virginia	( 29° F, -1.7° C)
Olympia, Washington	( 18° F, -7.8° C)
Spokane, Washington	( -1° F, -18.3° C)
Morgantown, West Virginia	( 10° F, -12.2° C)
Milwaukee, Wisconsin	( -14° F, -25.6° C)
La Crosse, Wisconsin	( -19° F, -28.3° C)
Osceola, Wisconsin	( -41° F, -40.6° C)
Cheyenne, Wyoming	( -17° F, -27.2° C)

The following are the lowest temperatures observed during January 1894: <sup>116</sup>

Port Francis, Ontario, <i>Canada</i>	( -46° F, -43.3° C)
St. John, New Brunswick, <i>Canada</i>	( -10° F, -23.3° C)
Ciudad Porfirio Díaz, <i>Mexico</i>	( 26° F, -3.3° C) (now Piedras Negras, Coahuila)
Mazatlán, <i>Mexico</i>	( 55° F, +12.8° C)
Topolobampo, <i>Mexico</i>	( 50° F, +10.0° C)
Hamilton, <i>Bermuda</i>	( 53° F, +11.7° C)

The depth that rivers and lakes froze in January 1894 in the *United States*: <sup>116</sup>

- \* At Dubuque, Iowa, the Mississippi River was frozen over on the 8<sup>th</sup>.
- \* At La Crosse, Wisconsin, the ice on the Upper Mississippi River was 22 inches thick.
- \* At Davenport, Iowa, the ice on the Upper Mississippi River was 8 inches thick.

- \* At St. Paul, Minnesota, the ice on the Upper Mississippi River was 20.5 inches thick.
- \* At Hermann, Missouri, the Missouri River was frozen over on the 25<sup>th</sup>.
- \* At Omaha, Nebraska, the ice on the Upper Missouri River was 15 inches thick.
- \* At Williston, North Dakota, the ice on the Upper Missouri River was 24 inches thick.
- \* At Yankton, South Dakota, the ice on the Upper Missouri River was 21 inches thick.
- \* At Port Huron, Michigan, the Black River was frozen over on the 25<sup>th</sup>.
- \* At Marquette, Michigan, on Lake Superior, the harbor was frozen over on the 25<sup>th</sup>.
- \* At Duluth, Minnesota, the ice on Lake Superior was 21 inches thick and at Sault Ste. Marie, Michigan, the ice was 18 inches thick.
- \* At Green Bay, Wisconsin, the ice on Lake Michigan was 18 inches thick, at Chicago, Illinois, the ice was 5 inches thick and at Grand Haven, Michigan, it was 2 inches thick.
- \* At Toledo, Ohio, the ice on Lake Erie was 4 inches thick and at Sandusky, Ohio, the ice was 4.5 inches thick.
- \* At Oswego, New York, the ice on Lake Ontario was 4 inches thick.
- \* At Alpena, Michigan, the ice on Lake Huron was 4 inches thick.
- \* In Wisconsin, the Rock River was frozen and ice was 11 inches thick. Ice on Rock Lake was 14 inches thick.
- \* In Minnesota, ice on the Thief River was 28 inches thick at the end of the month. In Minneapolis, the ice was 22 inches thick on the lake. At Marfield, the ice was 30 inches thick on lakes and ponds. At Blooming Prairie, the ice was 2 feet thick on Cedar River. At Willmar, the ice was 28 inches thick on the lakes.
- \* At Albany, New York, the ice on the Hudson River was 8 inches thick.
- \* At North Platte, Nebraska, the ice on the Platte River was 16 inches thick.

On 25 January 1894, the minimum temperature at Ames, Iowa was -37° F (-38.3° C).<sup>111</sup>

In January 1894, more ice was reported [east of Newfoundland, *Canada*] than in any corresponding month during the previous 12 years. The southernmost ice reported was in N. 44° 27', W. 54° 15', on the 18<sup>th</sup>, and the position of the easternmost ice was reported in N. 44° 48', W. 46° 14', on the 21<sup>st</sup>.<sup>116</sup>

On 27 January 1894, heavy snowstorms occurred over New England and New York in the *United States*, delaying traffic. At Provincetown, Massachusetts, trees were broken from the weight of the snow and damage was done to electric wires. At Nantasket Beach, Massachusetts, the coast was strewn with wreckage.<sup>116</sup>

On 29-30 January 1894, a severe gale and snowstorm prevailed over New England and the Middle Atlantic States in the *United States*. At Eastport, Maine, the storm began the evening of the 29<sup>th</sup>, and by 6:55 a.m. of the 30<sup>th</sup>, the wind had reached a maximum velocity of 78 miles per hour and an extreme velocity of 90 miles. There was very little shipping in port, and the tide being unusually low, the damage was not very great. The storm was the most severe since September 1869. At Gloucester, Massachusetts, a heavy southeast gale prevailed during the 29<sup>th</sup>; a vessel was wrecked near Eastern Point. All along the New England coast a number of vessels were damaged. At Atlantic City, New Jersey, the wind attained a maximum velocity of 52 miles per hour and an extreme velocity of 60 miles; damage was done to electric wires. Throughout New York and Pennsylvania the snow was exceptionally heavy, and caused great delay to traffic and damage to electric wires. At Baltimore, Maryland, the wind reached a maximum velocity of 48 miles per hour from the west. The storm was the most severe in years. One person was blown down and considerably injured and another injured by flying debris. Considerable damage was done to property.<sup>116</sup>

Heavy snowstorms struck across the *United States* on 11 & 12 February 1894. On 11 February, a heavy drifting snowstorm set in over Topeka, Kansas, delaying railroad and streetcar traffic. At Dodge City, Kansas, the most severe norther [a sudden cold gale coming from the North], accompanied by the heaviest snow that has visited that section in years, began in the early morning. No trains on the Santa Fe railroad arrived until 6 p.m. on the 12<sup>th</sup>. Cattle were lost and livestock on the plains suffered badly. On the 12<sup>th</sup>, high winds and heavy snowstorms extended from New England to the Mississippi Valley, delaying traffic and causing damage to property. Shipwrecks occurred along the New England and New

Jersey coasts, and in some cases were attended by loss of life. At Buffalo, New York, the storm was the most severe in the history of that station. It began on the February 12<sup>th</sup> at 7:35 a.m., and continued until the morning of the 13<sup>th</sup>. The snow, which was light and feathery, was drifted by the high wind in some sections to a depth of 4 to 5 feet. At Toledo, Ohio, snow began at 7:05 a.m., with a gale reaching a maximum velocity of 60 miles per hour from the northeast, and sometimes reached an extreme of 88 miles per hour; the storm was the heaviest ever experienced; the Weather Bureau observer at that place reports that snowdrifts in some places reached 8 feet high; considerable damage was done by high wind, and traffic was suspended; the gale caused the water in the river to rise rapidly, flooding docks and cellars. The heaviest storm in the history of Chicago, Illinois began in the early morning; snow began at 5:30 a.m., and continued during the day; the wind averaged nearly 70 miles an hour from the northeast for more than ten hours and reached a maximum velocity of 84 miles at 11 a.m.; damage was done to the amount of \$250,000. [In present currency, that would be equivalent to \$6.2 million in damages based on the Consumer Price Index (CPI) inflation rates.] At Detroit, Michigan, snow began at 9:20 a.m., and continued during the day, accompanied by high wind; trains were delayed throughout the State, and business in general suffered. At Port Huron, Michigan, snow began at 9:51 a.m., with high winds, reaching a maximum velocity of 48 miles per hour; the wind did not go below 40 miles an hour during the afternoon, drifting the snow in some places to a depth of 6 feet. At Milwaukee, Wisconsin, snow began during the early morning, accompanied by a gale of 42 miles per hour, drifting the snow badly. The storm was general throughout Iowa, Kansas, and Missouri, and traffic was greatly delayed.<sup>116</sup>

On 12 February 1894, violent blizzard struck the west of *United States*.<sup>94</sup>

A heavy "Pogonip" occurred at Magill, Nevada in the *United States* on 13 February 1894.<sup>116</sup>

On 24-26 February 1894, unusually severe snow and sleet storms prevailed from Massachusetts over the south Atlantic States, and extended over the Ohio Valley and Tennessee to Texas in the *United States* attended by heavy gales from the New England to the North Carolina coasts. The total depth of snowfall from this storm in the Southern States were: Florence, Alabama received 8 inches of snow; Newburg, Alabama received 9 inches; Osceola, Arkansas received 7 inches; Rison, Arkansas received 8 inches; Lafayette, Georgia received 9 inches; Atlanta, Georgia received 6 inches; Plain Dealing, Louisiana received 3.2 inches; Liberty Hill, Louisiana received 3 inches; Aberdeen, Mississippi received 7 inches; Pontotoc, Mississippi received 6 inches; Shelby, North Carolina received 16 inches; Bakersville, North Carolina received 14 inches; Effingham, South Carolina received 8.5 inches; and Yorkville, South Carolina received 8 inches.<sup>116</sup>

On 6 March 1894, the steamer *Teutonic* met with a gigantic ocean wave that swept over the vessel while steaming westward in the *Atlantic Ocean* from Europe to America.<sup>116</sup> [The *Teutonic* was a luxury liner from the White Star Line. Her length was 582 feet, constituting her the largest ship afloat at the time; breadth, 57 feet 6 inches; depth, 39 feet 4 inches, with a gross tonnage of 9,686 tons. The ship was referred to as a 10,000-ton racer. In September 1889 it made the voyage from Queenstown [Cobh, Ireland] to Sandy Hook [New Jersey] in 6 days, 7 hours and 14 minutes despite running through the teeth of a powerful hurricane.]

A great cold wave passed over Wyoming in the *United States* on 22-27 March 1894. It caused a continuous blizzard of seventy hours at Buffalo, Wyoming.<sup>116</sup>

A very severe cold wave passed through the South in the *United States* towards the latter part of March 1894. Freezing temperatures were reported in Arkansas beginning on 25 March for four consecutive nights. At Augusta, Georgia, the temperature fell to 25° F on the 27<sup>th</sup> and on the 28<sup>th</sup> there was another hard frost killing all the tender vegetation and fruits. Savannah, Georgia estimated the damage in the immediate vicinity was \$100,000 [\$2.5 million in today's dollars]. The cold spell of the 25-30<sup>th</sup> in

Mississippi at the critical period proved very disastrous to farming operations. Corn was cut to the ground. Peaches, pears, plums, pecans, grapes and the first crop of strawberries were killed, even to the coast. As an indication of the severity of the cold it is worthy of note that hickory nuts, acorns and young fruit trees was believed killed in the northern portions of the Mississippi. In Tennessee, the cold wave of March 26 and 27 killed fruit, vegetables, young clover, oats, tobacco plants in some localities, and seriously damaged wheat and Irish potatoes. In West Virginia, the hard freeze on the morning of the 26<sup>th</sup>, a hoar frost on the 27<sup>th</sup> and a killing frost on the 28<sup>th</sup> proved very destructive to all forms of vegetation, in many instances being almost fatal as far as a future crop was concerned. South Carolina was hit hard by the cold wave. The Director of the South Carolina State Weather Service has summarized the reports of damage done by the cold weather of March 26, 27, and 28, received by him from 106 stations fairly distributed over the 35 counties of that State as follows:<sup>116</sup>

Apricots and peaches — totally destroyed 84 reports; partially destroyed 6 reports  
 Figs and pears — totally destroyed 80 reports; partially destroyed 7 reports  
 Pomegranates and plums — totally destroyed 77 reports; partially destroyed 6 reports  
 Apples — totally destroyed 61 reports; partially destroyed 27 reports  
 Raspberries, strawberries, and blackberries — totally destroyed 66 reports; partially destroyed 11 reports  
 Rye and wheat — totally destroyed 2 reports; partially destroyed 38 reports.  
 Oats — totally destroyed 1 report; partially destroyed 46 reports  
 Corn — totally destroyed 21 reports; partially destroyed 25 reports  
 Melons, potatoes, cabbage, and garden truck — totally destroyed 84 reports; partially 8 reports  
 Grapes — totally destroyed 89 reports

Compared with April 1893, there was a marked increase in the quantity of ice reported in the North Atlantic Ocean [east of Newfoundland, *Canada*] in 1894. Ice was reported every day during the month except on April 13<sup>th</sup> to 15<sup>th</sup>.<sup>116</sup>

— On the 7<sup>th</sup>, the British bark *Ruth Palmer* collided with an iceberg off the Grand Banks and sunk. The crew were picked up by the French brigantine *Marie Gabrielle*, and landed at St. Pierre, Newfoundland on April 30<sup>th</sup>.

— On the 12<sup>th</sup>, the French steamship *Olbia* landed at St. Pierre, Canada much damaged by striking an iceberg on the voyage from Marseilles, France.

— On the 17<sup>th</sup>, the British steamship *Earncliffe* arrived at Halifax so much damaged by ice met outside of Halifax harbor that she had to go into dry dock. Extensive reefs of heavy field ice were reported on the eastern coast of Newfoundland.

— On the 18<sup>th</sup>, the British steamship *Valletta*, bound for St. John, New Brunswick, *Canada*, foundered in the ice 50 miles east of Halifax. Her crew was saved by the Norwegian bark *Liberte*.

— Reports state that easterly gales packed heavy ice on the shore and in the harbors of Cape Breton Island, blocking navigation even on the southern coast. It was reported that ice was very heavy in the Gulf of St. Lawrence on the 18<sup>th</sup>. British steamship *Newfoundland*, which for several days had been jammed in the ice off Cow Bay, Cape Breton Island, got clear April 19<sup>th</sup>, and proceeded to Halifax, Nova Scotia, *Canada*. British steamship *Premier* was unable to reach her destined port at Montreal, *Canada* on account of ice, and returned to Halifax.

— On the 22<sup>nd</sup> reports state that Halifax harbor was completely blocked by heavy Gulf ice. Six steamers and 50 sail vessels were detained in port on account of ice. No such blockade has occurred in the past forty-two years.

— On the 24<sup>th</sup> British steamship *Sarmatian*, from Liverpool to Montreal, stopped at Halifax, being unable to get up the Gulf of St. Lawrence on account of ice. Leaving Halifax on the 25<sup>th</sup>, she encountered heavy field ice 60 miles northwest of Bird Rocks. She met pack ice 12 feet thick, covered with seals.

— On the 26<sup>th</sup>, the British schooner *Algeria* had her bows crushed in by the ice and sunk while attempting to make Renew's Harbor, south of St. Johns, Newfoundland.

— On the 30<sup>th</sup>, the British steamship *Pomeranian*, in N. 48° 10', W. 62° 30', sighted two fields of pack ice and a schooner fast in the middle of one of them.

On 10-12 April 1894, unusually severe snowstorms, accompanied by gales, prevailed over New England and the Middle Atlantic States in the *United States*, causing loss of life and damage to shipping. Along the Massachusetts coast several vessels were blown ashore. At Highland Beach, New Jersey, 2 vessels were lost and 15 persons drowned. The sea was very heavy all along the New York and New Jersey coasts, and much damage was done to property. The depth of snow that fell during the storm was:

Darlington, Maryland - 24 inches; Fallston, Maryland - 24 inches; Chester, New Jersey - 21 inches; Addison, New York - 26 inches; Angelica, New York - 28 inches; Bedford, New York - 24 inches; Factoryville, New York - 26.5 inches; Le Roy, New York - 30 inches; Perry City, New York - 27.2 inches; South Canisteo, New York - 28.8 inches; Varysburg, New York - 26.0 inches; Wedgwood, New York - 26 inches; Aqueduct, Pennsylvania - 21 inches; Coatesville, Pennsylvania - 29.2 inches; Hamburg, Pennsylvania - 26 inches; Kilmer, Pennsylvania - 28 inches; Le Roy, Pennsylvania - 27.5 inches; Lewisburg, Pennsylvania - 25 inches; Lock Haven, Pennsylvania - 25.9 inches; Salem Corners, Pennsylvania - 31.5 inches; Selinsgrove, Pennsylvania - 28.5 inches; Wellsboro, Pennsylvania - 21.5 inches; York, Pennsylvania - 26 inches.<sup>116</sup>

On 10-11 April 1894, there was a severe gale on the coast of New Jersey in the *United States*, and heavy fall of snow.<sup>94</sup>

On 18 May 1894, a severe storm struck Lake Michigan in the *United States*. At Chicago, Illinois, this was the most severe storm in the history of the weather station. Snow fell with the rain during the storm. The wind was extremely gusty, blowing at the rate of 30 miles per hour one minute and 65 the next. Many vessels were caught on Lake Michigan and prevented from entering the harbor by the heavy seas; disasters were numerous and 10 lives were lost; the schooners *Evening Star*, *S. G. Mixer*, *Myrtle*, *Lincoln Dall*, *Jack Thompson*, *J. Loomis*, *McLaren*, *Mercury*, and *Rainbow* were total wrecks. The damage caused by this storm exceeded \$100,000 [\$2.5 million in today's dollars], without counting the damage to the right of way of the Illinois Central Railway, which amounted to many thousands more. A report from Alpena, Michigan, states that a heavy north gale and snowstorm prevailed over Middle Island; a raft in tow of the tug *John Owens* went ashore north of Middle Island. The schooner *American Union* that had earlier washed ashore on the 7<sup>th</sup> at Thompsons Harbor, 25 miles north of Alpena, went to pieces; loss of \$10,000. A severe northeast snowstorm swept over Boon, Michigan, continuing throughout the day; snow fell to a depth of 4.0 inches; much timber was broken from the weight of snow. At Port Huron, Michigan, a gale began in the afternoon and continued throughout the 19<sup>th</sup>. A schooner became water-logged a few miles north and went ashore; in the attempts to reach the vessel 4 persons were drowned; the crew were finally saved by the Life-Saving Service, but the vessel and cargo were a total loss. The storm was exceptionally heavy at Green Bay, Wisconsin; the water in the river, blown by the high wind, attained the highest point on record.<sup>116</sup>

An unusually heavy snowfall prevailed throughout the eastern and southern portions of Kentucky in the *United States* on the 19<sup>th</sup> and 20<sup>th</sup> of May. At Carlisle, Somerset, Lexington, Mount Sterling, and Corbin, Kentucky where the snow was from 3 to 8 inches deep, the snow fell while the temperature of the air was between 35° F and 40° F, which was unusually high. No snow had fallen in these regions in the month of May since 1854.<sup>116</sup>

---

**1894 A.D.** On [4-9] January 1894, a cyclone struck off the coast Cossack (near Roebourne) in *Western Australia*. [Within the space of 4 days two cyclones passed through this region.] Forty to fifty people died, mainly at sea. Flooding caused by the cyclone added an additional 21 deaths in the Geraldton region.<sup>99</sup>

In February 1894, there was flood in *Western Australia*. It was one of the greatest floods known in this part of *Australia*. The flood affected the regions around Bunbury, Derby, Fitzroy Crossing, and Halls Creek. The flood affected many rivers including the Ord, Margaret, Lennard, Barker and Fitzroy rivers. At least 25,000 sheep were lost and 5 people drowned.<sup>99</sup>

The month of February 1894 produced a remarkable number of electrical phenomena throughout the *Hawaiian Islands*. There were eight distinct thunderstorms during the month at Honolulu and nearly all unusually heavy for this region. One of these storms produced a significant amount of chain lightning.<sup>116</sup>

[Chain lightning or bead lightning is a form of lightning of longer duration than more typical lightning strikes. Chain lightning appears as a string of luminous segments instead of a continuous channel. It occurs infrequently.]

On 4 February 1894, a typhoon was observed in *Madagascar* and the Indian Ocean off the southeast coast of Africa.<sup>116</sup>

On 11-12 February 1894, a southwest gale struck over the British Isles. There was much damage on land, 6 persons killed, and many [ship] wrecks.<sup>94</sup>

On 12-13 February 1894, there was a great storm over *Europe* and the *United States*.<sup>94</sup>

On 21-23 February 1894, a typhoon was observed off the coast of *Japan*.<sup>116</sup>

On 28 April 1894, there was an overflow of the River Noire, near Quebec, *Canada* caused by a landslide. This flood caused about 20 deaths. Many livestock and much property were destroyed.<sup>97</sup>

On 11 May 1894, a severe hailstorm struck Vicksburg, Mississippi in the *United States*. One of the remarkably large hailstones had a solid nucleus, consisting of a piece of alabaster from one-half to three-quarters of an inch. During the same storm at Bovina, 8 miles east of Vicksburg, a gopher turtle, 6 by 8 inches, was entirely encased in ice, and fell with the hail.<sup>116</sup>

On 14 May 1894, a thunder and hail storm of short duration struck Fresno, California in the *United States* causing damage to fruit and grain. In the mountains, on the east side of Fresno County, the storm was reported very severe, and over 4,000 sheep were frozen to death.<sup>116</sup>

On 15-17 May 1894, there were destructive floods in Wisconsin in the United States and other places. Bridges were destroyed and railway traffic stopped. The waters began receding on 22 May 1894.<sup>97</sup>

The year 1894 in Bradford County, Pennsylvania in the *United States* was notably for the warm June; destructive electrical storms in July; and severe drought in August. Four days of almost incessant rain from 18-21 May 1894 put the Susquehanna River on a rampage causing considerable flood damage. June was one of the warmest in years and July notable for electrical storms, during which many barns were struck and burned and horses and cattle killed. August (with the exception of August 1881) was the driest in 16 years. Thus a wet May was followed by three months of severe drought, causing short crops and scant pastures.<sup>178</sup>

There were destructive floods in the Punjab, *India* in May; and in *Hungary* in June 1894.<sup>97</sup>

During May 1894 in the *United States*, 45 persons were killed by lightning; 34 persons were struck and severely injured; 12 barns were set on fire, with an estimated loss of \$35,000; 37 dwellings, 4 churches, and 1 schoolhouse were struck and damaged to greater or less extent; 58 horses and 22 cows were killed. During June 1894, 96 persons were killed and 102 severely injured by lightning; 69 barns were struck, with an estimated loss of \$49,000; 49 horses, 30 cows, and 15 sheep were killed; 80 dwellings were struck and more or less damaged; 22 churches, 1 railroad depot, 1 oil tank, 1 grain elevator, and 6 mills and factories were struck, the damage in the case of the eight last named being not less than \$257,500 [\$6.4 million in today's dollars]. During July 1894, 59 lives were lost and 94 persons injured by lightning; 41 barns, with a minimum loss of \$45,000, were struck; 33 dwellings, 12 churches, 2 academies, 3 mills or factories, and 2 railroad depots were struck; 24 horses, 13 cows, 5 mules, and 6 sheep were killed. During August 1894, 78 lives were lost and 76 persons injured by lightning; 81 barns, with a minimum loss of \$129,800 [\$3.2 million in today's dollars], were struck; 41 dwellings, 5 churches,

2 academies, and 2 mills or factories were struck; 22 horses and 15 cows, not in stables, were killed. During September 1894, 29 persons were killed and 14 severely injured by lightning; 56 barns were struck, with a loss of not less than \$141,350 [\$3.5 million in today's dollars]; 42 dwelling houses were struck and a number of churches, several schoolhouses, 1 armory, and 1 railroad depot. During October 1894, 7 persons were killed and 2 severely injured by lightning; 2 barns, 2 dwellings, 3 churches, and 2 car stables burned.<sup>116</sup>

On 3 June 1894, a tornado passed through the counties of Harney, Grant and Union in eastern Oregon in the *United States*. There was a very unusual hailstorm that accompanies the tornado. The formation was more in the nature of sheets of ice than simple hailstones. The sheets of ice averaged 3 to 4 inches square and from  $\frac{3}{4}$  of an inch to  $1\frac{1}{2}$  inches thick. They had smooth surface and in falling gave the impression of a vast field or sheet of ice suspended in the atmosphere and suddenly broken into fragments about the size of the palm of the hand.<sup>116</sup>

On 7 June 1894, there was a violent hailstorm at Vienna, *Austria* and other parts of *Hungary*, with loss of life, vineyards destroyed.<sup>94</sup>

On 27 June 1894, violent local storms, with characteristics of tornadoes, occurred at the following places in Minnesota and South Dakota in the *United States*: Cedar Mills, Cold Springs, Willmar, Colledgeville, Echo, Sleepy Eye, Fergus Falls, Forest City, Holland, Litchfield, Minneapolis, Montrose, Raymond, St. Paul, Selma, and Pipe Stone, Minnesota; Aberdeen, Alpena, Bath, Bonilla, Huron, Hitchcock, St. Lawrence, and Sisseton Agency, South Dakota. Ten persons were killed in Minnesota and 6 in South Dakota.<sup>116</sup>

The following are the highest temperatures observed during July 1894 in the *United States*:<sup>116</sup>

Montgomery, Alabama	( 98° F, 36.7° C)
Mobile, Alabama	( 95° F, 35.0° C)
Tucson, Arizona	(106° F, 41.1° C)
Yuma, Arizona	(113° F, 45.0° C)
Little Rock, Arkansas	(103° F, 39.4° C)
Fort Smith, Arkansas	(105° F, 40.6° C)
San Francisco, California	( 76° F, 24.4° C)
San Diego, California	( 77° F, 25.0° C)
Sacramento, California	(104° F, 40.0° C)
Denver, Colorado	( 96° F, 35.6° C)
Pueblo, Colorado	( 97° F, 36.1° C)
New Haven, Connecticut	( 94° F, 34.4° C)
New London, Connecticut	( 90° F, 32.2° C)
Wilmington, Delaware	(101° F, 38.3° C)
Washington, D.C.	( 97° F, 36.1° C)
Pensacola, Florida	( 93° F, 33.9° C)
Key West, Florida	( 90° F, 32.2° C)
Augusta, Georgia	( 92° F, 33.3° C)
Savannah, Georgia	( 94° F, 34.4° C)
Payette, Idaho	(107° F, 41.7° C)
Lewiston, Idaho	(105° F, 40.6° C)
Chicago, Illinois	( 96° F, 35.6° C)
Cairo, Illinois	( 95° F, 35.0° C)
Indianapolis, Indiana	( 97° F, 36.1° C)
Lafayette, Indiana	(100° F, 37.8° C)
Dubuque, Iowa	(102° F, 38.9° C)
Keokuk, Iowa	(102° F, 38.9° C)
Logan, Iowa	(110° F, 43.3° C)

Topeka, Kansas	(101° F, 38.3° C)
Elk City, Kansas	(115° F, 46.1° C)
Dodge City, Kansas	(106° F, 41.1° C)
Louisville, Kentucky	( 96° F, 35.6° C)
Lexington, Kentucky	( 93° F, 33.9° C)
New Orleans, Louisiana	( 99° F, 37.2° C)
Shreveport, Louisiana	(101° F, 38.3° C)
Eastport, Maine	( 91° F, 32.8° C)
Portland, Maine	( 97° F, 36.1° C)
Baltimore, Maryland	( 97° F, 36.1° C)
Boston, Massachusetts	( 97° F, 36.1° C)
Nantucket, Massachusetts	( 85° F, 29.4° C)
Marquette, Michigan	(100° F, 37.8° C)
Detroit, Michigan	( 96° F, 35.6° C)
Saint Vincent, Minnesota	(100° F, 37.8° C)
Saint Paul, Minnesota	(100° F, 37.8° C)
Vicksburg, Mississippi	(100° F, 37.8° C)
Saint Louis, Missouri	( 98° F, 36.7° C)
Billings, Montana	(103° F, 39.4° C)
Helena, Montana	( 94° F, 34.4° C)
North Platte, Nebraska	(103° F, 39.4° C)
Omaha, Nebraska	(106° F, 41.1° C)
Winnemucca, Nevada	( 94° F, 34.4° C)
Carson City, Nevada	( 90° F, 32.2° C)
West Milan, New Hampshire	( 90° F, 32.2° C)
New Brunswick, New Jersey	(100° F, 37.8° C)
Cape May, New Jersey	( 90° F, 32.2° C)
Santa Fe, New Mexico	( 84° F, 28.9° C)
Albany, New York	( 97° F, 36.1° C)
New York City, New York	( 96° F, 35.6° C)
Charlotte, North Carolina	( 93° F, 33.9° C)
Kitty Hawk, North Carolina	( 90° F, 32.2° C)
Bismarck, North Dakota	(101° F, 38.3° C)
Williston, North Dakota	(100° F, 37.8° C)
Cincinnati, Ohio	( 95° F, 35.0° C)
Columbus, Ohio	( 97° F, 36.1° C)
Oklahoma City, Oklahoma	(104° F, 40.0° C)
Fort Sill, Oklahoma	(108° F, 42.2° C)
Anadarko, Oklahoma	(114° F, 45.6° C)
Roseburg, Oregon	( 93° F, 33.9° C)
Portland, Oregon	( 94° F, 34.4° C)
Erie, Pennsylvania	( 91° F, 32.8° C)
Philadelphia, Pennsylvania	( 97° F, 36.1° C)
Block Island, Rhode Island	( 84° F, 28.9° C)
Charleston, South Carolina	( 91° F, 32.8° C)
Columbia, South Carolina	( 97° F, 36.1° C)
Shiloh, South Dakota	(113° F, 45.0° C)
Nashville, Tennessee	( 96° F, 35.6° C)
Knoxville, Tennessee	( 92° F, 33.3° C)
San Antonio, Texas	(106° F, 41.1° C)
Galveston, Texas	( 97° F, 36.1° C)
Salt Lake City, Utah	( 96° F, 35.6° C)
Burlington, Vermont	( 92° F, 33.3° C)
Lynchburg, Virginia	( 95° F, 35.0° C)
Norfolk, Virginia	( 94° F, 34.4° C)
Olympia, Washington	( 96° F, 35.6° C)

Spokane, Washington	( 95° F, 35.0° C)
Morgantown, West Virginia	( 97° F, 36.1° C)
Milwaukee, Wisconsin	( 96° F, 35.6° C)
La Crosse, Wisconsin	(100° F, 37.8° C)
Cheyenne, Wyoming	( 94° F, 34.4° C)

The following are the highest temperatures observed during July 1894: <sup>116</sup>

Ciudad Porfirio Díaz, <i>Mexico</i>	(104° F, 40.0° C)	(now Piedras Negras, Coahuila)
Leon de Aldamas, <i>Mexico</i>	( 88° F, 31.1° C)	(now León, Guanajuato)
Mexico City, <i>Mexico</i>	( 78° F, 25.6° C)	
Puebla, <i>Mexico</i>	( 79° F, 26.1° C)	
Topolobampo, <i>Mexico</i>	( 95° F, 35.0° C)	
Vera Cruz, <i>Mexico</i>	( 90° F, 32.2° C)	
Mazatlan, <i>Mexico</i>	( 90° F, 32.2° C)	
St. John, New Brunswick, <i>Canada</i>	( 77° F, 25.0° C)	
Hamilton, <i>Bermuda</i>	( 85° F, 29.4° C)	

On 26 & 27 July 1894, the maximum temperature at Spirit Lake, Iowa in the *United States* was 109° F (42.8° C).<sup>111</sup>

During the summer of 1894, there was a drought over the northern half of the *United States*. July 1894 was the driest month ever experienced in Iowa, breaking all previous records. Many areas in Iowa experienced temperature from 100° F to 109° F. The temperature in many areas of Iowa on the 26<sup>th</sup> was the highest for at least the past 33 years. There were many prairie and forest fires. Because of the excessive heat and the great deficiency of rainfall in July, the weather did great injury to the crops.<sup>116</sup>

There was a drought in Iowa and Missouri in the *United States* during the summer of 1894. The grass crop suffered most serious damage by the great drought of the past summer. The output of hay was cut short over 50% and the pastures were rendered practically worthless for grazing for a period of nearly three months. To a large extent the roots were destroyed by the intense heat and close grazing of the hungry stock. There was a general failure of the streams, reservoirs and wells, and dairymen were obligated to skirmish around at a lively rate to provide water as well as forage for their suffering herds.<sup>111</sup>

The great drought of 1894 in the *United States* began to show its effects about the middle of May, and during that month, the eastern and middle States and the northwestern States were saturated, while the Mississippi and Missouri valleys were comparatively dry. In June, there was a large amount of rainfall in the middle [Rocky Mountain] slope, and a great deficiency in the upper Mississippi valley and east Gulf States. In July, there were heavy rains in the south Atlantic and east Gulf States, and a general deficiency throughout the northern half of the *United States*, intensified in the west by the hot winds during the last week of the month. In August, the drought and hot weather covered the greater portion of the country, except the south Atlantic and Gulf States, which were saturated with excess; and there were also excessive rains in western Texas, causing heavy floods in the valley of the Rio Grande.<sup>111</sup>

The great drought of 1894 in the *United States* was not merely the drought of July and August but that of at least seven months or more. The deficit of rainfall in the various regions of the country at the end of 1893 were as follows: New England, 3.6 inches; middle Atlantic States, 1.3 inches; Ohio Valley and Tennessee, 2.9 inches; lower Lake region, 2.1 inches; upper Lake region, 2.6 inches; extreme northwest, 1.0 inch; upper Mississippi valley, 4.4 inches; Missouri Valley, 4.5 inches; northern slope, 2.5 inches; middle slope, 7.5 inches.<sup>116</sup>

The extensive fires during July and August 1894, principally in Minnesota, Wisconsin, Michigan, Pennsylvania, and New York in the *United States*, and the absence of extensive strong winds, had

conspired to cover a large portion of the country with an unusually thick cloud of smoke. The actual area covered by the forest fires of August did not exceed 5,000 square miles (3.2 million acres, 1.3 million hectares) whereas the area covered by the smoke was not less than 1,000,000 square miles (2.6 million square kilometers). This smoke overhung the country from Minnesota southward to Missouri and eastward to the Atlantic [Ocean].<sup>116</sup>

On 31 July 1894, New York in the *United States* reached a high temperature of 105° F (40.6° C).<sup>97</sup>

On 12 August 1894, there was a destructive cyclone at Herencia in central *Spain*, causing a great loss.<sup>94</sup>

On 13 September 1894, floods were reported at Lucknow in northern *India*. Houses were submerged underwater.<sup>97</sup>

On 20 September 1894, a tropical hurricane passed westward between *Dominica* and *Guadeloupe*. The center passed over the southern portion of San Domingo [Santo Domingo, *Dominican Republic*] and *Haiti* and along the southern coast of *Cuba*, finally crossing that island and emerging between Habana [Havana] and Matanzas, *Cuba* on the morning of the 24<sup>th</sup>; it passed northward between Key West and Tortugas, a little east of Titusville, Florida in the *United States* in the morning of the 26<sup>th</sup>, between Savannah, Georgia and Charleston, South Carolina on the morning of the 27<sup>th</sup>, near Morehead City, North Carolina on the morning of the 28<sup>th</sup>, and on the 30<sup>th</sup> the storm center was south of Rhode Island and east of New Jersey.<sup>116</sup>

On 23-25 September 1894, a hurricane struck *Cuba* causing 200 deaths.<sup>141</sup>

On 21 September 1894, there was a disastrous cyclone [tornado] over Iowa, Minnesota, and Wisconsin towns in the *United States*. It caused great destruction and much loss of life.<sup>94</sup>

On this evening and night of 21 September 1894, a very remarkable series of wind-rushes and tornadoes visited the northern part of Iowa, extreme southeast Minnesota, and west-central Wisconsin in the *United States*. Fifty-three lives were lost in Iowa and 5 in Minnesota. Losses to buildings were approximately as follows: In Iowa, Cerro Gordo County, \$3,000; Hancock County, \$40,000; Kossuth County, \$30,000 to \$50,000; Emmetsburg, \$7,000 to \$9,000; Fertile, \$1,000; New Haven, \$2,700; Osage, \$9,000; Ruthven, \$1,100; St. Ansgar, \$15,000; Thompson, \$3,500. In Minnesota: Eyota, \$2,000; Greenleaf, \$1,000; Homer, \$2,000; Hutton, \$700; Laird, \$2,000 to \$4,000; Le Roy, \$120,000; Spring Valley, \$59,875; Richland Center, Wisconsin, \$4,000. This makes the total estimated and reported loss as \$312,000; the whole loss was probably less than \$350,000. [In present currency, that would make the whole loss in the order of \$8.7 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>116</sup>

In October 1894, in general the rivers in the interior of the *United States* reached extreme low water levels during the month and in some cases, these were lower than at any time during the past fifty years.<sup>116</sup>

On 11 October 1894, a violent gale was reported off Newfoundland, *Canada*. There were many [ship] wrecks and loss of life.<sup>94</sup>

On 20-25 October 1894, there was a severe gale on the northeast coast of *England* and in the *British Channel*. Several vessels were driven ashore with loss of life. The gale also struck the *Bristol Channel*.<sup>94</sup>

On 23 October 1894, a severe drought was reported in New Orleans, Louisiana in the *United States*.<sup>97</sup>

On 31 October 1894, floods were reported in *France* and *Belgium*. About 100,000 hands [people] were out of work due to the floods.<sup>97</sup>

On 11-13 November 1894, there were destructive storms with much rain and floods in southeastern and western *England*, and on the *European Continent*. The storms stopped telegraphic communication.<sup>94</sup>

On 12-13 November 1894, there were heavy rains that caused the overflow of the River Avon at Bath, *England*. The floods caused much damage.<sup>97</sup>

On 15 November 1894, there was an overflow of the River Thames from Windsor to Oxford in *England*. Railway were stopped and there was much damage.<sup>97</sup>

On 20 December 1894 an electrical windstorm struck Port Laramie, Wyoming in the *United States* lasting from 10:15 a.m. until 7 p.m. The maximum velocity of wind occurred at about 1:30 p.m., when three houses were unroofed and substantial steel tower windmill was blown down.<sup>116</sup>

— The wind was phenomenal in that it would remove and break to pieces the most solid woodwork of buildings and leave adjoining frail parts of the woodwork undisturbed. Reliable information, obtained from over a section of country extending 12 miles south and 20 miles east, states that the electrical current was freely felt in many localities embraced in that area.

— Mr. Silas Doty, living 8 miles south, reports that he discovered a fence post on fire 200 yards north of his house, and upon going to it to extinguish the fire found it burnt more than half through where one of the fence wires was fastened, and partly burned where another wire was in contact with it. Other fence posts were slightly marked by the electric sparks.

— Mr. John P. Barnes, living 11 miles south of here, states that in going from his stable to his house he caught hold of a fence wire to assist him in walking against the strong wind and received a severe electric shock from which he was some time recovering. He had a strong healthy cow in a lot enclosed with wire fence. The wind drifted the cow into a corner against the fence and held her there, where Mr. Barnes found her dead late in the evening. He thinks that long contact with the heavily charged wires killed her, as there was no mark of violence or internal derangement to cause death.

— Mr. E. B. Hudson, 20 miles east of here, reports that two of his employees when going from work to house, soon after the commencement of the windstorm, were severely shocked when crossing a wire fence. One of the men caught hold of a wire and received a shock, which numbed and weakened his hand to such an extent that he was unable to take it from the wire but had to release it with his other hand. The injured hand and arm remained nearly helpless for several moments.

— The above account reminds one at first of the electricity attending the sand storms or the hot simoon, which is usually attributed to the friction of the particles of hot, dry sand. But electric phenomena is also observed in snowstorms that is formed in strong winds of dry, cold air, as has been frequently observed in North America, Kamchatka, Siberia, and Russia, and we may, therefore, attribute the electricity to the formation of snow, even though it be of small amount and mostly in the clouds above us.

On 21-22 December 1894, there was a violent gale over the *United Kingdom*, Holland [now *the Netherlands*] and *Belgium*. The gale caused great loss of life, much shipping and other property destroyed. The damage was especially severe in Liverpool, Hull, Leeds, Manchester, Belfast, Aberdeen, and other places.<sup>94</sup> [Liverpool, Hull, Leeds, and Manchester are located in *England*. Belfast is in *Northern Ireland*. Aberdeen is in *Scotland*.]

On 28-30 December 1894, another gale struck [*Great Britain*] with loss of life.<sup>94</sup>

In 1894 during the period 1-30 August, floods struck Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing and Hopei (now Hebei province) in northern *China* at Nan-yüeh. At T'ai-p'ing, the dikes were damaged. During the period between 1 August and 26 November, a severe drought engulfed Anhwei province at T'ai-p'ing.<sup>153</sup>

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

**Winter of 1894/ 1895 A.D.** There was a severe frost in *Britain* and on the [*European*] Continent. The cold began on 30 December 1894. It was mild from 14-21 January 1895. Then to 5 March 1895, there was [severe cold] and many deaths. On 9 February the temperature dropped down to 1° F (-17.2° C) in Loughborough in Leicestershire in east Midlands *England*, and 13° F (-10.6° C) in London, *England*.<sup>94</sup>

During the winter of 1894, very severe storms with heavy winds and snow prevailed in the *United Kingdom* and portions of the continent.<sup>111</sup>

At Thompson, Connecticut in the *United States*, the first snowstorm of the season in 1894 occurred on 5-6 November and was called the "election" snowstorm. It was the most severe in many years so early in the season. The depth of snow was 8 to 10 inches.<sup>116</sup>

During the winter of 1894-95 in Bradford County, Pennsylvania in the *United States*, there were light snowfalls in November. The first 22 days of December, the weather was unusually warm. Cold weather set in with a snowstorm on the 26<sup>th</sup>. The morning of the 29<sup>th</sup> was the coldest part of winter when the temperature in the county ranged from -16° F to -24° F [-27° C to -31° C]. January was very cold and sleighing was continuous from the end of December until February. A great four-days snowstorm and blizzard struck from 7-11 February. The storm created drifts 10 and 15 feet [3.0 – 4.6 m] deep and covered the roads everywhere. In cuts the snow was from 20 to 30 feet [6.1 – 9.1 m] and in one place 40 feet [12.2 m] deep. Such hills of snow had never before been known. On February 9<sup>th</sup>, temperatures dropped to -7° F [-22° C]. February was cold and a month of tremendous snowdrifts that blocked travel. Ice in the Susquehanna River passed out March 2<sup>nd</sup>. The first thunderstorm occurred on 25 March and the last snow squall on 15 April.<sup>178</sup>

On 27 and 28 December 1894, a cold wave swept down from the northwest carrying freezing temperatures to the Gulf of Mexico extending down to the Indian river country in Florida in the *United States*. The damage to the oranges and other fruit of that region amounted to millions of dollars. It was said to be the coldest weather experienced in that section within the past sixty years.<sup>111</sup>

Severe freezes in Florida in the *United States* occurred in the winters of 1747, 1766, 1774, 1799, 1828, 1835, 1850, 1857, 1880, 1884, 1886, 1894-95.<sup>137</sup>

On 27-29 December 1894, severe frost occurred in the southern portion of the *United States*. The low temperature and the severity of the frost in Florida were quite unprecedented in recent years, and the following extracts from the reports of observers are worthy of record:<sup>116</sup>

Montgomery, Alabama — December 28<sup>th</sup>, a light flurry of snow occurred in the morning. The temperature at 8 a.m. was 20° F. The day was bitter cold and blustery, causing considerable discomfort to people. The diurnal range of temperature was remarkably small, the maximum temperature only reached 23.2° F, which was the lowest maximum on record.

Mobile, Alabama — December 28<sup>th</sup>, freezing temperature prevailed all day, and much apprehension was felt over the safety of farm and garden produce. The 29<sup>th</sup>, very high pressure and cold weather, the minimum temperature being 16.1° F, second to the lowest that ever occurred at this station during the month of December.

Savannah, Georgia — December 29<sup>th</sup>, the temperature this morning fell to 12° F, the lowest ever recorded at this station in the month of December, and as low as ever recorded since the establishment of the Weather Bureau in 1871. 12° F was reached but once before, on January 12, 1886.

Jacksonville, Florida — December 27<sup>th</sup>, cold wave; temperature fell from 60° F at 8 a.m. of 26<sup>th</sup>, to 36° F at 8 a.m. on the 27<sup>th</sup>. The cold wave continued on the 28<sup>th</sup>, temperatures ranged from 27° F to 38° F: at midnight of the 28<sup>th</sup> the temperature had fallen to 19.5° F, and was going down at the rate of about 1° F an hour; from sunset to 10:30 p.m., ice three-quarters of an inch thick froze on a bucket of water on the office roof. On the 29<sup>th</sup>, the temperature fell to 14° F about 7 a.m., the lowest point recorded since the station was established, and 1.3° lower than the memorable freeze of January 12, 1886. The maximum temperature reached on the 29<sup>th</sup> was 34° F; ice 2½ inches thick froze on water in a bucket in the office.

Titusville, Florida — December 29<sup>th</sup>, the temperature fell rapidly during the night, minimum being 18.5° F, which was the lowest recorded at this station since it was established, and probably the lowest that has occurred in a great many years. At 8 a.m. the temperature was 20° F and partly cloudy, with brisk northwest winds which kept up during the greater part of the day.

Tampa, Florida — December 29<sup>th</sup>, weather last night was extremely cold, and this morning a minimum temperature of 18.9° F was recorded. This was 1° F lower than the minimum of January 1880. Everything in the shape of vegetation was frozen. Ice to the thickness of from 1½ to 2 inches was general, and in several dwellings ice formed to the thickness of ½ an inch. On the 30<sup>th</sup>, freezing weather continued throughout the night, the minimum temperature at 8 a.m. was 22.9° F.

Jupiter, Florida — December 29<sup>th</sup>, coldest weather since the establishment of the station in 1888. Minimum temperature, 24° F. Next coldest day, 3 March 1890, minimum temperature 33° F.

Key West, Florida — December 29<sup>th</sup>, day opened cloudy and very cold; cleared between 9 and 10 a.m., and remained clear. At 11 a.m., the minimum temperature, 43.6° F was recorded; after this there was a slow but steady rise. Since the establishment of this station 43.6° F was the lowest temperature recorded during the month of December.

The following are the lowest temperatures observed during January 1895 in the *United States*:<sup>115</sup>

Montgomery, Alabama	( 15° F, -9.4° C)
Mobile, Alabama	( 21° F, -6.1° C)
Tucson, Arizona	( 28° F, -2.2° C)
Yuma, Arizona	( 35° F, +1.7° C)
Little Rock, Arkansas	( 12° F, -11.1° C)
Fort Smith, Arkansas	( 5° F, -15.0° C)
San Francisco, California	( 38° F, +3.3° C)
San Diego, California	( 36° F, +2.2° C)
Denver, Colorado	( -7° F, -21.7° C)
Pueblo, Colorado	( -7° F, -21.7° C)
New Haven, Connecticut	( 5° F, -15.0° C)
New London, Connecticut	( 7° F, -13.9° C)
Wilmington, Delaware	( 12° F, -11.1° C)
Washington, D.C.	( 4° F, -15.6° C)
Pensacola, Florida	( 22° F, -5.6° C)
Key West, Florida	( 53° F, +11.7° C)
Augusta, Georgia	( 11° F, -11.7° C)
Savannah, Georgia	( 23° F, -5.0° C)
Swan Valley, Idaho	(-31° F, -35.0° C)
Lewiston, Idaho	( 2° F, -16.7° C)
Chicago, Illinois	( -9° F, -22.8° C)
Cairo, Illinois	( -2° F, -18.9° C)
Indianapolis, Indiana	(-13° F, -25.0° C)
Lafayette, Indiana	(-24° F, -31.1° C)
Dubuque, Iowa	(-20° F, -28.9° C)
Keokuk, Iowa	(-11° F, -23.9° C)
Topeka, Kansas	( -8° F, -22.2° C)
Dodge City, Kansas	( 2° F, -16.7° C)
Louisville, Kentucky	(-10° F, -23.3° C)
Lexington, Kentucky	(-12° F, -24.4° C)
New Orleans, Louisiana	( 27° F, -2.8° C)
Shreveport, Louisiana	( 18° F, -7.8° C)
Eastport, Maine	( -4° F, -20.0° C)
Portland, Maine	( -4° F, -20.0° C)
Baltimore, Maryland	( 9° F, -12.8° C)
Boston, Massachusetts	( 4° F, -15.6° C)
Nantucket, Massachusetts	( 10° F, -12.2° C)
Marquette, Michigan	(-10° F, -23.3° C)
Detroit, Michigan	( -4° F, -20.0° C)

Saint Vincent, Minnesota	(-32° F, -35.6° C)
Saint Paul, Minnesota	(-22° F, -30.0° C)
Vicksburg, Mississippi	( 19° F, -7.2° C)
Saint Louis, Missouri	( -8° F, -22.2° C)
Billings, Montana	(-32° F, -35.6° C)
Helena, Montana	(-15° F, -26.1° C)
North Platte, Nebraska	(-11° F, -23.9° C)
Omaha, Nebraska	(-12° F, -24.4° C)
Winnemucca, Nevada	(-14° F, -25.6° C)
Carson City, Nevada	( -4° F, -20.0° C)
West Milan, New Hampshire	(-29° F, -33.9° C)
New Brunswick, New Jersey	( 8° F, -13.3° C)
Cape May, New Jersey	( 15° F, -9.4° C)
Santa Fe, New Mexico	( -4° F, -20.0° C)
Albany, New York	( -4° F, -20.0° C)
New York City, New York	( 10° F, -12.2° C)
Charlotte, North Carolina	( 3° F, -16.1° C)
Kitty Hawk, North Carolina	( 22° F, -5.6° C)
Bismarck, North Dakota	(-32° F, -35.6° C)
Williston, North Dakota	(-36° F, -37.8° C)
Cincinnati, Ohio	(-10° F, -23.3° C)
Columbus, Ohio	( -8° F, -22.2° C)
Oklahoma City, Oklahoma	( -1° F, -18.3° C)
Fort Sill, Oklahoma	( -6° F, -21.1° C)
Roseburg, Oregon	( 20° F, -6.7° C)
Portland, Oregon	( 25° F, -3.9° C)
Erie, Pennsylvania	( -5° F, -20.6° C)
Philadelphia, Pennsylvania	( 10° F, -12.2° C)
Block Island, Rhode Island	(-10° F, -23.3° C)
Charleston, South Carolina	( 22° F, -5.6° C)
Columbia, South Carolina	( 10° F, -12.2° C)
Yankton, South Dakota	(-16° F, -26.7° C)
Nashville, Tennessee	( -3° F, -19.4° C)
Knoxville, Tennessee	( -3° F, -19.4° C)
San Antonio, Texas	( 25° F, -3.9° C)
Galveston, Texas	( 31° F, -0.6° C)
Salt Lake City, Utah	( 0° F, -17.8° C)
Burlington, Vermont	( -9° F, -22.8° C)
Lynchburg, Virginia	( -3° F, -19.4° C)
Norfolk, Virginia	( 15° F, -9.4° C)
Olympia, Washington	( 25° F, -3.9° C)
Spokane, Washington	( 10° F, -12.2° C)
Morgantown, West Virginia	(-11° F, -23.9° C)
Milwaukee, Wisconsin	(-12° F, -24.4° C)
La Crosse, Wisconsin	(-17° F, -27.2° C)
Cheyenne, Wyoming	(-12° F, -24.4° C)

The following are the lowest temperatures observed during January 1895 in the *Mexico*:<sup>115</sup>

Ciudad Porfirio Díaz	( 28° F, -2.2° C) (now Piedras Negras, Coahuila)
Leon de Aldamas	( 32° F, 0.0° C) (now León, Guanajuato)
Mexico City	( 33° F, 0.6° C)
Puebla	( 39° F, 3.9° C)
Topolobampo	( 55° F, 12.8° C)

On the night of 11/12 January 1895, an unusual weather phenomena, called a snowdust storm, struck Indiana, Kentucky and southern counties of Illinois in the *United States*. Over 100 weather monitors reported this phenomenon. The dust appears to have been intermingled with the snow as it fell. Samples were sent to the Division of Vegetable Pathology for analysis. The dust analysis indicated, "The soil is made up of silt, mixed with organic matter. A number of fresh water algae could be distinguished; through they had evidently been dead and dried for a long time. Two of these, viz, Coleochaete and a Desmid, possibly *Closterium*, indicate that the source of the 'dirt' was the bottom of some shallow lake, pond, or marsh that dried up."<sup>115</sup> [In the 1960's in Dallas, Texas, I witnessed a similar strange weather phenomena, a mud storm. It rained mud for approximately 15 minutes, coating everything with about 1/8<sup>th</sup> inch of mud. It was caused by a collision of a rainstorm and a dust storm.]

The winter at Ivigtût [now Ivittut], *Greenland* has been very mild during the winter of 1894-95, so that it was possible to work in the open mines until January 10, when the winter commenced, but without severe frost. "We believe this season will form an exceptional one in the Arctic, and it will be possible for a ship to reach whale Sound without much difficulty. The winter was so mild the ice did not solder and was constantly moving south; hence its early appearance (February 22) along the southwestern coast of Greenland. Our ships have been trading to Ivigtût for the past eighteen years, and the mild winter and early appearance of ice on the coast is a rare exception."<sup>115</sup>

---

#### **1895 A.D. – 1903 A.D. Australia. Drought**

Between 1895-1903 a severe drought struck *Australia*. The drought was most devastating in terms of livestock losses. The drought caused the population of sheep to be cut in half and the population of cattle was cut by 40%.<sup>99</sup>

An Australian newspaper in 1900 reported:<sup>100</sup>

The last four years were known in the eastern colonies of Australia as the Great Australian drought.

Draw a line from Lake Torrens in South Australia, in a southeasterly direction into New South Wales; continue it at a distance of about 50 miles north of the Murray as far as Deniliquin, and then extend it right through New South Wales and Queensland, at a distance of about 300 miles from the coast, until it bends round to the northern territory of South Australia. On the coast side of that line the seasons have been fairly normal. On the inland side of that line there has, until quite recently, been practically no rain for four or five years.

Half of New South Wales and Queensland is now a veritable desert, where sheep and cattle have perished in millions. Everywhere the ground is absolutely destitute of herbage. This condition prevails over a portion of land equivalent in size to France or Spain. Since the beginning of the drought there have several times been sufficient falls of rain to germinate the grass seed in the bare soil; but the new herbage has immediately been cut down with frosts, burnt up with the sun, or eaten off by the starving survivors of the sheep and the rabbits.

During 1895-1903, *Australia* experienced a national drought.<sup>101</sup>

The severe drought affected all areas of New South Wales. Central and southern regions were badly hit. The drought was most severe from September 1901 to November 1902. The Lachlan River stopped flowing at Condobolin. The Macquarie River dried up at Bathurst and above Warren. Lake George was almost dry by September 1902. Livestock losses were heavy. The number of cattle dropped by 1.5 million head. In 1902 the wheat yield was down to 3.28 bushels per acre, which was a record low.<sup>101</sup>

The drought also affected Tasmania, *Australia*. The state was very dry, especially in the north until 1902. In 1897, there were severe brushfires.<sup>101</sup>

The drought was very severe on the coast of Queensland. By 1899, the drought was prevalent in central Queensland and by 1902 the central and southeastern regions were affected. Between 1893 and 1902, the population of sheep was reduced by 14.5 million, and cattle fell by 4 million. In 1902, the wheat yield was down to 3.28 bushels per acre. Sugar cane production also declined.<sup>101</sup>

The drought severely affected the northern regions of Victoria, especially between April and November 1902. Gippsland and the western areas of Victoria were also affected. River transport on the Murray River halted between Echuca and Murray Bridge. Water for irrigation was cut off. Even drinking water in the Mallee was almost exhausted by May of 1902. Between 1894 and 1904, the population of sheep was reduced by 3 million. During 1902-03, the wheat yield was down to 1.29 bushels, the lowest since recordkeeping began to that date.<sup>101</sup>

The drought severely affected the entire region of South Australia. By 1896, the region was experiencing heavy livestock and crop losses. By 1902, the region that was formally pastureland became a desert. In 1902, the sheep population was down to 4.88 million, the lowest since 1872. During 1896-97, the wheat yield was down to 1.66 bushels per acre, the lowest since recordkeeping began to that date.<sup>101</sup>

Between 1891 and 1903, the coastal, northern and central regions of Western Australia were severely affected by the drought.<sup>101</sup>

Between 1896-1903 the drought was severe in the central regions of the Northern Territory. Heavy summer rains provided some relief in 1898 and 1901. Between 1897 and January 1903, the population of sheep was reduced by greater than 50% in the Northern Territory.<sup>101</sup>

The dryness of this drought may have exasperated brush fires. For a week, the Hobart area in Tasmania, *Australia* had bushfires that became very dangerous on 31 December 1897. At least 6 people died in the fires, which began on Mt. Wellington and moved quickly southwards to Longley, Sandfly, Kettering, Woodbridge and Gordon. Colebrook, north of Hobart, also had serious fires. At Longley, towards Huon, 22 settlers were burnt out; including the Longley Hotel, coaching stables, the police station, 2 churches & private residences. At Kettering, in the vicinity of Oyster Cove, 21 homesteads were destroyed & 2 men died in the fires.<sup>99</sup>

On 31 December 1897, there was a three-day bushfire in Tasmania, *Australia* later known as *Black Friday*. The bushfire killed 6 people, hundreds of animals and destroyed many houses and buildings. The fires began on Mount Wellington, then spread south to Langley, Sandfly, Kettering, Woodridge and Gordon. Another bushfire spread from Colebrook to the north of Hobart.<sup>101</sup>

In January 1898 in Victoria, *Australia*, brushfires burned for more than a week in Gippsland and Gisborne.<sup>101</sup>

The *Red Tuesday* bushfires, which began in February 1898, were widespread throughout South Gippsland in Victoria, *Australia* causing twelve deaths, over 2,000 buildings destroyed and 642,500 acres (260,000 hectares) burnt. There were 15,000 people affected by the fires and 2,500 people made homeless.<sup>99</sup>

A heat wave in the nation's southern regions of *Australia*, from December 1895 to January 1896, killed 437 people and injured about 5,000. At Bourke, western New South Wales alone, it lasted 13 days and killed 47 people. The daily maximum temperature averaged 116.6° F (47° C).<sup>99</sup>

There was a great heat wave in New South Wales, *Australia*. In January 1896, the temperature averaged 112° F (44.4° C), which caused 35 deaths. Then on 22 January, the temperature rose to 125° F (51.7° C)

resulting in 10 additional deaths.<sup>97</sup>

On 3 January 1896, the high temperature in Perth, *Australia* reached 112° F (44.4° C). During the summer of 1895-96, there were 11 days when the temperature was 100.0° F or greater.<sup>102</sup>

On 26 December 1897, there was a heat wave in Victoria and New South Wales, *Australia*, where the temperature measured in the shade averaged 107° F (41.7° C).<sup>97</sup>

In Adelaide, *Australia*, on 1 January 1900, the temperature reached 112.2° F (44.6° C).<sup>97</sup>

Droughts, famines and epidemics are fairly often intertwined. [Wild rodents in certain areas around the world are infected with plague. Their infection is transmitted to humans through the bites from infected fleas. In recent times, human bubonic plague occurrences are mostly associated with scattered cases in rural areas or communities.] This severe drought may have forced this wild rat populations to flee their natural habitat in the wild and migrated into villages and cities with their grain stores and food supplies. This rat migration may have been the trigger that activated an epidemic of the bubonic plague in Australia.

During the year 1900 bubonic plague outbreak in Sydney, *Australia*, an estimated 200,000 rats were destroyed by rat catchers and householders in a bid to end the epidemic.<sup>99</sup>

Bubonic plague caused 165 deaths (of a total 550) in the first year (1900) of the epidemic. The majority of the 1,200 cases reported were in Sydney, New South Wales, *Australia*. The disease affected people for a period of 10 years. Cases were reported in New South Wales, Victoria, Queensland, Western Australia and Northern Territory.<sup>99</sup>

On 22 August 1902, the drought in New South Wales, *Australia* ends in the northern districts.<sup>97</sup>

---

**1895 A.D.** On 12 January 1895, there was a disastrous gale on the northern and southeastern coast [of *Great Britain*]. The gale caused wrecks and loss of life.<sup>94</sup>

During the night of 20 January 1895, a lightning dust storm struck Oklahoma in the *United States*. According to Dr. J.C. Neal, "During the morning of January 20 the sky was filled with cirrus clouds, very feathery and white. In the afternoon it became hazy, then dark, and looked like rain. Wind in puffs from the southwest. At nightfall the sky cleared, but somewhat hazy. At 8 p.m., seventy-fifth meridian time, the wind changed to the west, and a gale began; by 9 p.m. it was frightful. The dust passed along in columns fully 1,000 feet high, the wind arose to a speed of 35, then 45 miles per hour, with gusts reaching 55 miles, the temperature fell rapidly, and we saw for the first time (about 9 p.m.) flashes of light that apparently started from no particular place, but pervaded the dust everywhere. As long as the wind blew, till about 2 a.m., January 21, this free lightning was everywhere but there was no noise whatever. It was a silent electrical storm. This morning the sky is clear and except that the dirt is piled up over books, windows, and in all the house, no one would know what a fierce raging of wind and sky we had."<sup>115</sup>

On 21 January 1895, there were destructive floods in the Thames valley and southwest counties of *England* and in *Wales*.<sup>97</sup>

On 24 March 1895, there was a destructive southwest gale over the *United Kingdom*. The gale was very severe in London and the midlands, with loss of life.<sup>94</sup>

During March and April of 1895, the Lalitpur subdivision in *India* suffered from rust and then were struck with a severe hailstorm.<sup>185</sup>

Duststorms struck many regions of the *United States* in April 1895. In Oklahoma, high winds and dust or sand storms at Healdton, Alva, Ponca City, and Pond Creek on the 14<sup>th</sup> and 15<sup>th</sup> and over most of Oklahoma on the 5<sup>th</sup>. In Minnesota, exceeding disagreeable duststorms were frequent, those of the 12<sup>th</sup>, 14<sup>th</sup>, and 21<sup>st</sup> were especially severe. In South Dakota, severe sand or dust storms were recorded as having occurred on the 4<sup>th</sup>, 5<sup>th</sup>, 14<sup>th</sup>, 25<sup>th</sup>, and 27<sup>th</sup> over portions of the State; the most severe in general occurred on the 14<sup>th</sup>. In North Dakota, furious and damaging duststorms at Ellendale, Gallatin, Lakota, and Steele on the 14<sup>th</sup>. The eastern section of Washington state was visited on the 1<sup>st</sup> by a violent duststorm, the severest ever known there, which unroofed some buildings, broke windows, carried away fences, etc. In Colorado, the voluntary observer, Mr. W.H. Powless, at Alma reports that on the evening of April 14 the sky had a peculiar brazen color; the snow that fell was tinged with pink. Those who were out in this snow reported their clothing covered with a deposit resembling mud [snowy mudstorm]. From newspapers we learn that on the 15<sup>th</sup> a terrible storm of sand and rain afflicted southern and western Kansas, Oklahoma, and the Panhandle of Texas. Egyptian darkness was said to have prevailed in western Oklahoma and the Panhandle. Showers of mud fell in Oklahoma, severe lightning occurred, and crops were badly damaged. The number of cattle killed was estimated at 5,000, and a score of these were smothered. Drifts of sand 6 feet deep were reported along the railroad tracks of western Kansas. A tornado occurred near Cherokee, Kansas, in the evening.<sup>115</sup>

On 21 April 1895, floods were reported on the lower Danube River. Villages were submerged. There was much suffering and some deaths.<sup>97</sup> [The lower Danube River commences at the Iron Gates Gorge on the east-central *Serbian*/southwestern *Romanian* border, then passes through *Bulgaria* and the *Ukraine*.]

On 27 April 1895, a reservoir in the Vosges in northeastern *France* burst.<sup>97</sup>

On 1 May 1895, there were destructive cyclonic storms [tornadoes] in Kansas, Iowa, Dakota, and the Sioux centre in the *United States* causing great loss of life.<sup>94</sup>

On 1 May 1895, tornadoes struck Halstead, Kansas in the *United States* killing 11 persons and injuring 12 more and another one struck Patterson, Nebraska killing 8 persons.<sup>115</sup>

Severe frost struck late in the season in many regions of *United States* in May 1895. New York and Pennsylvania were especially hard hit. The frosts of the 13<sup>th</sup>, 14<sup>th</sup>, 19<sup>th</sup>, 20<sup>th</sup> and 21<sup>st</sup> in Pennsylvania and western New York were said to have been nearly as severe as the great freeze of the 4<sup>th</sup> and 5<sup>th</sup> of June 1859. The frosts of the 12<sup>th</sup> and 20<sup>th</sup> in northwestern Pennsylvania, grapes, early apples, pears, cherries, early roses, strawberries, corn, and tomatoes, so far as they were above ground, were pretty generally killed. From Sunday night (May 12) to Tuesday night (May 21) the thermometer at nighttime ranged from 21° F to 22° F, and was nowhere above 24° F; in the daytime the range was from 44° F to 50° F. The frost killed the greater portion of the grape crop. The previous warm weather had brought vegetation forward remarkably; the grape shoots that were now all gone were 6 and 10 inches long. [Many of the states experienced great fluctuations of temperatures during the month. For example, Pennsylvania went from high temperatures during the beginning of the month to frost conditions and then later to high temperatures towards the end of the month. For example, at Hollidaysburg, Pennsylvania, the temperature reached 110° F on May 30.]<sup>115</sup>

Many observers and correspondents in the *United States* mentioned a general scarcity of birds in 1895. Analysis by the weather bureau indicated that while the seed-eating birds like the scarlet hanger, flycatcher, the sparrows, and warblers, which winter mostly in the West Indies or farther south, were about as numerous as usual, the insect-eating birds which winter within the limits of the United States were unusually scarce. In many places where there were normally plenty of bluebirds, phoebes, robins and thrushes, one could search for hours and not find a bird or nest. It was thought the unusually cold

weather during the previous winter and spring in the Southern States killed some birds, and many of the insects that they feed on, so caused the indirect death of many more. With the absence of these birds the Weather Bureau speculated a large increase in the insect pests in New England, unless the farmers take extra care to destroy them, and their destructiveness will probably be more marked next season in 1896 than in 1895.<sup>115</sup>

The following are the highest temperatures observed during July 1895 in the *United States*:<sup>115</sup>

Montgomery, Alabama	( 96° F, 35.6° C)
Mobile, Alabama	( 95° F, 35.0° C)
Tucson, Arizona	(105° F, 40.6° C)
Yuma, Arizona	(113° F, 45.0° C)
Little Rock, Arkansas	( 96° F, 35.6° C)
Fort Smith, Arkansas	( 96° F, 35.6° C)
San Francisco, California	( 83° F, 28.3° C)
San Diego, California	( 74° F, 23.3° C)
Denver, Colorado	( 95° F, 35.0° C)
Pueblo, Colorado	( 95° F, 35.0° C)
New Haven, Connecticut	( 89° F, 31.7° C)
New London, Connecticut	( 84° F, 28.9° C)
Wilmington, Delaware	(100° F, 37.8° C)
Washington, D.C.	( 94° F, 34.4° C)
Pensacola, Florida	( 93° F, 33.9° C)
Key West, Florida	( 91° F, 32.8° C)
Augusta, Georgia	( 95° F, 35.0° C)
Savannah, Georgia	( 98° F, 36.7° C)
Swan Valley, Idaho	( 96° F, 35.6° C)
Lewiston, Idaho	(105° F, 40.6° C)
Chicago, Illinois	( 92° F, 33.3° C)
Cairo, Illinois	( 93° F, 33.9° C)
Indianapolis, Indiana	( 94° F, 34.4° C)
Lafayette, Indiana	( 94° F, 34.4° C)
Dubuque, Iowa	( 98° F, 36.7° C)
Keokuk, Iowa	( 96° F, 35.6° C)
Topeka, Kansas	( 99° F, 37.2° C)
Dodge City, Kansas	( 97° F, 36.1° C)
Louisville, Kentucky	( 96° F, 35.6° C)
Lexington, Kentucky	( 94° F, 34.4° C)
New Orleans, Louisiana	( 94° F, 34.4° C)
Shreveport, Louisiana	( 96° F, 35.6° C)
Eastport, Maine	( 78° F, 25.6° C)
Farmington, Maine	( 96° F, 35.6° C)
Baltimore, Maryland	( 95° F, 35.0° C)
Boston, Massachusetts	( 85° F, 29.4° C)
Nantucket, Massachusetts	( 80° F, 26.7° C)
Marquette, Michigan	( 86° F, 30.0° C)
Detroit, Michigan	( 93° F, 33.9° C)
Saint Vincent, Minnesota	( 87° F, 30.6° C)
Saint Paul, Minnesota	( 94° F, 34.4° C)
Vicksburg, Mississippi	( 95° F, 35.0° C)
Saint Louis, Missouri	( 96° F, 35.6° C)
Billings, Montana	(101° F, 38.3° C)
Helena, Montana	( 94° F, 34.4° C)
North Platte, Nebraska	( 96° F, 35.6° C)
Omaha, Nebraska	( 98° F, 36.7° C)
Winnemucca, Nevada	( 94° F, 34.4° C)

Carson City, Nevada	( 92° F, 33.3° C)
West Milan, New Hampshire	( 89° F, 31.7° C)
New Brunswick, New Jersey	( 94° F, 34.4° C)
Cape May, New Jersey	( 91° F, 32.8° C)
Santa Fe, New Mexico	( 87° F, 30.6° C)
Albany, New York	( 90° F, 32.2° C)
New York City, New York	( 89° F, 31.7° C)
Charlotte, North Carolina	( 97° F, 36.1° C)
Kitty Hawk, North Carolina	( 94° F, 34.4° C)
Bismarck, North Dakota	( 94° F, 34.4° C)
Williston, North Dakota	( 96° F, 35.6° C)
Cincinnati, Ohio	( 95° F, 35.0° C)
Columbus, Ohio	( 97° F, 36.1° C)
Oklahoma City, Oklahoma	(100° F, 37.8° C)
Fort Sill, Oklahoma	(101° F, 38.3° C)
Roseburg, Oregon	( 98° F, 36.7° C)
Portland, Oregon	( 94° F, 34.4° C)
Erie, Pennsylvania	( 91° F, 32.8° C)
Philadelphia, Pennsylvania	( 94° F, 34.4° C)
Block Island, Rhode Island	( 79° F, 26.1° C)
Charleston, South Carolina	( 95° F, 35.0° C)
Columbia, South Carolina	( 96° F, 35.6° C)
Yankton, South Dakota	( 94° F, 34.4° C)
Nashville, Tennessee	( 95° F, 35.0° C)
Knoxville, Tennessee	( 94° F, 34.4° C)
San Antonio, Texas	( 99° F, 37.2° C)
Galveston, Texas	( 92° F, 33.3° C)
Salt Lake City, Utah	( 95° F, 35.0° C)
Burlington, Vermont	( 88° F, 31.1° C)
Lynchburg, Virginia	( 97° F, 36.1° C)
Norfolk, Virginia	( 95° F, 35.0° C)
Olympia, Washington	( 92° F, 33.3° C)
Spokane, Washington	( 93° F, 33.9° C)
Morgantown, West Virginia	( 98° F, 36.7° C)
Milwaukee, Wisconsin	( 90° F, 32.2° C)
La Crosse, Wisconsin	( 92° F, 33.3° C)
Cheyenne, Wyoming	( 92° F, 33.3° C)

The following are the highest temperatures observed during July 1895 in the *Mexico*:<sup>115</sup>

Ciudad Porfirio Díaz	(100° F, 37.8° C)	(now Piedras Negras, Coahuila)
Leon de Aldamas	( 85° F, 29.4° C)	(now León, Guanajuato)
Mexico City	( 78° F, 25.6° C)	
Puebla	( 83° F, 28.3° C)	
Topolobampo	( 96° F, 35.6° C)	

During the period between 3-8 July 1895 in the *United States*, the eastern slopes of the Rocky Mountains from central Kansas to the Lakes, and southerly from Iowa to central Texas, was visited by storms that caused great loss of human life and widespread and enormous destruction of property. The damage was done by tornados and floods. Railroad embankments and bridges were washed away, farms and villages flooded, and at two locations violent winds added to their destructive powers killing and maiming, and also tearing buildings to pieces. The casualties approached 100, including over forty deaths.

Conservative estimates place the loss of property during the four days at more than a million dollars. [In present currency, that would be equivalent to \$26 million using CPI inflation.] Growing crops were at their best, the wheat harvest had begun, and the season had so far passed as to preclude reseeding. The greatest destruction occurred at Baxter Springs, Kansas and Winona, Missouri on the 5<sup>th</sup>.<sup>115</sup>

On the afternoon of the 5<sup>th</sup>, a tornado swept over Baxter Springs, Kansas followed by a deluge of rain. Five persons were killed outright, and more than double that number were injured, some fatally' churches, schoolhouses, business structures, dwellings, and barns, with the contents of all, were destroyed.

On the same evening a cloudburst brought death and desolation to Winona, Missouri. Rain began falling about 10 o'clock, and an hour later a small stream passing through the town had become a raging torrent that submerged the village near its banks to a depth of four feet. Twelve were drowned and many others received severe injuries. Only the lightning flashes enabled the frightened inhabitants to partly see and avoid the dangers that surrounded them. Buildings standing on high ground or in the outskirts of the town alone escaped. Loss of life and property from violent storms on the same date occurred in other towns in Missouri, Kansas and Arkansas.

On 6 July 1895, there were destructive tornadoes in Kansas and Missouri in the *United States* with loss of life.<sup>94</sup>

On the afternoon of 13 July 1895, a tornado swept over the country in the vicinity of New York City in the *United States*. Fatalities occurred at Woodhaven in Long Island, New York and Cherry Hill, New Jersey. The town of Cherry Hill was practically demolished; three persons were killed and many more were hurt; 25 families were left homeless, and other losses of property resulted. Four dwellings and a depot were destroyed and 26 other buildings partly shattered. Amount of damage estimated at \$50,000 [\$1.3 million in today's dollars]. At Woodhaven one person was killed, nearly 30 were injured and a large amount of property was destroyed. The damage to a schoolhouse and other buildings was estimated at \$43,000 [\$1.1 million in today's dollars].<sup>115</sup>

On the afternoon of 19 July 1895 rain succeeded by hail and terrific winds, wrought losses in the Ohio oil fields near Findlay in the *United States*, amounting to \$500,000 within the town, and injured property in the surrounding country to about the same extent.<sup>115</sup> [In present currency, that would be equivalent to approximately \$26 million using CPI inflation.]

On the afternoon of 22 July 1895, five inches of rain fell at Silver City, New Mexico in the *United States* and a large portion of the town was carried away by the flood.<sup>115</sup>

On 26 and 27 July 1895, disastrous storms struck North Dakota, eastern Missouri, Iowa, Illinois, and Indiana in the *United States*. On the 26<sup>th</sup>, the hail in four counties destroyed many thousand acres of wheat, and a tornado followed, killing one man and adding largely to the loss of property. The storm track was estimated at 200 miles in length, and at places 4 miles in width.<sup>115</sup>

On 31 July 1895, Socorro, New Mexico in the *United States* was overwhelmed by water pouring from a cloudburst on the mountain side above the city. Six lives were lost, and the losses in and near the town were estimated at more than \$100,000 [\$2.6 million in today's dollars]. A similar disaster from the same cause, was reported on that date from Casper, Wyoming; two persons drowned, but the damage to property was less than at Socorro.<sup>115</sup>

A letter from the fleet of whalers in the Behring Sea [*Bering Sea*] of 14 August 1895 reads: "On sailing northward in July from Unalaska ice was met within about 100 miles, and was always present until reaching Port Clarence, and that it had never before been seen so near to Unalaska by any one. From Port Clarence to Point Barrow the vessel's progress was exceedingly slow on account of the drifting ice, scarcely a mile having been made in the first fifteen days of August. The northeast wind that usually keeps this ice off shore has been wanting." Dr. Sheldon Jackson reports a similar experience by the revenue cutter *Bear* while north of Behring Straits [*Bering Straits*]. The southern edge of the arctic ice pack had remained so far south as to prevent any passage north of Icy Cape from July 19 to August 22.

Parties from Point Barrow who had traveled down the coast for their mail, report that the past winter, 1894-95, had not been very cold, the lowest temperature being  $-30^{\circ}$  F.<sup>115</sup> [Unalaska is on Unalaska Island in the Aleutian Islands off of mainland Alaska. Port Clarence is on the east-central coast of Alaska. Point Barrow or Nuvuk is a headland on the Arctic coast in the U.S. State of Alaska. It is the northernmost point of all the territory of the United States. Dr. Sheldon Jackson was a Presbyterian missionary, who together with Captain Michael A. Healy of the United States Revenue Cutter Service, commander of the USRC Bear, made numerous trips into Siberia and helped import nearly 1,300 reindeer to bolster the livelihoods of Native Alaskan people. Icy Cape is north of Wainwright on the northeast coast of Alaska.]

From the Los Angeles Express of 26 November 1895, we learn that the British ship *Anglesey* arriving at San Francisco on that date, like every other vessel that has arrived at that city after rounding Cape Horn [*Chile*] during the summer and autumn of 1895, reports an unusual quantity of ice in that region, and corresponding unusual storms and freezing weather and snow. Usually a northwest wind drives the Antarctic ice southward, just as a southwest wind drives the Arctic ice northward.<sup>115</sup>

Over the period from 1892-1896 in Merzifon, *Turkey*, the coldest temperature observed was  $-2.2^{\circ}$  F ( $-19.0^{\circ}$  C) on 10 February 1893 and the hottest temperature was  $99.5^{\circ}$  F ( $+37.5^{\circ}$  C) on 6 August 1895.<sup>137</sup>

On 11 August 1895, a severe storm struck Baltimore, Maryland in the *United States* destroying buildings including an unfinished church, and telegraph and telephone lines to the value of about \$150,000 [\$3.9 million in today's dollars]. At the same time, a storm raged over four counties in Pennsylvania, where the loss in two boroughs was estimated at \$50,000 [\$1.3 million in today's dollars], caused in part by lightning and hail, but chiefly by wind.<sup>115</sup>

On 17-22 August 1895, there were severe thunderstorms in London and southwestern counties of *England*. The storms caused loss of life and produced much destruction of property. Again on 6-7 September 1895, a series of thunderstorms struck, especially over London and southern *England*.<sup>94</sup>

A hurricane moved from *Dominica* on 22 August 1895 to south of the middle of *Cuba* on the 25<sup>th</sup>, to between the west end of Cuba and Yucatan on the 26<sup>th</sup>, to Brownsville, Texas in the *United States* on the 29<sup>th</sup>.<sup>115</sup>

On the afternoon and night of 3 September 1895, a heavy rain, generally accompanied by wind, lightning, and hail, fell over central Indiana and Illinois, eastern Missouri, and southeastern Iowa in the United States. At Indianapolis, Indiana the losses by floods were estimated as high as \$100,000 [\$2.6 million in today's dollars], exclusive of injury to public works. Nearly 7 inches of water fell within eleven hours. Business streets were flooded and families rescued from drowning by the police. At many other towns the rain was heavy. In the country districts, corn was swept to the ground, outbuildings were leveled, farm animals drowned and killed by lightning, which also destroyed stacks and barns. At Peoria, Illinois, the storm was mentioned as the most severe of many years. At Bloomington, Illinois the rainfall during the night exceeded 6 inches; sewers were choked and streets and basements overflowed; in the vicinity cattle were killed and buildings and stacks burned by lightning. At New London, Missouri, hail fell during nearly two hours; some of the masses weighed 8 ounces, and the destruction of glass was large. At Clinton, Iowa, and in the surrounding country the storm was furious, and the losses by hail and lightning were serious.

On 6 September 1895, at Baltimore, Maryland in the *United States*, occurred the heaviest rainfall that had visited that city in twenty-five years. From 2 o'clock a.m. to 6 o'clock p.m., there was little cessation. For the sixteen hours the record of precipitation was 4.76 inches. Streets were flooded, one woman and a team of horses were drowned, and buildings thrown down and made dangerous by the undermining of the

foundations. There was little wind and no thunder or lightning. The damages were roughly estimated at \$100,000 [\$2.6 million in today's dollars]. A cloudburst near Glenn Falls Station, 23 miles from the city, carried away the railroad embankment for a long distance, and made the west branch of the Patapsco (ordinarily a few feet in width) a torrent an eighth of a mile wide, which inundated fields and destroyed the crops for several miles along the valley of the river. The excessive precipitation above referred to was not confined to Baltimore alone, but was common to a considerable portion of Maryland.<sup>115</sup>

On the afternoon of 6 September 1895, the worst storm of wind, rain, thunder, and lightning visited Joplin, Missouri in the *United States* that the town had experienced since 1875. Streets and houses were flooded and occupants of the latter driven out, a large water main was burst, mines were filled, and trains could not reach the city over the submerged tracks for several hours. Similar storms prevailed at Macon, Missouri, Girard and Fort Scott, Kansas, St. Paul, Minnesota, and Water Valley, Mississippi. In the vicinity of Water Valley, serious damage was done to corn and cotton.<sup>115</sup>

In the afternoon of 8 September 1895, southeastern Kansas in the *United States* was swept by a wind and rain storm of almost unprecedented force; several lives were lost and much property destroyed. In Gridley, a village of 400 inhabitants, many of the best buildings were wrecked and but four were uninjured. This was the work of the wind, and the contents of the ruined structures were quickly soaked by rain. The storm raged from the north to the line of the county, destroying churches, houses, barns, and granaries. At Emporia, a wing of the State Normal School was ruined, entailing a loss of \$25,000 [\$650,000 in today's dollars]. Considerable injury was also wrought to business buildings. The rainfall during the night was reported at 8 inches. The Neosho Valley for ten miles above Emporia was flooded, fields of shocked corn and thousands of tons of hay in stacks were washed away and the inhabitants driven to higher ground. Elk City was inundated, houses were washed away and hundreds left homeless. Neosho Rapids was flooded and fine business structures were ruined. Fort Scott, Fredonia, Independence, and many smaller towns and their surrounding farms suffered severely. In seven counties buildings, railroads, and highways were injured. A box standing isolated near the center of the storm path, 14 inches deep, was full of water on the morning of the 9<sup>th</sup>.<sup>115</sup>

On the 11 September 1895, Cape Vincent, New York in the *United States* experienced a terrific storm, attended by thunder and lightning. The railroad roundhouse and station were blown down killing 2 persons and injuring 14 others. Several business blocks were unroofed, buildings were set on fire by lightning, and rain washed away roads and flooded cellars. A similar, though less destructive storm, prevailed at Watertown, a few miles distant. At and near Turners Falls, Massachusetts, "a cloudburst of hail " covered the ground to a depth of 2 feet with hailstones, many of them " as large as a man's fist." In a territory about 1 mile by 6 miles, windows were riddled and all exposed vegetables destroyed.<sup>115</sup>

On 20 September to 1 October 1895, a hurricane struck *Cuba* causing 56 deaths.<sup>141</sup>

About midnight of 30 September 1895, hurricane wind began at La Paz, *Mexico* at the lower end of the Peninsula of California, and continued until 5 p.m. of October 1. This storm totally destroyed the city, and did much damage to the shipping. Reports from Guaymas, *Mexico*, state that the hurricane moved slowly northward during four days, September 30 to October 3, prostrating telegraph lines, and doing great damage to property and shipping.<sup>115</sup>

— At Topolobampo, *Mexico*, all buildings were greatly damaged. The Ahomy River overflowed its banks.

— In *Mexico*, the State of Sinaloa lost the entire sugar-cane crop, and so also the State of Sonora.

— The town of Culiacan, the capital of Sinaloa, on the interior plateau, experienced a cloudburst, and was greatly injured. The tremendous rain on the ridge of high mountains back of the city filled the canyons and descended thence to the plateau with fierceness never before known in that part of *Mexico*.

— At Mazatlan, *Mexico* many residences were damaged.

— At La Paz the storm and tide combined to raise the waters in the bay to an unprecedented height, flooding the lower part of the city.

— The steamer *Progreso* met the storm in the open ocean. She left San Francisco for Panama on September 24. Her course was a little farther off shore than that followed by the Pacific mail boats, and she was in rather light trim, therefore set rather high out of water. On the fifth day out, after strange barometric changes and a gale of wind, the hurricane burst upon the steamer from the southeast, but veered rapidly to the northwest. As the waves were growing higher and higher, and although there was but little daylight under the storm cloud yet a monster wave could be made out coming toward the vessel. Fortunately the *Progreso* was then headed bow on, and the wave passed clear over the bridge and the tops of the mid-ship houses, and over the whole length of the vessel, leaving a complete wreck of the deck, but without otherwise injuring the vessel.

On 1-2 October 1895, there was a destructive gale on the western coast of *England*, with loss of life.<sup>94</sup>

During the 18-20 October 1895, sand and dust storms, with low temperature and the wind at 50 miles per hour, prevailed over Minnesota and the Dakotas in the *United States*, and Manitoba, *Canada* and the inconveniences of such a blizzard were intensified by the alkaline character of the dust. Numerous prairie fires occurred in southwestern Minnesota and South Dakota, but especially on either side of the Red River Valley.<sup>115</sup>

On 21 October 1895, a hurricane struck *Cuba* taking some lives.<sup>141</sup>

On 31 October 1895, a great gale was raging at Buenos Ayres [Buenos Aires] on the coast of *Argentina*.<sup>115</sup>

By the end of October the *United States* had realized one of the longest and most extensive droughts on record. The States of West Virginia, Kentucky, southern Ohio, and western Pennsylvania had suffered more than any other region. Rains had fallen sufficiently to secure good crops in a portion of eastern Ohio and portions of Arkansas, Indiana, Iowa and Nebraska, Missouri and Kansas, but in general, throughout the watershed of the Mississippi and its tributaries, the drought of August, September, and October had been very severe. On the Atlantic Coast the total rainfall during this growing season has also been small, but as the crops depend upon the proper distribution of the rain throughout the season, the effect of the drought were not so disastrous as it might have been. The general rains of the Middle States and New England interrupted the drought in that region during the third week of October, but did not supply water to the western slopes of the Alleghenies [mountain range] in sufficient quantity to improve the navigation of the Ohio, which, at that time, was little better than a succession of pools. In eastern Pennsylvania the drought was considered as the most severe since 1869. On the 19<sup>th</sup> Captain E.P. Chancellor reported that the Ohio River from Pittsburg to Cincinnati was lower than he had ever known it, and could be waded anywhere above Cincinnati. On the eastern side of the Alleghenies, the Potomac River, and especially the Chesapeake and Ohio Canal, were lower than ever before recorded. At Cumberland, October 11, below the dam, the bed of the river was perfectly dry from shore to shore, and there was not enough depth of water in the intake lock of the canal basin to float an empty boat. Navigation was closed until the water should rise. At Portsmouth, Ohio, the lowest watermark at the close of October 1895 was 2 inches below that of 1881, but not yet down to that of 1838. A special correspondent of *The Evening Star*, writing from Gallipolis, Ohio on November 7, stated that over four or five counties in the extreme southern part of Ohio and on occasional trips into West Virginia and Kentucky he found the same condition everywhere. No rainfall since the snows of February; the effects of the drought were already felt in May, and by the first of June farmers were full of fear. Notwithstanding this, both wheat and corn gave good crops, and on the bottomlands, crops were of the finest quality. Potatoes, oats, and hay gave light crops, but the apple crop was the best ever known. July, August, and September were exceedingly hot, and up to this time there had not been a single heavy rain that would wet the soil to the depth of an inch. Local showers, of very limited area and short duration, had occurred at rare intervals. People commonly said "the showers have all been going around us all

summer; they had a good rain north or south of us, but we had not a drop." Very often the correspondent had a chance to test such reports, and generally found them erroneous; each locality considered itself an exceptional sufferer; but his wider observation showed that there was very little partiality in the distribution of those showers, except that they were a little more frequent and copious near the river. At Uniontown, Kentucky, the Ohio River was so low that it was said that an old vein of coal under the riverbed was worked and thousands of bushels taken out daily. Possibly, however, this was a partial error. The coal may have been dug out at Uniontown very much as it was at Milton, Kentucky, where the wrecks of old coal barges were uncovered and tons of coal taken out by the farmers. In connection with the drought of 1895 in the United States, the following items relative to other countries are quoted from newspaper reports:<sup>115</sup>

British Columbia, Canada — The Columbia River was lower than ever before known. The woods bordering on Puget Sound are very dry and suffering from forest fires. In some regions but one or two showers had fallen during July, August, September, and October.

Alaska — The rain and cloudiness had been about normal during August and September in the southern part of the Territory.

Europe — A drought had prevailed similar to that in the United States.

Australia — A very severe drought and great distress during July, August, and September, especially in New South Wales.

Greenland — The summer of 1895 was the mildest ever known in the neighborhood of Ivigtut. The mountains for the first time ever known were bare of ice and snow. Wild animals accustomed to the extreme cold have been compelled to go farther north. Blueberries were plentiful for the first time in many years. The water about the southern coasts was warm enough to bath in and apparently not colder than on the Jersey coast.

On 10-11 November 1895, gale and floods struck in different parts of *British Isles*, with loss of life. On 23-25 November 1895, northeastern gale struck the [*English*] *Channel*, with loss of life.<sup>94</sup>

On 23-25 December 1895, a southeast gale struck over the *United Kingdom* causing a great loss of life.<sup>94</sup>

In 1895-96 in Chhindwara, *India*, the rains stopped prematurely, but the autumn harvest was satisfactory. The spring crops did not germinate well on account of the hardness of the ground, and wheat only produced about a half of a normal crop. The poorer tracts were distressed but in the richer grounds of Sausar and Chhindwara tahsils, many farmers profited by the higher prices and either cleared themselves of debt or laid by a balance in cash.<sup>180</sup>

In 1895 during the period between 22 July and 19 August, a drought engulfed Anhwei (now Anhui province) in eastern *China* at T'ai-p'ing.<sup>153</sup>

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

*Also refer to the section 1895 A.D. – 1903 A.D. for information on the drought in Australia during that timeframe.*

**Winter of 1895 / 1896 A.D.** The River Thames in London, *England* froze.<sup>29</sup>

Two incidences of a natural weather phenomenon called "snow rollers" were observed in the *United States* during December 1895.<sup>115</sup>

— The passengers on the *Flint and Pere Marquette Railroad* in Michigan on December 10 observed snow rollers. They report that in large level fields hundreds of snowballs, some of them of colossal size, were rolled together by the action of the wind. The fields were covered with them.

— A similar phenomenon was reported from Spokane, Washington. The *Spokesman Review* of December 23 read: The wind has been playing strange with the snow in the vicinity of the waterworks on both sides of the river during the last few days, producing hundreds of snow cylinders of uniform size and as perfectly formed as though they had been cast in a mould. These cylinders were from 12 to 16 inches long and from 6 to 10 inches in diameter, and were hollow, except in the middle. The hollow in each end was funnel-shaped, being widest at the end where the cylinder

was quite thin, growing smaller as it nears the middle where there was a solid space. E.E. Alexander, whose farm was near the waterworks on the south side of the river, says there were hundreds of these cylinders near his place and also in the neighborhood of Minnehaha Park. "It is a strange and beautiful spectacle," said Mr. Alexander yesterday, "and I never saw anything of the kind before. I judge that the conditions under which these cylinders are formed are exceedingly rare. Most of them seem to have been formed Thursday night. For a time the wind blew from the southeast, then it suddenly changed to the southwest, and where there were fence posts or inequalities in the ground these drifts were broken into small sections, which the wind gathered up and started to rolling. The snow was just soft enough to ball, and as these little masses were pushed slowly along by the wind they began to roll, gathering more snow as they went, till the cylinders were formed. They rolled all the way from 20 to 100 feet, and looked like things of life as they sped along until stopped by their own weight. They could only roll about so far, when they became so heavy that the wind would no longer move them, and this accounts for their uniform size."

During the winter of 1895-96 in Bradford County, Pennsylvania in the *United States*, although there was a flurry of snow on October 9<sup>th</sup>, fall in general was warm and farmers continued plowing until January. There was a freeze around the middle of December but it soon warmed and the end of December produced summer-like weather. On January 6<sup>th</sup>, the temperature dropped to -12° F [-24° C] at South Hill and -18° F [-28° C] at Le Raysville. Snow followed the cold wave but not enough for sleighing. On February 6<sup>th</sup>, there was a thunderstorm with lightning, and on the 8<sup>th</sup>, a snowfall that supported sleighing. On the 15<sup>th</sup> of February it was again warm with rainfall. This was followed by the coldest blast of winter, when on the morning of the 17<sup>th</sup>, temperature in the county ranged from -14° F [-26° C] at Towanda to -25° F [-32° C] at Le Raysville. There was sleighing only on the highlands until the 11<sup>th</sup> of March when the deepest snowfalls of winter occurred. On 13 March, the temperature fell to -20° F [-29° C] at "Foot of Plane". March 29, 30 and 31 produced beautiful spring days and the robins were warbling their welcome songs. After the first week, it turned warm in April, the temperature rising to 100° F [38° C] at Towanda on the 13<sup>th</sup>.<sup>178</sup>

The following are the lowest temperatures observed during January 1896 in the *United States*:<sup>118</sup>

Montgomery, Alabama	( 19° F, -7.2° C)
Mobile, Alabama	( 22° F, -5.6° C)
Tucson, Arizona	( 21° F, -6.1° C)
Yuma, Arizona	( 31° F, -0.6° C)
Little Rock, Arkansas	( 15° F, -9.4° C)
Fort Smith, Arkansas	( 14° F, -10.0° C)
San Francisco, California	( 40° F, +4.4° C)
San Diego, California	( 39° F, +3.9° C)
Denver, Colorado	( 0° F, -17.8° C)
Pueblo, Colorado	( 5° F, -15.0° C)
New Haven, Connecticut	( -8° F, -22.2° C)
New London, Connecticut	( -2° F, -18.9° C)
Millsboro, Delaware	( 6° F, -14.4° C)
Washington, D.C.	( 8° F, -13.3° C)
Pensacola, Florida	( 22° F, -5.6° C)
Key West, Florida	( 55° F, +12.8° C)
Augusta, Georgia	( 18° F, -7.8° C)
Savannah, Georgia	( 22° F, -5.6° C)
Swan Valley, Idaho	(-11° F, -23.9° C)
Lewiston, Idaho	( 12° F, -11.1° C)
Chicago, Illinois	( -9° F, -22.8° C)
Cairo, Illinois	( 8° F, -13.3° C)
Indianapolis, Indiana	( -5° F, -20.6° C)
Lafayette, Indiana	(-12° F, -24.4° C)
Dubuque, Iowa	(-10° F, -23.3° C)
Keokuk, Iowa	( -4° F, -20.0° C)
Topeka, Kansas	( 1° F, -17.2° C)

Dodge City, Kansas	( 2° F, -16.7° C)
Louisville, Kentucky	( 3° F, -16.1° C)
Lexington, Kentucky	( 0° F, -17.8° C)
New Orleans, Louisiana	(28° F, -2.2° C)
Shreveport, Louisiana	(19° F, -7.2° C)
Eastport, Maine	(-13° F, -25.0° C)
Portland, Maine	(-13° F, -25.0° C)
Baltimore, Maryland	( 9° F, -12.8° C)
Boston, Massachusetts	(-10° F, -23.3° C)
Nantucket, Massachusetts	( 3° F, -16.1° C)
Marquette, Michigan	(-13° F, -25.0° C)
Detroit, Michigan	( -6° F, -21.1° C)
Saint Vincent, Minnesota	(-39° F, -39.4° C)
Saint Paul, Minnesota	(-18° F, -27.8° C)
Koochiching, Minnesota	(-49° F, -45.0° C)
Vicksburg, Mississippi	(22° F, -5.6° C)
Saint Louis, Missouri	( 5° F, -15.0° C)
Billings, Montana	(-20° F, -28.9° C)
Helena, Montana	(-20° F, -28.9° C)
Kipp, Montana	(-41° F, -40.6° C)
North Platte, Nebraska	(-14° F, -25.6° C)
Omaha, Nebraska	( -8° F, -22.2° C)
Winnemucca, Nevada	(11° F, -11.7° C)
Carson City, Nevada	(12° F, -11.1° C)
West Milan, New Hampshire	(-27° F, -32.8° C)
New Brunswick, New Jersey	( -1° F, -18.3° C)
Cape May, New Jersey	(11° F, -11.7° C)
Santa Fe, New Mexico	(11° F, -11.7° C)
Albany, New York	(-14° F, -25.6° C)
Lowville, New York	(-32° F, -35.6° C)
New York City, New York	( -3° F, -19.4° C)
Charlotte, North Carolina	(14° F, -10.0° C)
Kitty Hawk, North Carolina	(16° F, -8.9° C)
Bismarck, North Dakota	(-23° F, -30.6° C)
Willow City, North Dakota	(-40° F, -40.0° C)
Williston, North Dakota	(-24° F, -31.1° C)
Cincinnati, Ohio	( -1° F, -18.3° C)
Columbus, Ohio	( -3° F, -19.4° C)
Oklahoma City, Oklahoma	(11° F, -11.7° C)
Fort Sill, Oklahoma	(10° F, -12.2° C)
Roseburg, Oregon	(31° F, -0.6° C)
Portland, Oregon	(23° F, -5.0° C)
Erie, Pennsylvania	( 2° F, -16.7° C)
Philadelphia, Pennsylvania	( 4° F, -15.6° C)
Block Island, Rhode Island	( -4° F, -20.0° C)
Charleston, South Carolina	(27° F, -2.8° C)
Columbia, South Carolina	(15° F, -9.4° C)
Yankton, South Dakota	(-10° F, -23.3° C)
Nashville, Tennessee	(10° F, -12.2° C)
Knoxville, Tennessee	(10° F, -12.2° C)
San Antonio, Texas	(27° F, -2.8° C)
Galveston, Texas	(32° F, 0.0° C)
Salt Lake City, Utah	( 9° F, -12.8° C)
Burlington, Vermont	(-17° F, -27.2° C)
Lynchburg, Virginia	(11° F, -11.7° C)
Norfolk, Virginia	(14° F, -10.0° C)

Olympia, Washington	( 23° F, -5.0° C)
Spokane, Washington	( 1° F, -17.2° C)
Morgantown, West Virginia	( -1° F, -18.3° C)
Milwaukee, Wisconsin	(-12° F, -24.4° C)
Hayward, Wisconsin	(-39° F, -39.4° C)
La Crosse, Wisconsin	(-16° F, -26.7° C)
Cheyenne, Wyoming	( -4° F, -20.0° C)

The following are the lowest temperatures observed during January 1896 in the *Mexico*:<sup>118</sup>

Ciudad Porfirio Díaz	( 22° F, -5.6° C) (now Piedras Negras, Coahuila)
Leon de Aldamas	( 36° F, 2.2° C) (now León, Guanajuato)
Mexico City	( 36° F, 2.2° C)
Puebla	( 41° F, 5.0° C)

The thickness of ice in rivers and harbors in the *United States* on Monday, 27 January 1896 is as follows:<sup>118</sup>

*Missouri River* — Miles City, 16 inches; Williston, 25.5 inches; Bismarck, 30 inches; Pierre, 19 inches; Yankton, 18.5 inches; Sioux City, 15 inches; Omaha, 10 inches; Kansas City, 2.0 inches.

*Red River of the North* — Moorhead, 30 inches.

*Upper Mississippi* — St. Paul, 17 inches; La Crosse, 15 inches; Dubuque, 10.5 inches; Davenport, 9 inches; Keokuk and Hannibal, 0 inches.

*Hudson River* — Albany, 11 inches.

*Lake Superior* — Duluth, 21.5 inches; Sault Ste. Marie, 7 inches.

*Lake Michigan* — Green Bay, 13 inches; Milwaukee, 6 inches; Chicago and Grand Haven, 0 inches.

*Lake Huron* — Alpena, 9.5 inches; Port Huron, 6.0 inches.

*St. Clair River* — Detroit, 12 inches.

*Lake Erie* — Toledo, 4 inches; Sandusky, 4 inches; Cleveland, 4 inches; Erie, 7.5 inches; Buffalo, 4 inches.

*Lake Ontario* — Oswego and Rochester, 4 inches.

---

**1896 A.D.** On 26-27 January 1896, a cyclone struck *Australia*. It ripped a path of destruction between Townsville and Brisbane. The storm killed 18 people in Townsville. The storm caused heavy flooding. In February during the flooding of Brisbane, the ferryboat, *Pearl*, that had replaced the damaged Victoria Bridge, was driven into the bow of another ship and sunk. Thirty lives were lost in this accident.<sup>101</sup>

On 26 January 1896, a tropical cyclone *Sigma* caused a path of destruction from Townsville to Brisbane, *Australia*. In Townsville 18 people were killed, ships were wrecked in the harbor, fences blown down and verandahs ripped from houses. Trees up to 6 feet (2 meters) in circumference were uprooted. The storm surge swept upstream for three miles in the rivers and creeks causing many of the deaths.<sup>99</sup>

A storm skirted the middle Atlantic Coast of the *United States* on 6 February 1896. The rain and winds combined damaged and destroyed an immense amount of property throughout eastern Pennsylvania, New Jersey, and southern New England. The lowlands of New Jersey were inundated, and many towns and villages were flooded. Bridges were washed away and 11 lives were lost by drowning: 8 at Bristol, Connecticut; 2 at Pottstown, Pennsylvania; and 1 at Bound Brook, New Jersey. At Bound Brook, the water stood 6 feet deep in the principal streets of the village. In a number of other towns and villages the inhabitants were forced to take refuge in the second stories of their dwellings.<sup>118</sup>

On 10-17 February 1896, the Brisbane River flooded in Queensland, *Australia*. Following flood damage to the Victoria Bridge, the wooden steamer 'Pearl' (while being used as a ferry) was carrying passengers across the swollen Brisbane River when she was swept against the anchor chains of the yacht *Lucinda* and sunk on 13 February 1896. Twenty-eight bodies were recovered and identified but at least another 20 were never found.<sup>99</sup>

On 19 February 1896, violent storms were reported in the *Black Sea*. Three Russian, 4 foreign steamers, and 18 sailing ships were wrecked, over 100 lives lost.<sup>94</sup>

On 2 March 1896, there was a great loss of life and destruction of property reported from the overflow of the Tigris River, in *Mesopotamia*.<sup>97</sup> [Tigris River flows through southeastern *Turkey* and *Iraq*. Mesopotamia corresponds to modern day *Iraq*, northeastern *Syria*, southeastern *Turkey* and southwestern *Iran*.]

In March 1896, there were floods in many parts of *Switzerland*, through snow and heavy rains.<sup>97</sup>

On 29 March 1896, heavy rains in eastern Tennessee and southwestern Virginia in the *United States* caused a number of landslides and the loss of bridges throughout that region. Five persons were drowned by the floods in Russell County, Virginia; two others near Abrams Falls; and two lives were lost in Clay County, Kentucky, by the sudden flooding of Sextons Creek. The water was reported to have risen so rapidly that it seemed as if it were a solid wall 15 or 20 feet high. Several other dwelling houses and a number of outbuildings in the valley of the creek were washed away.<sup>118</sup>

On 20 April 1896, a tornado occurred in Sandusky County, Ohio, near Fremont in the *United States*; 3 killed and about 20 injured. The loss in this county alone was estimated at \$100,000 [\$2.6 million in today's dollars]. The greatest destruction was in spots, the tornado lifting from the ground and descending again several miles distant.<sup>118</sup>

On 25 April 1896, a destructive tornado struck the eastern edge of Cloud County, Kansas in the *United States*, passing eastward into Clay County, through a thickly settled and prosperous portion of the two counties; 8 people were killed and 20 injured. The path of the storm was nearly a ½ mile wide and about 20 miles long. Houses, barns, granaries, and fences were demolished, and the fragments strewn broadcast over the path of the storm. Newspaper reports state that hail fell, in some cases, 7½ inches in circumference, by actual measurement. A conservative estimate of the loss to the buildings alone, 27 dwellings being totally destroyed and many more injured was estimated at \$15,000.<sup>118</sup>

On 15 May 1896, a very destructive series of tornadoes struck in Denton and Grayson counties, Texas in the *United States*; 61 people were killed at Sherman, and 150 injured; 3 were killed at Gribble Springs, 2 at Justin, and 12 at Howe and vicinity. The property loss was variously estimated at from \$150,000 to \$200,000 [\$3.9 million to \$5.2 million in today's dollars].<sup>118</sup>

On 15 May 1896, destructive cyclones [tornadoes] produced great loss of life at Sherman, Texas in the *United States*. Then on 27 May 1896, they struck at St. Louis, Missouri. Then on 30 May 1896, another struck at Seneca, Missouri causing 30 deaths.<sup>94</sup>

On 17 May 1896, a series of tornadoes struck Kentucky, Kansas and Nebraska in the *United States*. At Elva, Kentucky, the tornado killed an entire family of 5 persons. At Frankfort, Kansas, 40 dwellings were either razed to the ground or badly damaged, but no one was killed, the people had fled to caves and cellars on the approach of the tornado. Twenty-five lives were lost in Kansas and Nebraska, and 73 injured. Property damage was estimated at \$300,000 [\$7.8 million in today's dollars].<sup>118</sup>

On 24-25 May 1896, severe storms with tornadoes, visited Iowa on the night of the 24<sup>th</sup> and the morning of the 25<sup>th</sup>, and northern Illinois in the early morning of 25<sup>th</sup> in the *United States*. The greatest destruction was in Polk and Jasper counties, Iowa, and near Chicago, Illinois. An independent series of tornadoes also occurred in Oakland, Macomb, and Lapeer counties, Michigan; 19 people were killed in Iowa; 8 in Illinois, and 47 in Michigan. The property loss in Iowa was about \$75,000; in northern Illinois, about \$15,000; near Chicago, about \$80,000; and in Michigan, nearly \$400,000. [In present currency, the total

damage from these storms would be equivalent to \$14.7 million based on the Consumer Price Index (CPI) inflation rates.]<sup>118</sup>

In the *United States* on 25 May 1896, very destructive tornadoes struck southeastern Michigan in the evening.<sup>118</sup>

The path of the storm was distinctly marked at Thomas (Oakland County), Michigan. The south side of the storm showed all the trees, houses, and fences thrown to the northeast, while in the center of the path, which was probably an eighth of a mile in width at this point, the debris was laid to the east. It was noticed in the center of the path that the grass was pounded down into the earth as though it had been washed into the earth by a heavy flow of water. The small trees on the south side of the path were stripped of their bark, even to the twigs, as though done by the careful hand of an experienced artisan. On one side of the road which runs north, at Thomas, the house of Mr. Kidder was carried bodily for about 300 feet, and then smashed into the earth, the contents of the house scattered beyond finding, while across the road, some 600 feet to the north, the frame house of Mr. Copland was taken free from the stone foundation, and the debris were found from 2 to 10 miles farther east-northeast. All that was left of his house was a square piano, which was standing on its side some 200 feet directly north of the foundations of the house, one end being pounded full of grass. One peculiarity of the freaks of this storm was the unroofing of the post office at Thomas, leaving only the lower story standing, and in the window was still displayed the weather forecast card of the day: "Severe local thunderstorms this afternoon and tonight; showers followed by fair, Tuesday." The forecast had been terribly fulfilled in this section.

Tornadoes occurred, or windstorms were reported, at about 6 p.m., local time, and at about 20 localities in the following Michigan counties: Montcalm, Kalkaska, Midland, Bay, Tuscola, Genesee, Lapeer, Oakland, Macomb, St. Clair, Sanilac, and Wayne, the most damage occurring in the counties of Oakland, Lapeer, and Genesee, in the order named. In Kalkaska County the tornado simply cut a path through the woods, and did not touch any houses.

The reports from all sources indicate that there were 45 lives lost, about 100 persons injured more or less severely, and about \$400,000 in damages to houses, barns, etc. [In present currency, that would be equivalent to \$10.3 million in damages based on the Consumer Price Index (CPI) inflation rates.]

In the *United States* on 27 May 1896, the most destructive tornado in the history of the country passed over Saint Louis, Missouri, at 6.10 p.m.<sup>118</sup>

#### Recapitulation of Saint Louis Tornado of 27 May 1896<sup>118</sup>

<u>Location</u>	<u>Lives Lost</u>	<u>Value of Property Destroyed in 1896 Dollars</u>
St. Louis, Missouri	137	\$ 10,239,000

[In present currency, that would be equivalent to \$334 million in damages based on the Consumer Price Index (CPI) inflation rates.]

The tornado, which passed through Saint Louis late in the afternoon of May 27, was the culmination of a protracted period of abnormally high temperatures, intensified during the latter portion of the time by unusually high humidity. The bricks and stones in the buildings and streets became an enormous storehouse of heat, free radiation at night being prevented by smoke and dust.

The storm entered St. Louis from the west between the Missouri Pacific Railroad tracks on the north and one or two blocks south of the poorhouse on the south, a width of about 1¼ miles. The path through the city was almost exactly in a due easterly direction, reaching the Mississippi River, about 6 miles distant, at 6.20 p.m.

The width of the storm track remained generally the same as it moved eastward until 2<sup>nd</sup> Carondelet Avenue was reached, when it narrowed to somewhat less than one mile, and thereafter continued within that limit. When the high ground at Grand Avenue and Compton Hill Reservoir was reached the storm apparently lifted so that the district north to Caroline Street, and east to California Avenue was touched but lightly, except along Lafayette Avenue, which was damaged considerably as far west as Compton Avenue. This Compton Hill district is about 25 feet higher than the surrounding neighborhood.

The district immediately to the south of the reservoir did not escape, and Russell Avenue between the reservoir and California Avenue was particularly unfortunate.

There was no evidence of the inward spiral rotary motion of the winds west of California Avenue, but in the district east of this avenue, south to Geyer Avenue and north to Lafayette Avenue, the position of the debris indicated the presence of the whirling motion, and from this section eastward the greatest destruction was wrought, the width of the path traversed by the whirl remaining the same.

The storm attained its maximum severity in Lafayette Park and the district immediately surrounding. The park is about two blocks square, and was thickly covered with trees, mostly of mature growth. Every tree, except perhaps a dozen small and very pliable ones, was either twisted or broken off, and in some cases uprooted. The bark was also stripped off of many. The debris lay in every direction, showing that the center of the whirl must have passed directly through the park. At the City Hospital, a short distance east of the park, the lower edge of the whirl evidently passed through the northwest half of the grounds where there was nothing but a complete and confused mass of wreckage to be found; while in the southeast half the inner walls were blown out toward the north, and almost all of the outer walls remained standing.

During the progress of the storm across the city, many who were directly within its limits heard a rumbling noise similar to that made by a long train of cars while passing through a tunnel. No unusual noises, however, were heard at the Weather Bureau station. A very noticeable characteristic of this storm was the comparatively uniform height of its lower edge above the ground, the distance being about 30 feet, rarely more or less. In a great majority of the houses, which were struck the damage was above the first floor, except in the cases of collapse in the center of the track, and of crushing of lower floors by the weight of debris falling from above. Hundreds of walls were blown out above the first floors, while the lower walls remained

practically intact. In Lafayette Park nearly all of the trees were broken or twisted off at an elevation of about 30 feet. Numerous other evidences of this uniform height were also observed.

The evidence of unusual heat, which often accompanies tornadoes, was observed at only one place, Lafayette Park. Here many of the branches and twigs bore signs of having been seared, as if by a hot iron.

Much damage appears to have been caused by great differences in the atmospheric pressure within very limited areas, creating, as it were, numberless small secondary whirls. For instance, single stones and bricks were taken out of walls. A wagon loaded with lumber and having two horses attached was standing near the river; the wagon was not even overturned, while the horses were carried away. In numerous instances the walls of a house would be blown outward, while its neighbor escaped practically untouched. Another point noticed was that in the storm track, whenever an opportunity was afforded to more or less equalize the pressure between the insides and outsides of structures, the damage was proportionately less than where there was no such opportunity. This was remarked in some houses where the windows had been left open, and also in others roofed with slate or shingles when compared with those roofed with tin. A patch of slate or shingles would be torn away, allowing the air to escape from within, and the remainder of the roof would escape injury. Not so, however, with tin roofs; being of one piece and more securely fastened, they were entirely taken away.

It was noted also by comparison with the data at other points that the storm increased in intensity as it entered Saint Louis, and again decreased after it left East Saint Louis. The immense increase of surplus heat which had been stored in the walls and streets of the city during the seven weeks previous, combined with that liberated by the heavy rainfall, may have contributed to this. As the storm left the city for the open country, its supply of fuel was greatly decreased, resulting in a corresponding loss of energy.

Regarding the actual intensity of the storm, there has been much difference of opinion, particularly among architects, civil engineers, and others whose opinions are of value. Many insist that no structure in the city could have withstood the full force of the tornado, and point to the disaster at Lafayette Park and the Saint Louis Bridge as confirmations of their theory. The evidence afforded by the park is probably satisfactory proof, but not so that afforded by the Saint Louis Bridge. Here some of the heavy masonry on the south side of the East Saint Louis approach was torn away, but it is extremely difficult to believe that it was done by direct application of air pressure. Competent and experienced engineers have assured me that the masonry on this bridge, supported as it was above and below, could withstand a pressure of at least 2,000 pounds to the square foot. The pressure per square foot on an absolute vacuum at sea level is only about 2,100 pounds, and it is not reasonable to suppose that even in the very center of the tornado whirl did anything approaching a perfect vacuum exist. Consequently pressure alone, or even pressure combined with a twisting motion, could not have produced the damage to the bridge. Probably the correct solution of the matter is that the supports were first torn out and then the unsupported columns of masonry were not sufficiently strong to withstand the pressure. Consequently they were blown down. If the supports had remained intact, there would have been no damage done to the columns.

In other portions of the city the greater part of the damage was unquestionably due to comparatively weak construction. In the vicinity of Lafayette Park, where most of the houses were well built, instances of total destruction were infrequent as compared with those in the districts farther east and in East Saint Louis.

Again, instances of heavy bodies, such as roofs, etc., being carried for a considerable distance (a frequent occurrence in tornadoes), were quite rare in this storm. In some instances roofs were pushed over to one side, and in others they simply settled down on the debris or lower walls after the upper ones had fallen or been blown outward. I have heard of none that were carried away. Neither did I hear of any trees being moved more than a few feet.

Probably the most remarkable evidence of the force of the storm was the following: On the long East Saint Louis approach to the Saint Louis Bridge a white pine plank, 2 by 8 inches, was driven into the south side of a steel girder with such velocity that it punched a hole in the web and remained sticking in the girder.

The meteorological conditions attending the tornadoes of May 27, 1896, showed that massive thunderstorm was of very considerable extent, embracing the whole of the States of Iowa and Missouri, the greater portion of Illinois, and extending eastward and southeastward into Kentucky, Tennessee, and West Virginia. The path of greatest destruction in the St. Louis tornado extended from Randolph County, Missouri to Jefferson County, Illinois, a distance of about 200 miles. After leaving Saint Louis a score or more of towns and villages was passed over and an additional 39 lives were lost before the fury of the storm abated.

When the Saint Louis tornado of 27 May 1896 reached the Mississippi River, it wrecked nearly every boat and filled the water with people struggling for life. Steamboats, wharf boats and barges were swept from their moorings and cast adrift in almost a solid line. These included 25 steamers (10 large passenger steamers, 5 ferryboats, 2 transfer boats, 2 tugboats and half a dozen small pleasure barges.) Some of the boats overturned and sunk immediately. Other boats were blown to the other side of the river where they crashed and wrecked.<sup>126</sup>

The steamer *J. J. Odil* broke loose from its mooring and was blown against the second pier of the Eads Bridge. The ship's boiler then blew up and the boat sank. Nine of the crew of twelve along with the Captain and 3 women passengers went missing.

The towboat *Dolphin #2* was blown free from her wharf boat at the foot of Morgan Street and dashed against the first pier. The collision caved in the starboard side. The towboat floated down the river for about 3 blocks and then sank. Eleven people who had fled the Steamers *Pittsburg* and *Libbie Conger* for safety aboard the towboat were tossed into the river where they clung to driftwood and floated downriver towards Pittsburg dike. These people, including 3 women, were then caught in an eddy and pulled under.

The *Bald Eagle* was blown downriver and capsized and sunk. Nothing has been heard of the 20 people aboard. The tugboat *Baton Rouge Belle* was forced from its mooring into the middle of the river where it rolled over and over. When it reached the foot of Chouteau Avenue, the boat crashed against the Wiggins Ferry Company wharf and sunk in ten feet of water. The *Exporter* and the *Harvester* were set adrift along with the main wharf boat and a number of barges. One of the boats was sunk at the foot of Arsenal Street. The tug *Rescue #2* sunk at the foot of Onve Street. The *City of Cairo* and the *Arkansas City* broke loose from their moorings at Choteau Avenue and Carroll Street respectively. They had few crew aboard. They disappeared.

The *City of Monroe* was ready to leave for New Orleans. She had a large crew and about 35 passengers. The tornado destroyed her upper decks. The winds drove her across the river where she lodged opposite the foot of Choteau Avenue. Even though the ship was dashed against the shore, it did not sink. The captain (Ziegler) told the crew not to jump overboard. He said, "There is no danger". Those were his last words. He was blown into the river where he drowned.

A few of the boats remained afloat after the tornado passed but their upper decks were torn away. Four boats and two ice barges lay at the foot of Cass Avenue. The *Polar Wave* had its pilothouse and part of her cabin blown off. The *Vinton* had its cabin blown off. The *Jack Frost* and the *Charlotte Boeckeler* lost their smokestacks and cabins. The ice barges *Ione* and *Snow* had their roofs blown off.

The *Libbie Conger* went down sideways. The boat missed the pier and floated down the river without her topsails. The harbor boat smashed into the dump boat, which prevented it from colliding with the pier. It floated down the river. Both of its chimneys were blown off.

At Jefferson Barracks during the night a large quantity of wreckage was seen floating down the river. Sometimes the wrecks were individual ships and other times a tangled mass. One large steamboat with a black smokestack, with only the pilothouse above water floated down the river. There were no signs of life aboard. Then a barge with 15 to 20 people aboard floated by. They were wildly waving lanterns for assistance. The wreckage that floated by consisted of boats, wharves, houses, furniture, logs, and lumber.

On 27 May 1896, a great tornado struck St. Louis, Missouri in the *United States*. The following is an account from Professor E. S. Holden, Director of the Lick Observatory, who was an eyewitness of the destruction.<sup>118</sup>

On the afternoon of May 27, I was in Forest Park in St. Louis with one of my daughters, about 3 o'clock, and the aspect of the sky at once reminded both of us of the "tornado-skies" we had been used to see. The upper sky was covered with a faint veil of grayish clouds parted into regular shapes roughly rectangular and some four or five degrees on a side. Between these figures were darker lanes, of gray-blue color. All around the visible horizon, from north, through west, to south, there was a rim of brassy lurid sky. In the west, or a little north of west and also in the southwest, were two heavy, black, towering clouds, roughly rectangular in figure. The aspect of these clouds was carefully watched to see if they sent out fibrous, twisted offshoots downward; and the brassy rim of sky next the horizon was examined to see if the color deepened toward green.

Either of these signs would, so far as our previous experience went, have indicated the coming of a veritable tornado. So long as they were absent the indications were for a severe thunderstorm later in the evening. It was "hurricane weather" and not "tornado weather" at first. A little before 4 o'clock, the sky looked decidedly more threatening and I decided to take my daughter to the Southern Hotel, which I knew to be one of the stoutest structures in the city. My rooms were on the eastern side, the safer side, which relieved the slight feeling of anxiety somewhat.

My own experience was sufficiently exciting. As I have said, our rooms were on the lee side of the hotel facing a street running north and south. Loaded wagons in the street below were blown on their wheels, and the horses thrown down. The heavy iron cornice of a tall building in course of construction was hurled to the street and destroyed; another building was set on fire by lightning, which entered by the wires on the roof; the hotel chimneystack was blown down, causing damage to glass, etc., of some \$5,000 and wounding several employees, etc.

The wind first blew violently up the street (north) and after the center of the storm had passed it suddenly changed direction and blew south, and this change of direction made new wrecks. The winds in such a storm blow circularly round, or toward the vortex, and when their direction is suddenly reversed like this, one recognizes that at least the crisis is half over. I saw very little hail. The occurrence of a violent storm in a city produces any number of strange happenings, freaks, and the published accounts of it usually dwell on these comparatively unmeaning details—freaks—which give no real idea even of the violence of the wind.

I took the time to visit, personally, the ruined parts of the city. The chief damage was done, not by the direct force of the winds from outside, but by the bursting of the houses from the inside. The barometric pressure in the vortex was very low. The pressure inside the houses was comparatively high. It was usually relieved by the bursting of the walls and windows. When these were uncommonly strong the roofs were lifted and, so soon as the pressure was equalized, dropped down nearly in their former positions. Whole blocks and squares were ruined in this fashion, so that not one house in ten was even habitable. The trees in Lafayette Park were mostly overthrown. The leaves on those left standing were blown into tatters, so that only the midrib with ragged

portions on each side were left. This instance will, I think, illustrate the force of the wind as well as any other. The gyrotory forces were by no means so well marked in this storm as in others that I have studied. It was not a typical tornado, though it partook of the tornado character.

Tornadoes are caused somewhat as follows: The atmosphere above a considerable region of country is in unstable equilibrium. The colder and heavier air is above, the warmer below. Anywhere in this large region tornadoes may occur. Tornadoes are local effects caused by the effort to establish a stable equilibrium quickly. They partake of the rotation of the large circular air movement, and revolve, as these do, in a direction counter-clockwise. Such rotations are produced in the large movements by the earth's rotation, but tornadoes are too small to be directly affected by the rotation of the earth. Their rotatory motion is probably determined by that of the general mass of air of which they form a part. The centrifugal force of their rotation tends to produce a vacuum in the center of the tornado. The surrounding air cannot enter at the sides of the gyrating column; it therefore rushes in at the bottom and blows towards the center and upwards. In violent tornadoes the barometer may be about three inches below the normal. (At St. Louis, it was about an inch lower.) The local tornado, thus inadequately and summarily described, is usually less than three hundred yards wide, and the winds within it and around it blow a hundred or more miles per hour. The storm itself travels in the general direction from S.W. to N.E. seldom more than 40 or 50 miles per hour.

On 27 May 1896, a tornado struck St. Louis, Missouri and East St. Louis, Illinois in the *United States*. More than 300 persons were killed and more than a thousand injured from the tornado. A great portion of East St. Louis was razed to the ground. Initial estimates placed the property damage at \$50 million. [In present currency, that would be equivalent to \$1.4 billion in damages based on the Consumer Price Index (CPI) inflation rates.] The destruction during the last two weeks of May, however, beginning with the tornado in Sherman [On 15 May, a tornado struck Sherman, Texas killing 60 people and injuring another 150.] and other points in the Southwest and ending with those in St. Louis, Missouri and vicinity, and including the waterspouts and other meteorological disturbances, broke all records in the *United States* for any equal period.<sup>197</sup>

On 6 June 1896, destructive rain and wind storms occurred in Minnesota, Wisconsin, Iowa, Illinois, and Missouri in the *United States*. Five persons were drowned, a number were injured by the wind; hundreds of cattle, sheep, and hogs were drowned. Newspaper estimates place the damage at half a million dollars [\$13 million in today's dollars].<sup>118</sup>

The following are the highest temperatures observed during July 1896 in the *United States*:<sup>118</sup>

Montgomery, Alabama	(101° F, 38.3° C)
Mobile, Alabama	( 99° F, 37.2° C)
Tucson, Arizona	(104° F, 40.0° C)
Yuma, Arizona	(110° F, 43.3° C)
Little Rock, Arkansas	(103° F, 39.4° C)
Fort Smith, Arkansas	(103° F, 39.4° C)
San Francisco, California	( 72° F, 22.2° C)
San Diego, California	( 80° F, 26.7° C)
Fresno, California	(111° F, 43.9° C)
Denver, Colorado	( 96° F, 35.6° C)
Pueblo, Colorado	( 96° F, 35.6° C)
New Haven, Connecticut	( 90° F, 32.2° C)
New London, Connecticut	( 88° F, 31.1° C)
Millsboro, Delaware	( 92° F, 33.3° C)
Washington, D.C.	( 94° F, 34.4° C)
Pensacola, Florida	( 99° F, 37.2° C)
Key West, Florida	( 90° F, 32.2° C)
Augusta, Georgia	(100° F, 37.8° C)

Savannah, Georgia	(101° F, 38.3° C)
Pollock, Idaho	(107° F, 41.7° C)
Lewiston, Idaho	(105° F, 40.6° C)
Chicago, Illinois	( 93° F, 33.9° C)
Cairo, Illinois	( 98° F, 36.7° C)
Indianapolis, Indiana	( 96° F, 35.6° C)
Lafayette, Indiana	( 95° F, 35.0° C)
Dubuque, Iowa	( 97° F, 36.1° C)
Keokuk, Iowa	( 95° F, 35.0° C)
Topeka, Kansas	( 99° F, 37.2° C)
Dodge City, Kansas	(100° F, 37.8° C)
Louisville, Kentucky	( 98° F, 36.7° C)
Lexington, Kentucky	( 94° F, 34.4° C)
New Orleans, Louisiana	( 96° F, 35.6° C)
Shreveport, Louisiana	(102° F, 38.9° C)
Eastport, Maine	( 84° F, 28.9° C)
Portland, Maine	( 92° F, 33.3° C)
Baltimore, Maryland	( 96° F, 35.6° C)
Boston, Massachusetts	( 93° F, 33.9° C)
Nantucket, Massachusetts	( 82° F, 27.8° C)
Marquette, Michigan	( 92° F, 33.3° C)
Detroit, Michigan	( 91° F, 32.8° C)
Dawson, Minnesota	(100° F, 37.8° C)
Saint Paul, Minnesota	( 95° F, 35.0° C)
Vicksburg, Mississippi	(100° F, 37.8° C)
Saint Louis, Missouri	( 98° F, 36.7° C)
Billings, Montana	(101° F, 38.3° C)
Helena, Montana	( 95° F, 35.0° C)
North Platte, Nebraska	( 95° F, 35.0° C)
Omaha, Nebraska	( 96° F, 35.6° C)
Winnemucca, Nevada	( 98° F, 36.7° C)
Carson City, Nevada	( 97° F, 36.1° C)
West Milan, New Hampshire	( 89° F, 31.7° C)
New Brunswick, New Jersey	( 96° F, 35.6° C)
Cape May, New Jersey	( 90° F, 32.2° C)
Santa Fe, New Mexico	( 82° F, 27.8° C)
Albany, New York	( 94° F, 34.4° C)
New York City, New York	( 89° F, 31.7° C)
Charlotte, North Carolina	( 98° F, 36.7° C)
Kitty Hawk, North Carolina	( 95° F, 35.0° C)
Bismarck, North Dakota	(103° F, 39.4° C)
Williston, North Dakota	( 92° F, 33.3° C)
Cincinnati, Ohio	( 95° F, 35.0° C)
Columbus, Ohio	( 95° F, 35.0° C)
Oklahoma City, Oklahoma	(101° F, 38.3° C)
Fort Sill, Oklahoma	(103° F, 39.4° C)
Roseburg, Oregon	( 99° F, 37.2° C)
Portland, Oregon	( 93° F, 33.9° C)
Erie, Pennsylvania	( 88° F, 31.1° C)
Philadelphia, Pennsylvania	( 93° F, 33.9° C)
Block Island, Rhode Island	( 82° F, 27.8° C)
Charleston, South Carolina	( 98° F, 36.7° C)
Columbia, South Carolina	(100° F, 37.8° C)
Yankton, South Dakota	(100° F, 37.8° C)
Nashville, Tennessee	( 98° F, 36.7° C)
Knoxville, Tennessee	( 94° F, 34.4° C)

San Antonio, Texas	(100° F, 37.8° C)
Galveston, Texas	( 93° F, 33.9° C)
Salt Lake City, Utah	( 97° F, 36.1° C)
Saint George, Utah	(111° F, 43.9° C)
Burlington, Vermont	( 93° F, 33.9° C)
Lynchburg, Virginia	( 96° F, 35.6° C)
Norfolk, Virginia	( 98° F, 36.7° C)
Olympia, Washington	( 93° F, 33.9° C)
Spokane, Washington	(100° F, 37.8° C)
Fort Simcoe, Washington	(112° F, 44.4° C)
Morgantown, West Virginia	( 93° F, 33.9° C)
Milwaukee, Wisconsin	( 94° F, 34.4° C)
La Crosse, Wisconsin	( 94° F, 34.4° C)
Cheyenne, Wyoming	( 90° F, 32.2° C)

The following are the highest temperatures observed during July 1896 in the *Mexico*:<sup>118</sup>

Ciudad Porfirio Díaz	( 99° F, 37.2° C)	(now Piedras Negras, Coahuila)
Leon de Aldamas	( 89° F, 31.7° C)	(now León, Guanajuato)
Mexico City	( 82° F, 27.8° C)	
Puebla	( 85° F, 29.4° C)	
Topolobampo	( 94° F, 34.4° C)	

The year 1896 produced extreme temperatures at Northfield, Massachusetts in the *United States*. A heat wave began on 16 April 1896 when the maximum temperature reached was 96.5° F. The heat wave ended around 23 September when the temperature fell to 31° F and then on 24 September when the temperature fell to 27° F. During the summer, the peak temperatures were warmer than 90° F on sixty-four days; during the hot spell in August, 100° F was recorded twice; 100° F recorded three times during summer. The weather was the driest on record for April to August, inclusive. On 25 December the temperature fell to -15° F and on 28 December it fell to -16° F.<sup>138</sup>

On 7 July 1896, a severe windstorm began on the west Florida coast of the *United States* in the morning, increasing in force as the day advanced. The maximum velocity of the wind at Pensacola (72 miles per hour from the southeast) was reached at 11.45 a.m. Much damage was done in that city. About 35 houses were unroofed, and there was a general destruction of signs, awnings, telegraph and telephone wires, smokestacks, windmills, etc. The greatest destruction, however, occurred in the harbor, and on the waterfront. Nine fishing smacks were sunk; one brig dragged her anchor and was washed ashore; two barks were badly damaged and a number of smaller craft wrecked and sunk.<sup>118</sup>

The most violent rains are the cloudbursts of the mountainous and arid regions of the west in the *United States*. These storms are not confined to any particular state or region but may occur in mountainous localities throughout the entire territory bounded by the British possessions on the north [Canada], the Mexican border on the south, the foothills of the Rockies on the east and the Sierras on the west. In the true cloudburst the rain seems to pour down rather than fall in drops, and, as a rule, the downpour of water covers an extremely small area. It often happens that the downpour occurs over rather narrow basins or on mountain slopes whose outlets are canyons or gorges leading to a valley or plain below. In these cases almost the entire amount of water quickly finds its way into the drainage channel, and, as a result, a wave of water rushes down the outlet with considerable velocity and in sufficient volume to destroy everything in its path. Such a flood wave almost swept away the town of Eureka, Nevada, in 1874, and caused the loss of 15 lives. A far greater disaster occurred in Bear Creek Canyon, Colorado, in July 1896. Thirty lives were lost and property valued at more than \$100,000 was destroyed. [In present currency, that would be equivalent to \$2.6 million in damages based on the Consumer Price Index (CPI) inflation rates.] The amount of rain that falls in one of these torrential downpours has never been

ascertained. A cloudburst passed over the edge of the little town of Palmetto, Nevada, in August 1890. A rain gauge that was not exposed to the full intensity of the storm caught 8.80 inches of water in an hour. In August 1891, two storms passed over Campo, California, within a few minutes of each other. The second storm was a veritable cloudburst. The observer succeeded in measuring the rainfall of the first shower and a portion of the second. Eleven and a half inches were measured within an hour. The rain gauge and support were carried away by the torrent of water in the second storm and the full record was not obtained.<sup>137</sup>

On 26 July 1896, an unusually destructive hailstorm passed over a strip of country about 60 miles in length, and from 5 to 10 miles in width, in the southeastern part of South Dakota, in the *United States*. The storm originated in the eastern part of Bon Homme County, traveled southeast through the counties of Yankton, Clay, and Union, across the Big Sioux River near Akron, and was last reported in the northwestern part of Plymouth County, Iowa. Another destructive hailstorm passed through Jerauld County, South Dakota, destroying every vestige of crops in its path, in a strip about 20 miles long and 4 miles wide. The damage in Jerauld County was estimated at \$25,000; the damage in Yankton County was estimated at \$100,000; no reports have been received as regards the damage in Clay and Union counties. [In present currency, that would be equivalent to \$650,000 damage at Jerauld County and \$2.6 million damage at Yankton County using CPI inflation.] The following is a description of the storm in Yankton County, by Henry Swinhoe, station agent, Weather Bureau, Yankton, South Dakota:<sup>118</sup>

I have the honor to report that a hailstorm of great severity occurred in this locality yesterday (July 26), doing an immense amount of damage, estimated in this county alone at \$100,000. The path of the storm included the best farming section of the county, from Lesterville on the west to Gayville on the east, and varying in width from 5 to 10 miles. This portion is practically laid waste, a few spots being less seriously damaged. The crops were beaten into the ground, the leaves and branches were stripped from the trees, and numbers of hogs and chickens were killed. Probably a small portion of the oats, which were in shock, may be saved; but the wheat, standing in the field, is completely destroyed where the hail occurred, and the thousands of acres of fine corn are now reduced to leafless stumps. The crops were the best that have been raised here for the last five or six years, and the loss to many of the farmers will be irreparable. Many specimens of hailstones and broken corn stalks were brought in by farmers this morning. Some of the stones measured 1 ½ inches in diameter sixteen hours after they had fallen; they were of very rugged appearance. Farmers from the worst part of the storm report a sea of ice and mud many miles in extent, the hail in the ravines being 2 feet in depth. The "storm appeared to travel from east to west several miles north of Yankton during the forenoon of Sunday, the atmosphere being very sultry, and a light breeze from the southeast. The storm appeared to remain stationary in the northwest till between 2 and 3 p.m., when it commenced to approach, and at the same time divided into two parts, one going south into Nebraska, and the other going east, at about 4 miles north of Yankton. This station, lying between the two main parts of the storm, received 0.74 of an inch of rain, and a maximum wind velocity of 38 miles per hour. No hail fell here, and no damage was done. The temperature was highest (86.9° F) about one hour before the storm; during the storm the temperature fell to 64.5° F. The color of the clouds in the distance was an inky black, changing on a near approach to a dark green, while the roar of the hail sounded at this station like distant thunder. I am told that some of the hailstones weighed 1 pound, twenty hours after the storm. They were composed of a number of very hard lumps of ice about one-half inch in diameter each, held together by soft ice, forming a mass sometimes 3 inches in diameter. Large holes were made through shingle roofs, and the overhanging eaves of buildings were chipped off.

Severe storms struck Indiana in the *United States* from the evening of the 27 July 1896 to the morning of the 28<sup>th</sup>. Approximately 6 inches of rain fell in Elwood, Fowler, Newcastle, and Anderson. At Bluffton, one hailstone weighed one pound and seven ounces. At Montpelier, the hailstones were 17 inches in circumference.<sup>118</sup>

Abnormal heat prevailed over the eastern two-thirds of the *United States* during the last few days of July and the first twelve days of August 1896. This heat wave caused a high number of deaths due to sunstroke. The number of deaths attributed to sunstroke during August is provided below:

Boston, Massachusetts	66
New York, New York	726
Brooklyn, New York	319
Philadelphia, Pennsylvania	218
Baltimore, Maryland	98
Washington, D.C.	36
Worcester, Massachusetts	4
Rochester, New York	2
Buffalo, New York	2
Pittsburg, Pennsylvania	5
Cincinnati, Ohio	13
Columbus, Ohio	2
Chicago, Illinois	178
Muskegon, Michigan	1
Davenport, Iowa	2
Keokuk, Iowa	1
St. Paul, Minnesota	1
St. Louis, Missouri	132
Chattanooga, Tennessee	1
New Orleans, Louisiana	9
Phoenix, Arizona	1
Additional Newspaper Accounts	207
Additional Special Reports	14
<b>Total</b>	<b>2,038</b>

This large number of fatal cases was collected as follows: 1,817 deaths reported by health officials of the cities named; 207 from newspaper notices that were not included in the foregoing; 14 from special reports. Large as this number is it must fall far short of the actual number of victims because many cities were absent from the tabulation. Many cases of sunstroke do not end in death. Only approximately 16.6% did from the analysis of data. If this mortality rate is assumed as an index of the general mortality rate from sunstroke, obtaining, in general, during this epidemic, then the 2,038 fatalities would represent the occurrence of 12,277 cases of sunstroke of varying degrees of severity, and even this may be far below the truth.<sup>118</sup>

On 6-7 August 1896, Richmond, Indiana in the *United States* was visited by a storm of lightning, thunder, and rain. The rainfall was excessive, amounting almost to a cloudburst. The damage resulting was estimated at between \$75,000 and \$100,000 [\$1.9 million and \$2.6 million in today's dollars].<sup>118</sup>

On 10 August 1896 due to the high temperature in Chicago, Illinois in the *United States*, there were 51 deaths.<sup>97</sup>

On 11 August 1896, the temperature reached 97° F (36.1° C) in New York in the *United States*. As a result there were many deaths.<sup>97</sup>

On 18 August 1896, a small whirlwind struck a big wooden freight shed, which was being constructed by the railroad company in Boston, Massachusetts in the *United States* and caused it to collapse, burying 35 men among the timbers. One man was killed and nine badly injured.<sup>118</sup>

On 10 September 1896, there was a tornado in Paris, *France*.<sup>94</sup>

On 25 September 1896, there were destructive gales over the southwestern region of the *United Kingdom*,

with loss of life. Again another gale struck on 6-7 October 1896.<sup>94</sup>

On 28-29 September 1896, a hurricane struck Florida, Georgia and South Carolina in the *United States*. [Various accounts give differing fatality figures of >130, 114, >100, and 100.]<sup>141</sup>

On 29 September 1896, there was a disastrous storm in the eastern *United States*, with much loss of life. The bridge at Columbia was destroyed. The town of Cedar Keys was destroyed.<sup>94</sup>

On 29-30 September 1896, one of the severest West India hurricanes ever experienced in the *United States* struck the Florida coast at Cedar Keys about 3.30 a.m., September 29. It passed thence to Lake Ontario and the St. Lawrence Valley in twenty-four hours at a rather uniform rate of about 46 miles per hour. As is usual in storms of this class the path of relatively great destruction was quite narrow, not extending over 50 miles at any part of its course. The loss of life and property from this storm is summarized below:<sup>118</sup>

<u>State</u>	<u>Loss of Life</u>	<u>Loss of Property in 1896 Currency</u>
Florida	68	\$ 2,225,000
Georgia	25	\$ 983,000
South Carolina	5	\$ 25,000
North Carolina	0	\$ 20,000
Virginia	5	\$ 695,000
Washington D.C.	1	\$ 443,000
Maryland	8	\$ 500,000
Pennsylvania	2	\$ 2,140,000
New York	0	\$ 50,000
<b>Total</b>	<b>114</b>	<b>\$ 7,031,000</b>

[In present currency, that would be equivalent to \$182 million in damages based on the Consumer Price Index (CPI) inflation rates.]

The storm pursued a northeasterly direction through Florida and Georgia. When near Savannah it seemed to curve slightly to the northward, passing thence almost due north to the St. Lawrence Valley.

The force of the wind varied greatly within quite narrow limits; places 50 to 100 miles on either side of the central path were not exposed to winds of unusual severity. The greatest violence was manifested in Florida during the early morning of the 29<sup>th</sup>. The second period of great violence began in Virginia about 9 p.m., and continued until a little after midnight when the storm had reached central Pennsylvania. There was then another lull in the violence of the storm, and a subsequent renewal of intensity during the early morning of the 30<sup>th</sup> at Syracuse, and other points in Cayuga and Cortland counties, New York.

The form and color of the clouds as observed in Washington D.C. during the early part of the storm greatly resembled ground fog driven by a high wind. They were very low, scarcely above the housetops, and of a pure white. With the shift of wind from southeast to south and southwest the form and color of the clouds changed, but the darkness soon became so intense that further observations could not be made. The display of atmospheric electricity was almost continuous, and in the form of broad diffused flashes, though not of marked brilliancy or intensity. The flashes were very similar to the well-known phenomenon of sheet lightning in summer. There was no thunder at Washington D.C. Thunder and lightning were not observed elsewhere in the storm's path except at a very few places.

During the evening of 29 September 1896, the severest storm or "wind-rush" ever experienced struck Washington D.C. Wind velocities at times reached 70 miles per hour. The most remarkable fact noted was that the destruction was in well-marked streaks and not universal. In hundreds of instances a well-constructed roof, rafters and all, was blown off, while close by very frail structures at the same height were uninjured. In some cases this effect was undoubtedly

heightened by the formation of eddies in the streets, and by the reinforcement of the wind blowing along streets running north and south, but making due allowance for all such cases, there was the clearest evidence that there was not a steady blow over the whole region, but that there were streaks or wind-rushes at various points and along certain well-defined lines. There was also evidence to show that the wind did not bear a definite relation to the baric gradient, for it died down quite rapidly after the maximum period had passed, while the gradient continued for a much longer time.

At the Abert building on Pennsylvania Avenue in Washington D.C., the west wall of the two top stories was blown out, and falling upon a low building it broke through the roof and killed one man. This building had been built very recently, and had not, up to that time, received the glass in either front (south) or back (north) windows, but these were covered with cotton cloth. The singular fact is that the cloth in the back windows was not disturbed. The east and west walls trended about 20° east of north and west of south, and the southeast wind struck them almost at right angles. It seems possible that the blow from the wind was so sudden that the west wall gave way and relieved the pressure before the cloth could be blown out of the back windows.

On K Street, N.W., between Thirty-First and Thirty-Second Streets in Washington D.C., two walls were forced out under peculiar conditions. Both walls were on the east side of buildings with a hip roof, the ridgepole running east and west. The windows were all closed so that the pressure on the inside must have been insignificant. Each wall gave way under its roof, which remained intact.

The steeple of the New York Avenue Presbyterian Church in Washington D.C. was blown down and appeared almost as if it had been picked up, turned upside down, and dashed down on its point. In the country about Washington there were two streaks of destruction that were well marked. One of them was about 2 miles beyond Cabin John Bridge on the Conduit road, and the other near the Tennallytown Pike. A careful search along Seventh Street and the Chevy Chase Road showed very slight action. On either side of Fourteenth Street, however, there was serious destruction to trees and roofs.

In Alexandria, Virginia the unroofing of houses and factories along the riverfront was quite serious. A church at the corner of Princess and Patrick Streets had its roof crushed in, but singularly enough, the tower, which was much taller than the church, was not injured in the least. Four lives were lost. In one case the west brick wall of a 3-story house was drawn out by the wind and crushed through the roof of a lower neighboring house, killing a man in the top story.

On 30 September 1896, a terrific windstorm swept over the central part of Bradford County Pennsylvania in the *United States*. The gale continued for about two hours and brought wreck and ruin on every side. People become frightened and arose from their beds to watch the fury of the great storm. Buildings were blown down, houses unroofed, chimneys blown away, trees uprooted, sheds and outbuildings demolished, fruit stripped from the trees, fences thrown down and some livestock killed. The force of the storm fell upon the towns along the Susquehanna River—Ulster, Sheshequin, the Towandas, Wysox, Asylum, Standing Stone, Terry, Wilmot and Wyalusing. Other localities that suffered severely were Monroe, Overton, LeRoy, Canton, Columbia, Burlington, Smithfield, Ridgebury, Orwell, Herrick, Pike and Tuscarora.<sup>178</sup>

On 6-8 October 1896, great floods, accompanied by a heavy gale, were reported in northern *Wales*. Railway traffic was suspended. Houses were flooded. There was much suffering at Llanelly. Damage estimates were over 100,000*l*.<sup>97</sup>

A West India hurricane moved slowly northeastward, but at some distance from the Atlantic coastline of the *United States* on 10-13 October 1896, causing very high tides and dangerous gales, especially on the New Jersey, Long Island, and the New England coasts. Much damage was done to bulkheads, wharves,

piers, and other property on the immediate shoreline. Beach property on the New Jersey and Long Island coasts suffered heavily. Probably half a million dollars was required to repair and replace the property damaged and destroyed [\$13 million in today's dollars].<sup>118</sup>

On 20 October 1896, there were destructive floods caused by heavy rains in *Italy* and *France*.<sup>97</sup>

On 4 November 1896, there were destructive floods, with loss of life, in Sao Miguel, *Azores*.<sup>97</sup> [São Miguel Island in the Portuguese Azores archipelago, is in the middle of the North Atlantic Ocean.]

On 26 November 1896, there was a destructive storm at Athens in southwest mainland *Greece*.<sup>94</sup>

On 4-5 December 1896, there were destructive gales on the eastern and southern *English Channel* coasts.

On 6-7 December 1896, the gales struck in Bordeaux and Dieppe in *France* and in the *Mediterranean Sea*.<sup>94</sup>

On 23 December 1896, there were great floods, with loss of life, in northern *Greece*. This flooding increased and villages were submerged by 31 December 1896.<sup>97</sup>

On 29 December 1896, it was reported that Nevertire, *Australia* was destroyed by a cyclone.<sup>97</sup>

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

*Also refer to the section 1895 A.D. – 1903 A.D. for information on the drought in Australia during that timeframe.*

---

**Winter of 1896 / 1897 A.D.** On 16-30 November 1896, a cold spell struck Montana and Northwest States in the *United States*. At Havre, Montana, on the 18<sup>th</sup>, the temperature dropped to -54° F. The next day, it was -51° F.<sup>118</sup>

A voluntary weather observer, Mr. A. B. Cox, reported from Kipp, Montana in the *United States*, how the Chinook came in 1896.<sup>118</sup>

Picture to yourself a wild waste of snow, wind beaten and blizzard furrowed until the vast expanse resembles a billowy white sea. The frigid air, blowing half a gale, is filled with needle-like snow and ice crystals [rare long prism diamond dust ice crystals] which sting the flesh like the bites of poisonous insects, and sift through the finest crevices. The sun, low down in the southern horizon, looks like a frozen globe, with halves, crescents, and bright prismatic bars encircling it.

Great herds of range cattle, which roam at will and thrive on the nutritious grasses indigenous to the northern Slope, wander aimlessly here and there, or more frequently drift with the wind in vain attempts to find food and shelter; moaning in distress from cold and hunger, their noses hung with bloody icicles, their legs galled and bleeding from breaking the hard snow crust as they travel—they appeal to the hardest heart for pity. It is sure death for human beings to be caught out in one of these awful blizzards, with the temperature down to -30° F or -50° F, unless rescue is speedy. Yet, such conditions frequently exist in this latitude, as they did for fifteen days in November 1896, when it seemed as if the elements had conspired to bring about another ice age, and annihilate every living thing.

Would the "chinook" never come? The wind veered and backed, now howling; as if in derision, and anon becoming calm, as if in contemplation of the desolation on the face of nature, while the poor dumb animals continued their ceaseless tramp, crying with pain and starvation. At last, on December 1, at about the hour of sunset, there was a change which experienced plainsmen interpreted as favorable to the coming of the warm southwest wind. At sunset the temperature was only -13° F, the air scarcely in motion, but occasionally seemed to descend from overhead. Over

the mountains in the southwest a great bank of black clouds hung, dark and awesome, whose wide expanse was unbroken by line or break; only at the upper edge, the curled and serrated cloud, blown into tatters by wind, was seen to be the advance courier of the long-prayed for "chinook." How eagerly we watched its approach! How we strained our hearing for the first welcome sigh of the gentle breath! But it was not until 11:35 p.m. that the first influence was felt. First, a puff of heat, summer-like in comparison with what had existed for two weeks, and we run to our instrument shelter to observe the temperature. Up goes the mercury, 34° F in seven minutes. Now the wind has come with a 25-mile velocity. Now the cattle stop traveling, and with muzzles turned toward the wind, low with satisfaction. Weary with two weeks standing on their feet they lie down in the snow, for they know that their salvation has come; that now their bodies will not freeze to the ground.

The wind increases in strength and warmth; it blows now in one steady roar; the temperature has risen to 38° F, the great expanse of snow 30 inches deep on a level is becoming damp and honeycombed by the hot wind, and we retire satisfied that the "chinook" is a genuine and lasting one.

Twelve hours afterward there are bare brown, hills everywhere; the plains are covered with floods of water. In a few days the wind will evaporate the moisture, and the roads will be dry and hard. Were it not for the "chinook" winds the northern Slope country would not be habitable, nor could domestic animals survive the winters.

The winter of 1896-97 in Bradford County, Pennsylvania in the *United States* was open and mild with little snow. There was a light snowfall on 12-13 November but not enough for sleighing. Thanksgiving was an ideal summer's day. It turned colder in the beginning of December and the snow on the 22-23<sup>rd</sup> permitted the first short period of sleighing. The 28<sup>th</sup> of December and the 1<sup>st</sup> of February were the coldest days of winter when the temperature fell below zero degrees Fahrenheit. The snowfall of 12-13 February permitted sleighing for a day or two. Bluebirds and robins appeared in early March. There was a thundershower on the 20<sup>th</sup> of March. Many farmers were plowing the fields during the end of March. On 19 April, it froze ice an inch [2.5 cm] thick. There was a heavy frost on the night of the 26<sup>th</sup> and an inch [2.5 cm] of snow in some places on the 27<sup>th</sup>. There was a heavy frost on the night of 21 May that caused some damage to early gardens and fruit. On 1 June, there was light snow in Western Bradford County.<sup>178</sup>

On 2 December 1896, a severe snowstorm covered Virginia, North and South Carolina, and Georgia in the *United States*. Rain on the night of the 1<sup>st</sup> turned to sleet, and later to snow. As a result the trees, telegraph and telephone poles throughout South Carolina and Georgia were so heavily coated with ice that they broke under the great weight. Telegraphic communication with the outside world was interrupted for more than 24 hours over a considerable portion of Georgia and South Carolina. Electric light and fire alarm systems were also completely disabled. In South Carolina on the morning of the 2<sup>nd</sup> at points within 50 miles of the coast; an ice storm covering everything with a coating of ice ½ to 1¼ inches thick. Snowfall measured 3 to 8 inches occurred over the central portion of South Carolina on the 2<sup>nd</sup>.<sup>118</sup>

During January 1897, Huron, South Dakota was struck by severe blizzards. January 1897 was remarkable because more precipitation occurred by far than during any other January since the local weather station was established in 1881, and also because one of the steadiest and most persistent periods of very low temperature that ever visited the station. The total depth of snowfall was 26.7 inches. Storms of more or less severity, commonly known as blizzards, occurred on the January 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup>, 4<sup>th</sup>, 16-17<sup>th</sup>, and 23<sup>rd</sup>-24<sup>th</sup>. From the 23<sup>rd</sup> to 29<sup>th</sup>, inclusive, the daily mean temperature ranged from 4° to 22° F below zero, with steady high winds. During the 3<sup>rd</sup>, in the daytime, the air was at times so full of fine, dry snow that objects, such as buildings, 50 feet away, were distinguishable only by outline. In the late afternoon and at night the air was at times literally full of flour-like snow as dense as fog and it was dangerous for persons

to be out, especially in the more sparsely built up portion of the city, as the swirling snow was blinding and bewildering. There were several instances at night of persons losing their way for a time in the residence portion of town. During the night of the 3<sup>rd</sup> the air was highly charged with electricity and contact with stoves or other metal produced a spark and quite a shock. For a time the tips of three twigs were illuminated by bright sparks and in some instances trees (box alder variety) appeared as though illuminated by numerous tiny electric lights. This storm continued on the 4<sup>th</sup> without abatement until 3 p.m., when there were signs of its force breaking. The snow ended at 10.20 p.m. making a storm of forty-eight hours' duration. The snow drifted heavily and by the evening of the 4<sup>th</sup>, there were drifts in the principal streets from 4 to 16 feet deep. Local business was almost entirely suspended, railroad and other traffic abandoned and complete train movement impossible for several days after. In some cases business houses could not be entered until a passage way was cut through the snowdrifts. Over the residence district, barns, sheds and other outbuildings were more or less, and in some cases entirely, covered. The snow was so very fine and dry that it penetrated buildings through the slightest openings, more so than in any other storm in the history of the town. In the country there was some loss of livestock, principally sheep, by sheds caving in with the weight of the snow, and the snow drifting into the buildings and smothering the stock.<sup>137</sup>

The thickness of the ice in rivers and harbors in the *United States* at the end of January 1897 was as follows: Sioux City, Iowa 19.0 inches; Bangor, Maine 16.5 inches; Eastport, Maine 18.0 inches; Gardiner, Maine 14.6 inches; Lewiston, Maine 20.0 inches; Concord, Massachusetts 14.0 inches; Duluth, Minnesota 24.0 inches; Moorhead, Minnesota 28.0 inches; St. Paul, Minnesota 23.0 inches; Valentine, Nebraska 21.0 inches; Bismarck, North Dakota 33.0 inches; Pierre, South Dakota 20.0 inches; Yankton, South Dakota 20.0 inches; Brattleboro, Vermont 12.5 inches; Green Bay, Wisconsin 10.5 inches; and at La Crosse, Wisconsin 13.0 inches. At the close of the month the Mississippi and tributaries were frozen up as far south as Quincy on the Mississippi River, Louisville on the Ohio River, and Hermann on the Missouri River.<sup>137</sup>

In many portions of British Columbia, *Canada* in January 1897, there was no snow on the level ground at the end of the month and the amount of snow on the mountains was not as great as usual. In Alberta, Assiniboia, Saskatchewan, and Manitoba, the precipitation was a little above the average in some localities and a little below in others; in southern Alberta and southwestern Assiniboia the amount of snow on the ground at the end of the month was only from 1 to 3 inches, but elsewhere it was considerable, as Edmonton reports 16 inches; Prince Albert and Winnipeg, 18 inches; and Minnedosa, 30 inches. The snow on ground in Ontario and Quebec was generally not up to the average; special stations reported as follows: Owen Sound, 42 inches; Southampton, 48 inches; Father Point, 22 inches; Anticosti, 34 inches; Chatham, 17 inches; Yarmouth, 19 inches; Sydney, 18 inches; and Charlottetown, 9 inches.<sup>137</sup>

In January 1897, the thickness of ice in rivers and harbors of *Canada* was: In Assiniboia, Regina and Medicine Hat, 30 inches. In Ontario; Port Arthur, 30 inches; Parry Sound, 10 inches; Port Stanley, 8 inches; Kingston, 15 inches; Midland, Bobcaygeon, and Gravenhurst, 14 inches; Sarnia, 10 inches; Barrie, 10 inches; Owen Sound, 12 inches; Sparrow Lake, 13 inches; Wiarton, 8 inches. In the Maritime Provinces: St. Andrews, 20 inches; Shippigan [Shippagan], 22 inches; Port Hastings, 16 inches; Georgetown, 11 inches.<sup>137</sup>

In March 1897, the thickness of ice in rivers and harbors of *Canada* was: Alberta, Bow River, Calgary, 36 inches. Saskatchewan, Battleford, 24 inches. Assiniboia, Swift Current Creek, Swift Current, 28 inches. Ontario, Lake Superior, Thunder Bay, 16 inches; White River, White River station, 18 inches; Lake Ontario, Bay of Quinte, Kingston, 8 inches; Ottawa River, Rockcliffe, 18 inches; Georgian Bay, Midland, 16 inches. New Brunswick, Miramichi River, Chatham, 14 inches. Prince Edward Island, Hillsborough Bay, Charlottetown, 7 inches. Cape Breton, Sydney River, Sydney, 18 inches. New Brunswick, Passamaquoddy Bay, St. Andrews, 20 inches.<sup>137</sup>

The following were the lowest temperatures observed during January 1897 in the *United States*: <sup>137</sup>

Montgomery, Alabama	( 14° F, -10.0° C)
Mobile, Alabama	( 18° F, -7.8° C)
Tucson, Arizona	( 26° F, -3.3° C)
Yuma, Arizona	( 39° F, +3.9° C)
Little Rock, Arkansas	( 12° F, -11.1° C)
Fort Smith, Arkansas	( 7° F, -13.9° C)
San Francisco, California	( 40° F, +4.4° C)
San Diego, California	( 40° F, +4.4° C)
Fresno, California	( 30° F, -1.1° C)
Denver, Colorado	(-14° F, -25.6° C)
Pueblo, Colorado	(-16° F, -26.7° C)
New Haven, Connecticut	( 5° F, -15.0° C)
New London, Connecticut	( 5° F, -15.0° C)
Millsboro, Delaware	( 3° F, -16.1° C)
Washington, D.C.	( 8° F, -13.3° C)
Pensacola, Florida	( 17° F, -8.3° C)
Key West, Florida	( 51° F, +10.6° C)
Augusta, Georgia	( 12° F, -11.1° C)
Savannah, Georgia	( 17° F, -8.3° C)
Idaho Falls, Idaho	(-17° F, -27.2° C)
Boise Barracks, Idaho	( 5° F, -15.0° C)
Rexburg, Idaho	(-39° F, -39.4° C)
Chicago, Illinois	(-20° F, -28.9° C)
Cairo, Illinois	( 4° F, -15.6° C)
Indianapolis, Indiana	(-14° F, -25.6° C)
Lafayette, Indiana	(-22° F, -30.0° C)
Dubuque, Iowa	(-23° F, -30.6° C)
Keokuk, Iowa	(-16° F, -26.7° C)
Topeka, Kansas	( -4° F, -20.0° C)
Dodge City, Kansas	( -3° F, -19.4° C)
Louisville, Kentucky	( -4° F, -20.0° C)
Lexington, Kentucky	( -6° F, -21.1° C)
New Orleans, Louisiana	( 23° F, -5.0° C)
Shreveport, Louisiana	( 13° F, -10.6° C)
Eastport, Maine	(-14° F, -25.6° C)
Portland, Maine	( -8° F, -22.2° C)
Baltimore, Maryland	( 8° F, -13.3° C)
Boston, Massachusetts	( 2° F, -16.7° C)
Nantucket, Massachusetts	( 10° F, -12.2° C)
Marquette, Michigan	(-15° F, -26.1° C)
Detroit, Michigan	(-16° F, -26.7° C)
Duluth, Minnesota	(-29° F, -33.9° C)
Minneapolis, Minnesota	(-26° F, -32.2° C)
Saint Paul, Minnesota	(-26° F, -32.2° C)
Vicksburg, Mississippi	( 17° F, -8.3° C)
Saint Louis, Missouri	( -2° F, -18.9° C)
Havre, Montana	(-38° F, -38.9° C)
Poplar, Montana	(-46° F, -43.3° C)
Helena, Montana	(-24° F, -31.1° C)
North Platte, Nebraska	( -9° F, -22.8° C)
Omaha, Nebraska	(-13° F, -25.0° C)
Winnemucca, Nevada	( 10° F, -12.2° C)
Carson City, Nevada	( 10° F, -12.2° C)
West Milan, New Hampshire	(-24° F, -31.1° C)

New Brunswick, New Jersey	( 2° F, -16.7° C)
Cape May, New Jersey	( 10° F, -12.2° C)
Santa Fe, New Mexico	( -1° F, -18.3° C)
Albany, New York	( -4° F, -20.0° C)
New York City, New York	( 5° F, -15.0° C)
Charlotte, North Carolina	( 6° F, -14.4° C)
Kitty Hawk, North Carolina	( 16° F, -8.9° C)
Bismarck, North Dakota	(-30° F, -34.4° C)
Williston, North Dakota	(-32° F, -35.6° C)
Cincinnati, Ohio	(-10° F, -23.3° C)
Columbus, Ohio	(-10° F, -23.3° C)
Oklahoma City, Oklahoma	( 3° F, -16.1° C)
Fort Sill, Oklahoma	( 5° F, -15.0° C)
Roseburg, Oregon	( 31° F, -0.6° C)
Portland, Oregon	( 22° F, -5.6° C)
Erie, Pennsylvania	( -5° F, -20.6° C)
Philadelphia, Pennsylvania	( 7° F, -13.9° C)
Block Island, Rhode Island	( 9° F, -12.8° C)
Charleston, South Carolina	( 19° F, -7.2° C)
Columbia, South Carolina	( 10° F, -12.2° C)
Aberdeen, South Dakota	(-34° F, -36.7° C)
Nashville, Tennessee	( 3° F, -16.1° C)
Knoxville, Tennessee	( -3° F, -19.4° C)
San Antonio, Texas	( 18° F, -7.8° C)
Galveston, Texas	( 21° F, -6.1° C)
Salt Lake City, Utah	( 9° F, -12.8° C)
Burlington, Vermont	(-15° F, -26.1° C)
Lynchburg, Virginia	( 8° F, -13.3° C)
Norfolk, Virginia	( 11° F, -11.7° C)
Olympia, Washington	( 10° F, -12.2° C)
Spokane, Washington	( 3° F, -16.1° C)
Beckley, West Virginia	(-18° F, -27.8° C)
Milwaukee, Wisconsin	(-18° F, -27.8° C)
La Crosse, Wisconsin	(-23° F, -30.6° C)
Cheyenne, Wyoming	(-21° F, -29.4° C)

The following were the lowest temperatures observed during January 1897: <sup>137</sup>

Saint John, New Brunswick, <i>Canada</i>	(-13° F, -25.0° C)	
Ciudad Porfirio Diaz, <i>Mexico</i>	( 22° F, -5.6° C)	(now Piedras Negras, Coahuila)
Leon de Aldamas, <i>Mexico</i>	( 34° F, +1.1° C)	(now León, Guanajuato)
Topolobampo, <i>Mexico</i>	( 55° F, +12.8° C)	
Mexico City, <i>Mexico</i>	( 37° F, +2.8° C)	
Aguascalientes, <i>Mexico</i>	( 35.6° F, +2.0° C)	
Guadalajara, <i>Mexico</i>	( 34.2° F, +1.2° C)	
Jalapa, <i>Mexico</i>	( 41.5° F, +5.3° C)	
Lagos, <i>Mexico</i>	( 28.7° F, -1.8° C)	
Merida, <i>Mexico</i>	( 54.5° F, +12.5° C)	
Monterey, <i>Mexico</i>	( 23.9° F, -4.5° C)	
Morelia, <i>Mexico</i>	( 37.4° F, +3.0° C)	
Oaxaca, <i>Mexico</i>	( 39.4° F, +4.1° C)	
Pachuca, <i>Mexico</i>	( 34.9° F, +1.6° C)	
Puebla, <i>Mexico</i>	( 39.9° F, +4.4° C)	
Saltillo, <i>Mexico</i>	( 21.2° F, -6.0° C)	
San Luis Potosi, <i>Mexico</i>	( 37.4° F, +3.0° C)	
Silao, <i>Mexico</i>	( 44.8° F, +7.1° C)	

Toluca, <i>Mexico</i>	( 31.6° F, -0.2° C)
Zacatecas, <i>Mexico</i>	( 29.8° F, -1.2° C)
Zapotlan, <i>Mexico</i>	( 44.4° F, +6.9° C)

The following provides the dates of the opening of navigation in the *Canadian* ports for the previous 20 years prior to 1897:<sup>137</sup>

Lake Superior, Port Arthur	Earliest: March 18	Latest: May 22
St. Marys River, Sault Ste. Marie	Earliest: April 8	Latest: May 12
St. Claire River, Sarnia	Earliest: March 7	Latest: May 3
Lake Erie, Port Colborne	Earliest: April 15	Latest: May 9
Lake Ontario, Burlington Bay	Earliest: March 1	Latest: April 28
Lake Ontario, Toronto	Earliest: February 13	Latest: April 25
Lake Ontario, Kingston	Earliest: March 6	Latest: April 24
St. Lawrence River, Montreal	Earliest: March 30	Latest: May 5

A curious phenomenon was witnessed on 14 January 1897, at the Black Eagle Falls of the Missouri River in the *United States*. "For several hours the river ceased to flow, leaving the bed of the stream bare. Factories depending on waterpower were obliged to shut down. The cessation of the flow of water was due to anchor ice. When the temporary obstruction was overcome the water came down with a magnificent rush, leaping several feet over the edge of the dam." The occurrence of anchor ice was frequently observed in European, and especially in Scotch rivers and lakes, as also in the rivers of New England. The nature and method of formation of anchor ice, which was also called ground ice or "ground-gru," has not yet been thoroughly investigated, but various hypotheses have been advanced concerning its formation substantially agree in the idea that the phenomena was caused by water cooled slightly below its freezing point and prevented from freezing by the rapid current of the river; when the eddies and movements of the water cease, or become sluggish, as at the bottom surface or behind any obstacle, then it freezes, and in so doing attaches itself to the obstacle as a nucleus or base which was usually, of course, considerably below the surface of the stream.<sup>137</sup>

---

#### 1896 A.D. – 1900 A.D. India. Famine

A very severe famine in *India* in 1896-98.<sup>94</sup>

In 1896 in Chhindwara, *India* and elsewhere, the monsoon ended abruptly at the end of October. The ground was too hard in many places for the spring crops to be sown. Showers in November aided germination and the harvest was about half of normal. The next two seasons were favorable in Chhindwara but in 1899-1900, the rains failed completely. The rainfall in August was 4 inches and in September it was 1 inch. All crops failed.<sup>180</sup>

Almost the whole of *India* suffered from lack of rains and poor harvests [in 1896-1897] except in the districts irrigated by canal (in the North-Western Provinces, the Meerut Division notably).<sup>185</sup>

The famine in Moradabad in Uttar Pradesh, *India* was caused by the early cessation of the rains in 1896. The rainfall during the months of June through October for 1896 was compared to the average for the previous 5 years (1891-95). At Sultanpur, rainfall for those 5 months was 21.08 inches compared to the normal average of 48.08 inches. At Musafirkhana, the rainfall was 20.00 inches compared to the normal average of 51.08 inches. At Amethi, the rainfall was 20.50 inches compared to a normal average of 45.47 inches. At Kadipur, the rainfall was 23.47 compared to a normal average of 60.11 inches. The rains stopped short in the last week in August 1896 and there was no rain till January 1897.<sup>185</sup>

In Sultanpur Division in the state of Uttar Pradesh in *India*, the area that was most affected by the famine was the villages skirting the river Gumti on both sides from the northwest to the southeast corners of the district. The famine was caused by the cessation of rains in the last week of August 1896 with no real

rain until January 1897.<sup>185</sup>

The Lucknow District in the state of Uttar Pradesh in *India* was in distress [famine] in [1896-97]. This was caused by the failure of the rains after the third week in August 1896. The rabi harvest of 1896 was poor and the kharif harvest of 1895 was not much better owing to the cessation of rains in the middle of September 1895. The rice crop was short in 1895 and practically failed in 1896.<sup>185</sup>

During the famine of 1896-97, the Allahabad District in the state of Uttar Pradesh in *India* suffered distress due to the failure of the rains and the harvest. For about the last 20 years, the poverty of the people increased the severity of the famine.<sup>185</sup>

In the Gorakhpur Division in the state of Uttar Pradesh in *India*, the cause of the distress was primarily the shortage of winter rice in 1895, owing to the early cessation of rain, and the partial failure of the spring rice and almost total failure of winter rice by a deficient and early closing of the rainy season in 1896.<sup>185</sup>

In Jahangirabad and Bara Banki [now Barabanki] in the state of Uttar Pradesh in *India*, the distress [in 1896-97] was due to the untimely failure of the rains and the scantiness of several harvests. It rained 1/4<sup>th</sup> in comparison to past years and even that short supply of rain arrived out of season.<sup>185</sup>

The Rae Bareli [now Raebareli] district in the state of Uttar Pradesh in *India* was one of the most distressed districts in Oudh [now Awadh] during the 1896-97 famine. The years 1893-94 and 1894-95 were unfortunate crop years owing to excessive rainfall. The year 1895-96, though not as bad, was still none of the most favorable. The insufficient monsoon rains of 1896-97 proved a deathblow to the agricultural prospects of the district.<sup>185</sup>

At Tajpur and Bijnor, *India*, the distress was caused partly by failure of the rains and partly to the abnormally high prices for food. The July and Christmas rains, on which the harvests in this district depend, failed.<sup>185</sup>

In the North-Western Provinces of *India*, 34.5 million out of a population of 47 million people were famine stricken. The remainder suffered from scarcity and the increase of food prices. The famine was caused by a failure of the rains in 1896 following a succession of unfavorable seasons and bad harvests. The famine of 1897 stands without a parallel in the famine records of *India*, both as regards to the magnitude and intensity.<sup>185</sup>

The famine [of 1896-97] in the Jaunpur district in the state of Uttar Pradesh in *India* was caused by deficient rainfall. For two years before the famine, the rainfall was unsatisfactory (the rains did not fall at the proper time), and this resulted in poor harvests.<sup>185</sup>

The whole of the Azamgarh district in the state of Uttar Pradesh in *India* was affected by the famine. The distress was most acute in tahails Azamgarh, Muhammadabad and Deogaon. The distress was due to the failure of the rains in 1896 and the consequent failure of the crops. It was also due to the abnormally high prices prevailing in the grain market, which rose to an extent, which was beyond the purchasing power of the poorer classes of the population. During the period from June 1896 to May 1897, the area received 17.74 inches of rainfall compared to a normal average of 43.45 inches.<sup>185</sup>

In 1896 the distress in Bundelkhand [now the states of Uttar Pradesh and Madhya Pradesh in central *India*] was due to the failure of the rains and harvests. In 1897, the distress was caused by the failure of the rains & harvest along with high prices for food.<sup>185</sup>

About 7% of the population of the Jhansi district in the state of Uttar Pradesh in *India* suffered from famine during the period 1895-97. This was caused by three successive bad years due to the failure of the rains and harvests.<sup>185</sup>

In the Jalaun district in the state of Uttar Pradesh in *India*, the distress was due to successive failure of crops and other natural calamities, such as hail, red rust, etc., from the year 1889, as well as abnormally high prices during the years 1896-97. The scanty rainfall of 1896 and the severe drought of 1897 brought matters to a crisis and severe famine resulted. The prices of food grains were high even than those experienced in past famines so far back as 1837. Since the past 9 or 10 years, the seasons had been unsatisfactory and as a result, individuals pawned or sold their jewels and then mortgaged their property in order to survive. This debt increased due to the severe failure of crops.<sup>185</sup>

In the Hamirpur district in the Himalayan state of Himachal Pradesh, *India*, the distress was caused by failure of the rains, the harvests, and the high prices of food grains. The rainfall was only about 25% of normal and so also was the harvests. Some food grains did not grow at all.<sup>185</sup>

The whole of the Agra Division in the state of Uttar Pradesh in *India* was affected by scarcity during 1896-97. The Agra, Etawah and Muttra districts were affected by distress [famine] whereas in the Etah, Mainpuri and Farukhabad districts, the distress was at no time acute. The distress was caused by the failure of the rains in 1897, following upon rather short rains in 1896. Bah and Khairagarh were affected by distress in 1897. The ability to quickly transport grains by rail, helped to stabilize food prices in *India* during this famine.<sup>185</sup>

In the Shahjahanpur district in the state of Uttar Pradesh in *India*, there was much suffering due to famine [in 1896-97].<sup>185</sup>

In the Fatehpur district in the state of Uttar Pradesh in *India* in 1897, the greatest distress [due to famine] was in the region contiguous to the Jumna River, running the whole length of the district from west to east. There had been a partial failure of rain for two years preceding the famine [of 1897].<sup>185</sup>

In the Pratapgarh district of Uttar Pradesh in *India*, the distress [famine] was caused by the total failure of the rains that resulted in a failure of the harvests.<sup>185</sup>

The root cause of over 99% of the famines in India is due to drought. In *India*, this translates to a failure of the monsoon. But the India famine of 1896-1900, [in which approximately 1.5 million people starved to death] was made extremely grave by the actions of the British Government through the demonetization of silver in 1893, whereby a factitious value was given to the rupee. The laboring millions in India, the *ryots*, who are the cultivators of the land, had long been in the habit of putting all their savings into silver bangles or other silver ornaments, and it was upon these small hoards that they depended to enable them to bridge a season of short crops and famines. The effects of the demonetization robbed them of their marketable value. Thereafter all the uncoined silver in *India* was deprived of a natural exchange rate. And when the famine struck, the *ryots* lacked the means to survive.<sup>179</sup>

A famine in *India* from September 1899 to January 1901.<sup>94</sup>

There was a great famine in *India* during the years 1896-97. The crops of 1894-95 in some are of the Central Provinces were far below the average yield, but the people quietly struggled on in the mute but earnest hope that the crop of 1896 would be good. The early rains, also, were too heavy in many localities, and failed utterly in others. The latter rains failed and the country was suddenly plunged into the rigors of a great famine. The poor people had been for two years in want, and had become inured to the hardships of hunger and privation. The officials at Bombay, Calcutta and other chief cities could not

legally recognize a condition of famine so long as the [tax] revenue continued to come in from the rural districts, and therefore no effort was made by the government at first to prevent the inevitable result – a great mortality for want of food.<sup>155</sup>

---

**1897 A.D.** On 6-7 January 1897, a great cyclone struck *Australia*. Trees were leveled for 100 miles (160 kilometers) southwest of Darwin and for 50 miles (80 kilometers) south of Darwin. Many lives were lost at sea.<sup>101</sup>

On 7 January 1897, it was reported that Port Darwin in the Northern Territory of *Australia* was wrecked by a hurricane; many deaths.<sup>94</sup>

In [6-7] January 1897, a cyclone struck Darwin in the Northern Territory of *Australia*. Around Darwin, a total of 28 people died on land or drowned at sea. Damage was estimated at £150,000. [In today's currency, that would be the equivalent of £12,600,000 or \$20,500,000 U.S. dollars using the retail price index.] The towns of Palmerston and Chinatown were both flattened. Of the 200 Chinese private dwellings only a few remained intact. A vast area of forest around Palmerston was devastated. Many people were left homeless. Due to poor hygiene and wet clothes after this massive disaster, many people succumbed to fever. Darwin Harbor's pearling fleet was decimated with 19 vessels sunk or wrecked and stranded in the mangroves. South of Palmerston, record floods were reported while the McKinlay River rose 16 feet (5 meters). There was severe erosion along the railway, which disrupted travel for at least a month. Trees are leveled for 100 miles (160 kilometers) south of Darwin. The severe gusts blew away half of the prison roof at the Fannie Bay Gaol [Jail]. Aboriginals that arrived at the Charles Point lighthouse in the weeks following the disaster reported deforestation, similar to Palmerston, all the way to Point Blaze, 40 miles (65 kilometers) to the southwest, including the offshore islands. They arrived at Charles Point in distress, for the country, which normally provided all their natural food was now barren. The ship warning beacons, which were placed around the promontory had disappeared in the storm. The beach was strewn with dead fish, birds and an opossum. The cyclone's extraordinary force ripped the bark off trees and stripped the paint off the lighthouse window frames. Further northeast, near Cape Don, the schooner Florence encountered gale force winds and heavy seas. Sheltering in a small bay, the Florence dragged two anchors. The huge waves threatened to smash the vessel on a reef. As a result, the skipper slipped the cables and ran the schooner onto a sandy beach.<sup>99</sup>

On 9 January 1897, there were floods in *Spain* through the rising of the Guadalquivir River.<sup>97</sup>

In early February 1897, there were extensive floods through heavy rains and snow, in southern midlands and eastern counties [in *England*].<sup>97</sup>

On 20 March 1897, there were destructive floods, with loss of life, in the Mississippi valley in the *United States*.<sup>97</sup>

In March 1897, there were remarkable rains in the watershed of the lower Mississippi River and its tributaries, culminating in a region of 18 inches of rain in the Valley of the Tennessee and causing the most destructive floods in the Mississippi River in the *United States*. From March 15<sup>th</sup> to the end of the month, a considerable portion of Arkansas and Missouri bordering on the Mississippi River and extending from Cairo, Illinois to Helena, Arkansas was flooded. At Memphis, Tennessee the river was about 40 miles in width. On the 20<sup>th</sup>, the river height read 37.1 feet at Memphis which was the highest ever known. From the foot of Chickasaw bluff, upon which Memphis stands, to the high ground on Crowley's Ridge, in Arkansas, there was one sheet of water. The people inhabiting the overflowed district were forced to abandon their homes, in many cases leaving their belongings behind and gladly escaping with their lives. The work of rescue was carried on as rapidly as possible, and every available steamer was pressed into the service. It was estimated that 6,000 people and 1,200 head of stock were brought to Memphis alone,

and many were carried to other places. Great suffering prevailed in the sparsely settled sections, owing to the difficulty of finding and reaching the imprisoned people, many of whom were exposed to the rain and cold for a considerable time before being discovered. Fortunately the number of deaths resulting from the flood was believed to be small. The money loss cannot be estimated. The people occupying the inundated districts were largely colored, and their possessions were of small value; but the aggregate loss in that direction, while not large, falls heavily on them. The destruction of railroad property, the delay of trains and total abandonment of some lines, the suspension of business, damage to plantations, and the inability to plant the season's crop generated a great loss to this region. The steamboat interests also suffered from the flood, owing to the fact that but few landings could be made, and those mostly by small boats, and to the general stagnation in business which necessarily prevails throughout the entire valley. During the last ten days of the month the seat of danger was south of Memphis, in Tunica, Bolivar, and Washington counties in Mississippi, and thence southward to Vicksburg. Through three crevasses [breaks] in Bolivar County, there flowed an immense stream of muddy water threatening to cover the greater portion of the Yazoo Delta. From Memphis to Vicksburg, the Mississippi River and tributary rivers were extremely high, reaching the highest waters ever known since the Weather Bureau records began. The most disastrous overflow of record occurred the latter part of the month by crevasses [breaks] in the levees of the Yazoo Delta, causing loss of stock, crops, and other property, and the suspension of railroad traffic, but fortunately no loss of life. The amount and extent of the disaster was inestimable because the area inundated is considered the garden spot of Mississippi if not of the entire cotton region. Other crevasses [levy breaks] were reported on the Arkansas side, which caused a like disaster to the counties north of the White River. Travel by boat was the only means of reaching the river stations along the Mississippi River. The new canal was used for a short cut to Yazoo City from Vicksburg.<sup>137</sup>

The Mississippi River in the *United States* reached 52.3 feet (1.2 feet above the previous high water mark) at Vicksburg, Mississippi on the 16 April 1897 and 19.6 feet (1.7 feet above the previous high water mark) at New Orleans, Louisiana on 8, 9 & 11 May. Because of heavy rainfall during the month, the Mississippi River swelled to 8 miles wide at Quincy, Illinois and 8 miles wide at Burlington, Iowa. By April 24<sup>th</sup>, about 200 square miles of land was submerged near Hannibal, Missouri. In Missouri, the smaller towns of Alexandria, Canton, La Grange and Gregory [Gregory Landing] were completely inundated by the floods. On April 30<sup>th</sup>, a very narrow strip of land could again be seen opposite Memphis, Tennessee for the first time since March 9<sup>th</sup>, a period of 52 days.

During the 19<sup>th</sup> century, the greatest flood of the Mississippi River in the *United States* in the upper Mississippi basin occurred in 1844 while the greatest flood on the Mississippi River south of the mouth of the Ohio River occurred in 1897. The highest water levels recorded in the principal cities in the Mississippi basin are as follows:<sup>123</sup>

City/State	Flood Stage	Date
St. Paul, Minnesota	19.7 feet	29 April 1881
Omaha, Nebraska	23.8 feet	24 April 1881
Kansas City, Missouri	24.9 feet	21 May 1892
Kansas City, Missouri	37 feet	20 June 1844
St. Louis, Missouri	41.4 feet	27 June 1844
Cincinnati, Ohio	71.1 feet	14 February 1884
Cairo, Illinois	52.2 feet	27 February 1883
Memphis, Tennessee	37.1 feet	19-21 March 1897
Vicksburg, Mississippi	52.3 feet	16 April 1897
New Orleans, Louisiana	19.5 feet	13 May 1897

On 30 March 1897, a severe tornado struck Chandler, Oklahoma in the *United States*, killing 14 people and injuring another 40. Property damage was estimated at \$100,000. [In present currency, that would be equivalent to \$2.6 million in damages based on the Consumer Price Index (CPI) inflation rates.] The path of greatest destruction was nearly half a mile wide and at least 10 miles long. On the next day, a tornado

passed through Orlando, Star City and Grady, Arkansas killing 7 people. This tornado was between  $\frac{1}{4}$  and  $\frac{1}{2}$  mile wide.<sup>137</sup>

The *Evening News of Detroit* newspaper gave the following account of an event taking place on 16 April 1897 at Lee, Michigan in the *United States*: “Between 10 and 11 o'clock the other night a bright light was seen emerging from the river. On first sight it was thought to be a lantern, but further investigation proved it to be a ball of light about as large as a large hen's egg floating through the air, about 10 feet from the ground, with whizzing sound and zigzag motion. It soon disappeared.” The weather service described this phenomena as Ignis Fatuus or Jack-O'-Lantern which are flickering flames and dancing balls of fire seen at nighttime in marshy places. The phenomenon appears to be rare in the United States, but common in some parts of Europe, probably owing largely to geological peculiarities as affecting the nature of surface soil. The light was undoubtedly caused essentially by the slow oxidation of gases containing some combination of phosphorus. Such gases, of course, result from the decomposition of animal and, more rarely, of vegetable matter.<sup>137</sup>

Heavy rains and winds struck eastern Texas in the United States on the 2 & 3 June 1897. This storm injured growing crops and wrecked possibly as many as 30 buildings, the greatest destruction at a single place occurring at Grand Prairie, within 13 miles of Dallas, Texas. Newspaper reports place the damage to crops at a quarter of a million dollars. [In present currency, that would be equivalent to \$6.5 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>137</sup>

On 15-16 June 1897, there was a destructive gale in *Irish Sea* and the west coast of *Great Britain*.<sup>94</sup>

On 24 June 1897, there was a very destructive hailstorm and cyclone in central Essex, *England*. Farmers were ruined and 70 square miles [181 square kilometers] devastated.<sup>94</sup>

On 24 June 1897, hailstorms struck Topeka and Pueblo, Kansas in the *United States* with extraordinary violence. The size of the hailstones was carefully determined at both places. At Topeka, they were described as “While the big hail was falling the observer placed a bucket over his head, and with another bucket ran out and scooped up a dozen balls. With a knife frequently steeped in hot water, these were cut in two and measured, giving the following diameters: One 4.75 inches, one 6.0, one 5.25, one 4.0, one 3.0, one 3.5, one 5.0, one 4.0, one 3.0, one 3.5, one 3.5, one 3.0, one 3.0, giving a mean for the whole lot of 4 inches.” In Topeka, 26 people were more or less severely injured by the hail. Much damage was done to roofs, skylights were broken to pieces, and the upper floors damaged by rain. The hailstones that fell in Pueblo were not quite so large as those that fell in Topeka, the largest measuring from 2 to 2.75 inches in diameter and weighing from 4 to 8 ounces.<sup>137</sup>

On 6 July 1897, the temperature at Northfield, Massachusetts in the *United States* reached 139° F in sun on sand, and 106° in shade. On 9 July the temperature peaked at 101° F. The unbroken heat wave in which temperatures equaled or exceeded 90° F ended July 12, having lasted twelve consecutive days, being the severest on record. The thermometer recorded 90° F or more from July 1 to July 25, inclusive, with two separate exceptions, being unequaled in twenty-one years of observation. On 16 October, at Central Vermont Railroad station [in Northfield, Massachusetts], the maximum temperature reached 92° F, being the highest on record there in October.<sup>138</sup>

In 1897, California in the *United States* suffered from a great drought caused by a lack of winter rains. In Ventura, a man shot all his range horses rather than see them die of starvation. Another rancher with a flock of 7,000 sheep killed 2,000 young lambs in order to save the lives of the ewes. Horses were taken to soap works and sold for \$2.50 each (The hides were worth \$1.50, the tails 50¢, and the balance was used in soap and land dressing). In Little Bear Valley, 1,500 sheep were abandoned by their owner, because he had no feed. Many farm workers sat idle and many grocery store clerks stood by empty

shelves, because there was no produce. Many farmers, ranchers and others became broke. Many had their land, ranches and homes foreclosed on.<sup>200</sup>

On 30 July-1 August 1897, there were destructive floods in *Silesia* in Central Europe and Saxony, *Germany*. The floods caused a great loss of life.<sup>97</sup> [*Silesia* is a historical region of Central Europe located mostly in *Poland*, with smaller parts also in the *Czech Republic*, and *Germany*. Saxony is now in northwest *Germany*.]

In 1897, a powerful cyclone struck Chittagong, *Bangladesh* causing 175,000 deaths.<sup>98</sup>

On 8 September 1897, a hurricane struck north central *Atlantic Ocean* causing 45 deaths.<sup>141</sup>

On 12 September 1897, there was a hurricane and great [tidal] wave at Port Arthur and Sabine Pass in Texas in the *United States*. Thirty-eight deaths were reported.<sup>97</sup>

On 21 September 1897, a cyclone struck near Brindisi, *Italy*. There was much damage and 45 deaths.<sup>94</sup>

On 25-27 September 1897, a hurricane struck *Cuba*. Some people died.<sup>141</sup>

On 29 October 1897, cumulus clouds formed over a forest fire at Arequipa in southern *Peru* (altitude 8,050 feet above sea level). At about 3:45 p.m. on that day there was observed behind the western flank of Mount Chachani (20,000 feet above sea level), and about 15 miles or so away, a column of smoke rising from a considerable fire of brushwood behind the mountain. The altitude above sea level of the fire was about 14,000 feet, judging by its relation to the height of the mountain. As the writer was looking at the smoke, which was rising to a considerable height, he noticed the formation of a small cumulus cloud directly over the smoke column, and approximately at a height of 17,000 or 18,000 feet above sea level, or 3,000 to 4,000 feet above the fire. The sky at this time was clear, except a trace of cirrus in the west and southwest. The wind at Arequipa was west about 15 miles an hour. The cloud was only a fragment, and disappeared very soon, drifting to the southeast. It was succeeded by another small cumulus, which again disappeared within five minutes. The smoke column was ascending apparently near vertically, but its top was blown somewhat toward the southeast. Successive cloudlets, rather fracto-cumulus than true cumulus, formed over the smoke, none of them lasting more than three minutes, and most of them only one minute. Eight distinct cloudlets were seen thus to form and dissolve within the space of half an hour, at the end of which time the smoke had disappeared.<sup>138</sup>

On 28-30 November 1897, there was a destructive gale over the *British Isles*, *Norway*, and *Denmark*. The gale caused many [ship] wrecks, with loss of life. Damage was done at London, Woolwich, Margate, Sheerness, Whitstable, and other places. Another gale struck on 3 December 1897.<sup>94</sup> [Woolwich is in south London. Margate is in eastern Kent in southeast *England*. Sheerness is in the northwest corner of the Isle of Sheppey in Kent, southeastern *England*. Whitstable is in Kent in southeastern *England*.]

On 28-30 November 1897, there were destructive floods and tidal waves on the *Kentish Coast*. Damage estimated of the loss were 30,000l.<sup>97</sup>

On 29 December 1897, there were severe gales in the *English Channel*, and elsewhere. Another gale struck on the west and northwest coasts on 1-2 February 1898.<sup>94</sup>

An analysis of thunderstorms in 1897 came to the following conclusions. In the northern hemisphere, August leads in the sheer number of thunderstorms followed closely by June and July. Thunderstorms are of great frequency in equatorial regions, but are not so frequent in northern latitudes. In *Java* the average number of thunderstorms for a year was 97; in *France*, 29; in *Finland*, 2; in *Iceland*, 1. In the rainless

area of *Peru* no thunder is ever heard, while at Pueblo, *Mexico*, in summer there is a thunderstorm every afternoon from 2 to 3 o'clock. Thunder can be heard about 10 miles; lightning can be seen about 200 miles. Thunder and lightning have always been objects of fear, and a recent investigator found "that of 298 classes of objects of fear to which 1,707 persons confessed, thunder and lightning lead all the rest." Lightning is a powerful destructive agent. Dr. Robert Bell, of the Geological Survey, considers lightning the commonest cause of forest fires, and supposes that such fires took place even in Pleistocene times. In our own time the destruction of life and property by this means is larger, perhaps, than is generally supposed. From 1880 to 1890 in the *United States* there were killed annually in this way 200 persons. In the eight years ending 1892 the fire losses [in the *United States*] due to lightning amounted to \$12,663,835. [In present currency, that would be equivalent to approximately \$327 million in damages based on the Consumer Price Index (CPI) inflation rates.] These figures were quoted from the "Chronicle Fire Tables," and considered reliable.<sup>138</sup>

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

*Also refer to the section 1895 A.D. – 1903 A.D. for information on the drought in Australia during that timeframe.*

*Also refer to the section 1896 A.D. – 1900 A.D. for information on the famine in India during that timeframe.*

**Winter of 1897 / 1898 A.D.** The following were the minimum temperatures observed during January 1898 in the *United States*:<sup>138</sup>

Montgomery, Alabama	( 18° F, -7.8° C)
Mobile, Alabama	( 20° F, -6.7° C)
Tucson, Arizona	( 17° F, -8.3° C)
Yuma, Arizona	( 26° F, -3.3° C)
Little Rock, Arkansas	( 19° F, -7.2° C)
Fort Smith, Arkansas	( 21° F, -6.1° C)
San Francisco, California	( 36° F, +2.2° C)
San Diego, California	( 36° F, +2.2° C)
Fresno, California	( 24° F, -4.4° C)
Denver, Colorado	( -3° F, -19.4° C)
Pueblo, Colorado	(-11° F, -23.9° C)
New Haven, Connecticut	( 0° F, -17.8° C)
New London, Connecticut	( 2° F, -16.7° C)
Millsboro, Delaware	( 15° F, -9.4° C)
Washington, D.C.	( 17° F, -8.3° C)
Pensacola, Florida	( 20° F, -6.7° C)
Key West, Florida	( 46° F, +7.8° C)
Augusta, Georgia	( 18° F, -7.8° C)
Savannah, Georgia	( 23° F, -5.0° C)
Rexburg, Idaho	(-40° F, -40.0° C)
Boise Barracks, Idaho	( -6° F, -21.1° C)
Chicago, Illinois	( 6° F, -14.4° C)
Cairo, Illinois	( 12° F, -11.1° C)
Indianapolis, Indiana	( 5° F, -15.0° C)
Lafayette, Indiana	( 6° F, -14.4° C)
Dubuque, Iowa	( 4° F, -15.6° C)
Keokuk, Iowa	( 4° F, -15.6° C)
Topeka, Kansas	( 10° F, -12.2° C)
Dodge City, Kansas	( 0° F, -17.8° C)
Louisville, Kentucky	( 15° F, -9.4° C)
Lexington, Kentucky	( 11° F, -11.7° C)
New Orleans, Louisiana	( 30° F, -1.1° C)
Shreveport, Louisiana	( 24° F, -4.4° C)
Eastport, Maine	( -9° F, -22.8° C)

Portland, Maine	( -6° F, -21.1° C)
Baltimore, Maryland	( 17° F, -8.3° C)
Boston, Massachusetts	( 1° F, -17.2° C)
Nantucket, Massachusetts	( 10° F, -12.2° C)
Marquette, Michigan	( 2° F, -16.7° C)
Detroit, Michigan	( 2° F, -16.7° C)
Minneapolis, Minnesota	( -5° F, -20.6° C)
Saint Paul, Minnesota	( -2° F, -18.9° C)
Vicksburg, Mississippi	( 24° F, -4.4° C)
Saint Louis, Missouri	( 10° F, -12.2° C)
Billings, Montana	( -1° F, -18.3° C)
Helena, Montana	( -1° F, -18.3° C)
North Platte, Nebraska	( -6° F, -21.1° C)
Omaha, Nebraska	( 8° F, -13.3° C)
Winnemucca, Nevada	(-16° F, -26.7° C)
Carson City, Nevada	( -5° F, -20.6° C)
West Milan, New Hampshire	(-37° F, -38.3° C)
New Brunswick, New Jersey	( 7° F, -13.9° C)
Cape May, New Jersey	( 15° F, -9.4° C)
Santa Fe, New Mexico	( -6° F, -21.1° C)
Albany, New York	(-12° F, -24.4° C)
New York City, New York	( 5° F, -15.0° C)
Charlotte, North Carolina	( 15° F, -9.4° C)
Kitty Hawk, North Carolina	( 20° F, -6.7° C)
Bismarck, North Dakota	(-10° F, -23.3° C)
Williston, North Dakota	( -4° F, -20.0° C)
Cincinnati, Ohio	( 11° F, -11.7° C)
Columbus, Ohio	( 0° F, -17.8° C)
Oklahoma City, Oklahoma	( 17° F, -8.3° C)
Fort Sill, Oklahoma	( 15° F, -9.4° C)
Roseburg, Oregon	( 22° F, -5.6° C)
Portland, Oregon	( 25° F, -3.9° C)
Erie, Pennsylvania	( 10° F, -12.2° C)
Philadelphia, Pennsylvania	( 12° F, -11.1° C)
Block Island, Rhode Island	( 6° F, -14.4° C)
Charleston, South Carolina	( 27° F, -2.8° C)
Columbia, South Carolina	( 17° F, -8.3° C)
Yankton, South Dakota	( -1° F, -18.3° C)
Nashville, Tennessee	( 17° F, -8.3° C)
Knoxville, Tennessee	( 19° F, -7.2° C)
San Antonio, Texas	( 27° F, -2.8° C)
Galveston, Texas	( 36° F, +2.2° C)
Salt Lake City, Utah	( -3° F, -19.4° C)
Burlington, Vermont	(-17° F, -27.2° C)
Lynchburg, Virginia	( 15° F, -9.4° C)
Norfolk, Virginia	( 20° F, -6.7° C)
Olympia, Washington	( 24° F, -4.4° C)
Spokane, Washington	( 2° F, -16.7° C)
Wheeling, West Virginia	( 9° F, -12.8° C)
Milwaukee, Wisconsin	( 2° F, -16.7° C)
La Crosse, Wisconsin	( -1° F, -18.3° C)
Cheyenne, Wyoming	( -9° F, -22.8° C)

The following were the minimum temperatures observed during January 1898: <sup>138</sup>

Saint John, New Brunswick, *Canada* (-17° F, -27.2° C)

Ciudad Porfirio Díaz, <i>Mexico</i>	(+26° F, -3.3° C) (now Piedras Negras, Coahuila)
Leon de Aldamas, <i>Mexico</i>	(+27° F, -2.8° C) (now León, Guanajuato)
Puebla, <i>Mexico</i>	(+26° F, -3.3° C)
Topolobampo, <i>Mexico</i>	(+50° F, +10.0° C)

The winter of 1897-98 in Bradford County, Pennsylvania in the *United States* was moderate. The first snowfall on 22 November was not sufficient for sleighing. On December 31, there was a heavy snowfall, which permitted excellent sleighing for most of January and February. The beginning of March was warm. There was a thundershower on the 19<sup>th</sup>, which was followed by a snowstorm. April came in cold but moderated towards the middle of the month when farmers, generally, sowed oats. May was wet with 17 rainy days.<sup>178</sup>

Severe cold weather prevailed in Florida in the *United States* on 2-4 January 1898. Following were the minimum temperatures which were reported from Jacksonville, Tampa, and Jupiter, respectively, viz January 2<sup>nd</sup>, 24° F, 28° F, 30° F; January 3<sup>rd</sup>, 26° F, 26° F, 30° F; January 4<sup>th</sup>, 38° F, 38° F, 34° F. These conditions were very destructive to early vegetables throughout this region, killing nearly all those of the more tender kinds. Considerable injury was done to citrus trees, many of the young trees and later shoots being destroyed. The pineapple interests also suffered some damage, although few, if any, plants were entirely killed. Severe cold weather again prevailed in Florida exactly one month later on 2-3 February 1898. Following were the minimum temperatures, which were reported from Jacksonville, and Tampa respectively, viz February 2<sup>nd</sup>, 26° F, 31° F; and February 3<sup>rd</sup>, 32° F, 38° F. Heavy frosts occurred on the morning of the 6<sup>th</sup> to 9<sup>th</sup> of April inclusive, in the South Atlantic and Gulf States, with light frost on the 8<sup>th</sup> as far south as Jacksonville, Florida. The district subjected to the greatest injury from frost was the trucking region of North Carolina.<sup>138</sup>

Injury from frost occurred in various portions of the citrus region of southern California in the *United States* during the winter of 1897/98. The following minimum temperatures were recorded:

<b>California City</b>	<b>December 1897</b>	<b>January 1898</b>
Anaheim	35° F	26° F
Colton	27° F	26° F
Crafton	24° F	28° F
Escondido	18° F	21° F
Fallbrook	30° F	29° F
Los Angeles	30° F	31° F
Ontario	28° F	29° F
Pomona	25° F	26° F
Redlands	27° F	27° F
Riverside	27° F	30° F
San Bernardino	27° F	24° F
San Diego	36° F	36° F
Santa Barbara	32° F	34° F
Santa Paula	20° F	24° F
Ventura	26° F	25° F

Generally newspapers indicated lower temperatures were recorded in January 1898, than in many years previous, and the amount of injury to citrus fruit during the January freeze was generally estimated at from 10 to 20 per cent. The value of the orange crop alone was estimated at from \$6,000,000 to \$7,000,000. Frosts, which in some instances were quite destructive, also occurred in the fruit regions of California on nearly every night from the March 12th to the 27th, inclusive. Almond and apricot crops were for the most part generally destroyed and considerable injury done to peaches and other fruits then in blossom. Many efforts at protection were made, but were not generally successful, owing to the extreme severity of the frosts. In some instances even grain was severely injured.<sup>138</sup>

Frosts and freezing weather occurred in the truck-growing regions near Galveston, Texas in the *United States* on January 2, 16, and 27 and on February 3, 6 and 21.<sup>138</sup>

On 12 January 1898, a tornado 300 feet wide passed directly through the business and residence portion of Fort Smith, the chief city of western Arkansas in the *United States*. Thirty-three persons were killed outright, 19 later died from injuries; 73 [total] were injured; property loss \$450,000. [In present currency, that would be equivalent to \$11.6 million in damages based on the Consumer Price Index (CPI) inflation rates.]<sup>138</sup>

As the clock was striking midnight and the Weather Office was about to be locked up, the barometer reading 28.846, actual, the wind south, not a drop of rain having fallen, the air feeling sultry and very damp, and while the book of mean pressures was being examined for comparative barometer readings, a gurgling noise was heard, like water rushing out of a bottle, followed immediately by a rumbling, such as that made by a number of heavy carriages rolling rapidly over a cobblestone pavement, and finally like a railroad train. These three noises appeared in this order of succession; each was distinctly different and clearly distinguishable from the other. This noise or roar was recognizable as the "tornado roar." About two seconds elapsed between the first roar and the rattling and quivering of the office window by the wind and the terrific driving rain which at once forced itself in between the frame and the sash, at the top, the bottom, and the sides, and flooded the office. The book of means was laid aside and the observer went to the landing in the large skylight on the roof of the observatory, whence he saw the tornado cloud 450 feet distant to the southward, a twisted black mass of two clouds, accompanied by lightning from the upper parts of the clouds. [The Weather Bureau Observer, standing within the skylight, on the roof of the Observatory, 54 feet above the ground and 450 feet north of the central portion of the track, could see on a level with his eye and higher up, objects flying out of the cloud toward the north and west.] The lightning was a continuous series of flashes of a pale yellow color; the noise of the thunder sounded like the muffled beating of a number of drums within the cloud. The clouds appeared like inverted siphons, each curved over downward from the right or left hand side of the cloud, respectively, to the center, where they came in contact with each other and twisted about one another downward to the ground, being narrowest about 40 feet from the ground and, probably, about 100 feet high.

The tornado cloud was seen emerging out of the National Cemetery and passing by the United States Post Office and the county courthouse. In its passage through the cemetery it uprooted forty trees, lifted the iron flagstaff, although embedded in solid granite, snapped to pieces the 1-inch wire cable guy of the staff, lifted bodily from its base 500 feet of 12-inch brick wall 4½ feet high, and demolished the keeper's residence. In its passage through vacant property to the principal business street it passed over the residence of Mrs. Mivelaz, the brick walls of which burst outward with a loud explosion, undoubtedly due to the low air-pressure at the center of the tornado; a similar fate befell a frame building. Farther on, and on the left-hand side of the tornado track, a two-story stone building was demolished and a three-story brick building was carried entire 25 feet away from its foundation. Some of the debris from the tornado was found the next day at Ozark, Arkansas, 30 or 35 miles distant.

In January 1898, the Kansas section director, wrote about an unusual weather phenomena that occurred in Saline County, Kansas in the *United States*. He described a fall of snowballs ranging "from the size of a baseball to a half-bushel measures". He reasoned that just as storms can produce a fall of hailstones, that they could likewise produce a fall of snowballs. He probably confused this phenomenon with "snow rollers". Freshly fallen snow is often rolled into balls and cylinders by a gentle wind, and this mysterious phenomenon is called "snow rollers". [Several years ago in Indiana, one morning I observed around 40 snow rollers in the flat farm fields. Many were cylinders 2-3 feet in diameter and 4-6 feet in length. These were rolled up like a jellyroll. First impressions were they must have been man-made. But on closer examination, there were no footprints in the snow. It's as if they were made by ghosts in the night. But a scientific explanation provided the answer. The wind was fairly strong the night before and that may account for their unusually large size].<sup>122</sup>

On 31 January 1898, there was a destructive blizzard in Boston, Massachusetts in the *United States*. The city was blocked. Two hundred horses were killed.<sup>97</sup>

A severe snow and windstorm passed over eastern New York and New England in the *United States* on 31 January and 1 February 1898. The storm was tremendously destructive near Boston, Massachusetts to property and to life. Not since March 12, 1888, some say January 17, 1867, has such a blizzard reached New England. The heavy snow blockaded the streetcars and greatly delayed steam railroad travel, and in a few instances trains were temporarily blockaded. There was a general wrecking of overhead wires, and hundreds of poles, iron and wood, were blown down or fell from greatly increased strain from the clinging snow and falling wires. Although the danger from crossed and live wires was very great, no person was killed, although about 30 horses were electrocuted in various parts of the city. The storm also served to close up the school system, close many of the large stores, and threaten a milk famine. On the New England Coast it brought death to more than a score of mariners, destruction to 10 vessels, and damage to as many more. The bodies of 7 sailors were recovered at Nahant, Massachusetts; 4 at Gloucester, Massachusetts; 3 at Rockport, Massachusetts; and 12 at Bakers Island, Massachusetts. Conservative estimates place the loss by the storm to electric and steam railroads, telegraph and telephone companies in the city of Boston and neighboring cities and towns, to corporations and individuals generally at about \$1,500,000. [In present currency, that would be equivalent to \$39 million in damages based on the Consumer Price Index (CPI) inflation rates.] The damage to shipping was estimated at from \$150,000 to \$200,000.<sup>138</sup>

Another article described this storm as follows: Heavy snow fell all night of January 31-February 1, and the wind attained the velocity of a gale of from 50 to 70 miles per hour from the northeast. On the morning of February 1, New England was completely snow-bound. The snow, which was damp and clinging, together with the wind, completely annihilated overhead wires of all sorts; transportation lines were almost completely blocked and traffic was not resumed with regularity for several days; thousands of suburban residents who earn their daily living in the city of Boston were unable to move from their homes. Other snowstorms continued to strike the New England area during February. The snow covering in Maine, New Hampshire and Vermont at the end of February was unusually heavy. Depths ranging from 40 to 70 inches were reported in Maine, 10 to 40 inches in New Hampshire and Vermont, and from 10 to 20 inches in Massachusetts. This great body of snow seriously interfered with lumbering operations throughout northeastern New England. The financial loss was placed at not less than \$1,000,000 [\$26 million in today's dollars].<sup>138</sup>

During 1898, a severe cold spell struck Northfield, Massachusetts in the *United States*. On 3 February, minimum temperature -28.5° F; February 3, at the toll bridge, lowest and coldest place in town, minimum temperature -35° F. On 31 January and 1 February, the total snowfall with gale was 2 feet. On 1 February, the depth of snow on ground was 3½ feet, being the greatest on record.<sup>138</sup>

In February [1898], a rare long prism diamond dust ice crystals storm occurred in Colorado in the *United States*. The American Indians refer to this phenomenon, a mist or fog of frozen vapor, as *pogonip*. The Indians were more afraid of it than they are of rattlesnakes, and called it the "white death".<sup>124</sup>

This phenomenon occurs most frequently in the northern part of Colorado, in Wyoming, and occasionally in Montana.

About two years ago a party of three women and two men were crossing North Park [basin] in a wagon in the month of February. The air was bitterly cold, but dry as a bone and motionless. The sun shone with almost startling brilliancy. As the five people drove along over the crisp snow they did not experience the least cold, but really felt most comfortable, and rather enjoyed the trip. Mountain peaks 50 miles away could be seen as distinctly as the pine trees by the roadside.

Suddenly one of the women put her hand up to her face and remarked that something had stung her. Then other members of the party did the same thing, although not a sign of an insect could be seen. All marveled greatly

at this. A moment later they noticed that the distant mountains were disappearing behind a cloud of mist. Mist in Colorado in January! Surely there must be some mistake. But there was no mistake, because within ten minutes a gentle wind began to blow, and the air became filled with fine particles of something that scintillated like diamond dust in the sunshine. Still the people drove on until they came to a cabin where a man signaled to them to stop. With his head tied up in a bundle of mufflers, he rushed out and handed the driver a piece of paper, on which was written: "Come into the house quick, or this storm will kill all of you. Don't talk outside here."

Of course no time was lost in getting under cover and putting the horses in the stables. But they were a little late, for in less than an hour the whole party was sick with violent coughs and fever. Before the next morning one of the women died with all the symptoms of pneumonia. The others were violently ill of it, but managed to pull through after long sickness.

"I saw you people driving along the road long before you got to my house, and I knew you did not know what you were driving through," said the man, as soon as the surviving members of the party were able to talk. "That stuff you saw in the air was small particles of ice, frozen so cold that it goes clear down into the lungs without melting. If one were to stay out a few hours without covering his head he would surely die. One winter about eight years earlier a whole Indian tribe across the Wyoming line died from its effects.

On 18-22 February 1898, a heavy snow and wind storm moved from Texas northeastward across the country to New England in the *United States*. This storm produced significant snowfalls in Iowa, Minnesota, Wisconsin, Michigan, northern Illinois, northern Indiana and Ohio. The total snowfall at Milwaukee exceeded 24 inches, and in many places accumulated to a depth of from 10 to 15 feet. All business was more or less interfered with, but the street railway lines suffered the greatest inconvenience. The mail trains were delayed from eight to twenty-four hours, especially from the south and west, and in one instance a train was literally buried by snow, which had drifted into a cut. Not since the memorable snowstorm of March 2-4, 1881, has there been a snowstorm of equal severity in this locality [Milwaukee, Wisconsin]. As this storm moved to the eastward, it produced rain, hail, and sleet. In several locations the storm deposited rain, which froze as it fell [freezing rain], forming a coating of ice several inches in thickness on all exposed objects. Much damage was done to trees and shrubbery of all kinds. In New England the storm was reported as being the most severe of its kind since 1837.<sup>138</sup>

On 21-22 February 1898, there was a destructive snowstorm in southwestern counties [of *England*].<sup>94</sup>

On 15 March 1898, a severe snowstorm struck Montana in the *United States*. The storm was exceptionally heavy in the northeastern part of the State; the snow was drifted to the depth of 6 to 8 feet in places in Lewistown. The cold wave and snowstorm which spread southward down the mountain valleys on the 20<sup>th</sup>-21<sup>st</sup> gave heavy snows in this section, which were badly drifted, and being followed on the 24<sup>th</sup> by another heavy snowfall with high winds, the cuts were blown full. The Great Northern Road could not get a train through over the Divide for several days, and stage lines were delayed everywhere.<sup>138</sup> Newspaper clippings indicate more snow in the mountains than ever before known at the end of March.

On 24-26 March 1898, there were severe gales with snow, over the *United Kingdom*, with loss of life.<sup>94</sup>

### 1898 A.D. – 1899 A.D. Russia. Famine

*Russia* suffered from a major famine in 1898-99.<sup>96</sup>

**1898 A.D.** On 4 February 1898, a cyclone struck Mackay, *Australia*, severely damaging the city.<sup>101</sup>

According to an extract from the *San Francisco Call*, the British bark *Fairfield*, of Glasgow, encountered on her trip between Shanghai and Tacoma a waterspout and hurricane that stripped her bare of canvas. The *Fairfield* passed within a quarter of a mile of this waterspout when about a week out from Shanghai, *China* viz, on February 10 [1898]. The sky became suddenly overcast and soon an electric storm was raging. The sky darkened and the wind came in puffs of hurricane violence. An attempt was made to turn the ship northward but it was too late to escape the storm. In a very few minutes an immense black

funnel cloud went swirling by, striking terror into every one aboard. There was an awful roar and the water seemed to be sucked from the ocean up to a height of 300 feet. Had the *Fairfield* been in the path of the waterspout she might have been destroyed in a twinkling. An hour after the waterspout passed the sun was shining and the ship was sailing through a peaceful sea as though nothing had happened. The vessel was in the most violent part of the storm for about forty minutes.<sup>138</sup>

On 16 February 1898, there were disastrous floods at Bungendore, in New South Wales, *Australia*. The whole town of Bungendore was submerged under water, with the water on some streets 5 feet (1.5 meters) deep. Two men were drowned and there was much property damage when Turalla Creek flooded.<sup>99</sup>

Numerous forest fires broke out in the South Atlantic States in the *United States* about the middle of February 1898. No rain had fallen for some time, and the forest and swamplands were very dry. The fires were fanned by the high southwest winds of the 15<sup>th</sup>, and spread with great rapidity, notwithstanding the efforts of the citizens to check them. Many buildings, fences, and bridges were burned and much lumber was destroyed, the losses aggregating upward of \$1,000,000. [In present currency, that would be equivalent to \$26 million in damages based on the Consumer Price Index (CPI) inflation rates.] The fires devastated portions of the counties of Moore, Richmond, Cumberland, Union, Bladen, Robeson, Pender, and Sampson in North Carolina; Marlboro, Sumter, Aiken, Berkeley, Darlington, Orangeburg, Colleton, Barnwell, Marion, Chesterfield, Richland, Lexington, Fairfield, Williamsburg, Georgetown, and Florence in South Carolina.<sup>138</sup>

Beginning 15 March 1898, a great flood rose in the Ohio River in the *United States*, coming largely from its northern tributaries. At Cincinnati, Ohio the rise was continuous to a maximum height of 61.4 feet, which was reached on the 29<sup>th</sup>. This was the highest stage in March since the record began in 1858. Great destruction was wrought by the flood on the streams of Indiana and Ohio, as well as along the Ohio River itself. The freshet from the upper Mississippi, joined to that from the Ohio, inaugurated a flood of considerable magnitude at Cairo, Illinois. The rise commenced on the March 13<sup>th</sup> and continued to rise until April 6<sup>th</sup>, when a stage of 49.8 feet had been attained. Corresponding steady rises followed at Memphis, Tennessee; Vicksburg, Mississippi; and New Orleans, Louisiana. On 3 April 1898, a levee broke at Shawneetown, Illinois, whereby the town was inundated, 30 persons were drowned, and considerable property destroyed.<sup>138</sup>

The Cincinnati Enquirer of 22 March 1898 reports that sulfur rain fell at Mount Vernon, Kentucky in the *United States*, early on the morning of March 21, and also at several other places in Rockcastle County; the stuff burned and gave out fumes of sulfur. According to the editor of the National Weather Service, "Those who are not seeking after mysteries may rest assured that such a rain of sulphur simply brings down to the ground some pollen from the pine woods, or some other light substance that has only a short time before been carried up by a strong gust of wind. It saddens one to think that any superstition should attach to such an ordinary phenomenon, one that occurs every day of the year at some place on the globe. Still more is it a pity that our daily press should repeat, and apparently indorse, any of the popular errors regarding these and other meteorological phenomena. It is quite as easy for a popular journal to present the best thoughts of the best people as it is to merely diffuse and strengthen the errors of the ignorant. The past century has witnessed the banishment from our text-books of innumerable erroneous ideas that were accepted by our ancestors. Why can not the daily press assist in the work of educating the public and resolutely refuse to print such nonsense as "the people generally consider this a sure harbinger of war," or such headings as "a red sun: bloody omen," or again, "great drought: belief that the world is drying up and that its end is drawing near"? If any one thing is more clearly taught than another by all our teachers, both religious and secular, it is that the future is not and can not be revealed by signs and omens."<sup>138</sup> [In my opinion, the same holds true today over a hundred years later when the press blindly generates unwarranted scare stories about man-made global warming. They continue to feed the flames.]

March 1898 was an unusually rainy month throughout the group of *Hawaiian Islands*. Kaumana (near Hilo), Hawaii, reports 55.58 inches; 10.18 inches fell at Luakaha, Oahu (5 miles from Honolulu); on the 24<sup>th</sup> unprecedented floods did much damage, especially in Oahu and Kauai; heaviest rain on north side of Oahu on the 27<sup>th</sup>. There was frequent thunder and lightning from the 12<sup>th</sup> to the 24<sup>th</sup>.<sup>138</sup>

On 29 March 1898, a cyclone struck Darwin in the Northern Territory of *Australia*. There were strong winds with heavy rain and severe flooding between Darwin and Daly River.<sup>99</sup>

During March 1898, a cyclone struck Cossack in Western Australia. This cyclone developed in the Bonaparte Gulf and moved down the west coast of *Australia*. It tore through Cossack, wreaking havoc both on shipping and causing over £30,000 damage to the town.<sup>99</sup> [In today's currency, that would be the equivalent of £2.5 million or \$4 million U.S. dollars using the retail price index.]

A very severe storm, known locally as a "willy-willy" visited the northwest coast of *Australia* at the end of March and beginning of April 1898. The first well-marked sign of its approach came from Port Darwin, in the Northern Territory of South Australia, on March 28th. The barometer at 9 a.m. read 29.40 inches, and fell to 29.34 inches during the course of the day, accompanied by heavy rain. This is the lowest reading recorded there since that town was devastated by a terrible cyclone about a year previously. The storm, keeping out to sea, travelled in a southwest direction at first, passing Wyndham on the 29th where the barometer fell to 29.33 inches, with heavy rain. It continued to move down the coast, passing Derby on the 30th (29.51 inches) and Broome a little later on the same day (29.60 inches). Its motion now appeared to lie retarded, due probably to the fact that it was recurving and preparing to travel in a more or less southeast direction. The winds now commenced to freshen, blowing from the East at Cossack and northeast farther up the coast, and this, combined with the shape of the isobars, indicated that the storm center was still lying out at sea. On the morning of the 2<sup>nd</sup> the wind was from the North at Condon, East at Cossack, and South at Onslow, blowing strong at each place, and the barometer at Cossack had fallen to 29.54 inches, with very high sea. The storm, apparently, was now moving from the sea straight on to Cossack, where the barometer fell rapidly, reaching a minimum of 28.718 inches at 5 p.m. Some idea of the hurricane that was then experienced by the inhabitants of this town may lie gathered from the following extracts from the newspaper *West Australian*.<sup>102</sup>

In Cossack, *Australia*, the town presents a very dilapidated spectacle. In no storm previously experienced has so much damage been wrought. Telegraph communication between Roebourne and Cossack, and eastwards, is entirely cut off. The line between the two former places is down for three or four miles. The tramway embankment across the marsh is washed away, and the rails have parted in places and been lodged 20 yards from the site of the embankment. All the approaches and bridges, both along the tramway line and on the road, have been completely washed away; the rails standing several feet from the ground. Communication is cut off by road.<sup>102</sup>

In Cossack, *Australia*, "Several daring persons walked up to Roebourne through mud and slush up to their knees to communicate the news of the most terrible disaster that has befallen Cossack, which appears to have been the very center of the hurricane. The experiences of some of the residents of Cossack are most heartrending. Mr. and Mrs. Wilson, observing their dwelling collapsing, left it with the intention of proceeding to Mr. C. W. Paterson's residence, a few hundreds yards off. They had a terrible time of it. They were for four hours hanging on to the spinifex [a type of grass], in the midst of the storm, before they reached their destination. Wilson lost sight of his wife for a whole hour, and then only found her by chance. S. Hemingway and B. Thompson, after their residences had collapsed, got into a 400-gallon tank to save their lives, and remained there, up to their middle in water, till daylight. The jetty has sunk down many feet, and the goods shed is frightfully torn about by the storm. The sea burst in the door facing the creek and swept a quantity of cargo out. Fearful damage has been done to shipping. The *S.S. Beagle* is

piled up on the rocks on the south side of the jetty, in front of the Weld Hotel, with her stern resting on the fallen walls of the jetty and her bows on the rocks. The schooner *Maggie Gollan* is a total wreck on the beach, towards Japtown. The dilapidated jetty was fully loaded with general merchandise for Condon. The cargo is now strewn along the strand from one end to the other. The schooner *Harriet* is high and dry on the beach close to the north side of the jetty. The *S.S. Croydon*, which was moored near the stock jetty, on the opposite side of the creek, was carried fair on to high land. The cutter *Rose* has been washed up between the residences of A. Rouse and A. S. Thompson. Smaller crafts, such as passenger boats, etc. were carried greater distances inland. The only boat that remained at her moorings was the police boat. Not a single boat other than this is safe.”<sup>102</sup>

Floods occurred in Arkansas in the *United States* during the first half of May 1898. During this flood the high water record at Fort Smith and Dardanelle, Arkansas, was broken. At Fort Smith, the highest of record, heretofore, was 30.9 feet, which occurred 19 May 1892, and at Dardanelle the highest of record was 27.9 feet, which occurred 18 May 1892. During the 1898 flood the water at Fort Smith and Dardanelle registered 35.4 and 29.3 feet, respectively.<sup>138</sup>

A series of tornadoes ripped across the *United States* on 18 May 1898. The storms killed 47 people and produced property losses of \$700,000, [approximately \$18 million in today's dollars] not including the loss of timber. [Fifteen were killed in Iowa with property damage estimated at \$150,000. Sixteen were killed in Illinois with property damage estimated at \$340,000. Sixteen were killed in Wisconsin with property damage estimated at \$210,000 and with over 100 injured.]<sup>138</sup>

About 18 May 1898, destructive tornadoes struck Iowa, Illinois and Minnesota in the *United States* with loss of life.<sup>94</sup>

On 6 June 1898, a very severe hailstorm struck between Rocky Ford and La Junta, Colorado in the *United States*. The storm path was 5 miles wide and 12 miles long. Trees were stripped of foliage, young hogs, turkeys, etc. were killed and much fruit was destroyed. The hailstones varied from about the size of peas to that of hen's eggs and were accompanied by severe wind. The hail was left in drifts 15 inches deep.<sup>138</sup>

On 24 June 1898, a very destructive hailstorm originated in Benson County, North Dakota in the *United States*. It moved eastward in a path from 1 to 8 miles in width, passing through the counties of Ramsey and Walsh, North Dakota, and Marshall, Minnesota. Crops in the pathway of the storm were very much damaged. According to newspaper reports, the area of grain destroyed was about 50,000 acres, and the loss from \$150,000 to \$200,000 [\$4 - \$5 million in today's dollars]. A few buildings were wrecked by the wind, and many head of livestock were killed by lightning. Two persons were killed by lightning 12 miles west of Minnewaukon [Minnewaukan, North Dakota].<sup>138</sup>

The year 1898 in Bradford County, Pennsylvania in the *United States* was notable for the numerous destructive electrical storms in July, August and September. Those of August 24 and September 4 were severe. On 6 September, a tornado swept over the central part of Springfield Township in Bradford County. The tornado killed two men, blew down buildings, killed livestock and destroyed crops.<sup>178</sup>

On 10-11 September 1898, a hurricane struck the *Caribbean island* of St. Vincent and Barbados in the *Lesser Antilles*. [Most accounts cite 383 fatalities but one account cites 283 deaths.]<sup>141</sup>

On 26 September 1898, a destructive tornado struck at St. Catharine's and Merriton, Niagara, in *Canada*. The tornado caused 5 deaths.<sup>94</sup>

On 2 October 1898, a hurricane struck Georgia, South Carolina and North Carolina in the *United States* causing between 150 and 180 deaths.<sup>141</sup>

On 15 October 1898, severe gale struck round *Great Britain*, many deaths.<sup>94</sup>

On 2-3 November, there was a gale in Great Britain, with loss of life.<sup>94</sup>

In early November 1898, there were destructive floods in Shan-Tung [Shandong in the northeast coast of *China*].<sup>97</sup>

In 1898 during the period between 15 October and 13 November, a drought engulfed Hopei (now Hebei province) in northern *China* at Ning-ching.<sup>153</sup>

On 27 November 1898, there was a violent gale off New England in the *United States*. Six vessels were wrecked causing 180 deaths.<sup>94</sup>

On 26-27, and 31 December 1898, there was a destructive southwest gale over the *United Kingdom*.<sup>94</sup>

*Also refer to the section 1895 A.D. – 1903 A.D. for information on the drought in Australia during that timeframe.*

*Also refer to the section 1896 A.D. – 1900 A.D. for information on the famine in India during that timeframe.*

*Also refer to the section 1898 A.D. – 1899 A.D. for information on the famine in Russia during that timeframe.*

---

**Winter of 1898 / 1899 A.D.** On 23-25 November 1898, there were blizzards and floods in the Midland region of *England* and in the *English Channel*. Some deaths were reported.<sup>94</sup>

The winter of 1898-99 in Bradford County, Pennsylvania in the *United States* began with a beautiful fall. Many ripe red raspberries were picked during the beginning of October. The first killing frost occurred on 23 October. Snowfall during the first week of December permitted good sleighing on the highlands. January came in cold and blustery, the temperature being -3° F [-19° C] on January 1<sup>st</sup>, and -10° F [-23° C] on January 2<sup>nd</sup>. A storm of sleet struck on February 3<sup>rd</sup>, which covered the roads with a glare of ice and made travel dangerous. A snowstorm followed. The memorable cold wave reached this section on the night of 8 February and continued for five days. On 9 February, temperatures in the county ranged from -12° F to -20° F [-24° C to -29° C]; on the 10<sup>th</sup> from -20° F to -30° F [-29° C to -34° C]; on the 11<sup>th</sup> from -18° F to -34° F [-28° C to -37° C]. On the 12<sup>th</sup>, there was a heavy snowfall with the weather severe and biting. On the 13<sup>th</sup>, there was a strong wind that piled the roads full of snowdrifts, cutting off traffic and mail from every quarter. There was good sleighing until about the first of March when heavy rains set in. Bluebirds and robins appeared during the beginning of March, and by the middle of April farmers were busy plowing their fields and sowing oats. May was a month of delightful weather.<sup>178</sup>

A storm originated in the Rio Grande Valley in the *United States* and advanced from Texas to the St. Lawrence Valley from 5-7 January 1899. This storm caused heavy snowfalls in the upper Ohio Valley and the lower Lake region on the 6<sup>th</sup>, and heavy gales the night of the 6<sup>th</sup> over the lower Lakes and along the north Atlantic coast.<sup>123</sup>

In the *United States*, the Mississippi River froze its entire length down to the Gulf of Mexico. Some ice even flowed into the Gulf. In places like Cairo, Illinois the thickness of the ice was 13 inches (33 centimeters). The ice in New Orleans was two inches (5 centimeters) thick and one inch (2.5 centimeters) thick at the mouth of the Mississippi River. During four consecutive days the cold weather was so severe that the event was referred to as “The Great Cold Wave”. On February 10, a strong storm came down from *Canada*. Logan, Montana recorded a low temperatures of -61° F (-52° C). On February 11, at Quantico, Virginia recorded temperatures of -30° F (-34° C). Pittsburg, Pennsylvania saw a temperature of -20° F (-29° C). In Chicago, the ground froze to a depth of 5 feet (1.5 meters). The storm traveled up the East Coast depositing 2 feet (0.6 meters) of snow in Washington D.C. and 4 feet (1.2 meters) of snow

in Philadelphia, New York, and Boston and 10 feet (3 meters) of snow in the Chesapeake Bay area. On February 14, Tallahassee, Florida saw temperatures as cold as -2° F (-19° C). Other locations that saw rare low temperatures include Dallas, Texas at -10° F (-23° C), Kansas City, Missouri at -22° F (-30° C), and Scottsbluff, Nebraska at -45° F (-43° C).<sup>22, 23</sup>

In the *United States* in 1899, an area west of Galveston Harbor froze from the Barrier islands to the mainland. In the same cold snap, children were skating on the San Antonio River.<sup>33</sup>

On 9-13 February 1899, a blizzard struck New York and the *United States*. Forty deaths were reported.<sup>94</sup>

During the first half of February the most remarkable cold wave, or series of cold waves, in the history of the Weather Bureau traversed the *United States* from the north Pacific to the south Atlantic coasts, damaging crops and fruits in the Southern States to the extent of millions of dollars. During the first eight days of the month the lowest temperatures on record were reported at points in the north Pacific coast States; from the 9<sup>th</sup> to the 12<sup>th</sup> many places in the Central, Western, and Northwestern States reported the coldest weather on record. During the 13<sup>th</sup> and 14<sup>th</sup> the cold wave overspread the Southern and Eastern States, attended, on the 13<sup>th</sup>, by the lowest temperatures on record from the southern Rocky Mountain slope to the south Atlantic coast, by zero temperatures to the Gulf coast of Alabama, and by a snowstorm of unprecedented severity in the Middle Atlantic States.<sup>67, 123</sup>

The following are the lowest temperatures observed during February 1899 in the *United States*:<sup>123</sup>

Fort Logan, Montana	( -61° F, -51.7° C)
Leech Lake, Minnesota	( -59° F, -50.6° C)
Fort Keogh, Montana	( -55° F, -48.3° C)
Detroit City, Minnesota	( -53° F, -47.2° C)
Park Rapids, Minnesota	( -51° F, -46.1° C)
Lovell, Wyoming	( -51° F, -46.1° C)
St. Paul's Mission, Montana	( -51° F, -46.1° C)
Basin, Wyoming	( -51° F, -46.1° C)
Adel, Montana	( -50° F, -45.6° C)
Glasgow, Montana	( -50° F, -45.6° C)
Easton, Wisconsin	( -50° F, -45.6° C)
Pokegama Falls, Minnesota	( -50° F, -45.6° C)
Tower, Minnesota	( -49° F, -45.0° C)
Baldwin, Michigan	( -49° F, -45.0° C)
Humboldt, Michigan	( -49° F, -45.0° C)
Billings, Montana	( -49° F, -45.0° C)
Amherst, Wisconsin	( -48° F, -44.4° C)
Barron, Wisconsin	( -48° F, -44.4° C)
Knapp, Wisconsin	( -48° F, -44.4° C)
Steven's Point, Wisconsin	( -48° F, -44.4° C)
Fort Laramie, Wyoming	( -48° F, -44.4° C)
Bemidji, Minnesota	( -48° F, -44.4° C)
Sandy Lake Dam, Minnesota	( -48° F, -44.4° C)
McKinney, North Dakota	( -48° F, -44.4° C)
Ewen, Michigan	( -47° F, -43.9° C)
Fort Berthold, North Dakota	( -47° F, -43.9° C)
Roseau, Minnesota	( -47° F, -43.9° C)
Camp Clarke, Nebraska	( -47° F, -43.9° C)
Doland, South Dakota	( -47° F, -43.9° C)
Forestburg, South Dakota	( -46° F, -43.3° C)
Thomaston, Michigan	( -46° F, -43.3° C)
Cody, Wyoming	( -46° F, -43.3° C)
Hallock, Minnesota	( -46° F, -43.3° C)

Crow Agency, Montana	(-46° F, -43.3° C) (near Little Big Horn)
Kipp, Montana	(-46° F, -43.3° C)
Shelby, Montana	(-46° F, -43.3° C)
Minnewaukan, North Dakota	(-46° F, -43.3° C)
Woodbridge, North Dakota	(-46° F, -43.3° C)
Manhattan, Montana	(-45° F, -42.8° C)
Willow River, Minnesota	(-45° F, -42.8° C)
Gering, Nebraska	(-45° F, -42.8° C)
Milton, North Dakota	(-45° F, -42.8° C)
Portal, North Dakota	(-45° F, -42.8° C)
Newfolden, Minnesota	(-44° F, -42.2° C)
Harney, South Dakota	(-44° F, -42.2° C)
Big Timber, Montana	(-44° F, -42.2° C)
Mancelona, Michigan	(-43° F, -41.7° C)
Sidnaw, Michigan	(-43° F, -41.7° C)
Waverly, Michigan	(-43° F, -41.7° C)
Holdrege, Nebraska	(-43° F, -41.7° C)
Poplar, Montana	(-42° F, -41.1° C)
Lost River, Idaho	(-41° F, -40.6° C)
Grayling, Michigan	(-41° F, -40.6° C)
Lake City, Michigan	(-41° F, -40.6° C)
Hay Springs, Nebraska	(-41° F, -40.6° C)
Williston, North Dakota	(-41° F, -40.6° C)
Republican City, Nebraska	(-40° F, -40.0° C)
Lathrop, Michigan	(-40° F, -40.0° C)
Swan Valley, Idaho	(-40° F, -40.0° C)
Rock Rapids, Iowa	(-40° F, -40.0° C)
Sibley, Iowa	(-40° F, -40.0° C)
Spirit Lake, Iowa	(-39° F, -39.4° C)
Pierre, South Dakota	(-39° F, -39.4° C)
Lawrenceville, Pennsylvania	(-39° F, -39.4° C)
Scipio, Utah	(-39° F, -39.4° C)
Pagoda, Colorado	(-39° F, -39.4° C)
Walden, Colorado	(-39° F, -39.4° C)
Milligan, Ohio	(-39° F, -39.4° C)
Coalton, Ohio	(-38° F, -38.9° C)
McArthur, Ohio	(-38° F, -38.9° C)
Fort Collins, Colorado	(-38° F, -38.9° C)
Bismarck, North Dakota	(-37° F, -38.3° C)
Sault Sainte Marie, Michigan	(-37° F, -38.3° C)
Usk, Washington	(-36° F, -37.8° C)
Duluth, Wisconsin	(-36° F, -37.8° C)
Dayton, West Virginia	(-35° F, -37.2° C)
North Platte, Nebraska	(-35° F, -37.2° C)
Frankfort, Kansas	(-34° F, -36.7° C)
Saint Paul, Minnesota	(-33° F, -36.1° C)
La Crosse, Wisconsin	(-32° F, -35.6° C)
Birch Tree, Missouri	(-32° F, -35.6° C)
Zeitonia, Missouri	(-32° F, -35.6° C) (now called Gad's Hill)
Woodstock, Vermont	(-30° F, -34.4° C)
Erasmus, Tennessee	(-30° F, -34.4° C)
Yankton, South Dakota	(-30° F, -34.4° C)
Boca, California	(-30° F, -34.4° C)
Flagstaff, Maine	(-30° F, -34.4° C)
Greensboro, Pennsylvania	(-30° F, -34.4° C)
Helena, Montana	(-30° F, -34.4° C)

North Lake, New York	( -30° F, -34.4° C)
Idaho Falls, Idaho	( -29° F, -33.9° C)
Morrisonville, Illinois	( -29° F, -33.9° C)
Abilene, Kansas	( -29° F, -33.9° C)
Greensburg, Kentucky	( -29° F, -33.9° C)
Monterey, Virginia	( -29° F, -33.9° C)
Wells, Nevada	( -29° F, -33.9° C)
Berlin Mills, New Hampshire	( -29° F, -33.9° C)
Earlington, Kentucky	( -28° F, -33.3° C)
Cheyenne, Wyoming	( -28° F, -33.3° C)
Silver Lake, Oregon	( -27° F, -32.8° C)
Parkersburg, West Virginia	( -27° F, -32.8° C)
Columbus, Indiana	( -27° F, -32.8° C)
Salem, Indiana	( -27° F, -32.8° C)
Pueblo, Colorado	( -27° F, -32.8° C)
Dodge City, Kansas	( -26° F, -32.2° C)
Dubuque, Iowa	( -26° F, -32.2° C)
Sunnyside, Maryland	( -26° F, -32.2° C)
Omaha, Nebraska	( -26° F, -32.2° C)
Monero, New Mexico	( -26° F, -32.2° C)
Winnebago, Illinois	( -25° F, -31.7° C)
Northfield, Maine	( -25° F, -31.7° C)
Chase, Maryland	( -25° F, -31.7° C)
Topeka, Kansas	( -25° F, -31.7° C)
Morgantown, West Virginia	( -25° F, -31.7° C)
Corning, Arkansas	( -25° F, -31.7° C)
Winslow, Arkansas	( -25° F, -31.7° C)
Beaver, Oklahoma	( -25° F, -31.7° C)
Fort Defiance, Arizona	( -24° F, -31.1° C)
Marquette, Michigan	( -23° F, -30.6° C)
Lafayette, Indiana	( -22° F, -30.0° C)
Denver, Colorado	( -22° F, -30.0° C)
Milwaukee, Wisconsin	( -22° F, -30.0° C)
Chicago, Illinois	( -21° F, -29.4° C)
Keokuk, Iowa	( -21° F, -29.4° C)
Truckee, California	( -21° F, -29.4° C)
Lexington, Kentucky	( -20° F, -28.9° C)
North Bridgton, Maine	( -20° F, -28.9° C)
Columbus, Ohio	( -20° F, -28.9° C)
Indianapolis, Indiana	( -18° F, -27.8° C)
Deckertown, New Jersey	( -17° F, -27.2° C) (now Sussex)
Valleyhead, Alabama	( -17° F, -27.2° C)
Cincinnati, Ohio	( -17° F, -27.2° C)
Oklahoma City, Oklahoma	( -17° F, -27.2° C)
Norwalk, Connecticut	( -16° F, -26.7° C)
Minden, Louisiana	( -16° F, -26.7° C)
Mount Pleasant, North Carolina	( -16° F, -26.7° C)
Leeds, Massachusetts	( -16° F, -26.7° C)
Saint Louis, Missouri	( -16° F, -26.7° C)
Amarillo, Texas	( -16° F, -26.7° C)
Washington, D.C.	( -15° F, -26.1° C)
Evansville, Indiana	( -15° F, -26.1° C)
Fort Smith, Arkansas	( -15° F, -26.1° C)
Aberdeen, Mississippi	( -15° F, -26.1° C)
Binghamton, New York	( -15° F, -26.1° C)
Louisville, Kentucky	( -14° F, -25.6° C)

Cairo, Illinois	( -14° F, -25.6° C)
Fort Sill, Oklahoma	( -14° F, -25.6° C)
Nashville, Tennessee	( -13° F, -25.0° C)
Detroit, Michigan	( -13° F, -25.0° C)
Little Rock, Arkansas	( -12° F, -24.4° C)
Tallapoosa, Georgia	( -12° F, -24.4° C)
Winnemucca, Nevada	( -12° F, -24.4° C)
Spokane, Washington	( -12° F, -24.4° C)
Erie, Pennsylvania	( -12° F, -24.4° C)
Santuck, South Carolina	( -11° F, -23.9° C)
Knoxville, Tennessee	( -10° F, -23.3° C)
Millsboro, Delaware	( -10° F, -23.3° C)
Birmingham, Alabama	( -10° F, -23.3° C)
New London, Connecticut	( -10° F, -23.3° C)
New Brunswick, New Jersey	( -10° F, -23.3° C)
Salt Lake City, Utah	( -10° F, -23.3° C)
Burlington, Vermont	( -10° F, -23.3° C)
New Haven, Connecticut	( -9° F, -22.8° C)
Atlanta, Georgia	( -8° F, -22.2° C)
Lewiston, Idaho	( -8° F, -22.2° C)
Albany, New York	( -8° F, -22.2° C)
Fort Worth, Texas	( -8° F, -22.2° C)
Cape May, New Jersey	( -8° F, -22.2° C)
Baltimore, Maryland	( -7° F, -21.7° C)
Portland, Maine	( -6° F, -21.1° C)
New York City, New York	( -6° F, -21.1° C)
Philadelphia, Pennsylvania	( -6° F, -21.1° C)
Shreveport, Louisiana	( -5° F, -20.6° C)
Santa Fe, New Mexico	( -5° F, -20.6° C)
Montgomery, Alabama	( -5° F, -20.6° C)
Charlotte, North Carolina	( -5° F, -20.6° C)
Carson City, Nevada	( -4° F, -20.0° C)
Boston, Massachusetts	( -4° F, -20.0° C)
Lynchburg, Virginia	( -3° F, -19.4° C)
Columbia, South Carolina	( -2° F, -18.9° C)
Tallahassee, Florida	( -2° F, -18.9° C)
Vicksburg, Mississippi	( -1° F, -18.3° C)
Mobile, Alabama	( -1° F, -18.3° C)
Block Island, Rhode Island	( 0° F, -17.8° C)
Nantucket, Massachusetts	( 2° F, -16.7° C)
Augusta, Georgia	( 3° F, -16.1° C)
Norfolk, Virginia	( 3° F, -16.1° C)
San Antonio, Texas	( 4° F, -15.6° C)
Olympia, Washington	( 5° F, -15.0° C)
Kitty Hawk, North Carolina	( 6° F, -14.4° C)
Pensacola, Florida	( 7° F, -13.9° C)
Roseburg, Oregon	( 7° F, -13.9° C)
Charleston, South Carolina	( 7° F, -13.9° C)
New Orleans, Louisiana	( 7° F, -13.9° C)
Savannah, Georgia	( 8° F, -13.3° C)
Galveston, Texas	( 8° F, -13.3° C)
Portland, Oregon	( 9° F, -12.8° C)
Jacksonville, Florida	( 10° F, -12.2° C)
Tucson, Arizona	( 17° F, -8.3° C)
Yuma, Arizona	( 28° F, -2.2° C)
San Francisco, California	( 34° F, +1.1° C)

San Diego, California	( 34° F, +1.1° C)
Key West, Florida	( 44° F, +6.7° C)

During the winter of 1898-99 in the *United States*, the thickness in ice in rivers peaked during February 1899 at the following levels: <sup>123</sup>

Moorhead, Minnesota	42.0 inches
St. Paul, Minnesota	30.0 inches
La Crosse, Wisconsin	32.0 inches
Dubuque, Iowa	27.5 inches
Davenport, Iowa	21.5 inches
Keokuk, Iowa	26.0 inches
Hannibal, Missouri	16.0 inches
Williston, North Dakota	32.0 inches
Bismarck, North Dakota	34.0 inches
Pierre, South Dakota	25.0 inches
Yankton, South Dakota	26.0 inches
Sioux City, Iowa	24.0 inches
Omaha, Nebraska	22.0 inches
Topeka, Kansas	15.0 inches
Kansas City, Missouri	13.0 inches
Wichita, Kansas	12.0 inches
Pittsburg, Pennsylvania	1.4 inches
Parkersburg, West Virginia	5.0 inches
Columbus, Ohio	8.0 inches
Memphis, Tennessee	1.0 inch
Fort Smith, Arkansas	9.0 inches
Little Rock, Arkansas	5.0 inches
New Orleans, Louisiana	2.0 inches
Brattleboro, Vermont	18.5 inches
Concord, Massachusetts	22.0 inches
Albany, New York	11.0 inches
New Brunswick, New Jersey	13.0 inches
Harrisburg, Pennsylvania	12.0 inches
Lynchburg, Virginia	5.0 inches
Richmond, Virginia	6.0 inches
Columbia, South Carolina	2.0 inches

The following are accounts of the great storm that struck the United States during 9-14 February 1899: <sup>123</sup>

New Orleans, Louisiana, reported: “the early vegetable crop was entirely destroyed, the orange crop was a total loss, and trees were killed, the cane crop was considerably injured, and fruit, aside from oranges, was seriously injured. The freeze benefited the rice land. The evening of the 13<sup>th</sup> there was one inch of snow on the ground, and ice two inches in thickness had formed.”

Alabama reported: “The month was the coldest on record. Several persons were frozen to death; stock suffered very much; in some counties cows, hogs, and goats froze to death, and poultry froze on the roost; large numbers of game birds perished, and swift-running streams, never before known to freeze, were covered with ice; the ice on ponds in middle counties was thick enough for skating on the 13<sup>th</sup> and 14<sup>th</sup>, while at Montgomery sleighing was indulged in for three days.”

According to the Weather Bureau in Atlanta, Georgia, while the entire state suffered severely, the damage was greatest in the southern half, where peaches, as well as a number of young trees, were killed. A covering of snow generally protected the grains. Livestock suffered, and in some counties cows and goats were frozen to death.

Jacksonville, Florida, reported that “on the night of the 12<sup>th</sup>, heavy sleet and snow prostrated telegraph lines north and cut off communication with Washington D.C. The cold was so severe over the western and parts of the northern districts that cattle, horses, and sheep died from exposure. The lowest temperature reported was 4° F below zero over the western district. The temperature fell to 29° F in the southern part of Dade County. The vegetable crop over central, northern, and western portions of the State has been destroyed; oats, peaches, and pears damaged, and probably the greater portion of young citrus trees over the north-central counties has been seriously damaged.”

Little Rock, Arkansas reported: “The extreme cold which swept over the State, like a breath from the frozen pole, from the 8<sup>th</sup> to, and including, the 16<sup>th</sup>, broke all records both as to the minimum temperature and the protracted character of the cold spell. Only once "within the memory of the oldest inhabitant" was it equaled, and that was in "the winter of 1863, when the Union forces hauled their cannon across the *Arkansas River* on the ice," and only once since the establishment of the Weather Bureau in this city was the river frozen over for a greater length of time. The records show but two previous occasions when the river was frozen over. On February 3, 1886, it was frozen over from shore to shore; in February, 1895, it was again frozen from shore to shore from the 7<sup>th</sup> to the 17<sup>th</sup>, both dates included.”

New York City reported the following: “During Sunday night and Monday heavy snow fell without intermission. Up to midnight Sunday (12<sup>th</sup>), owing to light winds there had been but little confusion on account of snow, notwithstanding the ground was covered to an average depth of 14 inches. About 4 a.m. Monday (13<sup>th</sup>), a gale came on from the northeast, which continued with increasing force till 4:30 p.m., when it shifted to northwest and continued throughout the night with hurricane velocity. The snow was very dry, and drifted badly; street traffic, which before had not been interrupted, was maintained with great difficulty, and finally abandoned altogether, with the exception of two cable lines. At 8 p.m. (13<sup>th</sup>), the conditions were worse. The average depth of snow on the ground was 23 inches, and it drifted to a depth of 6 feet in many places. After 8 p.m. the snowfall became lighter, and ceased during the early morning of February 14, with a fall of 15.6 inches during the storm, and a total depth on the ground of 24 inches. Monday was very generally observed as a holiday, and all business was suspended. When Tuesday morning came, with clearing weather and a resumption of business, the scene in lower Broadway was one of indescribable confusion. All traffic was confined to the narrow space covered by car tracks, while snow was piled on either side to a depth of 8 feet.”

New Jersey reported: “The extreme cold was followed by one of the most severe snowstorms on record. Snow began to fall on the evening of the 11<sup>th</sup>, and continued until early in the morning of the 14<sup>th</sup>. During this period it fell to the depth of from 30 inches in the southern to 44 inches in the northern portions. All railroad travel was suspended by the 13<sup>th</sup>, and country roads were impassable for several days, the drifts being from 3 to 8 feet high in many places.

Chicago, Illinois reported: “On account of the absence of snow, the ground in the vicinity of Chicago was frozen in many places to the depth of five and one-half feet, causing great damage by the freezing up of the water and gas mains and service pipes. Plumbers have been unable to meet the demands for their services, and the exigency has brought forward the novel method of thawing out frozen pipes by the use of an electric current. Great suffering was caused by the severe cold among the poorer classes, and many people were frozen to death. Several steamboats which maintain winter service on Lake Michigan were blocked by the thick ice and unable to reach port for three or four days.”

Michigan reported: “The month was remarkable for excessive cold, it being the coldest on record. Lake Michigan was almost frozen over on the 15<sup>th</sup>. Much fruit was destroyed and considerable game, especially quail, partridge and ducks, perished on account of the extreme cold.”

Missouri reported: “As a result of the extremely low temperatures of the first half of the month peach buds were very nearly all killed and a large per cent of the trees badly frozen, many being

killed to the snow line. Pears, plums, and apricots also suffered severely, a large portion of the buds being killed and, in some instances, the wood badly damaged. The hardier varieties of cherries generally escaped, but sweet cherries were killed to a considerable extent. Apples were reported badly damaged in some localities but it is believed that, as a rule, they were not seriously injured. The hardy varieties of grapes are generally safe. In most of the east-central, southeastern and south-central counties winter wheat was well protected by snow during the severe cold weather and was not seriously injured, except in localities where some of the late sown was killed, but generally throughout the northern and western sections the ground was nearly or quite bare and much of the crop was greatly damaged. Clover was also badly killed in some sections, especially where closely pastured, but in many counties was reported in good condition at the close of the month.”

Pennsylvania reported: “On the 11<sup>th</sup> all previous records of low temperatures were broken in nearly all sections of the State, and during the latter part of the day a severe snowstorm, accompanied by high winds, set in, and by the morning of the 12<sup>th</sup> railroads and trolleys were so badly blocked that transportation of all kinds was almost suspended. The storm continued with unabated energy throughout the 12<sup>th</sup> and 13<sup>th</sup>, during which time traffic was at a standstill. The snow was piled up in high drifts and cities and towns were completely cut off from outside communication, except by wire, and the streets were almost impassable to pedestrians. There being no heavy lodgment of ice or snow on the telegraph lines, telegraph and telephone service was but little interrupted. Many employees were unable to reach their places of business in the cities, and in the coal regions, mines were shut down because the miners were snowbound in their homes.”

*Niagara Falls* experienced a major ice jam. According to the *Post Standard* of Syracuse, New York, the Niagara River was frozen over from Lewiston down to Youngstown for the first time in twenty-two years. An ice jam formed along the river on February 13 and the river was frozen solid on the 14<sup>th</sup> from the base of the *Niagara Falls* to *Lake Ontario*, except at the Rapids. Above *Niagara Falls* the ice was packed in high piles in the river. Much dynamite was exploded to drive the ice from the inlets leading to the different power plants. In the gorge at the foot of the *Niagara Falls* some of the ice hills were nearly fifty feet high and one was said to be over a hundred feet high. Such a large quantity of ice had not been seen in the Niagara River for many years.

This storm reached Cuba. Havana, Cuba reported much damage by storm along coast front. The water and waves were the highest known in twenty-five years, and a number of houses were washed away, and many others, including their furniture, damaged or ruined. No estimate of amount of damage can be made. Camps and corrals of United States troops along the oceanfront greatly damaged. No lives lost. The Havana newspaper *Times of Cuba* of 14 February 1899 reported: “Yesterday winds and waves created sad havoc in many a household on the beach. The huge waves toppled over three houses at the ends of Aguila and Laza streets as if they were eggshells. Several persons in the houses were badly injured. From 6 to 7 in the morning those who live on the beach noticed the increasing height and periods of the waves, and by 8:30 a. m. the water was dashing upon the houses skirting the edge of the shore. The waves mounted higher and higher as the wind became more savage, and for a few hours it seemed as if a small sized cyclone was at work. The day was unusually tempestuous at sea.”

The storm was felt even near the equator. Colon, Columbia (now Colón, Panama near the Atlantic entrance to the Panama Canal) reports “On the 13<sup>th</sup> a moderate storm of the northern type prevailed in the afternoon. The sea became high during the evening. The wind decreased somewhat during the night of the 13<sup>th</sup>, and gradually shifted to northeast during the morning of the 14<sup>th</sup>, backing to north in the evening. The sea continued high, and steamers left their wharves in the early morning and sought anchorage in the mouth of the harbor.”

Snow fell and ice formed in South Carolina in the *United States* in 5 April 1899. The snow was confined to the northern border counties.<sup>123</sup>

On 10 April 1899, a protracted cold spell prevailed over the South producing heavy killing frosts in Alabama, Mississippi, Georgia, and east Tennessee in the *United States*. Heavy frosts occurred as far south as Mobile, Alabama and light frosts were reported in Jacksonville, Florida. Many farmers took advantage of early warnings by covering their crops with protective blankets of hay or canvas to prevent serious injury.<sup>123</sup>

---

**1899 A.D.** On 2-3 January 1899, there was a gale in the *English Channel* and *Irish Sea*, with loss of life.<sup>94</sup>

On 12-16 January 1899, violent gales struck over the *United Kingdom* and *European Continent*. Some deaths were reported.<sup>94</sup>

On 20-24 January 1899, there was a gale that caused floods in *Wales* and the Thames valley in *England*.<sup>94</sup>

On 11-13 February 1899, there was a destructive southwest gale and tidal wave in *Wales*.<sup>94</sup>

On 4-5 March 1899, a cyclone struck along the coast of Bathurst Bay, *Australia* in Queensland. The cyclone severely damaged the pearling fleet in Bathurst Bay. Fifty-five vessels were sunk and 300 people drowned. The storm surge caused the coastal waters to rise 49 feet (15 meters) above normal tidal levels in the bay.<sup>101</sup>

On 4 March 1899 a cyclone, *Mahina*, struck Bathurst Bay, near Princess Charlotte Bay (Cape York) in Queensland, *Australia*. The pearling fleet suffered great losses with 152 boats sunk or wrecked. Some of these boats were found kilometers inland. At least 307 crewmembers lost their lives. Over 100 aborigines also died in forest country or trying to help shipwrecked men when the back surge swept them far out into the sea where they drowned. Tons of fish and some dolphins were found 49 feet (15 meters) above sea level and up to several kilometers inland and rocks were embedded in trees. On Flinders Island, dolphins were found 50 feet (15.2 meters) up on the cliffs. On that night of 4 March, Constable J.M. Kenny reported that a 48-foot (14.6-meter) storm surge swept over their camp at Barrow Point (south of Cape Melville) atop a 40-foot (12-meter) high ridge and reached 3 miles (4.8 kilometers) inland, the largest storm surge ever recorded. After crossing Bathurst Bay, the cyclone *Mahina* - now generally known as the Bathurst Bay 'Hurricane' - continued on, with diminishing strength but caused considerable flooding, southwest across the peninsula to the southeastern corner of the Gulf of Carpentaria. There it doubled back on its tracks and died over the land on 10 March.<sup>99</sup>

On 11 March 1899, a hurricane struck Queensland, *Australia*, 411 persons drowned.<sup>94</sup>

On 7 April 1899, there was a southwest gale over the *United Kingdom*, with loss of life.<sup>94</sup>

On 27-28 April 1899, a cyclone [tornado] devastated Kirksville and Newtown, Missouri in the *United States*. It caused about 100 deaths.<sup>94</sup>

A series of tornadoes struck northern Missouri, western Iowa and central Nebraska in the *United States* in 1899 on April 19<sup>th</sup>, 26<sup>th</sup>, 27<sup>th</sup> and 30<sup>th</sup>. Fifty-one persons were killed outright or received injuries from which they have since died, and probably 200 received serious wounds. The property loss was about \$300,000. [In present currency, that would be equivalent to \$7.8 million in damages based on the Consumer Price Index (CPI) inflation rates.] A tornado struck Kirksville, Missouri on 27 April. The path of the tornado was about 800 feet wide and 1½ miles long. The tornado either totally or partially destroyed about 300 buildings and 34 lives were lost. On the same day, another tornado struck Newtown, Missouri, causing the loss of 12 lives.<sup>123</sup>

On 30 April 1899, a mudstorm struck South Dakota, Iowa and Nebraska in the *United States*. The mudstorm was caused by the collision of a dust storm and a rainstorm. An area of low pressure moved from Colorado northeastward into Iowa in the United States. During the prevalence of the southerly winds on the southeast side of the storm center, the dust was carried in great quantities northward, but when the clouds coming from the west began to drop a little rain, preliminary to the heavy northwest winds that were to follow, then the dust became mud and the rain became a very dirty rain. This succession of dust followed by muddy rain moved eastward over the greater part of Nebraska. During most of this time the sunlight was so obscured that lamps were lighted. This weather occurred in a weather pattern that also spawned several tornadoes.<sup>123</sup>

A tornado struck Colesburg, Iowa in the *United States* on 16 May 1899. Nine buildings were totally destroyed and 18 badly damaged. Five persons were killed and 12 injured. The property loss was very heavy, probably \$30,000 [\$775,000 in today's dollars]. The path of great destruction was, on an average, 30 rods [500 feet] wide and 12½ miles long.<sup>123</sup>

A very severe rain and hail storm struck Kansas in the *United States* on 21 & 22 May 1899. The storm was especially destructive in parts of Saline, Marion, Chase, Butler, Elk and Chautauqua Counties in Kansas. In those counties, torrents of rain fell soon swelling the streams to overflowing and drowning probably 1,000 head of livestock. Five hundred ten cattle were drowned in one bunch in Butler County. The cattle went into a draw and were overcome by the flood of water and icy hail. Some of the cattle when found were covered by drifts of hail, and chunks of ice to a depth of from 10 to 12 feet.<sup>123</sup>

A tornado struck in Brule County, South Dakota in the *United States* on 27 May 1899. Seven persons were killed. Several buildings in the path of the storm were totally demolished, involving a loss to buildings and livestock together at about \$8,000.<sup>123</sup>

During May 1899 in the *United States*, sixteen persons were killed by tornadoes and about 34 injured, while the property loss was about \$130,000. During the same month, 104 persons were killed by lightning strikes and 88 injured.<sup>123</sup>

On 12-13 June 1899, tornadoes struck the upper Mississippi [River], Wisconsin and Minnesota in the *United States*. New Richmond was almost destroyed, about 200 persons killed and many injured.<sup>94</sup>

A tornado destroyed the city of New Richmond, Wisconsin in the *United States* on 12 June 1899. A severe local storm occurred in western Wisconsin during the early evening of the 12<sup>th</sup>, which was most destructive at New Richmond, a town of about 1,500 inhabitants, of whom 114 were reported to have been killed by the fury of the storm, which also wrecked a large number of the most substantial buildings in the main portion of the town. In the aftermath several findings were observed:<sup>123</sup>

- \* A large iron safe weighing 3,000 pounds was caught up by the tornado and carried several hundred feet.
- \* An iron bar 4 feet long, 4 inches wide, and ½ inch thick, was driven into a lombardy poplar and solidly embedded at about 3 feet above the ground.
- \* A complete circle of boards driven deep into the earth, the circle was 90 feet in diameter. Furrows showed where other boards had struck the earth and were carried on.
- \* A sill beam 20 feet by 10 inches, from a destroyed planing mill, 2 rods to the southeast was thrust into the ground, so that only 5 feet protruded.
- \* The loss of life was very large in the cellars where people fled for shelter. The wind was so fierce that everything was swept clean, and then the debris from other buildings poured into the cellars with fatal results.

On 30 June 1899, a destructive frost struck in the morning in Hardin, Allen, Hancock and Marion Counties in Ohio in the *United States*. It was believed that a small mass of dense cold air, descended to the ground and then spread out horizontally, forming spots of low temperature.<sup>123</sup>

The following are the highest temperatures observed during July 1899 in the *United States*:<sup>123</sup>

Montgomery, Alabama	( 98° F, 36.7° C)
Mobile, Alabama	( 96° F, 35.6° C)
Tucson, Arizona	(107° F, 41.7° C)
Yuma, Arizona	(111° F, 43.9° C)
Little Rock, Arkansas	( 94° F, 34.4° C)
Fort Smith, Arkansas	( 95° F, 35.0° C)
San Francisco, California	( 73° F, 22.8° C)
San Diego, California	( 78° F, 25.6° C)
Fresno, California	(111° F, 43.9° C)
Denver, Colorado	( 95° F, 35.0° C)
Pueblo, Colorado	( 96° F, 35.6° C)
New Haven, Connecticut	( 90° F, 32.2° C)
New London, Connecticut	( 89° F, 31.7° C)
Millsboro, Delaware	( 93° F, 33.9° C)
Washington, D.C.	( 94° F, 34.4° C)
Pensacola, Florida	( 95° F, 35.0° C)
Key West, Florida	( 90° F, 32.2° C)
Augusta, Georgia	(100° F, 37.8° C)
Savannah, Georgia	( 98° F, 36.7° C)
Swan Valley, Idaho	( 94° F, 34.4° C)
Lewiston, Idaho	(104° F, 40.0° C)
Chicago, Illinois	( 90° F, 32.2° C)
Cairo, Illinois	( 92° F, 33.3° C)
Indianapolis, Indiana	( 94° F, 34.4° C)
Lafayette, Indiana	( 94° F, 34.4° C)
Dubuque, Iowa	( 92° F, 33.3° C)
Keokuk, Iowa	( 95° F, 35.0° C)
Topeka, Kansas	( 94° F, 34.4° C)
Dodge City, Kansas	( 96° F, 35.6° C)
Louisville, Kentucky	( 95° F, 35.0° C)
Lexington, Kentucky	( 95° F, 35.0° C)
New Orleans, Louisiana	( 93° F, 33.9° C)
Shreveport, Louisiana	(101° F, 38.3° C)
Eastport, Maine	( 80° F, 26.7° C)
Portland, Maine	( 87° F, 30.6° C)
Baltimore, Maryland	( 96° F, 35.6° C)
Boston, Massachusetts	( 94° F, 34.4° C)
Nantucket, Massachusetts	( 82° F, 27.8° C)
Marquette, Michigan	( 89° F, 31.7° C)
Detroit, Michigan	( 90° F, 32.2° C)
Saint Paul, Minnesota	( 91° F, 32.8° C)
Vicksburg, Mississippi	( 94° F, 34.4° C)
Saint Louis, Missouri	( 93° F, 33.9° C)
Billings, Montana	(102° F, 38.9° C)
Helena, Montana	( 98° F, 36.7° C)
North Platte, Nebraska	(101° F, 38.3° C)
Omaha, Nebraska	( 92° F, 33.3° C)
Winnemucca, Nevada	( 98° F, 36.7° C)
Carson City, Nevada	( 95° F, 35.0° C)
Claremont, New Hampshire	(101° F, 38.3° C)

New Brunswick, New Jersey	( 96° F, 35.6° C)
Cape May, New Jersey	( 84° F, 28.9° C)
Santa Fe, New Mexico	( 84° F, 28.9° C)
Albany, New York	( 94° F, 34.4° C)
New York City, New York	( 90° F, 32.2° C)
Charlotte, North Carolina	(100° F, 37.8° C)
Kitty Hawk, North Carolina	( 95° F, 35.0° C)
Bismarck, North Dakota	(100° F, 37.8° C)
Williston, North Dakota	( 92° F, 33.3° C)
Cincinnati, Ohio	( 94° F, 34.4° C)
Columbus, Ohio	( 94° F, 34.4° C)
Oklahoma City, Oklahoma	( 92° F, 33.3° C)
Fort Sill, Oklahoma	( 95° F, 35.0° C)
Roseburg, Oregon	( 92° F, 33.3° C)
Portland, Oregon	( 93° F, 33.9° C)
Erie, Pennsylvania	( 89° F, 31.7° C)
Philadelphia, Pennsylvania	( 96° F, 35.6° C)
Block Island, Rhode Island	( 80° F, 26.7° C)
Charleston, South Carolina	( 96° F, 35.6° C)
Columbia, South Carolina	(105° F, 40.6° C)
Yankton, South Dakota	( 97° F, 36.1° C)
Nashville, Tennessee	( 98° F, 36.7° C)
Knoxville, Tennessee	( 98° F, 36.7° C)
San Antonio, Texas	(100° F, 37.8° C)
Galveston, Texas	( 91° F, 32.8° C)
Salt Lake City, Utah	( 97° F, 36.1° C)
Burlington, Vermont	( 89° F, 31.7° C)
Lynchburg, Virginia	( 95° F, 35.0° C)
Norfolk, Virginia	( 95° F, 35.0° C)
Olympia, Washington	( 95° F, 35.0° C)
Spokane, Washington	( 98° F, 36.7° C)
Morgantown, West Virginia	( 96° F, 35.6° C)
Milwaukee, Wisconsin	( 90° F, 32.2° C)
La Crosse, Wisconsin	( 92° F, 33.3° C)
Cheyenne, Wyoming	( 91° F, 32.8° C)

The following are the highest temperatures observed during July 1899: <sup>123</sup>

Ciudad Porfirio Díaz, <i>Mexico</i>	( 98° F, 36.7° C)	(now Piedras Negras, Coahuila)
Leon de Aldamas, <i>Mexico</i>	( 87° F, 30.6° C)	(now León, Guanajuato)
Puebla, <i>Mexico</i>	( 79° F, 26.1° C)	
Basseterre, <i>Saint Kitts</i>	( 87° F, 30.6° C)	
Bridgetown, <i>Barbados</i>	( 88° F, 31.1° C)	
Cienfuegos, <i>Cuba</i>	( 93° F, 33.9° C)	
Havana, <i>Cuba</i>	( 91° F, 32.8° C)	
Puerto Principe, <i>Cuba</i>	( 97° F, 36.1° C)	
Kingston, <i>Jamaica</i>	( 94° F, 34.4° C)	
Port of Spain, <i>Trinidad &amp; Tobago</i>	( 90° F, 32.2° C)	
San Juan, <i>Puerto Rico</i>	( 87° F, 30.6° C)	
Santiago de Cuba, <i>Cuba</i>	( 94° F, 34.4° C)	
Willemstad, <i>Curaçao</i>	( 89° F, 31.7° C)	
Isle de Vieques, <i>Puerto Rico</i>	( 90° F, 32.2° C)	
Humacao, <i>Puerto Rico</i>	( 92° F, 33.3° C)	

On 30 June-5 July 1899, there was an overflow of the Brazos River in Texas in the *United States*, which caused great damage. This flood caused an estimated 100 to 300 deaths.<sup>97</sup>

In early July 1899, there was an overflow of the Brazos River, in Texas in the *United States*, which caused over 100 deaths.<sup>97</sup>

During the closing days of June and the early part of July, phenomenally heavy rains caused destructive floods in the valley of the Brazos River, Texas in the *United States*. The flood resulted from heavy rains, which set in near the mouth of the Brazos on the afternoon and night of June 26 and progressed slowly inland until June 28, when phenomenally heavy rains occurred over the central portion of the Brazos drainage basin. In some localities the rains were unprecedented in the history of Texas. These floods caused the loss of 40 to 60 lives and destroyed property and crops to the estimated value of nearly \$10,000,000.<sup>123</sup>

The Brazos River, with its tortuous channel of nearly one thousand miles in length, passes through a narrow valley, which ranges in width from a few miles to several miles in different localities. This valley is unsurpassed for productiveness. The banks of the Brazos for 200 miles from its mouth range in height from 20 to 40 feet, and in ordinary seasons are not overflowed to any serious extent. Heavy rains about its source cause the river to swell into a torrent, which flows with great impetuosity, but does not often overflow its banks. The banks of the river are formed of a tenacious red or blue clay, which yields very slowly to the force of the current. The width of the channel ranges from 150 to 200 feet. The gradient of the river from Waco to the Gulf of Mexico is little more than two feet to the mile.

The flood in the valley of the Brazos River, commenced on June 29 in central Texas and passed out into the Gulf of Mexico between the 12<sup>th</sup> and 15<sup>th</sup> of July 1899, has been, in all respects, the most destructive flood which ever struck this region, one of the most fertile and productive in Texas. The Brazos River, with its deep channel, has the capacity for carrying off a vast amount of water, and as a result destructive floods on this river are very rare. According to calculations published in a special bulletin of the Texas Section, Climate and Crop Service, the Brazos River discharges into the Gulf of Mexico, on an average, annually, during the months of April, May, and June, 6,447,403,576 cubic yards of water. In this flood, the river carried off more than this amount of water in fifteen days.

Phenomenally heavy rains fell on June 28 and 29 over the drainage basin of the Brazos River in the central portion of the State, and these were followed by heavy rains for four or five days in succession. During the last four days of June 1899, the heaviest rainfall in the records of Texas occurred near the headwaters of the Brazos River. Turnersville, about 240 miles from the Gulf, had over 33 inches of rain in ninety hours, and Hearne, some 80 miles toward the southeast, reported over 30 inches. Probably an area of nearly 2,000 square miles experienced a rain of about 30 inches in less than four days. On June 29, all the tributaries of the Brazos River from McLennan County south to Brazos County were higher than they had ever been before. This water, with that of succeeding rains, caused a flood in the Brazos, which inundated all low lands to a depth ranging from 2 to 12 feet. In places it is said that the river was more than 12 miles wide. The flood moved southward very slowly, and it was fourteen days from the time the crest of the flood was noted in central Texas until it passed out into the Gulf of Mexico.

The damage to crops was very great. All crops on the immediate river bottoms from McLennan County south were a total loss. The land bordering on the Brazos River is the most productive in the State. There was a large acreage in cotton, corn, sugar cane, and other crops. The following are the counties, which had suffered the greatest damage: McLennan, Falls, Robertson, Milam, Brazos, Burleson, Grimes, Washington, Waller, Austin, Fort Bend, and Brazoria. There was small acreage inundated in some other counties, but no great damage resulted outside of these. Cotton planters suffered most. The loss of corn was great, and besides the crop that was planted and growing, there was a large amount of last year's crop yet in the bins, which had spoiled. Sugar cane plantations in the Brazos bottoms suffered much. In some places half the crop was destroyed. Minor crops were also of considerable importance in some of these counties, and the loss of these represents a large sum. Farming implements, stock, and many of the small tenant

houses in the bottoms were washed away. Houses left standing were in many instances not in a fit condition for use. The total losses, judging from press reports and other available information, aggregates to nearly ten million dollars. The number of people who were left without means of sustenance was very large. The towns, which suffered most, were Calvert, Brookshire, Richmond, Sandy Point, Columbia, and Brazoria. While the water was well up in some of these towns no great damage resulted except to small settlements in low parts of the surrounding country. There was much suffering during the early part of the flood from hunger and exposure. Notwithstanding rescue parties were organized as rapidly as possible some of the sufferers were in tree tops and on houses for two or three days without food. Life saving crews were organized at Galveston and other points, and sent with boats to aid in the rescue.

Both the previous 1833 and 1843 Brazos River Floods, the creeks and lakes in this locality were dry; in fact there was no water in the county whatever, and all waters of the two floods were brought down by the rivers from up the country, while in the 1899 flood every creek and slough was filled to its utmost by the heavy rains prior to the overflow; such being the case there could not have been any more river water brought down the stream in 1899 than in 1833. The flood of 1899 is the only overflow that hurt the farmers of this section of Texas. All previous floods came before planting time, or sufficiently early to enable farmers to replant their crops. The aggregate loss to individuals, plantations, municipalities, and counties from this flood was, according to these estimates, \$7,690,856. The loss to railroads was conservatively estimated at \$1,000,000, which makes the total loss as a result of the overflow, \$8,690,856. [In present currency, that would be equivalent to \$225 million in damages based on the Consumer Price Index (CPI) inflation rates.]

On 11 July 1899, serious floods were reported in *Silesia, Galicia, and northwest Hungary*. Crops were destroyed and there was much damage.<sup>97</sup>

On the night of 12 July 1899, within a few hours of each other and a short distance apart, 2 barquentine vessels were driven to destruction during a gale in the Perth region of *Western Australia* with the loss of 33 lives. Wreckage washed up at Rockingham, Australia confirmed the loss of the *Carlisle Castle*, a 1,484-ton vessel. None of the crew of 22 survived, no bodies were ever found. It was believed that the vessel had struck the vicious Coventry Reef during the severe gale, which raged that night and was smashed to matchwood. The other ship, the *City of York*, a 1,218-ton vessel, with a cargo of timber, ran into the same gale as she approached Rottneest Island (west of Perth) lighthouse. The vessel sent out a signal requesting a pilot. None were available so the lighthouse replied with a flare intended to warn the ship but she misread the signal and continued her course towards the harbor. The vessel struck the reef, heavily ripping out most of her bottom. Some of the crew reached safety in a boat but a second boat containing the captain and 14 men was swamped by the huge seas and 11 drowned.<sup>99</sup>

On 1 & 2 August 1899, a violent local storm visited Carabelle, Florida in the *United States*, and vicinity. Great damage befell the town of Carabelle, where not more than a score of unimportant houses withstood the storm. The result to shipping was disastrous. The following vessels, most of them loaded, were wrecked: 14 barks, 40 small boats under twenty tons, and 3 pilot boats. The value of the vessels and cargoes lost was \$375,000. The city of Carabelle was damaged to the extent of \$100,000, other towns to the extent of \$50,000, and crops were destroyed to the value of \$50,000. [In present currency, the combined damage would be equivalent to \$15 million based on the Consumer Price Index (CPI) inflation rates.] The number of persons drowned and killed was 6.<sup>123</sup>

On 3 August 1899, destructive storm off Florida in the *United States*, many deaths.<sup>94</sup>

On 2 August 1899, violent thunderstorms struck New York, New Jersey, eastern Pennsylvania, Delaware, Maryland, and the District of Columbia [Washington D.C.] in the *United States*. In the storm stricken region of Maryland, 139 buildings, including barns and sheds, were destroyed by the wind; 3 were struck

by lightning and burned; 7 were damaged by lightning; and 43 by the wind. In the northern portion of the storm's path in Maryland, the main loss was occasioned by hail. Where the winds were the highest and the lightning most incessant there the hail was the heaviest. In some places hailstones lay unmelted for hours, and some of the elongated forms were 6 inches in length. In the areas of great destruction by hail the damage occurred largely in streaks or parallel bands, with intermediate strips that were left untouched.<sup>123</sup>

On 7 August 1899, a hurricane struck St. Kitts in the *West Indies*.<sup>144</sup>

On 7-12 August 1899, there was a fearful hurricane in the Lesser Antilles in the *West Indies*; 100 deaths, at Montserrat, 1,500 injured, 8,000 homeless, total deaths about 2,000.<sup>94</sup>

During 8-19 August 1899, a great Atlantic hurricane struck the island of *Puerto Rico* and the Carolinas [North and South Carolina] in the *United States* causing 3,433 deaths.<sup>107</sup>

On 8-19 August 1899, an Atlantic hurricane struck *Puerto Rico* and the Carolinas in the *United States*. One set of sources indicates this hurricane cause over 3,064 deaths; while another set of sources indicates this hurricane cause over 3,433 deaths. [Garriott (1900) and Alexander (1902) indicate thousands of additional deaths in *Puerto Rico* due to subsequent starvation. Stick (1952) and Chapman indicate at least 50 deaths in shipwrecks along coastal Carolina. Barnes (1995) has at least 30 along the coast of North Carolina and 14 inland in that state.]<sup>141</sup>

A great hurricane struck the *West Indies* beginning on 7 August 1899. It appeared east of Martinique on the morning of the 7<sup>th</sup>. During the afternoon and night of the 7<sup>th</sup> this storm devastated the more southern of the Leeward Islands of the Lesser Antilles, and on the 8<sup>th</sup> caused the loss of hundreds of human lives and destroyed millions of dollars' worth of property in Puerto Rico. Moving thence north of west the disturbance crossed the Bahamas Islands during the 11<sup>th</sup> and 12<sup>th</sup>, attended by a considerable loss of life and property, and from the 13<sup>th</sup> to the 17<sup>th</sup> skirted the south Atlantic coast of the *United States*, after which it disappeared in the direction of Newfoundland. At Puerto Rico and Hatteras, North Carolina, where its vortex passed near regular reporting stations of the Weather Bureau, the hurricane was of exceptional severity, and at Hatteras it will go on record as the severest storm within the recollection of the oldest inhabitants.<sup>123, 124</sup>

The hurricane crossed directly over the Island of Guadeloupe early in the afternoon, and passing 50 to 75 miles south of St. Kitts late in the afternoon of the 7<sup>th</sup>, and reached the southeast coast of Puerto Rico shortly after 8 a.m. on the morning of August 8. At St. Kitts the lowest barometer, 29.268 inches, was reached at 5 p.m., and the maximum wind velocity was 72 miles an hour from 4:22 to 4:27 p.m., with an extreme velocity for one minute of 120 miles at 4:40 p.m. Along this portion of the track the destruction of life and property was most marked on the islands of Guadeloupe, Montserrat, and St. Croix, which lay along the path covered by the storm's vortex.

Tuesday, August 8, 1899, will go on record as a day during which Puerto Rico experienced one of the most disastrous hurricanes noted in the history of the West Indies. In the morning the hurricane center struck the southeastern part of the island and moved west-northwest, passing very near and apparently to the northward of Ponce. The lowest barometer reading noted at the Weather Bureau station at San Juan was 29.23 inches at 8.30 a.m. Reports of readings of aneroid barometers in the possession of voluntary observers who were located nearer the path of the storm's center show a barometric gradient, which will account for the terrific violence of the hurricane. At Guayama, Puerto Rico, a reading of 27.75 corrected for elevation and instrumental error, was registered. [According to the barometric pressure, this hurricane would have been rated a Category 4 hurricane at this location.] At Juana Diaz a reading of 28.11 inches was recorded at 9:30 a.m.

During the 8<sup>th</sup> the storm center continued a west-northwest course and reached the northeast coast of Santo Domingo, Dominican Republic, the morning of the 9<sup>th</sup>. In Santo Domingo the storm was severe in the northeast and north parts of the island, while in the southern part but little damage was done.

From the morning of the 9<sup>th</sup> to the morning of the 12<sup>th</sup> the path of the hurricane was without the region of observation, and during this period it moved from the northeast coast of Santo Domingo to a position some 50 miles south of Nassau, Bahamas, a distance of about 700 miles at a velocity of less than 10 miles an hour. In its passage over the Bahamas the storm was quite severe, and at Nassau a minimum barometer reading of 29.10 inches was reported. By the morning of the 13<sup>th</sup> the storm center had reached a position off Jupiter, Florida, with a minimum barometer reading of 29.22 inches at 8 a.m.

The subsequent course of the storm lay off and nearly parallel with the south Atlantic coast of the United States, where, as shown by the detailed reports from Weather Bureau stations, herewith, it apparently acquired its greatest intensity in the region about Hatteras from August the 16<sup>th</sup> to the 18<sup>th</sup>, with a minimum barometer reading of 28.620 at 8 p.m. on August the 17<sup>th</sup>, an unprecedentedly low reading for the Hatteras station. The storm recurred and by 9 September was centered off the coast of Provence, *France* producing gales in that region until 12 September.

As of 16 August, reports from Ponce, Puerto Rico showed that already 500 bodies have been recovered, and it was thought that there were many yet to be found. In Humacao, Puerto Rico, 60 persons were killed, and from every side came reports of tremendous loss of life and destruction of property. The smaller fruits and vegetables were reported as utterly lost, and this includes bananas, which are the principal food of the inhabitants. As a result a possible famine stares the island in the face.

An observer at Juana Diaz, Puerto Rico reported that the rainfall from 6 a.m. of the 8<sup>th</sup> to the same hour on the 9<sup>th</sup> was 11.20 inches. This report agrees with those from Ponce, where the rainfall was said to have been torrential, many of the deaths at that place being the result of drowning.

Along the military road from Coamo, Puerto Rico, desolation reigned on every side. Only two houses were left standing at Aibonito, and 6 persons were reported dead at that place. Only two houses were left standing between Coamo and Aibonito, and the road was blocked in many places by huge boulders, which were blown and washed down from the cliffs, which border the road. The celebrated baths at Coamo were utterly destroyed. As San Juan is built of brick and the houses have thick walls and flat roofs comparatively little damage was done in this city.

At Mayaguez, Puerto Rico, this hurricane was one of the severest that ever chastened the island, nor had the oldest men heard of anything the likes before. In the city, the damage to property was large, and from the country the news was appalling. One-fourth of the coffee crop only will be saved, the loss of cane was considerable, and crops of minor fruits, which are the sustenance of the poor, have disappeared. The loss of life was greater than ever before, houses with all the inmates were washed away by the floods.

As regards the damage and destruction it was so enormous that it was difficult to make an estimate. A very conservative estimate of the actual losses of the districts of Guayama, Arroya, Patillas, and Maunabo can be safely placed at \$1,000,000. [In present currency, that would be equivalent to \$26 million in damages based on the Consumer Price Index (CPI) inflation rates.]

At Arecibo, Puerto Rico, the flood of the three rivers, which by a common mouth, empty into the sea near this town, was such an enormous one that old people here had no recollection of anything to equal it. The loss of life and property was beyond an approximate estimate at that time. Some gave the number of the drowned and killed at 500 more or less, while others place the figure as nearly 1,000. Almost all the peasantry houses and huts in the plains, and higher up on the river sides, have been carried to sea or destroyed, while in the lower part of this town, which was

several meters underwater, the loss of property was immense, and most of the poor people were deprived of shelter. Crops sustained damage amounting to many hundred thousand dollars. The dam of the aqueduct, situated on the hills, broke, carrying away everything in its path. Thousands of cattle from the pasturelands, in which the district abounded, as well as stock from the estates, disappeared into the sea. Railroads and bridges were destroyed and ruin and desolation reign supreme.

At Humacao, Puerto Rico, the estimated loss of property was \$1,000,000; loss of life nearly eighty, though the count was not accurately kept, as many of the dead were buried in the place where the loss of life occurred. A tidal wave came in and destroyed almost all houses in this port. A large vessel, *the Monroe*, of New York, was driven ashore.

In the Islands of the *Bahamas*, the hurricane struck six or eight islands, doing at all of them great damage in the way of blowing down or unroofing houses, destroying crops, uprooting fruit orchards, and wrecking or injuring vessels. The loss of life was considerable. At Nassau, the loss was quite severe. There were about fifty vessels in port, mostly small fishing and sponging craft, at least one-half of which were torn from their moorings and dashed against the rocky shores of the islands or were sunken at their anchorages. The steam tug *Nassau*, formerly tender for Ward's New York and Cuba Line of steamers, broke her moorings, drifted down the harbor, and was wrecked on the reefs west of the city. Two steam yachts drifted over the bar out to sea and have not been heard of since. On shore the damage was considerable. A large fruit-preserving factory, a big sponge warehouse, a music hall, a dancing pavilion, and about one hundred smaller buildings being blown down. Some damage was done to the roofs of the public buildings, and the contents of the Government House were damaged by water. A general look of desolation and destruction pervaded the entire city. It was already known that at least one hundred lives were lost, mostly fishermen and spongers, and it was expected that the number would be increased when news came from the outlying islands. The scattered position of our islands, slow means of communication, and a tendency to exaggerate make it difficult to obtain accurate information. The following data, though not strictly accurate, may be as close as we can ever get to it. Number of small craft lost, 50. Conservative estimates place the total loss of life at 125, probably 100 occurring at Red Bays. A few sponge vessels were missing which may swell the totals given.

At Hatteras, North Carolina, in the United States during the early morning of the 17<sup>th</sup> the wind increased to a hurricane and at 4 a.m. was blowing at the rate of 70 miles an hour; 10 a.m. it had increased to 84 miles; and at 1 p.m. it was blowing 93 miles an hour, with occasional extreme velocity of 120 to 140 miles an hour. The record of wind after about 1 p.m. was lost, but it was estimated that it blew with even greater force from about 3 p.m. to 7 p.m., and it was believed that between these hours the wind reached a regular velocity of at least 100 miles an hour. The barometer began to fall rapidly about 8 a.m. of the 17<sup>th</sup>, and 8 p.m. of that date it had reached the unprecedentedly low reading of 28.620 inches, where it remained about an hour, when it began to rise rapidly. This hurricane was the most severe in the history of Hatteras. The scene on the 17<sup>th</sup> was wild and terrific. By 8 a.m. the entire island was covered by water from the Sound, and by 11 a.m. all the land was covered to a depth of from 4 to 10 feet. This tide swept over the island at a fearful rate carrying everything movable before it. There were not more than four houses on the island in which the tide did not rise to a depth of 1 to 4 feet, at least half the people had to abandon their homes and seek safety with those who were fortunate enough to live on the higher grounds. The frightened people were crowded 40 or 50 in a house. All this day the gale, the tide, and the sea continued with unabated fury. During the lull in the evening the tide ran off with great swiftness, causing a fall in the water of several feet in less than half an hour. Domestic livestock were drowned, and it was believed that the property loss to Hatteras alone would amount to \$15,000 or \$20,000. The fishing industry was, for a time, swept out of existence, and of the 13 fish-packing houses, which were situated on the waterfront, 10 with all their equipments and contents were lost. A great proportion of the houses on the island were badly damaged and many families lost their homes. All bridges were swept away and roadways were piled high with wreckage. All telegraph and telephone lines were down.

The following vessels were known to be lost between Hatteras and Big Kinnakeet, North Carolina: A large steamship foundered about one mile off Hatteras beach the night of the 17<sup>th</sup>, and it was thought all on board were drowned. From the marks on some of the wreckage, which drifted ashore, it was supposed her name was the *Agnat* and that she was German or Norwegian. She was loaded with cotton and staves, a portion of which cargo drifted on the beach. The Diamond Shoals Light Ship which was stationed off Hatteras broke loose from her moorings the morning of the 17<sup>th</sup> and was carried southward by the gale; when the wind shifted to the southeast she was carried ashore near Creeds Hill Life-Saving Station, where she now lies high on the beach. The crew was saved by the Creeds Hill life-saving crew. The three-masted schooner *Florence Randall* went ashore 1 mile north of Big Kinnakeet Life-Saving Station the night of the 16<sup>th</sup>. The crew was saved by the Kinnakeet life-saving crew. The schooner was a total loss.

On 8-15 August 1899, there were destructive storms in South America in *Chile*.<sup>94</sup>

On 10 August 1899, there were destructive floods in Chubat region in southern *Argentina*.<sup>97</sup>

On 10 August 1899, about two million bushels of wheat in North Dakota in the *United States* were destroyed by hail.<sup>123</sup>

On 3 September 1899, there was a hurricane in the *Azores* [an archipelago in the middle of the North Atlantic Ocean], which caused [ship] wrecks and loss of life.<sup>94</sup>

On 8 September 1899, there was a gale off Nova Scotia, *Canada*. Many deaths were reported. Then on 15-16 September 1899, there was a gale off Newfoundland, 400 fishing vessels reported lost.<sup>94</sup>

On 8-13 September 1899, a hurricane struck the islands of the *West Indies*.<sup>123</sup>

At St. Kitts the wind reached a velocity of 62 miles an hour at 8:18 p.m. of the September 8<sup>th</sup>, and an extreme velocity for one minute of 120 miles an hour was recorded at 5:51 p.m. This hurricane, as compared with that of August 7, was slightly less intense, and far less disastrous, owing, no doubt, to the fact that only the strong trees and buildings were left, and these were able to successfully resist the attacks of the weaker storm. Otherwise there would have been very much the same story to tell. A few small huts were destroyed, rendering about 200 people homeless; two schooners, with cargoes, total value \$25,000, wrecked; one small boat, valued at \$240, wrecked, and cane crop badly damaged. The neighboring islands to the east suffered about the same as St. Kitts, except the little island of Anguilla, where as many as 200 houses were demolished and 800 people were rendered homeless. The steamship *Caracas*, of the Red D Line, met the storm 400 miles north of Puerto Rico, and experienced its fury from midnight on Saturday until Monday morning. In about the same region the schooner *Isaac Newton* was dismasted and waterlogged on Sunday, the 10<sup>th</sup>. The crew of this schooner, when rescued on the 13<sup>th</sup> by the steamship *Fontabelle*, were standing in water waist deep, and had been without food and fresh water for three days. They report the occurrence, during the hurricane, of a severe hailstorm, lasting about half an hour, and producing intense cold. The hailstones were very large, and fell with great force.

A hurricane swept over the Island of Bermuda during the night of September 12. Many houses were blown down and others were unroofed. The storm raged during all of last night. No lives were lost, but heavy damage was done to public and private property, fruit and cedar trees. The causeway was wrecked and the government house was damaged. Giant cedars were uprooted, ornamental and fruit trees were destroyed, and wharfs were washed into the sea. All communication with St. Georges was cut off and news from the western end of the island and the dockyard was not obtainable at that time. The telephone and telegraph poles and wires were down, causing a total interruption of business. There was considerable damage at the military camp. The city hall, public gardens and hotels, and several public and private dwellings were also damaged, and numerous small craft in the harbors were sunk or driven ashore. The storm was the

worst known here since the hurricane of 1880; in fact, many of the inhabitants say it exceeded that of 1880 in violence. It was rumored that damage amounting to £100,000 was done at the dockyard alone. On Ireland and Boaz Islands everything was more or less injured. The damage there was roughly estimated at £100,000. At Somerset, all the boats and small craft were destroyed, trees demolished, and houses unslated and otherwise damaged. At Prospect Camp the damage was estimated at £3,000. More than half a mile of the causeway connecting the mainland with St. Georges was totally destroyed. The cost to repair was estimated at £13,000. News from St. Georges, received by a whaleboat, says serious damage had been done there to trees, houses, etc. All the boats had been destroyed or badly injured. At that time, reports from outlying parishes were slowly coming in. They all show that there was great destruction of trees and serious injury to houses and other property. From what was learned preliminary reports found no loss of life.

During the night of September 14<sup>th</sup>, violent gales off the Newfoundland coast caused considerable damage to fishing craft and the loss of four lives.

On 15 September 1899, there were floods in *Austria*. Nineteen lives lost by the collapse of a bridge over the Traun River [in northern *Austria*].<sup>97</sup>

On 29-30 September and 2 October 1899, there was a gale in the *English Channel*, wrecks and loss of life.<sup>94</sup>

On 7 October 1899, there was a typhoon in central and eastern *Japan*. Train was blown off a bridge, 50 deaths.<sup>94</sup>

On 7- 8 October 1899 and in April 1900, there were destructive floods in Salem [*England*]. Villages were swept away. There were 40 deaths.<sup>97</sup>

On 8 October 1899, there was a destructive storm and floods in Salerno in southwestern *Italy*, which caused about 40 deaths. Then on 20 October 1899, there was another storm in southern *Italy*, much damage and 3 deaths.<sup>94</sup>

On 27-30 October 1899, there was a destructive storm in *Jamaica*; several deaths.<sup>94</sup>

On 28-29 October 1899, a hurricane struck *Jamaica* and *Cuba*. Many people died in *Jamaica*. In *Cuba*, there was some loss of human lives.<sup>141</sup>

On 28-31 October 1899, a storm traveled from the *Caribbean Sea* and then along the Atlantic coast of the *United States*. In *Cuba* and *Jamaica* the feature of the storm was the exceptionally heavy rainfall. During the evening of 28<sup>th</sup>, 13 houses blown down and tobacco seed plants and banana plants destroyed; night of 28<sup>th</sup> considerable damage done by inundation of a portion of Camajuani, Cuba and the blowing down of several houses at Sancti Spiritus, Cuba; damage and loss of one life at Santiago de Cuba, and damage by the overflowing of the Cauti [Cauto] River. In Florida, Georgia, and South Carolina no special damage was caused, although dangerous gales prevailed off the coasts. At Charleston, South Carolina, the wind reached a velocity of 58 miles an hour from the northwest at 10:05 p.m. on the 30<sup>th</sup>. The night of the 30<sup>th</sup> the storm was one of the severest on record along the North Carolina coast near Wilmington, and an enormous amount of damage was caused by exceptionally heavy seas and high tides. The total loss of property in that section was placed at a quarter of a million dollars. [In present currency, that would be equivalent to \$6.5 million in damages based on the Consumer Price Index (CPI) inflation rates.] A number of coasting vessels were lost, and the steamer *Catherine Whiting* was wrecked on Goss Beach, Brunswick County. The value of sailing vessels and their cargoes, which were lost along the North Carolina coast, was placed at \$144,000. The ravages of the storm along the Virginia coast the night of the

30<sup>th</sup>, and during the 31<sup>st</sup> represented losses of thousands of dollars. The tide was the highest noted in years, and the high wind caused the water to overflow lowlands.<sup>123</sup>

*Also refer to the section 1896 A.D. – 1900 A.D. for information on the famine in India during that timeframe.*

*Also refer to the section 1898 A.D. – 1899 A.D. for information on the famine in Russia during that timeframe.*

---

**Winter of 1899 / 1900 A.D.** In October 1899, a very severe snowstorm occurred in western Montana in the *United States*, directly along the eastern foothills, and extending from Augusta to the international boundary line. The storm was unexpectedly severe, and a number of sheepherders, probably as many as twelve, lost their lives before a place of shelter could be reached. The storm-swept area was about 20 miles wide and upward of 100 miles long. The depth of snowfall over this strip was from 30 to 40 inches, but on either side the amount was very much less.<sup>123</sup>

During the night of 15 December 1899 in the *United States*, heavy snow fell in Idaho, northern Utah, and elsewhere in the middle and northern Rocky Mountain districts; in Colorado a heavy snow and windstorm caused a blockade of railroads along the Arkansas-Platte Divide, and very low temperature continued several days in the Western and Northwestern States. The storm produced the following low temperatures: 10° F occurred at Spokane, Washington; 8° F at Walla Walla, Washington; 6° F at Baker City, Oregon; and 0° F at Kalispell, Montana.<sup>123</sup>

A cold wave of considerable severity moved southeastward from the northeastern Rocky Mountains slope in the *United States* on 15 February 1900, reaching the Florida Peninsula on the morning of the 18<sup>th</sup> and *Cuba* and *Puerto Rico* on the 19<sup>th</sup> and 20<sup>th</sup>.<sup>124</sup>

The winter of 1899-1900 in Bradford County, Pennsylvania in the *United States* was an open and mild, with heavy rains and little snow. October alternated between hot and cold waves and the month ended with heavy rain. On 14 November, 3 inches [8 cm] of snow fell, but it quickly melted. On 11 & 12 December, there was a heavy rain. In the middle of January, snow fell sufficiently to support a short run of sleighing on the highlands. On 22 February, a thunderstorm was followed by a cold wave. During the last week of February, there were such heavy rains that it caused high water in the larger creeks and considerable damage was done by washouts. On 16 March, snowfall enabled people in the valleys to enjoy their first and only sleigh-ride of the season. The last snow fell at Barclay on May 4<sup>th</sup>. Oats were sowed about the middle of April. The beginning of May was dry and forest fires raged in the townships of Overton and Barclay, damaging thousands of acres of timber.<sup>178</sup>

---

**1900 A.D.** In 1900 in the *United States*, the great floods occurred in February in the Atlantic States, particularly in New England and eastern New York; those of April in the east Gulf States; and the extremely disastrous ones of April and May in Texas. The reported losses from these floods were estimated at \$12 million.<sup>124</sup> [In present currency, that would be equivalent to \$310 million in damages based on the Consumer Price Index (CPI) inflation rates.]

On 7 April 1900, there was a great cloudburst and floods in Texas in the *United States*, about 40 deaths and vast loss of property.<sup>97</sup>

On 29 April 1900, there was a cyclone in Huelva in southwestern *Spain*; much damage done.<sup>94</sup>

Several editorials in the Journal *Nature*, discussed a linkage between the height of the annual Nile Flood in *Egypt* and the yearly monsoon floods in *India*. Even as early as 1881, this linkage was being discussed

when Mr. Morgan Brierly wrote “the famine years in India are generally years of low flood in Egypt.” In 1899, the rainfall in India was 11.14 inches less than normal and this also corresponded to a very low flood in the Nile River, the lowest in a century. In comparison in the year 1893, the rainfall in India was 9.07 inches more than normal and this corresponded to a high flood on the Nile.<sup>124</sup>

The following were the highest temperatures observed during the summer of 1900 in the *United States*:<sup>124</sup>

Montgomery, Alabama	( 99° F, 37.2° C)
Mobile, Alabama	( 96° F, 35.6° C)
Phoenix, Arizona	(112° F, 44.4° C)
Yuma, Arizona	(112° F, 44.4° C)
Little Rock, Arkansas	( 96° F, 35.6° C)
Fort Smith, Arkansas	(100° F, 37.8° C)
San Francisco, California	( 92° F, 33.3° C)
San Diego, California	( 89° F, 31.7° C)
Fresno, California	(109° F, 42.8° C)
Denver, Colorado	( 97° F, 36.1° C)
Pueblo, Colorado	(100° F, 37.8° C)
New Haven, Connecticut	( 98° F, 36.7° C)
Washington, D.C.	(101° F, 38.3° C)

Santo Domingo, Dominican Republic	( 93° F, 33.9° C)
Willemstad, Curaçao	( 93° F, 33.9° C)

In July 1900, there was a major flood at Hawkesbury/Nepean Valley in New South Wales, *Australia*. The water level was recorded at 46 feet (14.08 meters) above the sea level height at Windsor Bridge.<sup>99, 109</sup>

During 3-7 July 1900, a phenomenal snowstorm struck New South Wales, *Australia*.<sup>176</sup>

\* The snow area extended from Congewai in the Hunter district to Condobolin and Warrumbungle in the west. Railway traffic became paralyzed, passengers being shut up in their carriages, unable to reach hotels. In places the snow was 8 feet deep on the rails. Telegraph wires were down everywhere. Boats were sent to flooded districts. Bathurst had a unique experience, all business being suspended; roofs, verandahs, and lightly constructed buildings collapsed under the weight of the snow. The phenomenal fall of snow at Bathurst was surpassed on the mountains, and at places between Locksley

and Rydal, it fell to a depth of 4 feet. The passenger train, which left Bathurst, was unable to proceed beyond Locksley.

\* At Blayney snow began to fall at 5 a.m. on the 5<sup>th</sup>, light at first, but the storm increased as the morning advanced; at 8 a.m. there was over 9 inches of snow on the ground, and by noon it had increased to 17 inches in depth in the main street; at 2 p.m., on the flats of the town, the snow was, in places, 3 feet deep, the minimum depth being 22 inches, the storm continued till 5 p.m., when the standard measurement in the main street was 27 inches. Such a fall was never experienced before in Blayney; many sheds, balconies, and verandahs collapsed, whilst the damage done to the guttering of houses was immense. Railway traffic was completely blocked from the afternoon of 5<sup>th</sup> till afternoon of 6<sup>th</sup>.

\* Snow fell in many regions. The town of Capertee received 15 inches. O'Connell [20 km southeast of Bathurst] received an average of 24 inches. Milthorpe [now Millthorpe, 20 km south-southeast of Orange] received 22 inches that produced 3-4 foot drifts. Parkes received 4 inches. Maluna received 1 inch. Ilford [55 km northeast of Bathurst] received 24 inches. Yass received 4 inches. Rylston [now Rylstone, 30 km south of Bathurst] received 18 inches. Katoomba received 12 inches. Rockley [30 km south of Bathurst] received 32 inches. Molong received 15 inches. Cowra received 5 inches. Mudgee received 22 inches. Taralga received 18-24 inches. Wellington received 4 inches. Forbes received 9 inches. Murrumburrah [45 km northwest of Yass] received 6 inches. Marsdens [now Marsden, 60 km west-northwest of Grenfell] received 2 inches. Carcoar [15 km southwest of Blayney] received 3 feet. Wallerawang [10 km northwest of Lithgow] received 2 feet. Crookwell received 24-30 inches. Canowindra received 1 foot. Hill End received 16 inches. Orange received 18 inches. Waroo [now Warroo, 40 km west of Forbes] received 3 inches. Kiandra received 30 inches.

\* The snowstorm also produced heavy rainfall in many areas. Mittagong received 12.56 inches. Richmond received 12.41 inches. Moss Vale received 12.30 inches. Katoomba received 10.59 inches. Araluen received 9.27 inches. Lithgow received 8.41 inches. Campbelltown received 8.40 inches. Kiama received 8.30 inches. Penrith received 8.05 inches.

\* Floods resulted from this storm in the coastal rivers and eastern tributaries of the Darling; also in the Macquarie, Lachlan, and Murrumbidgee Rivers. The Nepean River was many feet over the floor of the Camden Bridge. The Hawkesbury River was 34 feet 6 inches at Penrith and 35 feet over the bridge at Richmond. The Namoi River was 22 feet at Walgett. The Barwon River was 28 feet at Walgett. The Murrumbidgee River was 32 feet 9 inches at Wagga Wagga and 33 feet 6 inches at Gundagai. The Goulburn River was 22 feet. The Macquarie River was 33 feet at Dubbo.

On 13 July 1900, there was an extraordinary fall of rain at Galveston, Texas in the *United States*, a depth of 14 inches recorded in twenty-four hours, of which 3 inches fell in sixty minutes.<sup>124</sup>

On 16 July 1900, the temperature in the shade at Camden-Square in London, *England* reached a peak of 95.2° F (35.1° C).<sup>97</sup>

On 15 August 1900, there were floods in various parts of *Japan*, 200 deaths reported.<sup>97</sup>

On 29 August 1900, there was a destructive cyclone [tornado?] at Mafeking [Mahikeng which is inland in northwest *South Africa*].<sup>94</sup>

On 8-9 September 1900, there was a destructive hurricane and tidal wave that struck Galveston, Texas in the *United States*. The city was wrecked, nearly 8,000 perished; enormous loss. After the devastation there was much looting. The troops were called in and about 25 persons were shot.<sup>94</sup>

On 8 September 1900, a hurricane struck Galveston, Texas in the *United States*. The hurricane caused between 8,000 and 12,000 deaths. This is the second deadliest known Atlantic hurricane.<sup>107, 141</sup>

Measured by losses of life and property and the depression of the barometer at Galveston, Texas, the hurricane of September 8, 1900, was the severest storm that ever occurred in the *United States*. On Galveston Island upward of 6,000 human beings were drowned, or killed by falling buildings or flying

debris, and property to the estimated value of \$30,000,000 was destroyed. [In present currency, that would be equivalent to \$775 million in damages based on the Consumer Price Index (CPI) inflation rates.] Enormous losses of life and property were also reported in the inland coast country. The barometer, which reached a verified minimum of 28.48 inches at Galveston, was lower by 0.10 inch than any reading previously made at a station of the Weather Bureau. The devastation at Galveston was caused principally by a storm wave, which swept in from the Gulf in advance of the hurricane's vortex. This wave, 4 feet in depth, struck the already submerged island with almost irresistible force, and entirely destroyed the south, east, and west portions of the city for a distance of two to five blocks inland. In other parts of the city many houses were destroyed and none escaped injury.<sup>124</sup>

The following special report was made by Dr. Isaac M. Cline, the Section Weather Station Director. The oldest residents of Galveston Island were not thrown into a panic even when the water had flooded the whole city. They remembered the height reached by the tide in the storm of 1875, and as most of them, having built their houses after that event so that the first floor was above the level of danger then, were dwelling in such residences or had friends who occupied them, they repaired to these refuges. But the water climbed above its old mark and the wind, reaching a maximum at times of 100 miles an hour, assisted it in destroying nearly all of the stoutest houses. Dr. Cline occupied such a building, and was confident that the water would not reach his first floor, but his home was utterly demolished. He spent all the late afternoon in carefully watching the advancing height of the water and he did not give up his hope that his place would withstand the storm until the 1875 water mark was passed. In that last hour he waved warnings from his porch to his neighbors, telling them to fly to higher ground. Some could heed his warnings, but by far the most of the people were caught in the same way that he was.<sup>124</sup>

#### SPECIAL REPORT ON THE GALVESTON HURRICANE OF SEPTEMBER 8, 1900.

The hurricane, which visited Galveston Island on Saturday, September 8, 1900, was no doubt one of the most important meteorological events in the world's history. The ruin, which it wrought beggars description, and conservative estimates place the loss of life at the appalling figure, 6,000.

A brief description of Galveston Island will not be out of place as introductory to the details of this disaster. It is a sand island about thirty miles in length and one and one half to three miles in width. The course of the island is southwest to northeast, parallel with the southeast coast of the State. The City of Galveston is located on the east end of the island. To the northeast of Galveston is Bolivar Peninsula; a sand spit about twenty miles in length and varying in width from one-fourth of a mile to about three miles. Inside of Galveston Island and Bolivar Peninsula is Galveston Bay, a shallow body of water with an area of nearly five hundred square miles. The length of the bay along shore is about fifty miles and its greatest distance from the Gulf coast is about twenty-five miles. The greater portion of the bay lies due north of Galveston. That portion of the bay, which separates the island west of Galveston from the mainland, is very narrow, being only about two miles in width in places, and discharges into the Gulf of Mexico through San Louis Pass. The main bay discharges into the Gulf between the jetties; the south one being built out from the northeast end of Galveston Island and the north one from the most southerly point of Bolivar Peninsula. The channel between the jetties is twenty-seven to thirty feet in depth at different stages of the tide. There are channels in the harbor with a depth of thirty to thirty-five feet, and there is an area of nearly two thousand acres with an anchorage depth of eighteen feet or more. The mainland for several miles back from the bay is very low, in fact much of it is lower than Galveston Island, and it is so frequently overflowed by high tide that large areas present a marshy appearance. These are in brief the physical conditions of the territory devastated by the hurricane.

The usual signs, which herald the approach of hurricanes, were not present in this case. The brick-dust sky was not in evidence in the smallest degree. This feature, which has been distinctly observed in other storms that have occurred in this section, was carefully watched for, both on the evening of the 7<sup>th</sup> and the morning of the 8<sup>th</sup>. There was cirrus clouds moving from the southeast during the forenoon of the 7<sup>th</sup>, but by noon only altostratus from the northeast were observed. About the middle of the afternoon the clouds were divided between cirrus, altostratus, and cumulus, moving from the northeast. During the remainder of the 7<sup>th</sup>, stratocumulus clouds prevailed, with a steady movement from the northeast. A heavy swell from the

southeast made its appearance in the Gulf of Mexico during the afternoon of the 7<sup>th</sup>. The swell continued during the night without diminishing, and the tide rose to an unusual height when it is considered that the wind was from the north and northwest. About 5 a.m. of the 8<sup>th</sup>, Mr. J. L. Cline, Observer, called me and stated that the tide was well up in the low parts of the city, and that we might be able to telegraph important information to Washington. He, having been on duty until nearly midnight, was told to retire and I would look into the conditions. I drove to the Gulf, where I timed the swells, and then proceeded to the office and found that the barometer was only one-tenth of an inch lower than it was at the 8 p.m. observation of the 7<sup>th</sup>. I then returned to the Gulf, made more detailed observations of the tide and swells, and filed the following telegram addressed to the Central Office at Washington:

“Unusually heavy swells from the southeast, intervals one to five minutes, overflowing low places south portion of city three to four blocks from beach. Such high water with opposing winds never observed previously.”

A storm velocity was not attained until about 1 p.m. on the 8<sup>th</sup>, after which the wind increased steadily and reached a hurricane velocity about 5 p.m. The greatest velocity for five minutes was 84 miles per hour at 6:15 p.m., with two miles at the rate of 100 miles per hour. The anemometer blew away at this time, and it is estimated that prior to 8 p.m. the wind attained a velocity of at least 120 miles per hour. For a short time, about 8 p.m., just before the wind shifted to the east, there was a distinct lull, but when it came out from the east and southeast it appeared to come with greater fury than before. After shifting to the south at about 11 p.m. the wind steadily diminished in velocity, and at 8 a.m. on the morning of the 9<sup>th</sup> was blowing at the rate of 26 miles per hour from the south.

The barometer commenced falling during the afternoon of the 6<sup>th</sup> and continued falling steadily but slowly up to noon of the 8<sup>th</sup>, when it read 29.42 inches. The barometer fell rapidly from noon until 8:30 p.m. of the 8<sup>th</sup>, when it registered 28.48 inches, a fall of pressure of about one inch in eight and one-half hours. After 8:30 p.m. the barometer rose at the same rapid rate that had characterized the fall. On account of the rapid fall in pressure, Mr. John D. Blagden, Observer, took readings of the mercurial barometer as a check on the barograph. His readings confirm the low pressure shown by barograph and indicate the great intensity of the hurricane.

Mr. Blagden looked after the instruments during the hurricane in a heroic and commendable manner. He kept the wires of the self-registering apparatus intact as long as it was possible for him to reach the roof. The rain gage blew away about 6 p.m., and the thermometer shelter soon followed. All the instruments in the thermometer shelter were broken, except the thermograph, which was found damaged, but has been put in working order.

Storm warnings were timely and received a wide distribution not only in Galveston but throughout the coast region. Hundreds of people who could not reach us by telephone came to the Weather Bureau office seeking advice. I went down on Strand Street and advised some wholesale commission merchants who had perishable goods on their floors to place them 3 feet above the floor. One gentleman has informed me that he carried out my instructions, but the wind blew his goods down. The public was warned, over the telephone and verbally, that the wind would go by the east to the south and that the worst was yet to come. People were advised to seek secure places for the night. As a result thousands of people who lived near the beach or in small houses moved their families into the center of the city and were thus saved. Those who lived in large strong buildings, a few blocks from the beach, one of whom was the writer of this report, thought that they could weather the wind and tide. Soon after 3 p.m. of the 8<sup>th</sup> conditions became so threatening that it was deemed essential that a special report be sent at once to Washington. Mr. J. L. Cline, Observer, took the instrumental readings while I drove first to the bay and then to the Gulf, and finding that half the streets of the city were under water added the following to the special observation at 3:30 p.m.: "Gulf rising, water covers streets of about half city." Having been on duty since 5 a.m., after giving this message to the observer, I went home to lunch. Mr. J. L. Cline went to the telegraph offices through water from two to four feet deep, and found that the telegraph wires had all gone down; he then returned to the office, and by inquiry learned that the long distance telephone had one wire still working to Houston, over which he gave the message to the Western Union telegraph office at Houston to be forwarded to the Central Office at Washington.

I reached home and found the water around my residence waist deep. I at once went to work assisting people, who were not securely located, into my residence, until forty or fifty persons were housed therein. About 6:30 p.m. Mr. J. L. Cline, who had left Mr. Blagden at the office to look after the instruments, reached my residence, where he found the water neck deep. He informed me that the barometer had fallen below 29.00 inches; that no further messages could be gotten off on account of all wires being down, and that he had advised everyone he could see to go to the center of the city; also, that he thought we had better make an attempt in that direction. At this time, however, the roofs of houses and timbers were flying through the streets as though they were paper, and it appeared suicidal to attempt a journey through the flying timbers. Many people were killed by flying timbers about this time while endeavoring to escape to town.

The water rose at a steady rate from 3 p.m. until about 7:30 p.m., when there was a sudden rise of about four feet in as many seconds. I was standing at my front door, which was partly open, watching the water, which was flowing with great rapidity from east to west. The water at this time was about eight inches deep in my residence, and the sudden rise of 4 feet brought it above my waist before I could change my position. The water had now reached a stage 10 feet above the ground at Rosenberg Avenue (Twenty-Fifth Street) and Q Street, where my residence stood. The ground was 5.2 feet elevation, which made the tide 15.2 feet. The tide rose the next hour, between 7:30 and 8:30 p.m., nearly five feet additional, making a total tide in that locality of about twenty feet. These observations were carefully taken and represent to within a few tenths of a foot the true conditions. Other personal observations in my vicinity confirm these estimates. The tide, however, on the bay or north side of the city did not obtain a height of more than 15 feet. It is possible that there was 5 feet of backwater on the Gulf side as a result of debris accumulating four to six blocks inland. The debris is piled eight to fifteen feet in height. By 8 p.m. a number of houses had drifted up and lodged to the east and southeast of my residence, and these with the force of the waves acted as a battering ram against which it was impossible for any building to stand for any length of time, and at 8:30 p.m. my residence went down with about fifty persons who had sought it for safety, and all but eighteen were hurled into eternity. Among the lost was my wife, who never rose above the water after the wreck of the building. I was nearly drowned and became unconscious, but recovered through being crushed by timbers and found myself clinging to my youngest child, who had gone down with myself and wife. Mr. J. L. Cline joined me five minutes later with my other two children, and with them and a woman and child we picked up from the raging waters, we drifted for three hours, landing 300 yards from where we started. There were two hours that we did not see a house nor any person, and from the swell we inferred that we were drifting to sea, which, in view of the northeast wind then blowing, was more than probable. During the last hour that we were drifting, which was with southeast and south winds, the wreckage on which we were floating knocked several residences to pieces. When we landed about 11:30 p.m., by climbing over floating debris to a residence on Twenty-Eighth Street and Avenue P, the water had fallen 4 feet. It continued falling, and on the following morning the Gulf was nearly normal. While we were drifting we had to protect ourselves from the flying timbers by holding planks between us and the wind, and with this protection we were frequently knocked great distances. Many persons were killed on top of the drifting debris by flying timbers after they had escaped from their wrecked homes. In order to keep on the top of the floating masses of wrecked buildings one had to be constantly on the lookout and continually climbing from drift to drift. Hundreds of people had similar experiences.

Sunday, September 9, 1900, revealed one of the most horrible sights that ever a civilized people looked upon. About three thousand homes, nearly half the residence portion of Galveston, had been completely swept out of existence, and probably more than six thousand persons had passed from life to death during that dreadful night. The correct number of those who perished will probably never be known, for many entire families are missing. Where 20,000 people lived on the 8<sup>th</sup> not a house remained on the 9<sup>th</sup>, and who occupied the houses may, in many instances, never be known. On account of the pleasant Gulf breezes many strangers were residing temporarily near the beach, and the number of these that were lost cannot yet be estimated. That portion of the city west of Forty-Fifth Street was sparsely settled, but there were several splendid residences in the southern part of it. Many truck farmers and dairy men resided on the west end of the island, and it is estimated that half of these were lost, as but very few residences remain standing down the island. For two blocks, inside the shaded area, the damage amounts to at least fifty per cent of the property. There is not a house in Galveston that escaped injury, and there are houses totally wrecked in all

parts of the city. All goods and supplies not over eight feet above floor were badly injured, and much was totally lost. The damage to buildings, personal, and other property in Galveston County is estimated at about thirty million dollars. The insurance inspector for Galveston states that there were 2,636 residences located prior to the hurricane in the area of total destruction, and he estimates 1,000 houses totally destroyed in other portions of the city, making a total of 3,636 houses totally destroyed. The value of these buildings alone is estimated at \$5,500,000.

The grain elevators, which were full of grain, suffered the smallest damage. Ships have resumed loading and work is being rushed day and night. The railroad bridges across the bay were washed away, but one of these has been repaired and direct rail communication was established with the outside world within eleven days after the disaster. Repairs and extensions of wharfs are now being pushed forward with great rapidity. Notwithstanding the fact that the streets are not yet clean and dead bodies are being discovered daily among the drifted debris, the people appear to have confidence in the place and are determined to rebuild and reestablish themselves here. Galveston being one of the richest cities of its size in the United States, there is no question but that business will soon regain its normal condition and the city will grow and prosper as she did before the disaster. Cotton is now coming in by rail from different parts of the State and by barge from Houston. The wheels of commerce are already moving in a manner, which gives assurance for the future. Improvements will be made stronger and more judiciously; for the past twenty-five years they have been made with the hurricane of 1875 in mind, but no one ever dreamed that the water would reach the height observed in the present case. The railroad bridges are to be built ten feet higher than they were before. The engineer of the Southern Pacific Company has informed me that they will construct their wharfs so that they will withstand even such a hurricane as the one we have just experienced.

I believe that a sea wall, which would have broken the swells, would have saved much loss of both life and property. I base this view upon observations which I have made in the extreme northeastern portion of the city, which is practically protected by the south jetty; this part of the city did not suffer more than half the damage that other similarly located districts, without protection, sustained.

From the officers of the U. S. Engineer tug *Anna*, I learn that the wind at the mouth of the Brazos River went from north to southwest by the way of west. This shows that the center of the hurricane was near Galveston, probably not more than 30 miles to the westward. The following towns have suffered great damage, both in the loss of life and property: Texas City, Dickinson, La Marque, Hitchcock, Arcadia, Alvin, Manvel, Brazoria, Columbia, and Wharton. Other towns further inland have suffered, but not so seriously. The exact damage at these places cannot be ascertained.

On 12 September 1900, a hurricane struck off Newfoundland and Prince Edward Island, *Canada*. The French fishing fleet was lost. There was a great loss of life.<sup>94</sup>

On 22 September 1900, floods were reported in Calcutta and Delhi, *India*, with loss of life.<sup>97</sup>

In October 1900, there was a flood in the *United States* of considerable proportions over the Wisconsin tributaries of the Mississippi River, due to excessive rains over that district. At La Crosse, Wisconsin, 7.23 inches of rain fell during the twenty-four hours ending at 8 a.m. of the 28<sup>th</sup>. Heavy rains had also occurred during the early days of the month. Great damage was wrought by the high waters in the Chippewa, Black, and Wisconsin rivers, and the total losses reported exceeded \$100,000 [\$2.6 million in today's dollars]. Streets in towns were flooded, families driven from their homes, stock drowned, crops ruined, and railroads washed out, but very fortunately, no lives were lost. At Portage, Wisconsin, on the 9<sup>th</sup>, the Wisconsin River reached 12.5 feet on the gage (the highest known stage), and the lowlands for five or six miles around were from four to six feet underwater. The Government levee at Portage gave way and the lower portions of the city were flooded in a very few minutes.<sup>124</sup>

On 26-27 October 1900, there was a heavy rainstorm and destructive floods in the Newcastle district of *England* resulting in 5 deaths.<sup>94</sup>

In early November 1900, there was a typhoon at Hong Kong, *China*, which caused over 70 deaths.<sup>94</sup>

On 10 November 1900, Hong Kong, *China* was visited by the most disastrous typhoon that it had experienced since 1874. It caused the loss of over 200 lives, some 270 junks and fishing boats in the harbor, and the loss of the government's new dredger, costing £40,000 and the foundering of H.M.S. gunboat *Sandpiper*. The American barque *Benjamin Sewall* broke her cable and drifted on to the Chinese gunboat *Fupo*, carrying away her masts, spars, and boats. The damage to the *Sewall* running ashore was about \$10,000 [\$250,000 in today's dollars]. The American barque *State of Maine*, Captain Colcord, was fortunate in being able to save 8 Chinese from a sinking junk alongside. The greatest loss was caused by the sudden veering of the wind at 8 o'clock. The damage to the city was not as great as to the shipping in the harbor, although iron lampposts and telegraph posts were twisted and bent, and all buildings of a temporary character were blown down and those in process of construction badly damaged. The consular buildings sustained the loss of all the blinds on one side of it and of a large portion of the windows on the other side. The trees and foliage about the grounds were badly wrecked, as they were all over the city.<sup>124</sup>

On 13 November 1900, a destructive typhoon struck *Guam* [in the western Pacific Ocean]. The U.S.S. *Yosemite* was lost.<sup>124</sup>

On 11-13 November 1900, a destructive typhoon struck off *Guam* and the *Philippines*. Hundreds were killed.<sup>94</sup>

On 20 November 1900, the severest "kona" ever known swept through the *Hawaiian Islands*. Prior to this, exceptionally hot weather was succeeded by 6 weeks of heavy rains. The "kona" is the Hawaiian native name for a storm from the southwest, a direction from which few storms come in this region. In reality, it is a cyclonic disturbance crossing the Pacific, and when its track lies far enough south, it appears there as a southwest wind. The Hawaiian Islands are exempt from anything like a hurricane or typhoon, just as they are wholly exempt from the extreme heats of the tropics. Although there were no actual losses of vessels, the shipping suffered severely. The Oahu Railroad suffered two washouts and a landslide, which disarranged traffic for three days. This was something that never occurred before. On Kanau [Kanu], the flood came in such torrents as to break down a protecting cement wall. On Molokai the torrent came down in such floods that at one time it scooped out a course for itself many feet deep, carrying millions of cubic feet of earth, rock, and boulders in its onrush. On Maui, the rain fell at the rate of 4 inches a day for 3 days in succession. The telephone system of the island was in chaos. The whole island of Haleakala [Haleakalā or East Maui Volcano] seemed a rushing torrent and streams flowed in great volume where there were never known to be any before. Kahului, Maui was under water for several days. During the storm on Maui, the Iao River overflowed its banks, carrying a raging torrent to the sea.<sup>124</sup>

During the afternoon and evening of 20 November 1900, a series of tornadoes struck southeastern Arkansas, northern Mississippi, and western Tennessee in the *United States*. The actual deaths resulting from these storms number at least seventy-three, while a large number of persons were seriously injured and a much greater number rendered homeless by the destruction of their dwellings. Through the farming districts the loss was mainly confined to fences, farm buildings, and cabins. Unpicked cotton was stripped from the stalk and scattered broadcast over the country, and instances were noted where large quantities of cotton were carried by the tornado to distant forests and deposited upon trees making them appear to be covered with snow. The estimated damage exceeded a half million dollars [\$13 million in today's dollars].<sup>124</sup>

\* At Ulm, Arkansas, several dwellings were destroyed and 2 persons killed.

\* The town of Moro, Arkansas was almost entirely swept away, only 4 buildings left standing; 3 persons were killed.

- \* At Dundee, Mississippi 6 persons were killed, many buildings destroyed, great damage done to fences and unpicked cotton. An additional 9 people were killed from Dundee to Arkabutla, Mississippi.
- \* At Arkadelphia, Mississippi, a town of about 1,000 inhabitants, scarcely anyone escaped without injury. Hundreds of homes were swept away without warning, and 11 persons were killed and a very large number severely injured.
- \* At Strayhorn, Mississippi, 11 people were killed
- \* At Coldwater, Mississippi, 1 person was killed and much valuable property destroyed.
- \* At Guys Switch, Mississippi, the tornado demolished 10 or 12 buildings, among which was the big sawmill plant of J. Guy & Co. Mr. Guy described the storm as follows: "We were running a sawmill at the time and did not notice the approach of the storm until within a few yards of us. The destructive part of the storm lasted about five or ten minutes. There were 23 men in the mill at the time, and though it was completely demolished no one was hurt. The storm was moving northeast with a path, I think, about 500 yards wide. It passed my place and swept everything before it. There was no hail, very little thunder and lightning, and no rain until the storm had passed. The trees outside of the storm's path lay mostly with their tops toward the center of the track of greatest destruction. The cloud was funnel shaped, and when it came in contact with the ground flattened out, and as it rose became narrower. One man was killed and several badly hurt by flying and falling lumber."
- \* At Lagrange, Tennessee, the tornado destroyed about 20 buildings and caused the death of 2 persons. The property loss at this place aggregates \$50,000. Within a path 175 yards wide practically every building was leveled to the ground. A strange relic left by the storm at Lagrange was a tin sign bearing the inscription "Johnson Bros., Lula, Miss." evidently brought by the tornado from that place more than 80 miles distant.
- \* At Ripley, Tennessee at least 25 dwellings were destroyed and a large number of people injured, but none were reported killed.
- \* The tornado passed through the suburbs of Columbia, Tennessee in a northeasterly direction, sweeping a path from 100 to 300 yards wide and destroying everything within its reach; 27 persons were killed and between 60 and 70 more or less injured. About 50 dwellings were destroyed, and the loss in buildings alone was estimated at \$30,000. A settlement near Columbia, known as Macedonia, about 2 miles from the original striking point of the tornado, containing about 25 houses, was completely demolished, and 13 people were buried under the debris.
- \* At Nolandsville [Nolensville], Tennessee, 3 persons were killed and about 13 buildings destroyed.
- \* At Laverne, Tennessee, 2 persons were killed and 25 buildings demolished.
- \* In the vicinity of Huntington, Mississippi, 10 buildings were destroyed and about 20 persons injured.
- \* At Vance, Mississippi, a tornado destroyed a general store and 10 cabins and killed 3 children.

On 20 November 1900, a destructive cyclone [tornado] struck Columbia, Tennessee in the *United States* causing many deaths.<sup>94</sup>

During 7-10 December 1900, the most disastrous hurricane within the past twenty-five years struck the island of New Britain [an island off the northwest coast of Papua, *New Guinea*]. The storm came after an unusually trying season of drought. The rain and squalls began on the 2<sup>nd</sup> or 3<sup>rd</sup> and increased in force daily until the hurricane and tremendous sea of the afternoon of the 7<sup>th</sup>.<sup>124</sup>

Exceptionally severe weather prevailed along the steamer routes of the Atlantic and Pacific Oceans during December 1900; and from the 20<sup>th</sup> until the close of the month disastrous storms visited the *British Isles* and the middle-western and northwestern coasts of continental *Europe*.<sup>124</sup>

On 20-21 December 1900, there was a gale over *United Kingdom* with loss of life. Twenty-two Shetland fishermen drowned.<sup>94</sup>

On 27, 29 December 1900, there was a destructive gale over the *United Kingdom*.<sup>94</sup>

On 30-31 December 1900, there were heavy floods in the Midlands and western *England*.<sup>97</sup>

In 1900 during the period between 27 June and 25 July, a drought engulfed Kansu (now Gansu province) in northwest *China* at Ching-sh'uan, Lanchow, P'ing-liang, Chuang-lang, Ku-yüan and Lin-t'an. During the period between 24 September and 22 October, a drought engulfed Hopei (now Hebei province) in

northern *China* at Nan-yüeh and Hsing-t'ai.<sup>153</sup>

*Also refer to the section 1890 A.D. – 1900 A.D. for information on the drought in South Africa during that timeframe.*

*Also refer to the section 1895 A.D. – 1903 A.D. for information on the drought in Australia during that timeframe.*

*Also refer to the section 1896 A.D. – 1900 A.D. for information on the famine in India during that timeframe.*

**Winter of 1900 / 1901 A.D.** On 22-24 November 1900, a storm of heavy sleet and snow struck the highlands of western New York in the *United States*. At Hammondsport, New York:<sup>124</sup>

The falling moisture clung to and froze fast upon everything. Nearly every fruit orchard was more or less damaged, and some were totally ruined. Thousands of trees were either uprooted or thoroughly stripped of branches. Whole tracts of forest were similarly affected, in many instances being crushed to the ground. Fruit trees of almost every description were more or less damaged. Young orchards escaped with slight injury, from the fact that the weight bent the trees to the ground, thus saving them. It was said that 1½ inches of ice formed on every twig and branch of the trees. This will give a faint idea of the immense weight. One man says that in a tract of second growth hickory and white oak from thirty to fifty feet tall, the trees were bent entirely over, the tops resting on the ground. When the sun loosened the ice many sprung back, but portions of them were splintered and ruined. The drippings from pine boughs formed in many instances complete thatched roofs. Pine timber was, therefore, less injured than others, from the fact that all of the pine boughs were so closely bound together that the weight was more equally distributed.

One of the strange sights of the effects of the storm was that upon wire fences. In many cases they were one solid sheet of ice, with scarcely a crevice large enough for a field bird to penetrate. The amount of damage can hardly be estimated but it will be immense at the best. In the memory of the oldest inhabitant nothing like it had ever been known in this region. The result will be a great scarcity of apples and other fruit for years to come in the region thus affected.

The winter of 1900-01 in Bradford County, Pennsylvania in the *United States* was open with little snow but was remarkable for rain and windstorms. Heavy rains broke a severe drought during the last week in November. A destructive windstorm swept over sections of the county on November 21 and another hit North Towanda on December 23. Several inches of snow fell January 25, affording the first sleighing of winter, and continued for most of February. February 23 was the coldest day when the temperature fell to -8° F [-22° C]. On March 3, a destructive windstorm hit the valley of Towanda Creek. On March 10, a heavy rainfall caused a sudden rise in the streams, which with the breaking up of ice at various points created floods and overflows, doing much damage to bridges and other property. The heaviest snowfall was on April 2, which was 18 inches [46 cm] deep in some parts of the county. It was too wet for farming, until the end of April. May was remarkable for heavy rains, with wind, thunder and hailstorms, the most notable of these occurred on May 23.<sup>178</sup>

A terrible storm passed over northern *England* and southern *Scotland*. In *England*, when the storm centers passes by far to the north, southern *England* experiences the mildest winter weather. Thus, on 26 December 1900, the weather in London, *England* was one of the greenest Christmases on record, for the weather had been so mild that primroses and corn flowers were abloom as far north as Liverpool and Yorkshire, while Devonshire reveled in a subtropical climate and the Isle of Wight was a garden of roses in midwinter. Never had flowers been more abundant in the London market at Christmas time, nor had mistletoe been cheaper. The London sky had been heavily clouded and the air filled with mist, while the weather had been unseasonably warm.<sup>124</sup>

On January 6, severe cold weather somewhat suddenly spread over *Europe*. A blizzard prevailed throughout southern *Russia* and southern *Austria*; a bitter easterly wind and gale prevailed on the east coast of *Great Britain*, frozen harbors and enormous snow drifts impeded traffic on the northern shore of the *Black Sea*, and violent gales in the *Adriatic Sea*. Snow fell as far south as Naples and Rome, *Italy* and

Marseilles, *France*. The temperature at St. Petersburg and Moscow, *Russia* was unusually low even for those locations.<sup>124</sup>

During the week of 9-16 January 1901, Dawson, *Canada* experienced an average weekly temperature of -58° F (-50° C). The lowest temperatures occurred on the 16<sup>th</sup> when Dawson experienced a low of -68° F (-55.6° C) and Forty Mile Creek experienced -78° F (-61.1° C). These were the lowest temperatures on record in that region. From Skagway to Dawson and below, the Yukon was covered with deep snow. From Skagway to White Horse for 100 miles the railroad was blocked and all trains tied up.<sup>124</sup>

On 20 January 1901, Santiago de Cuba, *Cuba* reports the severest cold known for many years, viz, a temperature of 60° F and dry northerly winds, that brought great discomfort.<sup>124</sup>

## Acknowledgement

I would like to acknowledge and thank Google Books and the many dedicated individuals who spent time, effort and resources in scanning and achieving the historical books cited in this paper. Their effort placed a goldmine of historical weather information at my fingertips. Without their effort this project would have never gotten off the ground.

Many of the weather chronologies that I first encountered were British in origin and focused heavily on weather events in the United Kingdom. Reasoning that other similar chronologies existed throughout the world in other languages, I began a search. But foreign language has never been one of my strengths. I found a helper called Google Translator ( <http://translate.google.com/#> ) that did a good job of translating phrases and weather event descriptions. When this resource was combined with the Google Books Advanced Search Engine ( [http://books.google.com/advanced\\_book\\_search](http://books.google.com/advanced_book_search) ), these two resources made a remarkable team.

I would like to deeply acknowledge and thank Eleonora O'Connor-Risch for contributing to this weather chronology by passing on her research into the Chronicles of Novgorod, a very early Russian chronology. I would also like to thank her for researching and contributing Australian weather information. She is a bit of a wonder at uncovering bits of weather data scattered in the windswept vistas of times past.

I would like to acknowledge and thank Daniel Godet for bringing an excellent French chronology to my attention.

I would like to acknowledge the expert assistance of Brenda Roach in translating several French passages and Rev. Michael T. Madden for help in checking the old German and Latin translations.

I would like to acknowledge and thank Katherine Barich for the weather related tidbits she decided to share.

I would also like to acknowledge Robert Juhl for the information he contributed.

---

## Revision Tracking

Rev. Original: 7 December 2010

Rev. 1: 24 January 2011 [correction to Winter 1809/10; added very early Russian chronology (Ref. 76); added American chronologies (Ref. 77 & 78)].

Rev. 2: 7 March 2011 [addition of French chronology (Ref. 79) and Italian accounts (Ref. 80-82); implemented several corrections].

Rev. 3: 3 June 2011 [added information on the most severe famines, Australian chronologies, U.S. Weather Data and began to fill in the gap between 1850-1900 A.D., references 83-128].

Rev. 4: 14 December 2011 [added substantial weather data from the U.S. Monthly Weather Reports, added hurricane data, added early Japanese weather data, the Finland & Estonian famine of 1695-97, added a small portion of the Chinese flood and drought data and incorporated numerous corrections. Added references 129-153].

Rev. 5 [6<sup>th</sup> Edition]: 14 June 2012 [completed the addition of China flood and drought data. Also added some early French and German events. Added references 154-172.]

Rev. 6 [7<sup>th</sup> Edition]: 3 March 2014 [made corrections to old German translations of reference 172, added 1783 Fractured Comet Impact Hypothesis, added Taiwan Mega-Tsunami, added references 173-306.]
